During the year there was a recasting of the field artillery organizations at home due to the return from South Africa of a number of units that had been in colonial service. The result was to increase the peace establishment of the expeditionary force batteries and turn over a part of the ammunition service in time of war to the mechanical transport division of the army service corps. It was decided that the field and howitzer batteries for the expeditionary force should have a peace establishment of 158 men and 75 horses, and by transforming three horse artillery batteries into field batteries and using three batteries from South Africa there would be 15 service batteries at home above the expeditionary force batteries, a number which would be increased to 18 when the remainder of the field artillery in South Africa returned to England. The total number of service batteries and companies at home and abroad is 25 horse, 135 field, 9 mountain, 98 garrison companies, including 12 heavy batteries.

The infantry in the British army consisted of four regiments in the brigade of guards, comprising nine battalions, 67 regiments of infantry of the line, and two rifle regiments with a total of 148 battalions. The normal composition of a line regiment was two battalions, but during the year it was decided to establish four battalions of each regiment and measures were taken to that effect.

Exclusive of the Indian army, there were 85 troops, companies, and other formations of engineers for field bridging, searchlight, railway, survey, and similar duties. A new army signal service was formed, composed of royal engineer wireless and telegraph men, and infantry and cavalry signalers. The Army Service Corps was organized in 80 companies, including 56 for horse transport, 15 for mechanical transport, five supply and four remount companies.

The United Kingdom was divided into six commands designated as follows: I. Aldershot; II. Southern; III. Eastern; IV. Irish; V. Scottish; VI. Northern. The Aldershot command is not territorial, being held in immediate readiness for foreign service, but the others are subdivided into districts for the management of infantry recruiting, recruit depots, mobilization, etc. London forms an independent district apart from commands. Excluding India, the principal commands abroad are Gibraltar, Malta, Egypt, and South Africa, in addition to the supreme command of the inspector-general of over-sea forces, Sir Ian Hamilton, G. C. B., in 1913. The expeditionary force referred to consisted of six divisions, one cavalry division, and technical administrative troops, which would supply a complete army estimated at 5660 officers and 162,000 non-commissioned officers and men, or the largest over-sea army in the world.

The regular establishments showing the number of all ranks, including India, with the corresponding figures for 1912 and 1913, are given in the accompanying table:

**THE ESTABLISHMENT OF THE REGULAR ARMY
INCLUDING INDIA**

	1913-14	1912-13
Cavalry	20,332	20,470
R. artillery { horse and field	29,310	30,070
{ garrison	18,584	18,738
Royal engineers	10,230	10,197
Royal flying corps	1,005
Infantry	149,507	149,721
Army service corps	6,463	6,587
Royal army medical corps	4,781	4,951
Colonial and native Indian corps
in imperial pay	8,765	8,871
Departmental corps	3,563	3,534
Additional numbers *	1,000	3,800
Total	253,530	256,849

* Voted to cover regimental fluctuations from time to time.

In addition are permanent staff and the territorial force, staff and departments, and miscellaneous establishments.

The British army reserve was divided into three sections, section A consisting of reservists who would join the colors, if required, without a general mobilization, and, therefore, are available for special expeditionary purposes; sections

B and C are the ordinary reserve, including those who had enlisted for short service and had been discharged from their active duties. Section D consisted of men who, after completing the 12 years of their original engagement, re-engaged in the reserve for a further four years. The strength of the army reserve on October 1, 1912, was as follows:

	A	B	D	Total
Cavalry		7,453	2,983	10,436
Horse and field artillery	674	13,584	3,882	18,140
Garrison artillery.....		6,629	213	6,842
Engineers	424	4,413	702	5,539
Infantry	4,217	63,092	17,706	85,015
Various	453	11,059	1,593	13,305
Total	5,768	106,230	27,079	139,077

The Territorial Force. During 1913 progress was made with the organization and recruitment of the territorial force, including the various branches and schemes for education and recruitment. This is truly a national movement and its success depends in large measure upon the participation of the general public and the interest of the citizens. The strength, on April 1, 1913, was 9299 officers and 244,510 other ranks. During the 12 months 64 recruits, and 692 men rejoining the previous service, became members of the force and, as only 40,259 men would become time-expired in 1913-1914, as against 114,621 in 1912-1913, an annual recruit contingent of 65,000 was anticipated. In 1912, 61 per cent. of the force attended camp for the full fifteen days and 26 per cent. for the legal minimum of eight days, or other period less than 15 days. The camp attendance of the enrolled members of the force, 88 per cent., elicited favorable commendation from continental officers. The territorial force on October 1, 1912, was as follows:

	Establishment	Strength
Yeomanry	26,111	24,607
Royal horse and field artillery	34,118	29,202
Royal garrison artillery.....	11,899	9,305
Royal engineers.....	14,583	12,789
Infantry	202,372	165,300
Army service corps.....	8,932	7,363
Various	15,283	12,867
	313,298	261,433
Officers of officers' training corps and unattached list available on mobilization.		1,037
Total	313,298	262,470

The national service was also being developed in 1913 by securing the registry of men available for military service or other work in connection with the army.

NAVY. Number and displacement of warships (including colonial vessels) of 1500 or more tons, and of torpedo craft of 50 or more tons, built and building, December 1, 1913: Dreadnoughts (battleships having a main battery of all big guns, that is, 11 or more inches in calibre): built, 18, of 353,350 tons; building, 14, of 367,500 tons. Predreadnoughts (battleships of about 10,000 or more tons, whose main batteries are of more than one calibre): built, 40, of 589,385 tons; building, none. Coast-defense vessels (smaller battleships and monitors): none built or building. Battle cruisers (armored cruisers having guns of largest calibre in main battery and capable of taking their place in line

of battle with the battleships): built, 9, of 187,800 tons; building, 1, of 28,500 tons. Armored cruisers: built, 34, of 406,800 tons. Cruisers (unarmored warships of 1500 or more tons): built, 72, of 371,715 tons; building, 20, of 79,320 tons. Torpedo-boat destroyers: built, 143, of 104,985 tons; building, 44, of 42,865 tons. Torpedo boats: built, 49, of 11,488 tons; building, none. Submarines: built, 72, of 27,188 tons; building, 22, of 20,395 tons. Total tonnage: built, 2,052,711, building, 538,580. Excluded from the foregoing: Ships over 20 years old from date of launch unless reconstructed and rearmend within five years; torpedo craft over 15 years old; transports, colliers, repair ships, torpedo depot ships, and other auxiliaries; vessels not actually begun or ordered although authorized. The United Kingdom is first among the nations in amount of warship tonnage both built and building.

Officers and men in 1913, 145,553, including 3 admirals of the fleet, 12 admirals, 22 vice-admirals, 56 rear-admirals, 683 captains and commanders, and 2414 other line officers.

Dreadnoughts recently added to the British fleet are *King George V.*, commissioned November 16, 1912; *Conqueror*, November 23, 1912; *Centurion*, May 22, 1913; *Audacious*, October 21, 1913; *Ajax*, October 31, 1913. The principal characteristics of the *King George V.* are: Displacement, 24,000 tons; length between perpendiculars, 555 feet; beam, 89 feet; draft, 27.5 feet; designed speed, 21 knots; battery, 10 13.5-inch guns and 24 4-inch guns; torpedo tubes, 3; maximum thickness of armor belt, 12 inches. The battle cruiser *Princess Royal* was commissioned November 14, 1912. The principal characteristics of this ship are: Displacement, 26,350 tons; length between perpendiculars, 660 feet; beam, 88.5 feet; draft, 27.5 feet; designed speed, 29 knots; battery, 8 13.5-inch guns and 16 4-inch guns; torpedo tubes, 2; maximum thickness of armor belt, 9 inches. The battle cruiser *New Zealand* was commissioned November 19, 1912, and the battle cruiser *Queen Mary*, September 4, 1913. The light cruisers *Chatham*, *Southampton*, and *Dublin* were commissioned respectively December 3, 1912, and February 25 and March 11, 1913; the light cruisers *Active* and *Fearless* were commissioned respectively April 2 and October 14, 1913.

The fourteen dreadnoughts under construction in the autumn of 1913 are: The *Iron Duke* (building at Portsmouth), to be completed January, 1914; the *Marlborough* (Devonport), January, 1914; the *Emperor of India* (Barrow), May, 1914; the *Benbow* (Dalmuir), May, 1914—these ships have each a displacement of 25,000 tons and a main battery of 10 13.5-inch guns, and will use both coal and oil as fuel; the *Queen Elizabeth* (Portsmouth), October, 1914; the *Warspite* (Devonport), October, 1914; the *Valiant* (Clydebank), March, 1915; the *Barham* (Govan), March, 1915—these four ships have each a displacement of 27,500 tons and a main battery of 8 15-inch guns, and will use only oil as fuel; the *Malaya* (Elswick), September, 1915—this vessel, of the same class as the *Queen Elizabeth*, was offered to the imperial navy by the council of the Federated Malay States in November, 1912; the *Royal Sovereign* (Portsmouth), the *Royal Oak* (Devonport), the *Ramilles* (Dalmuir), the *Revenge* (Barrow), and the *Resolution* (Jarrow), to be completed in Janu-

ary, 1916—these five ships, it is reported, will revert to coal for fuel. The battle cruiser building in 1913 was the *Tiger* (Clydebank), to be completed May, 1914.

GOVERNMENT. The legislative power rests with the Parliament, consisting of the House of Lords and the House of Commons. In 1913 the peers entitled to sit in the House of Lords (including the lords spiritual and temporal and three royal princes) numbered 638. The general election of December, 1910, returned 670 members of the Commons to the second Parliament of George V., which convened January 31, 1911. England has 465 members in the Commons, Wales 30, Scotland 72, and Ireland 103. Party representation in November, 1913, was as follows: Liberals, 264; Laborites, 39; Nationalists, 76; Independent Nationalists, 8; Unionists (opposition), 283; total, 670.

The executive authority is vested in the king, acting through his ministers. The king in 1913 was George V. (born June 3, 1865), who, as second (but only surviving) son, succeeded Edward VII. May 6, 1910. Heir-apparent, Edward, born June 23, 1894, and created Prince of Wales June 23, 1910.

The ministers hold office during the pleasure of the king or while the cabinet possesses a majority in the House of Commons. In 1913, the ministry was that of Mr. Asquith (Liberal), which was formed April 8, 1908. Those of the ministers who constitute the cabinet were as follows at the end of 1913: Prime minister and first lord of the treasury, Herbert Henry Asquith (appointed by the king April, 1908); lord high chancellor, Viscount Haldane (1912); lord president of the council, Viscount Morley of Blackburn (1910); lord privy seal, Marquis of Crewe (1908-11 and from 1912); first lord of the admiralty, Winston Spencer Churchill (1911). Secretaries of state: for home affairs, Reginald McKenna (1911); foreign affairs, Sir Edward Grey (1905); the colonies, Lewis Vernon Harcourt (1910); war, Col. John E. B. Seely (1912); India, Marquis of Crewe (1910). Chancellor of the exchequer, David Lloyd-George (1908); secretary for Scotland, Thomas McKinnon Wood (1912); chief secretary of the lord lieutenant of Ireland, Augustine Birrell (1907); postmaster-general, Herbert Louis Samuel (1910). Presidents of committees of the council: Board of trade, Sydney Charles Buxton (1910); local government board, John Burns (1905); board of agriculture, Walter Runciman (1911); board of education, Joseph Albert Pease (1911). Chancellor of the duchy of Lancaster, Charles Edward Henry Hobhouse (1911); first commissioner of works, Earl Beauchamp (1910); attorney-general, Sir John Allsebrook Simon (1913). There are various other ministers besides the foregoing, but they are not members of the cabinet.

HISTORY

THE GENERAL POLITICAL SITUATION. It is a remarkable circumstance that despite the urgent domestic problems confronting Great Britain, British politics should revolve about Ireland: that the Asquith ministry should be most virulently assailed, not for its attack on the House of Lords, not for its benefactions to labor, not for its projected land reform, but for its simple

determination to give Ireland a measure of self-government. The year 1913 exhibited a strange spectacle. With all their love of law and order, the Conservatives condoned and openly supported the revolutionary propaganda of the Ulster Unionists, whose avowed intention was to involve Ireland in a disastrous and bloody civil war rather than accede to the demand which the majority of the Irish people have so persistently and hitherto vainly made for home rule. In the face of threatened bloodshed, the ministry pressed its home rule bill, twice approved by the House of Commons and twice rejected by the Lords. If once more the Commons pass the bill, it will become law under the Parliament act of 1911, and the vexatious Irish problem will be eliminated from British politics. No words could be found adequately to express the Conservative repugnance to the ruthlessness of the majority in the House of Commons. The Liberal-Labor-Nationalist coalition, it seemed, was determined to utilize the Parliament act to the full, and would not be interrupted by demands for a general election. The government's Scottish reform bill had been forced upon the Lords after one rejection; its Welsh Church bill would be passed next session. The Opposition, unable to agree on a tariff policy, or on a definite land policy, or on a solution of the Irish question, contented itself with attacking government measures, denouncing the electoral reform bill as a vote-getting partisan measure, threatening civil war in Ulster, and asking why the House of Lords was not at once reformed. The Unionists found much to criticize in the army and navy. But the most damaging attacks of all were directed at the personal honor rather than at the policies of the ministers. A rumor had gotten abroad that the chancellor of the exchequer and two other members of the government had wrongly speculated in Marconi stocks; and although protracted investigations cleared the ministers of guilt, the Unionist press kept the scandal alive as a most effective weapon against the ministry. Meanwhile no little trouble was being caused by the violent tactics of the militant suffragists and by the outbreak of numerous strikes, of which that led by James Larkin at Dublin was the most notable. A difficult question arose. Should the government arrest James Larkin or Mrs. Pankhurst for inciting to violence, and let Sir Edward Carson, the Ulster Unionist, go free?

THE HOME RULE BILL. The government of Ireland bill, familiarly known as the home rule bill, was introduced by Mr. Asquith on April 11, 1912, and carried through two readings in that year. Of its provisions, fully discussed in the *YEAR BOOK* of 1912, it is necessary to recall simply that the bill would establish a bicameral Irish legislature with limited powers; that the imperial Parliament, in which Ireland would still be represented, would continue to control foreign relations, foreign commerce, and many other matters; and that provision was made for the imposition of taxes by the Irish Parliament and the gradual reduction of the financial support given Ireland by the imperial government. One important amendment had been incorporated in the bill, namely, the provision that after five years the members of the Irish Senate should be elected by proportional representation. After the Christmas holidays the British House of Commons proceeded to discuss the report

stage of the home rule bill. In accordance with the schedule mapped out in the preceding October, the government allotted seven days to this stage, notwithstanding Mr. Bonar Law's contention that the discussion was being unduly abbreviated, and that only 212 of the 1646 lines of the bill had been discussed in committee. On January 1, Sir Edward Carson, the leader of the Ulster Unionist agitators, spoke eloquently and earnestly in favor of an amendment to exclude "the province of Ulster" from the home rule bill. Mr. Asquith and Mr. Churchill saw in the amendment merely an attempt to wreck the whole bill, and the former went on to say that even in the province of Ulster there were seven Roman Catholic home-rulers to every nine Protestants. The Protestant minority might find home rule distasteful, but never oppressive; for every safeguard would be prepared in the interests of the minority. Sir Edward Carson had asked "and has the House now made up its mind . . . to drive them (the Ulster Unionists) out of the constitution under which they are willing to remain, and to compel them to live under a constitution which they abhor, and which is loathsome to them?" In reply, Mr. Redmond (Irish Nationalist), asked, "Will you, if this bill fails, by force coerce the rest of Ireland to continue to live under a system of rule established at the Union, and which they loathe, and ever loathed from that day to this?" The amendment to exclude Ulster was rejected by 294 votes to 197. But in the interest of the Protestants of Ireland, new provinces were added. The properties and privileges of universities (Dublin, Trinity College, Queen's) were not to be diminished without their consent. An amendment to clause 3 made it still more impossible for the Irish Parliament to expropriate Protestant religious bodies. A Liberal amendment to clause 9 on elections to the Irish House of Commons provided that "in any constituency which returns three or more members the elections shall be held on the principal of proportional representation, and each elector shall have one transferable vote." This was expected to give the Unionists two more members. In the debate on the third reading, the question of the coercion or the exclusion of Ulster was again brought up. Mr. Bonar Law believed that Ulster would prefer civil war, or government by "a foreign country" to home rule. The exclusion of Ulster was demanded, not as the basis for a compromise, but as an alternative to bloodshed. The Liberals, however, unwilling to present their Nationalist allies with a "mutilated Ireland," and confident that with their rights properly safeguarded few Ulstermen would rebel against home rule, proceeded to pass the third reading by a vote of 367 to 257 on January 16.

The home rule bill was then presented for the disapproval of the Lords. Its rejection was a foregone conclusion, even before the four nights of debate; nevertheless the government offered to consider "any method by which, without altogether destroying its substance, it can be made less alarming to its most bitter opponents." The bill was rejected on January 30 by a vote of 326 to 69.

Under the Parliament act, the home rule bill must be passed over the veto of the Lords three times in three successive sessions. Mr. Asquith proposed to use this procedure for enacting into law not only the home rule bill, but the Scottish temperance bill and the Welsh disestablishment

bill as well, both of which were passed by the Commons before adjournment (February 14) and rejected by the Lords. Consequently all three were reintroduced in the summer session, which began on March 10. At present we shall follow only the home rule bill. The formal first reading took place May 7. In the debate on second reading, Sir Edward Carson declared that "the whole force of the whole Conservative and Unionist party" would support Ulster in armed resistance. He was supported by Mr. Bonar Law, who reproached the government for compelling the whole Unionist party to endorse the attitude of Ulster. By way of reply, the government repeated its offer to adopt any provision for the safety of Ulster's interests, and reproached the Opposition in turn for suggesting no plan by which the Irish problem could be solved. Mr. Redmond, towards the end of the debate, made a clear-cut statement of the Nationalist position: "Ireland to-day is full of hope and expectation. Beware how you dash that hope to the ground. Rebellion is threatened. Rebellion is justified in high quarters. The rebellion of a portion of the population of four counties, because they disapprove of the act of the imperial Parliament before any wrong has been done, and before any oppression has been attempted, would be a crime and a calamity. Rebellion by over three-fourths of the people of a country distracted, tortured, and betrayed, deprived of the rights of freemen, and condemned to a barren policy of coercion, would be too horrible a thing to contemplate; and it is because this is so that I rejoice with all my heart to believe and to know that the future of this bill is safe, and that the future of Ireland is assured." The bill passed second reading in the Commons on June 10 by a majority of 98. In the committee stage there would ordinarily have been numerous obstructionist amendments; but inasmuch as a bill sent up to the House of Lords for a second time under the Parliament act may not be amended, the committee of the whole reported the bill without alteration. It may be noted that it is possible for the Commons to make suggestions which they invite the Lords to incorporate in the bill; in connection with the home rule bill no suggestions were made, and the bill as read a third time on July 17 was unaltered. When it came up before the Lords again, Lord Loreburn urged them carefully to discuss the details of the measure in a spirit of frankness and conciliation; but the Lords refused a second reading to the bill, and on July 15, by 302 votes to 64, adopted Lord Lansdowne's reasoned amendment "that this House declines to proceed with the consideration of the bill until it has been submitted to the judgment of the country."

An appeal to "the judgment of the country" had been demanded again and again by Unionist orators. On January 1, in response to the challenge of Mr. Asquith, Mr. Bonar Law had promised that if the home rule bill were submitted as a clear issue to the judgment of the country, and vindicated, he would "not in any way, shape, or form encourage the resistance of Ulster." This would not avert civil war, however, and the Unionists freely acknowledged that men who had signed the covenant would not meekly submit to the verdict of the people of Great Britain. In demanding a general election the Opposition was not trying to avert civil war,

but in effect asking the government to make sure of the popular decision. Inasmuch as the electors might be influenced by the threats of the covenanters, it was felt that the decision would not be calm or fair. The popular sentiment might be gauged either by a general election or by referendum. In either case the decision, if affirmative, would not mollify Ulster, if negative would not solve the Irish question, and whether affirmative or negative the polling would mean delay and distraction for the ministry. The Unionists frequently and solemnly adjured the government not to coerce Ulster without the express mandate of the nation. But Ulster would not be coerced without the consent of the people; for, as Mr. Churchill explained, there would be a general election before the home rule bill could be put into effect, and should the Conservatives come back in power, they could easily repeal the act or exclude Ulster. Possibly if the Conservatives had felt confident that a majority of the British electorate believed Irish home rule to be wrong, they would have been willing to bide their time, for it was plainly proved that no oppression of Ulster could take place before the next general election. The Liberals had been careful to provide that the home rule bill should not go into effect immediately upon enactment, but upon "the appointed day," so as to afford an opportunity for reversal between the date of enactment and execution. This would make the argument about coercing Ulster without the approval of the people sound highly fallacious: the Ulstermen had now to rearrange their plans. Instead of resisting the establishment of home rule in Ireland, as originally planned, they must needs rise in arms the day the bill should be enacted into law. The Conservatives still talked about forcing home rule on Ulster against the country's will; but the situation had changed. Ulster was no longer opposing home rule: Ulster was now disputing the right of Parliament to pass a law. While protesting allegiance to the United Kingdom, and to the British constitution, Ulster was treasonably plotting against a government legally established under that constitution. Two explanations were possible. A few Unionists professed to obey the king while fighting the ministry, and some even proposed that the royal veto—unheard of since the days of Queen Anne—should now be used against home rule. Others called the ministry unrepresentative, thereby implying that sovereignty rested in the people, but never questioning the right of the certainly less representative House of Lords to exercise a veto. It was not surprising that the Liberals saw in the whole agitation a covert attack on the Parliament act of 1911. The supremacy of the House of Commons, established in principle, was to be denied in practice; the Irish question was to remain a vexation to British politics and an excuse for upsetting the ministry; and Lloyd-George's land reforms, and Mr. Asquith's designs on the House of Lords, were to be defeated in the name of Ulster.

WAR OR CONFERENCE. In September and October there were three ways of looking at the Ulster question. One could join with the Irish Nationalists in the cry "full steam ahead" with the home rule bill; one could shout with the Unionists "exclusion of Ulster," "appeal to the people," or "war"; or one could advocate "home rule by the consent." Of the last, more will be said hereafter. It was the threats that at

first attracted chief attention. Mr. Bonar Law warned the government that "blood will be shed as soon as it (the bill) becomes law" (October 29), and advised them to heed the example of James II., whose stubbornness ended in revolution (November 28). Unionist leaders were confident that "some of the greatest generals in the army" would fight for Ulster. And Sir Edward Carson did not confine himself to empty threats. "Ulster volunteers" to the number of 50,000 were enlisted and drilled; Sir George Richardson was appointed commander-in-chief; arms and ammunition were smuggled into Ireland; and subscriptions were taken for a fund of £1,000,000 out of which to indemnify the Ulster volunteers for loss or injury. The standing committee of the Ulster Unionist Council, with Sir Edward Carson as chairman, made arrangements on September 24 for the formation of a provisional government for Ulster. During September and October Sir Edward and others toured Ulster, reviewing the volunteers and making inflammatory speeches. On September 27 eight or ten thousand volunteers were reviewed at Balmoral (Belfast). Every effort was made to goad the Protestants of Ulster to fury. On September 28 a Presbyterian minister fired his audience by the words, "We know that home rule means Rome rule, and Rome rule means persecution." He failed to recollect that hitherto the Catholics of Ireland had been persecuted rather than persecutors, that in the home rule bill Protestantism was strongly safeguarded, that a Protestant Parliament in London would not lightly abandon fellow-religionists to oppression. These latter considerations, it should be noted, induced many Irish Protestants to espouse the cause of home rule.

The arming and drilling of troops in Ulster was a bold manœuvre on the part of the Unionists. For it meant the establishment of a dangerous precedent. Whoever felt his interests injured could henceforth take up arms against the legally constituted government. The Irish Nationalists were not slow to imitate their opponents, and on a larger scale. If the Unionists would fight against home rule, the Nationalists would fight for it. Then, too, there were the suffragists. Miss Pankhurst could now collect an "army" in the slums of London. But gravest of all was the influence on the laboring classes. If their masters could disregard the law with impunity, why could not they also? If Unionists could carry arms, why not trade-unionists? Fortunately, only a few of the trade-union leaders expressed this query. On the part of many Liberals and of many moderate Conservatives, there was a very sincere desire to see the Irish question settled without recourse to coercion, and with as little as possible of partisan rancor. Probably no one voiced the plea for conciliation better than did Lord Loreburn, former Liberal lord chancellor. In a letter to the public, published in the *London Times* on September 11, Lord Loreburn admitted that if the home rule bill should be enacted into law in 1914, as seemed probable, the government might expect "serious rioting in the north of Ireland," especially since the Unionists in England were believed to be ready to "condone if not approve" violence. Whether the insurrection proved serious or not, a forced and unwilling submission on the part of Ulster must breed bad feeling and make "a cordial partnership in self-government between Protestant and Roman Catholic Ire-

land" well-nigh impossible. On the other hand, should the home rule bill be defeated, the results would be even more disastrous. The situation demanded compromise, conciliation, and the clearing up of misunderstandings. And to this end Lord Loreburn suggested a "conference or direct communication between the leaders" to prepare a compromise acceptable to all. Lord Loreburn's first disappointment came when Sir Edward Carson said, "We are not going into a conference when a conference means not even a compromise but absolute surrender. . . . We do not trust the government, or any movement of the government." To the mind of Mr. John Redmond, Sir Edward's rejection of the offer clearly demonstrated that the Ulster opposition "is implacable, it is irreconcilable, its root is the old spirit of ascendancy, it is simply a brutal and arrogant determination to override the will of Parliament." The possibility of compromise continued to be agitated, however. Mr. Churchill and Sir Edward Grey both seemed to be impressed with the idea. Compromise, however, could only mean the temporary exclusion of Ulster; for Mr. Asquith in an important speech at Ladybank on October 25, laid down three points upon which he would not yield: an Irish Parliament, an executive responsible to it, and "nothing is to be done which will erect a permanent, or an insuperable, bar in the way of Irish unity." It was not likely that the opposition would come to an agreement on these terms, when even the permanent exclusion of Ulster would not satisfy Lord Lansdowne.

WELSH DISESTABLISHMENT. Like the home rule bill, the bill for the disestablishment of the Church of England in Wales was passed twice by the House of Commons, and twice rejected by the Lords. It was first introduced April 23, 1912, and went through committees in January, 1913, on report. In February Mr. McKenna's scheme for the commutation of life interests was adopted; this would give the church £2,000,000 to represent life interests, Mr. McKenna declared. The bill passed third reading in the Commons on February 5, by 347 to 240. In the House of Lords, the bill was condemned "root and branch" by the Archbishop of Canterbury and rejected on February 11, after three days' debate, by a majority of 201. The Welsh Church bill was again introduced in the House of Commons, and passed first reading May 7, second reading June 16, and third reading July 8, by a majority of 103. On July 22 the House of Lords, as with the home rule bill, resolved, "That this House declines to proceed with the consideration of this bill until it has been submitted to the judgment of the country." Should the bill be passed once more by the next session of the Commons, it will become law. Outside of Parliament the disestablishment was condemned in sermons, and a monster mass-meeting in Hyde Park showed the strength of the opposition.

THE SCOTTISH TEMPERANCE ACT. A third measure which the ministry was attempting to pass under the Parliament act was the Scottish temperance bill, extending local option to Scotland. When the Lords received it from the Commons for the first time, they amended it instead of rejecting it. The Commons on February 6 refused to agree to the amendments, for the ministry held them to be "equivalent to a rejection of the principle of the bill, and they (the ministry) were unable to look upon

the measure (as amended) as likely really to effect much for temperance in Scotland." Accordingly, the ministry reintroduced the bill in the summer session, and it was passed by the Commons on July 9 by a majority of 118. The Lords were now willing to compromise, and passed the bill on July 31, with the amendments that the bill should come into operation June 1, 1920 instead of 1917, and that boroughs with population under 25,000 should be considered single areas for local option. The amendments were approved by the Commons, August 13, and the bill became law.

THE WORK OF PARLIAMENT. The three measures discussed above were by no means the only business of the parliamentary sessions which lasted from December, 1912, to March 7, 1913 (with an interruption in February), and from March 10 to August 15 (with a recess from May 8 to 27). The session which ended on March 7 enacted a shops act amending the shops act of 1912 in its application to restaurants, restricting the hours of employment to 65 a week and guaranteeing 32 whole week-day holidays and 26 Sunday holidays. More important was the trade-unions bill, read in the House of Commons January 31, passed by the Lords on February 19, and signed by the king, March 7. The act permits trade unions to expend their funds for political purposes, i.e. (1) election expenses, (2) the maintenance of members of Parliament or other incumbents of public offices, (3) the holding of political meetings and distribution of political literature. Before such expenditures may be made, however, a poll must be taken of the members of the union, and a majority of those voting must consent to the principle of political action. Political funds must be kept separate, and any member may refuse to contribute to the political funds, without losing his right to participate in the non-political functions of the trade union. It is interesting to follow the tactics of the opposition to this measure. Although in committee the Conservatives had attempted to amend the trade-unions bill out of existence, on occasion of the third reading in the House of Commons Mr. Bonar Law advised his adherents to accept the bill, and went on to state that the Conservatives were not hostile to trade-unionism but that they considered political activity as incompatible with the true function of trade unions, the securing of better conditions for workmen.

The session of 1913 was opened on March 10. The king's speech reviewed the events of the last three months, commented on the attempts of the British government to keep in close touch and coöperation with the other powers and "to exercise a beneficent influence in hastening the conclusion of the war." In the field of imperial affairs, the state entry into Delhi (December 23) was singled out for mention, as well as the progress in imperial defense. Ministers from Canada and New Zealand had been present in London to discuss the naval situation. "The recent gift of a battleship by the Malay States, the ready consent of the New Zealand government to the retention in the North Sea fleet of the battleship contributed by them, the steady progress toward the establishment of the Australian fleet, and the discussions now proceeding in the Canadian Parliament on matters of defense, testify to the universal desire within the empire, for the maintenance of common safety." These remarks were *à propos* of the

TWO COMMANDING FIGURES IN THE STRUGGLE FOR HOME RULE FOR IRELAND

forthcoming defense estimates. In outlining the legislative programme for the session, the speech was brief. Parliament would be asked to consider: the completion of land purchase in Ireland, the Sudan loan, care of the feeble-minded, further restriction of the industrial employment of children, prevention of plural voting at parliamentary elections, and "the development of a national system of education"—and in addition, of course, the second passage of the home rule, Welsh Church, and Scottish temperance bills.

The progress of the three last-mentioned measures has already been traced. The plural voting bill, which was not passed, will be dealt with separately. It remains to note a number of minor measures enacted before August 15. The army act placed the number of regulars at 185,600, exclusive of the Indian army. A children act prohibited taking children and young persons out of the United Kingdom to sing or to perform for profit, unless under the license of a police magistrate. The purpose of another act was to permit the extension of the polling hours as early as 7 A.M. and as late as 9 P.M. The government of Sudan loan act authorized the government of Sudan with the guarantee of the imperial exchequer to raise loans amounting to £3,000,000, for irrigation and railway construction in the interest of the cotton industry. Better provision for the feeble-minded was assured by the mental deficiency act. The banking laws were amended by a bankruptcy act. The provisional collection of taxes act was designed to facilitate the collection of the income-tax. Hunger-strikes on the part of militant suffragists made it necessary to pass the prisoners act, more descriptively styled the "cat-and-mouse-act," whereby the home secretary was permitted at discretion temporarily to release prisoners whose ill-health rendered their further detention dangerous. The appellate jurisdiction act created two additional lords of appeal in ordinary, and increased from five to seven the number of colonial judges who may become members of the judicial committee of the Privy Council, with a view to the better representation of the Dominions. Finally, Mr. Lloyd-George's insurance act amendment, passed in August, supplemented and altered the national insurance act of 1911 in a number of details; for instance, section 3 places persons between 65 and 70 in practically the same position as other insured persons; and section 34 makes it an offense, punishable by fine, for an employer to deduct either all or part of his own contribution from the wages of the employee.

THE PLURAL VOTING BILL. One of the most bitterly criticised measures of the Liberal-Labor government was its plural voting bill, read a first time in the House of Commons on April 8, and a second time on May 1. The object of the bill was to penalize voting for members of Parliament in more than one constituency, thereby making it impossible for a man to vote for a University member and at the same time to exercise his residential franchise, say in London. Some 500,000 voters, mostly Conservatives, would be affected. Quite naturally the Conservatives were much incensed by the measure. They protested that it was a partisan measure, designed simply to increase the Liberal vote. In opposing it, they exhibited a certain inconsistency: some justifying the principle of plural representation,

i.e. representation of property and brains, and trying to preserve the plural vote at least in the city of London and in the universities; others admitting the justice of the "one man, one vote" principle, but refusing to approve the present reform unless accompanied by a redistribution of seats. After being read a third time on July 11 in the House of Commons, by a majority of 71, the bill was thrown out by the Lords in one sitting, July 24, on Lord Crewe's resolution "That this House is not prepared to accept a bill which deals only with the question of plural voting and makes no attempt to remove the serious imperfection of the present electoral law," carried by 166 to 42. Lord Lansdowne on this occasion voiced the extreme criticism of the bill which, he asserted, "is an attempt—I would almost say a cynical attempt—to load the electoral dice in their (the government's) favor." The Liberals replied that the present dice were loaded in favor of the Tories, who exercised undue weight not only through the plural vote, but through the House of Lords.

THE GOVERNMENT PROGRAMME. When Parliament was prorogued on August 15, a considerable part of the programme for the next session was already public property. In the first place, the home rule and Welsh Church bills would be passed for the third time under the Parliament act, and placed on the statute-books. These out of the way, the ministry would proceed with reforms of education, of the House of Lords, and of the agrarian system. The educational policy of the government was outlined on July 22 by Mr. J. A. Pease, president of the board of education. Commenting on the present national system of education, he complained that it was neither national nor a system. The reform to be introduced would bring intermediate education within the reach of all who desired it, by requiring the local authorities to do for intermediate education what the act of 1902 compelled them to do for elementary instruction. Every county and county borough council would have to provide for a complete and progressive system within its area. To make this possible, the government would increase the financial support extended to local education authorities, and make grants according to the average attendance of all children in the area, rather than the children in each school. The new system would retain the voluntary schools, at least for the present.

The reform of the House of Lords, delayed by other more pressing problems, must also be dealt with in the coming session. The government had already been reproached for not taking up the matter earlier, and it was felt that further procrastination would be dangerous. Mr. Samuel ably summarized the reasons for accomplishing the reform during the lifetime of the present Parliament: (1) Mr. Asquith had promised it, (2) the Conservatives might return to office and by half-measures postpone a thoroughgoing reform, and (3) the House of Lords should be so constituted as to "be a check not only on a Liberal House of Commons, but on a Tory House of Commons as well."

THE LIBERAL LAND POLICY. More widely discussed than either education or the House of Lords reform was the land policy promulgated by Mr. Lloyd-George. In 1912, it will be remembered, a (rural) land inquiry committee had begun an investigation of (1) wages, hours of labor, housing, and allotments, and (2) condi-

franchisement of women. A suffragist was killed in an attempt to interrupt the Derby races. Miss Pankhurst surrounded herself with an "army" of roughs. Against such tactics the government was almost powerless. Suffragists were imprisoned but, by refusing to eat, forced the government to choose between starving them or releasing them. In some cases forcible feeding broke the "hunger strike," but in others it failed. Mr. McKenna, the House secretary, thought he had solved the problem when his prisoners' bill (see above) was passed, allowing him to reincarcerate prisoners who had been released after self-imposed starvation. Under this "cat-and-mouse act," as it was called, Mrs. Pankhurst and other leading suffragists were repeatedly arrested, released, and re-arrested, seemingly without effect upon the militant suffragists who continued to destroy property and denounce the ministry.

OTHER EVENTS. Interesting in the light of Mr. Churchill's declaration that oil will be the fuel of future battleships, were the attempts of British financiers to gain oil concessions, especially in South America. See articles on MEXICO, and on various Central and South American republics.

For a discussion of the Irish transport workers' strike, see **STRIKES**. The Ambassadors' Conference held at London and the part played by Great Britain in the Balkan war negotiations are treated under **TURKEY AND THE BALKAN PEOPLES**. The cordialities exchanged between Great Britain, France, and Spain are discussed under **SPAIN**. For Great Britain's relations to China, see **CHINA, Opium Question; International Loan; Tibet**. See also **PERSIA**. And see **SOCIALISM, Great Britain**.

GREECE. A constitutional European monarchy, hereditary in the male line of the house of Holstein. It lies between the Ionian and Aegean Seas and was composed in 1913 of twenty-six nomes. Athens is the capital.

AREA AND POPULATION. Previous to the war in the Balkans, the area was given as 64,657 square kilometers, or 24,964 square miles. By the treaty of Bucharest, signed August 6, 1913, Greece was enlarged by the addition of portions of Macedonia, Albania, and a number of Turkish islands to an area estimated (including Crete) at 115,975 square kilometers, carrying a population of close upon 5,000,000. These additions include Epirus, southern Macedonia (including Salonika), and a strip of seaboard in western Thrace extending to Kavala. The annexation of Crete by Greece has not so far received the recognition of the powers. The population of Greece, according to the census of 1907, was 2,631,952. Athens had 167,497 inhabitants; Piræus, 71,505; Patras, 37,724; Corfu, 27,397; Volo, 23,563; Larissa, 18,001; Hermopolis, 17,773. In the new territories are Salonika, 144,200 inhabitants; Serez, 32,000; Candia, (Heraclæon), 25,185; Canea, 24,209; Kavala, 20,000; Yanina, 20,000; Kastoria, 14,000; Veria, 12,000; Niausta, 11,000; Vodina, 11,000; Drama, 11,000; Yanitsa, (Yenije-i-Vardar), 10,000.

EDUCATION, ETC. Primary education is free and nominally compulsory, and is maintained by local taxation aided by state subsidies. State-directed secondary schools exist, but are ill attended, as are also the special schools. The university at Athens attracts largely Turkish subjects.

The Greek Orthodox is the national religion, though entire religious toleration prevails. The patriarch of Constantinople is the nominal head of the church in Greece, but actual authority rests with a Holy Synod composed of the metropolitan of Athens and four archbishops and bishops.

PRODUCTION. The coast regions are elevated, irregular, and deeply indented; the interior is largely mountainous. Efforts are being made by the government to better agricultural conditions. The soil is extremely fertile and produces cereals, olives, figs, almonds, pomegranates, citrous fruits, vines, and currants (the staple crop). So detrimental to the industry has the annual over-production of currants become that large plantations have been uprooted in accordance with a law limiting the output. The 1911 crop was estimated at 325,000,000 lbs. The olive crop is important; output for 1911 was reported at 31,224,000 oke; yield of olive oil, about 20,300,000 gallons. Tobacco is grown. Unofficial estimates report 100,000 horses, 360,000 cattle, 2,900,000 sheep. Sericulture is carried on. The mineral yield in 1910 included iron, 608,349 tons; lead, 185,207; sulphur, 51,531; magnesite, 48,913; zinc, 37,108; manganese iron, 35,594; iron pyrites, 27,557; emery, 8000; chromite, 7000.

COMMERCE. The development of the trade is shown in the following table, values in thousands of drachmas:

	1906	1908	1910	1911	1912
Imports.....	144,636	152,635	160,536	172,202	154,067
Exports.....	123,526	109,244	144,571	140,903	145,022

The principal articles of trade in 1911 are shown in the table below, values in thousands of drachmas:

Imports	1000 dr.	Exports	1000 dr.
Cereals	46,384	Currants	46,728
Coal	21,296	Tobacco	17,855
Textiles, etc.....	20,493	Wine	14,513
Timber	9,926	Arg. lead.....	8,746
Chem. prods.....	8,809	Zinc	5,831
Fish	6,147	Olive oil.....	5,389
Mins. and metals.	4,750	Figs	5,377
Paper	4,543	Olives	4,033
Sugar	4,498	Spirits	3,512
Coffee	3,615	Iron	3,345
Skins	3,472	Raisins	3,117
Cotton	3,226	Hematite	3,111
Animals	3,183	Skins	2,275
Rice	2,612	Valonia	2,259
Iron	2,571	Silk, etc.....	2,072
Machinery	2,226	Resins	1,219

Great Britain contributed imports valued at 40,850 thousand francs, and received exports to the value of 33,777 thousand; Russia, 34,449 and 2601; Austria-Hungary, 23,721 and 13,520; Bulgaria, 14,146 and 360; Germany, 13,336 and 16,364; France, 10,438 and 13,733; Turkey, 8931 and 4803; Italy, 6542 and 4012; United States, 4143 and 12,561; Belgium, 3214 and 9340; Netherlands, 4087 and 11,235; Rumania, 2905 and 890; Egypt, 943 and 11,453; etc. There entered at the ports in the 1907 trade 6412 vessels, of 4,812,834 tons; cleared, 6253, of 4,814,549 tons. Through the Corinthian canal (opened to traffic August 6, 1893) there passed, in 1912, 2707 steamers, of 982,396 tons, and 1427 sailing, of 45,364. The merchant marine included, in 1913, 389 steamers, of 433,663 tons, and 788 sailing, of 136,689 tons.

COMMUNICATIONS. Previous to the outbreak of the war there were, besides 1609 kilometers of railway, several lines under construction. In

GREECE

January, 1913, it was decided to push forward new construction as rapidly as possible in order to complete the long-desired land connection with the rest of Europe. There were (1911) 8155 kilometers of telegraph lines and 15,580 of wires; stations, 745; wireless stations, 18. Post offices, 1278. There were 1750 kilometers of urban (wires 5902) telephone lines and 1375 kilometers of interurban wires.

ARMY. Like other armies of the Balkan states, the army of Greece underwent important changes in strength and organization during the Balkan wars. It had been trained by French officers under the direction of General Eydoux, and in 1912, previous to the outbreak of hostilities, was organized in four divisions, each consisting of a staff, 3 regiments of infantry, 1 division of machine gun troops, 1 regiment of cavalry, 1 regiment of field artillery, with 8 batteries, 1 division of mountain artillery, 1 battalion of engineers, 1 company of train, 1 company of sanitary troops, with an effective strength of 17,600 men, 1500 mounted men, and 48 guns. This organization was substantially increased and instead of four divisions, as many as ten divisions were found in the troops in the field, although it was stated that neither the oldest, nor the youngest classes of men enrolled, were called out, although many Greeks from abroad returned to serve in the army. The estimate of the military strength actually in the field ran in excess of 110,000 men, to which the army had been raised from a previous peace strength of about 30,000.

A royal decree August, 1913, provided for army reorganization. The new army will be organized in six army corps with headquarters at Larissa, Athens, Janina, Salonika, Seres, and Kozani, and while at first composed of two divisions only later will be increased to three, so that the first organization of 11 divisions later will be increased to 18. Each division will contain 3 infantry regiments, each of 3 battalions, an artillery regiment, a squadron of cavalry, a company of sappers, and the usual departmental troops. There were in 1913 but 33 infantry regiments which would have to be increased to 54, the cavalry would remain at 3 regiments, but the field artillery of 4 regiments was to be raised to 6 regiments each of 6 batteries, and eventually a regiment would be provided for each division. Eighty batteries of new quick-firing guns had been ordered from the Schneider works. The 12 Evzone, or rifle battalions, were not to be increased, but the technical troops were to be greatly augmented. A new law providing for an increased annual contingent of recruits had been framed whereby men would be liable for 36 years' military service, 2 years spent in the active army, 10 years in the first reserve, 9 years in the second reserve, 7 in the territorial army, and 7 in its reserve. Under the new law it was believed that an annual recruit contingent of 25,000, instead of 13,000, would be forthcoming, and at the end of 21 years there would be an army of some 470,000.

NAVY. The contract with the British government for a loan to Greece of British naval officers for instruction and advice in naval affairs expired in April, 1913, and was renewed on new terms. Rear-Admiral Mark E. F. Kerr took the place of Rear-Admiral Tufnell, resigned, with an enlarged staff and executive instead of

advisory powers. The mission will undertake the reorganization of the Greek navy, which consisted in July, 1913, of 4 ironclads, 1 modern cruiser, 14 destroyers, 4 corvettes, 13 torpedo boats, and 2 submarines. In January, 1913, the keel was laid at Stettin of the battleship *Salamis*, of 19,500 tons, 23 knots speed, with 8 14-inch and 12 6-inch guns. Personnel, about 4000, conscripts for two years or voluntary enlistment.

GOVERNMENT. The reigning king, Constantine I., succeeded to the throne on the assassination of his father, George I., March 18, 1913. King Constantine was born August 2, 1868, and he married in 1889 Princess Sophia of Prussia, sister of Emperor William II. The heir-apparent is Prince George, born July 19, 1890; he has one brother, Prince Alexander, born August 1, 1893, and two sisters.

After centuries of subjection to the Porte, Greece became an independent kingdom in 1830, following a war lasting from 1821 to 1829. The constitution of 1864 was amended in 1911, and vests the executive power in the king and his (responsible) ministers. The *Boulé* is the legislative body, whose members are elected for four years by manhood suffrage. The ministry in 1913 was composed as follows: E. Venezelos, premier and minister of war; D. Panas, foreign affairs; K. Raktivan, justice; E. Repoulis, interior; I. D. Tsirimokos, worship and instruction; A. N. Diomidis, finance; N. Stratos, marine; A. Michalacopoulos, national economics.

HISTORY. The chief events of 1913 had to do with the part played by Greece in the Balkan War, and an account of them will be found in the articles *TURKEY AND THE BALKAN PEOPLES*, and *CRETE, History*. In the midst of the war, King George went to the recently conquered city of Salonika and there on March 18 was assassinated by a partially insane Greek, Alexander Skinas by name. The act aroused great indignation among the Greek people. King George was succeeded by his son, Prince Constantine, who had already become a popular hero by virtue of the victories won under his leadership in the war. In the territorial settlements of the year Greece profited to a greater extent than any of the other Balkan states, to a greater extent even than the most optimistic Greek patriot had foreseen at the beginning of the struggle. By the Treaty of London with Turkey (May 30) and the Treaty of Bucharest (August 10) with Bulgaria and Serbia, the Hellenic kingdom acquired all of Thessaly, that part of Epirus which included Janina, and the most valuable maritime districts of Macedonia and Thrace, including such important ports as Salonika and Kavala, as well as full realization of the long cherished ambition to annex Crete. By various arrangements of the great powers it was also made known in December that Greece would be permitted to retain all the *Ægean* Islands except Imbros and Tenedos and the nine islands occupied by Italy, with the *proviso*, however, that no fortifications should be erected on Chios or Mitylene. Thus, as a general result of the Balkan War, the Greek kingdom was considerably more than doubled in area and population. The consequent accession of prestige brought Greece into rivalry with Italy, particularly as the Greek inhabitants of the islands still occupied by Italy clamored for annexation to Greece, and the Epirotes of Koritza and

other districts protested violently against being deprived of Greek citizenship and incorporated, as a concession to Italian and Austro-Hungarian interests, into the new principality of Albania. According to a statement made in the Assembly in December by M. Diomidis, minister of finance, the public cost of the whole war to Greece amounted to 379,485,000 drachmas, of which 292,115,000 were expended on the army and 87,370,000 on the navy. This extraordinary outlay brought the year's expenditure up to 413,500,000 drachmas, with a deficit of 101,000,000 drachmas, which would be met out of the yield of the loan which was being negotiated in Paris. The revenue from the new territories for the year 1913 was estimated at 41,000,000 drachmas. The government faced very difficult problems in establishing orderly, civil administrations for the new territories and in welding them into the Hellenic kingdom. A good beginning had already been made in the last months of 1913: M. Dragoumis was acting as governor-general of Crete, and M. Repoulis, of Macedonia; a project to connect the railway system of Greece with that of Macedonia was being vigorously pushed; and attention was being paid to find land and employment for the some 150,000 Greek refugees from Turkey, Bulgaria, and Albania, who had emigrated into the new territories. The capitulations, which had long obtained under the Turkish régime in Crete and in Macedonia, and in accordance with which foreign subjects were tried in their respective consular courts, were speedily abolished by the Greek government. Plans were elaborated in September for a thorough reorganization of the army and navy: the former would be raised to 400,000 men and would be trained by General Eydoux and his staff of French officers; the latter would be effected by British advisers headed by Rear Admiral Kerr. In August M. Coromilas resigned as foreign minister on account of ill health and was succeeded by M. Panas, who, as Greek minister at Sofia, had played a leading part before the war in the negotiations that led to the formation of the Balkan Alliance. With the bulk of the Greek nation M. Venezelos as prime minister maintained a popularity second only to that of King Constantine, but in the Assembly one or two political groups, especially that headed by the former premier M. Ralli, assailed him as too yielding in his conduct of the final negotiations with Turkey and the powers. These attacks led to dissensions within the cabinet, and on December 3 M. Stratos, minister of marine, resigned and entered the opposition.

GREECE, ARCHAEOLOGY OF. See **ARCHAEOLOGY.**

GREEN, JOHN. An American oculist, died December 7, 1913. He was born in Worcester, Mass., in 1835, and graduated from Harvard in 1885. He studied medicine at that university and in Europe. In 1862 he was in the medical service of the Western sanitary commission, and in that year and the year following was assistant surgeon of the army of Tennessee and served with the Federal troops in Maryland. In 1866 he removed to St. Louis, where he practiced with great success until his death. In 1886 he was appointed professor of ophthalmology in the St. Louis Medical College of Washington University. He had international fame as an oculist.

GREENE, DANIEL CROSSBY. An American missionary, died September 15, 1913. He was born in Roxbury, Mass., in 1843, and graduated from Dartmouth College in 1864. He served throughout the Civil War as a private, and in 1869 went to Japan as a missionary under the auspices of the American Board. From 1870-74 he was at Kobe, and from 1874-80 at Yokohama. From 1873-80 he was a member of the Yokohama New Testament translation committee, and was professor of Old Testament Exegesis at Kyoto from 1881-87. In 1901-2 he was president of the Asiatic Society in Japan. He lectured on "Japan" at Harvard University in 1908-9. His published writings include, *Chinese New Testament, Prepared for Japanese Readers* (1878); *Course of Study for Students of Japanese Language* (1903). He was a member of the commission for revising the Japanese New Testament, and he revised and brought up to date *Ritter's History of Protestant Missions in Japan* (1898). He edited *The Christian Movement in Its Relation to the New Life in Japan* from 1902-6 and in 1910-11.

GREENLAND. Danish Arctic colony, estimated area 2,200,000 kilometers (849,420 square miles). Area of settlements, colony proper, 88,100 square kilometers (34,015 square miles). For further statistics, see 1912 YEAR BOOK.

GREENLAND, EXPLORATION OF. See **POLAR EXPLORATION, ARCTIC.**

GRENADA. The largest of the (British) Windward Islands colonies. Area, 133 square miles; population (1911), 66,750. St. George's (4916 inhabitants) is the capital. The sugar industry has given way to the production of cacao, of which the export in 1911 was valued at £223,104. Total imports (1911), £309,227; exports, £264,640; revenue (1911-12), £98,645; expenditure, £81,012. Shipping entered and cleared (1911), 535,161 tons. Debt (1912), £123,670. Lieutenant-Colonel Sir James Hayes Saddler was governor in 1913. Attached to Grenada are part of the Grenadines, the largest being Carriacou, with an area of 8467 acres and 6886 inhabitants.

GRENADINE ISLANDS. Dependency of Grenada (q.v.).

GRUBB, EDWARD BIRD. An American soldier and public official, died July 7, 1913. He was born in Burlington, N. J., in 1841, and in 1860 graduated from Burlington College. At the outbreak of the Civil War he enlisted in the Third New Jersey Volunteers, and was promoted to be major and lieutenant-colonel. In 1863 his term of service expired and he recruited two regiments of volunteers. He went again to the front with General Grant, and in March, 1865, was brevetted brigadier-general for gallant services. When mustered out at the close of the war, he took charge of his father's iron works in New Jersey and Pennsylvania. In 1885 he lost his fortune, but two years later inherited another from his brother and again went into the iron business. In 1889 he was an unsuccessful candidate for governor of New Jersey. He was appointed minister to Spain by President Harrison in 1890. On the conclusion of his term of service in 1892, he returned to New Jersey and resumed his iron business. He was candidate for Congress in 1908, but was defeated. He suffered financial reverses, and in 1911 was appointed superintendent of the Home for Disabled Soldiers at Kerney, N. J.

GUATEMALA. The most northwesterly of the Central American republics. The capital is Guatemala City.

AREA, POPULATION, ETC. On account of a boundary dispute with Honduras, the area cannot be stated with exactness. In 1913 a commission of the two countries was carrying on the work of locating the frontier. One estimate of the area is 48,290 square miles; a recent planimetric calculation showed 43,641 square miles. The census of December 31, 1903, showed a population of 1,842,134, about 60 per cent. Indian and most of the remainder Mestizo. As calculated for the end of 1909, the population was 1,991,261; so that in 1913 the inhabitants probably numbered considerably over 2,000,000. Births in 1911 and 1912, respectively, 71,895 and 73,797; deaths, 35,234 and 43,355; marriages in 1912, 5340. Estimates of urban populations cannot be very accurate, but the following have been reported: Guatemala City, 125,000; Quezaltenango, 34,000; Cobán, 31,000; Totonicapán, 29,000; Esquintla, Jalapa, Zacapa, and Chiquimula, each about 18,000; Santa Cruz del Quiché, 17,000; Jutiapa, 16,000; Antigua, Salamá, and Huehuetenango, each about 15,000; Amatitlán, 12,000; Sololá, 11,000.

In 1911, public primary schools numbered 1821, with 55,685 pupils; in 1912, 1837, with 59,631 pupils. In 1911 there were 1657 students in secondary and normal schools. There is a medical college, with 74 students in 1912, and a law school, with 65 students.

PRODUCTION AND COMMERCE. The soil is fertile. The most important crop is coffee, produced largely on German plantations. Corn is the leading food crop, and other products of importance are sugar, bananas, cacao, and tobacco. Rubber, chicle, and mahogany, cedar, and dye woods are exploited. There is little mining or manufacturing.

The invoice value of imports through the maritime custom houses in 1908 was \$5,811,586; in 1909, \$5,251,317; in 1911, \$6,514,421; in 1912, \$7,781,985. In their reports, the Guatemalan authorities add to these values 25 per cent.—an estimate covering freights, commissions, insurance, etc.—and the value of the imports through frontier custom houses. On this basis, the imports in 1911 are stated at \$8,166,670 and in 1912, \$9,822,462. Exports have been as follows: In 1908, \$6,756,138; in 1909, \$10,079,219; in 1911, \$11,005,835 (including \$24,111 through the frontier of Salvador); in 1912, \$13,156,537 (including \$20,950 through Salvador). Leading maritime invoice values in 1911 and 1912, respectively, in thousands of dollars: Cotton goods, 1849 and 1926; iron and steel manufactures, 626 and 730; food products, 420 and 713; wheat flour, 354 and 512; wines and liquors, 223 and 341; silk goods, 267 and 328; woolen goods, 278 and 300; railway material, 311 and 290; agricultural and industrial machinery, 196 and 281; drugs and medicines, 218 and 276; linen, hemp, and jute goods, 272 and 214.

Principal exports in 1911 and 1912, respectively, in thousands of dollars: Coffee clean, 7283 and 9126; coffee in parchment, 1991 and 1863; bananas, 527 and 667; sugar (including panela), 344 and 565; chicle, 151 and 275; woods, 158 and 242; cattle hides, 325 and 190; rubber, 160 and 141.

In 1912 the United States sent imports and received exports valued at \$4,532,361 and \$3,863,-

829, respectively; Germany, \$2,250,862 and \$6,975,006; United Kingdom, \$1,739,598 and \$1,710,052; France, \$436,882 and \$969; Belgium, \$146,431 and \$18,586; Italy, \$96,496 and \$11,310; other countries, \$322,006 and \$576,786; total, \$9,822,462 and \$13,156,538. Entered at the ports in 1912, 811 steamers, of 1,139,865 tons.

COMMUNICATIONS. The length of railway open to traffic at the end of 1912 is reported at 449 miles (722 kilometers). San José and Champerico, on the Pacific are connected by rail with Guatemala City, and the latter with Puerto Barrios, on the eastern coast. The Ocos line was in progress. Telegraph lines, over 4200 miles; offices, about 225. Post offices in 1912, 323.

FINANCE. The paper peso of Guatemala has a greatly depreciated value. It was worth about 6½ cents in 1908, 6 in 1909, 7 in 1910, and 5½ in 1911. Revenue and expenditure in 1910 amounted to 51,571,000 and 45,959,000 pesos paper, respectively; in 1911, 62,047,000 and 69,162,000. The budget for the year ending June 30, 1914, showed the following estimated expenditures: Interior and justice, 4,856,940 pesos paper; foreign affairs, 1,983,633; finance, 2,596,974; public debt, 25,211,741; public works, 2,632,310; war, 6,235,852; public instruction, 4,084,395; other, 568,942; total, 48,170,787. Public debt December 31, 1911: foreign, \$7,414,000 and £1,480,000 (exclusive of arrears of interest); internal, 103,129,468 pesos paper.

ARMY. Service in the active army is obligatory for all citizens from the ages of 18 to 25, and in the militia from the ages of 26 to 50, but citizens paying a tax of 50 pesos are exempt, as well as certain officials and other individuals prescribed by the law. On a peace basis the army consists of about 6000, which, in time of war, would be increased to about 85,000, embracing about 55,000 of the first line and 30,000 of the second. French officers have been engaged in training the troops, but discipline and organization are far from perfect.

GOVERNMENT. The legislative power is vested in the National Assembly of 69 members, elected for four years by direct vote, and in the Council of State of 13 members, partly elected by the Assembly and partly appointed by the president. The latter is elected by direct vote for six years, and is assisted by a cabinet of six members. The president in 1913 was Manuel Estrada Cabrera, who succeeded to the executive office in March, 1898, and subsequently was elected for terms ending March 15, 1905, 1911, and 1917.

HISTORY. The government of Guatemala at last yielded to the British demands for the payment of the arrears on the public debt. The 10,000,000 pesos held by British creditors was to be liquidated from the proceeds of the export tax on coffee, at the rate of 1 peso per sack. The budget for the period July 1, 1913, to June 1, 1914, totaled 48,170,788.02 pesos, with departmental expenditures as follows:

	Pesos
Interior and justice.....	4,856,940
Foreign relations.....	1,983,633.38
Treasury expenses.....	2,596,974
Public credit.....	25,211,741
Fomento	2,632,310.20
War	6,235,852
Public instruction.....	4,084,395
Miscellaneous	568,942.44
Total	48,170,788.02

Guatemala invited the other Central American republics to a conference in Guatemala City in October to consider the possibility of closer unification of the Central American railway, telegraph, and postal services. Licentiate Angel Maria Bocanegra was elected by the Legislative Assembly of Guatemala to the position of judge in the Supreme Court of Justice of Central America.—A Guatemalan boundary commission was coöperating with a Honduran commission to fix the frontier.—The president appointed Licentiates Antonio Batres Jauregui, Carlos Salazar, Antonio Gonzalez Saravia, and Alberto Mencos to the Hague Permanent Court.

GUIANA. See **BRITISH GUIANA**, **DUTCH GUIANA**, **FRENCH GUIANA**.

GUELPHS AND BRUNSWICK. See **GERMANY**.

GUTH, WILLIAM WESTLEY. An American educator, appointed in 1911 president of Goucher College, Baltimore, Md. He was born in Nashville, Tenn. in 1871, and graduated from Leland Stanford Junior University in 1895. After studying law he was admitted to the bar in the same year, and practiced in San Francisco from 1895 to 1898. In 1900 he was ordained to the Methodist Episcopal ministry, and for one year was pastor at West Chelmsford, Mass. He studied at the universities of Halle and Berlin, receiving the degree of Ph.D. from the former in 1904. In the same year he became pastor of the Epworth Church, Cambridge, Mass. After serving here until 1908, he was appointed president of the College of the Pacific. He traveled extensively in Egypt, Palestine, and Asia Minor, and in Europe and England. He was the author of *The Assurance of Faith*.

GUTHRIE, GEORGE WILKINS. An American lawyer and diplomat, born in Pittsburgh, Pa., in 1848. He graduated from Western University of Pennsylvania (now University of Pittsburgh) in 1866, and afterward studied law at Columbian (now George Washington) University. He was admitted to the bar in 1869 and began practice in Pittsburgh. In 1876 he was associate counsel for the Tilden electors before the Florida returning board after the election of President Hayes. He was candidate for mayor of Pittsburgh on the Reform ticket in 1896, but was defeated. He was elected mayor of Pittsburgh in 1906, serving until 1909. During his administration many reforms were made in the government of the State, and prominent officials awoke to find themselves convicted of bribery. In July, 1913, he was appointed ambassador to Japan by President Wilson.

GYMNASTICS. The fifteenth annual intercollegiate gymnastic meet was won by Pennsylvania with a score of 25 points. Princeton was second with 16 points, and Yale third with 8 points. Other scores were: New York University, 6; Rutgers, 5; Harvard, 3. The all-round championship was won by T. Clark of Pennsylvania, with 218 6-10 points. In dual college meets, Pennsylvania defeated Rutgers 25-23, Yale 30-24, and New York University 31-23. Yale defeated Princeton 32½-21½, and Amherst 32-22; Rutgers defeated Columbia, 31-19, and New York University 26-22; Princeton defeated Pennsylvania 27½-26½. The Western intercollegiates were won by Wisconsin, with Chicago second, and Minnesota third.

The club championships of the A. A. U. resulted as follows: Horizontal bar, Franz Kanis,

Newark Turn Verein; rope climb, 18 feet, Edward Lindenbaum, Young Men's Hebrew Association; parallel bars, Paul Krimmel, New York Turn Verein; club swinging, Ray W. Dutcher, New York A. C.; side horse, Roy E. Moore, New York Turn Verein; tumbling, M. J. Bedford, National Turn Verein; flying rings, J. D. Gleason, West Side Y. C. A.; all-round, Franz Kanis, Newark Turn Verein. The English individual championships were captured by L. Harrison Bradford, All Saints.

GYPSY MOTH. See **ENTOMOLOGY**.

GYRO COMPASS. See **BATTLESHIPS**.

HAGENBECK, CARL. A German naturalist and trainer of wild animals, died April 13, 1913. He was born in St. Pauli, a suburb of Hamburg, in 1844. His father was a fishmonger but was interested in natural history, and in 1848 received in the course of his business six large seals. This encouraged him to add to his own trade the business of buying, selling, and renting live animals. His son rapidly extended these operations, and he soon had travelers in every part of the world. The enterprise extended into a vast business, the most important branch of which was the purveying of trained animals, upon a large scale. In 1892 he purchased a large piece of land at Stellingen, near Hamburg, for the purpose of establishing a zoölogical exhibition park. This developed into the famous Animal Park, which is one of the sights of Hamburg.

HAGUE CONFERENCE, THIRD. See **ARBITRATION, INTERNATIONAL**.

HAGUE TRIBUNAL. See **ARBITRATION, INTERNATIONAL**.

HAITI. A republic occupying the western part of the West Indian island of Haiti. The capital is Port-au-Prince.

AREA, POPULATION, ETC. The estimated area is 11,072 square miles. The number of inhabitants is variously estimated, but it is certain that the country is one of the most densely populated of the American republics. According to an estimate of 1909, based on parish registers, the population was about 2,030,000. An estimate of 1912 placed the number at 2,500,000. Probably nine-tenths of the people are negroes, and most of the remainder are mulattoes. Port-au-Prince is the largest city, with perhaps 100,000 inhabitants; Cap Haïtien is estimated to have 30,000, Les Cayes, 25,000, Gonaïves, 18,000. In 1913 there were reported 549 public and 126 private schools; there are three high schools and six lycées. The educational system is very imperfect, and illiteracy is prevalent. The language spoken is a French patois; the religion is Roman Catholicism.

PRODUCTION AND COMMERCE. Coffee is the leading crop; others of importance are cacao, sugar-cane, tobacco, and cotton. Logwood and other valuable woods are cut for export. There are several sugar mills, and rum and other spirits are distilled. Mining is almost entirely undeveloped. According to custom-house reports, imports in the fiscal years 1911 and 1912 amounted to \$7,948,117 and \$9,876,555. The Haitian authorities state that the actual values were considerably greater and, on account of under valuation estimate the 1912 imports at \$11,165,590. Importation from the United States in 1912 amounted to \$7,302,484; France, \$1,050,416; United Kingdom, \$761,206; Germany, \$484,915; all other countries, \$277,534; total, \$9,876,555. Exports in the fiscal year 1912

were valued at \$17,285,485. The greater part of the exports goes to France. Weight in thousands of pounds of the chief exports in 1911 and 1912, respectively: Coffee, 51,796 and 78,168; cacao, 3228 and 6905; cotton, 4198 and 4339; logwood and roots, 74,608 and 93,384; cotton seed, 8058 and 8459.

COMMUNICATION. The reported length of railway in 1913 was 208 kilometers (129 miles). A length of 400 kilometers (about 250 miles) was reported under construction. The Gonaïves-Esmery, a line thirty-one miles in length, was opened. Telegraph line (1910), 124 miles. Post offices (1911), 88.

FINANCE. Revenue is derived principally from import and export duties, paid in American gold. The paper gourde is nominally worth 96.5 cents, but it is greatly depreciated; its average value has been about 20 cents, but in 1912-13 it advanced to about 30 cents. For the fiscal year 1913, the estimated revenue was \$3,914,480 and 7,571,083 gourdes, and the estimated expenditure \$3,904,291 and 9,095,006 gourdes. The larger estimated disbursements in thousands of dollars and of gourdes were: Public debt, 2802 and 331; interior and police, 315 and 1314; war and marine, 231 and 2380; instruction and worship, 132 and 1860. On March 31, 1912, the public debt, including arrears, amounted to \$24,422,281 and 15,176,950 gourdes.

ARMY. Haiti maintains a regular army raised partly by enlistment and with a varying strength depending upon the condition and exigencies of the government. Any statement of its strength is conjectural since the number actually under arms has been estimated as about 3000, while the nominal strength has been stated as over 10,000.

GOVERNMENT. The legislative power is vested in a national assembly of two chambers, the Senate (39 members) and the Chamber of the Communes (96). Members of the lower chamber are elected for three years by direct vote. The senators are elected for six years by the Chamber of the Communes from a list prepared partly by the president and partly by the electors. According to the constitution the president is elected for seven years by the two chambers in joint session. His cabinet consists of six members. General Antoine Simon was elected president December 17, 1908; he was deposed upon the successful revolution of 1911 headed by General Cincinnatus Leconte, who was elected to the presidency on August 16 as from May 15, for seven years. On August 8, 1912, General Leconte lost his life in a fire which destroyed the executive residence. His successor was chosen in the person of General Tancred Auguste for the term ending May 15, 1910. General Auguste died May 2, 1913, and on May 4 Senator Michel Oreste was elected president for the unexpired term. President Oreste, inaugurated May 4, 1913, chose as his ministers: General Philippe Argant, war; M. Emmanuel Morel, interior; M. Auguste Bonamy, finance; M. Etienne Mathon, foreign relations; M. Auguste Supplice, public works and agriculture; and M. Tertullian Guibaud, justice and education. Subsequently M. Supplice was succeeded by M. Morel, and the department of the interior was taken over by M. Seymour Pradel. In January, 1914, occurred revolutionary outbreaks headed by Davilmar Théodore, former president of the Senate, and

Oreste Zamor, provincial authority at Cap-Haïtien, and on the 27th of the month President Oreste fled for safety to a German warship.

HISTORY. The twenty-seventh Congress sat in special session from April 28 to August 27. One of the most important matters considered was the coinage bill submitted on July 18, 1913, by M. Auguste Bonamy. According to the provisions of the bill, the currency was to be reformed, with the gold gourde ($=\frac{1}{4}$ gold dollar, U. S.) as the monetary unit, divided into 100 centimes. The silver gourde was to be of the same weight and fineness as the U. S. quarter. The bill also provided for the withdrawal of paper money through the National Bank of Haiti.

A new customs tariff was put into effect on August 1, providing specific duties (except on jewelry, which is taxed 10% *ad valorem*) on the basis of the half kilo, and a general surtax of 5% of the duty. Agricultural and mining implements were admitted free; muslins and prints at reduced rates. The Oreste government took energetic steps to enforce the income tax of August 11, 1903, and by a decree of June 7, industrial, commercial, and civil companies were ordered to file financial statements with the minister of finance, in order that the tax of 10% on dividends, interest, and revenue might be declared.

In November it was reported that revolution was brewing at Port-au-Prince. President Oreste surrounded himself constantly with a heavy guard, and actual fighting occurred in the North in December. At the close of the year an agreement was signed at Port-au-Prince whereby the claims of the French government against Haiti, pending for several years, were to be settled by arbitration.

HALE, WILLIAM BAYARD. See MEXICO, *History*.

HALES BAR DAM. See DAMS, and TRANSMISSION OF ELECTRIC POWER.

HALL, FREDERICK BYRON. An American jurist, died January 15, 1913. Born at Saratoga Springs, N. Y., in 1843; and educated in the public schools, he served for one year in the Civil War, but was discharged on account of sickness. In 1867 he graduated from Brown University; he was admitted to the bar in 1870; and in 1877 was appointed judge of the Court of Common Pleas of Fairfield County, Connecticut. He served in this position until 1889 when he was appointed judge of the Superior Court of the State. In 1897 he was appointed judge of the Supreme Court of Errors, and from 1909 until the time of his death was chief justice of this court.

HALLETT, MOSES. An American jurist, died April 25, 1913. He was born in Galena, Ill., in 1834, and received an academic education. After studying law he was admitted to the bar in 1858. Two years later he removed to Colorado where from 1863 to 1865 he was a member of the Territorial Council. From 1866-76 he was chief justice of the Supreme Court of Colorado, serving until 1906. From 1892 he was professor of American constitutional law and federal jurisprudence at the University of Colorado.

HALLOCK, JOSEPH NEWTON. An American editor and clergyman, died March 24, 1913. He was born at Franklinville, N. Y., in 1834, and graduated from Yale College in 1857. He

studied divinity at the Yale Theological Seminary, graduating in 1860. For several years he occupied pastorates as a Congregational minister. In 1880 he became editor-in-chief and proprietor of *The Christian Work*, and continued as editor of this paper until his death. He was a director in several large financial corporations. He was the author of, among other books, *How to Teach* (1857), *The Christian Life* (1890), *What Is Heresy* (1894), *Mormonism* (1896), *Life of D. L. Moody* (1900).

HALLOCK, WILLIAM. An American physicist, died May 20, 1913. He was born in Milton, N. Y., in 1837, and graduated from Columbia College in 1879. He then took the degree of Ph. D. at Würzburg, Germany, returning shortly after to the United States, and accepting an appointment as physicist for the New York Geological Survey at Washington. He served in this position for nine years and for a part of this time was professor of physics at the Corcoran Scientific School at Washington. In 1889 he was appointed professor of chemistry and toxicology at the National College of Pharmacy. This service continued until 1892, when he became assistant in the astro-physical laboratories at the Smithsonian Institution. He then returned to Columbia as associate professor of physics. In 1902 he was made full professor, and four years later dean of the faculty of political science, and held this office until all the graduate faculties at Columbia were merged in 1909.

HAMILTON, JOHN ANGUS LUSHINGTON MOORE. An English newspaper correspondent and writer, died June 14, 1913. He was born in London, but after doing newspaper work in England, removed to New York, where for a time he was a reporter. He then returned to London to devote himself chiefly to work as war correspondent and special correspondent for various London papers. He was in the siege of Mafeking in 1899-1900, and the Boxer uprising in 1900-1902, the Balkans in 1903, the Russo-Japanese war, 1904-1905, in the troubles in Assam, 1911-1912, and in the Balkan war, 1913. He was assigned to the Turkish army in the Balkan war and was twice captured by the allies. After leaving the Balkans, he came to the United States, where he attempted to give a lecture tour. This, however, proved a failure, and he committed suicide. Mr. Hamilton received a number of war medals for his services. He published several books, including the *Siege of Mafeking* (1900); *Korea* (1904); *Afghanistan* (1906); *Problems of the Middle East* (1908); *Somaliland* (1910); and *In Abor Jungles* (1912).

HAMILTON, WILLIAM GASTON. An American engineer and philanthropist, grandson of Alexander Hamilton, died January 23, 1913. He was born in New York City in 1832, and at the age of eighteen he showed so strong a predilection for mechanical engineering that he was placed as an apprentice in the machine shops of Henry R. Dunham & Co. He worked through all the departments of this concern and in succession became vice-president, engineer, and president of the firm of Breese, Kneeland & Co., owners of the Jersey City Locomotive Works. He served as general manager and mechanical engineer in the building and operating of the Great Western Railway. In 1886, at the age of fifty-four, he retired from active business,

and at once devoted his time to civil and philanthropic activities. In 1894 he was chairman of a committee for the erection of public baths in New York City. He was for many years manager of the Association for Improving the Condition of the Poor, and was a member of the boards of many other philanthropic societies. He wrote *Useful Information for Railway Men*, and achieved some distinction as an amateur painter.

HAMILTON COLLEGE. An institution of higher learning at Clinton, N. Y., founded in 1812. The total enrollment in the various departments of the college in the autumn of 1913 was 200. The faculty numbered twenty. Ralph C. Super was appointed associate professor in the Spanish, French, and German languages, and Willard B. Marsh was appointed assistant in history and speaking. The productive funds of the college amount to about \$1,150,000. The library contains about 60,000 volumes. The president is M. W. Stryker, D.D., LL.D.

HAMMOND, JAMES BARTLETT. An American inventor, died January 27, 1913. Born in Boston in 1839, and graduated from the University of Vermont in 1861, in the same year he enlisted in the Federal army and served throughout the Civil War. At its close he graduated in theology from the Union Theological Seminary in 1865, going then to Germany, where he specialized in philosophy and science. He then turned his mind to mechanical invention and patented, in 1880, a typewriting machine on scientific principles, which was one of the first typewriters constructed. He introduced the idea of the keyboard and the true alignment, placed his typewriter on the market in 1884, and made his fortune.

HAMPTON NORMAL AND AGRICULTURAL INSTITUTE. An institution for the education of negroes, founded at Hampton, Va., in 1868. The enrollment in all departments of the university in 1913 was 637. There were 135 members of the faculty. There were no notable changes in the faculty during the year, and no important benefactions were received. The important funds of the institute amount to about \$2,650,000, and the income to about \$285,000. There are about 35,000 volumes in the library. The president is H. B. Frissell, D. D.

HARBORS. See DOCKS AND HARBORS.

HARVARD UNIVERSITY. The total enrollment in the academic department of the university in the autumn of 1913 was 2359. In the special schools the enrollment was as follows: Graduate School of Arts and Sciences, 497; Graduate School of Applied Science, 139; Graduate School of Business Administration, 113; Divinity School, 57; Law School, 695; Medical School, 296; Dental School, 196. The faculty numbered 803, of whom 141 were professors, 9 associate professors, 86 assistant professors, 78 lecturers, and 7 associates. In the Summer School of 1913 there were enrolled 1250 students. The endowments received during the year were for the music department, psychical research, and a chair of Japanese language and literature, of which the first incumbent was to be Professor Anesaki. Professor E. C. Moore was appointed professor of education, and Professor A. C. Coolidge was appointed exchange professor to the University of Berlin. Bertrand A. W. Russell was appointed professor of philosophy. For an ac-

count of the gifts and bequests received during the year, see GIFTS AND BEQUESTS, and for further notes about the university in general, see the article UNIVERSITIES AND COLLEGES. In Radcliffe College, the Women's Department of the university, there were enrolled in 1913, 568 students. The president of the university is A. Lawrence Lowell.

HAUPTMANN, CARL. See GERMAN LITERATURE.

HAUPTMANN, GERHART. See GERMAN LITERATURE.

HAVEMEYER, WILLIAM FREDERICK. An American capitalist, died September 7, 1913. He was born in New York City in 1850, and was the son of William F. Havemeyer, and a brother of John Craig Havemeyer. When his father in 1865 founded the sugar refinery of Havemeyer Brothers in Brooklyn, W. F. Havemeyer took a great interest in the business, and was eventually admitted to the partnership. He carried on the business with his brother until the consolidation of the firm of Havemeyer Brothers with the American Sugar Refining Company, when he retired from the sugar refining business, engaging in many other financial enterprises, and acquiring a large fortune. In addition to his business interests, he was active in social and philanthropic work, founding the Havemeyer laboratory of New York University, and becoming a member of the counsel of that university. He was an important collector of autographs and manuscripts of the colonial period.

HAWAII. POPULATION AND IMMIGRATION. The estimate based on statistics of births, deaths, arrivals, and departures, showed a population on June 30, 1913, of 217,744, an increase of 25,835 or 13.46 per cent. since the census of 1910. The only races which show a decrease during the past three years are the pure Hawaiians, through an excess of deaths, and the Chinese through an excess of departures. The largest increases are in the Filipinos, introduced by the Hawaiian Sugar Planters' Association; Spanish, introduced by the territorial government; other Caucasians, chiefly American, who have come in large numbers, many in the military forces of the United States; and part Hawaiians, Portuguese, and Japanese, mainly through an excess of births. During the year there were introduced into the territory 2413 Spanish and 228 Portuguese. There were also introduced 65 Russians. Sugar planting during the year introduced 5747 Filipinos. Since 1909, there have been introduced 13,715 Filipinos. The percentage of non-Asiatic laborers employed on the sugar plantations has increased from 12.3 on the organization of the territorial government to 37.15 in 1913. The Japanese on the islands in 1913 were estimated to number 83,100; the Portuguese, 23,160; the Chinese, 21,500; and the Filipinos, 12,600.

AGRICULTURE. The chief industries of the Islands are agricultural. The sugar industry far surpasses all others combined in the value of the output. During 1913, the exports of sugar were valued at \$35,235,170 of raw sugar, and \$1,372,650 of refined sugar. These were largely decreased from the corresponding amounts of 1912. The fruit-raising industry is large and increases from year to year. The growing of pineapples occupies first place. The exports of fruit and nuts, which consist chiefly of pine-

apples, amounted to \$40,055,622 in 1913, compared with \$2,948,733 for 1912. Experiments have been made in the growing of tobacco. This has met with considerable success. Coffee was at one time an important product of the Islands, but in recent years it has fallen off greatly. The exports for 1913, however, show a considerable increase over those of 1912. In the former year they were valued at \$492,833, and in the latter \$390,494. Coffee is raised chiefly by Chinese, Japanese, and Portuguese, although the larger estates are in the hands of the Anglo-Saxons. The livestock industry is important; most of the meat grown is consumed in the islands. Swine are grown in large numbers, as the Oriental population consumes large quantities of pork.

COMMERCE. The imports and exports for the year ended June 30, 1913, exclusive of specie, aggregated \$79,474,880. This was a decrease of \$4,668,880 from 1912, although it has a large increase over the largest amount for any other preceding year. The decrease was entirely in exports to the continental United States, which was due to low prices and a shortage of the sugar crop on account of drought. The imports amounted to \$36,002,940, an increase of \$7,308,618 over those of 1912. The imports from continental United States amounted to \$29,129,409, an increase of \$6,033,531, and those from foreign countries amounted to \$6,830,531, an increase of \$1,275,087. The chief imports during 1913 were bags, \$824,157; cement, \$20,048; chemicals, \$1,594,787; coal, \$325,329; cottons, \$172,244; fertilizers, \$271,706; foodstuffs, \$2,326,764; iron and steel, \$107,425; spirits, \$294,237; miscellaneous, \$936,924. The exports of 1913 amounted to \$43,471,940, a decrease of \$11,977,498. Those to continental United States amounted to \$42,713,294, a decrease of \$12,362,871, while those to foreign countries amounted to \$758,646, an increase of \$385,373. The exports of domestic merchandise amounted to \$42,652,572 to continental United States and \$740,284 to foreign countries, while those of foreign merchandise amounted to \$60,722 to continental United States, and \$18,362 to foreign countries. The imports and exports by countries for the fiscal years 1911-12, are shown in the following table:

Countries	Imports		Exports	
	1912	1913	1912	1913
Australia & Tasmania	\$ 330,263	\$ 467,078	\$ 7,820	\$ 14,979

SHIPPING AND TRANSPORTATION. During the fiscal year 1913, tonnage entered into the ports of the islands amounted to \$1,582,255, an increase of \$211,940 over the tonnage of 1912. The tonnage cleared amounted to \$1,577,102, an increase of \$207,993. This figure is much larger than that for any preceding year. It is exclusive of vessels engaged in interisland

traffic, and vessels in the military and naval service. The total number of vessels entered in 1913 was 483, compared with 431 in 1912, and the vessels cleared numbered 476, compared with 429 in 1911.

The territory is peculiarly dependent for its progress on the developments of its transportation facilities. In 1913, there was considerable growth of these facilities, chiefly by the addition of five steamers in the transportation service with other islands. There were also harbor improvements and much wharf, railroad, and wagon-road construction. Six large steamers were building during the year for the traffic with the mainland. The construction of a large floating dock at Honolulu was also begun. The event of chief importance in connection with transportation in the islands, was the enactment at the session of the legislature in 1913 of a public utilities act, which created a public utilities commission, and conferred broad powers upon it. This affected not only transportation service, but public utilities of all kinds, including electric light and power, telegraph, telephone, and other service. Inter-island traffic is conducted chiefly by the Inter-island Steam Navigation Company, which has a fleet of 17 steamers. Traffic between Hawaii and the mainland and Mexico is carried on with both the Atlantic and Pacific coasts. The bulk of the traffic with the Atlantic coast is handled by the American-Hawaiian Steamship Company, which operates two fleets of steamers—one in the Pacific and one in the Atlantic, the connecting link being the Tehuantepec National Railway, 192 miles in length from the Pacific coast to the Gulf of Mexico. The company has 22 vessels, and is engaged in freight traffic entirely. A triangular service is maintained between Hawaii, Salina Cruz, San Diego, San Francisco, and Puget Sound ports, with six steamers of 12,000 tons capacity. These steamers operate on a 11-day schedule and take 66 days for the round trip of 8800 miles. There is also a Pacific coast service, with four steamers on a 11-day schedule. These take 44 days for the round trip. Other navigation companies are the Matson Navigation Company which operates six steamers running to the Pacific coast, the Oceanic Steamship Company, and two companies which operate oil steamers.

There was considerable railroad construction during the year on several of the islands. There is only one street railway in the territory; this is in Honolulu. The number of passengers carried in 1913 was 11,307,460.

EDUCATION. The years 1912 and 1913 were of unusual importance in the school history of the islands, due to a large extent to legislative enactments by the legislature of 1911, which placed the public schools largely on an automatic adequate and financial basis, and provided also for many new buildings. During the year there was expended for public schools \$677,799. The number of all schools is 212, with an increase of five for the year. The teachers in 1913 numbered 986, of whom 674 were in the public schools. Of the teachers, 238 were males, and 748 females. The pupils in all schools numbered 32,938, an increase of 3029 for the year. In the public schools were 25,631, an increase of 1879. The Japanese furnished the largest increase in the pupils of any one race. They numbered 10,990,

Portuguese 5497, Hawaiians 4390, part Hawaiians 4146, Chinese 3783, all others 4232.

FINANCE. The year 1913 was on the whole a very satisfactory one in respect to both receipts and expenditures. The net receipts for the year were \$4,247,701, and the net disbursements were \$4,208,389. The net receipts exceeded the net disbursements by \$39,311. The net cash balance at the close of the year aggregated \$1,308,347. The principal increases in revenue were in property tax and land sales. The principal decrease was in inheritance taxes, which were only \$19,321, as compared with \$187,974 in 1912. The bonded debt of the Territory at the beginning of the year was \$5,450,000, which increased during the year by the issue of \$1,500,000 or 4 per cent. public-improvement bonds, and decreased by the payment of \$110,000 of the 1903 issue of four per cent. fire-claim bonds, leaving a total bonded indebtedness of \$6,840,000 at the close of the fiscal year.

PUBLIC HEALTH. All the islands are fairly well covered with a well-organized and efficient sanitation force. The legislature of 1913 provided for the employment of a sanitary engineer. In the towns, cottages are largely replacing tenement houses, and on the plantations, buildings which are occupied by laborers are being much improved. There were no epidemics during the year. The number of cases of communicable diseases was 1587, many of which were cases of measles among the arrival of United States troops and immigrants. The diseases causing the greatest number of deaths were pneumonia 426, and tuberculosis 341.

Campaigns for the elimination of rats and mosquitoes were carried on at Honolulu and Hilo during the year. As the result, there was a notable reduction of mosquitoes in Honolulu. During the year 16,778 rats and mongoose were killed in that city. None of these were found to be infected with the plague. No case of the plague has occurred in Honolulu for three years. New methods of dealing with leprosy in the islands continued to meet with good results. There were four institutions maintained in connection with this disease: The leper settlement on the island of Molokai and the leper hospital and the homes for non-leprosy boys and girls, respectively, of leprosy parents at Honolulu. During the year 72 lepers were received and 62 died. Six were paroled as perhaps cured, one was discharged as not a leper, and three were returned to their home countries, leaving a total of 726 at the close of the year. Of these, 444 were males and 282 were females; 606 were Hawaiians and part Hawaiians, 47 were Portuguese, 38 Chinese, 13 Japanese, 5 Germans, 3 Americans, and 14 scattered among other races.

POLITICS AND GOVERNMENT. The seventh legislature of the Territory began its biennial session on February 19, 1913, and was in session for sixty days. A large amount of legislation of an advanced character was enacted, particularly on political, industrial, and social subjects. These included a law, referred to elsewhere, providing for a public utilities commission. A blue-sky law failed passage. Laws were passed providing remedies for the desertion of wives and children, and for compelling fathers to support their illegitimate children. A new compilation provision and annotation of all the laws of the territory was authorized. In all, 170

bills were passed, the largest number enacted by any legislature of the Territory.

During the session of the legislature, one of the senators from the island of Hawaii died, and a special election was held in April, to choose his successor. There were two Republicans, one Democrat, and one Home Rule candidates. The Democrat was elected by a vote of 761, which was a plurality.

On July 25, President Wilson nominated L. E. Pinkham governor of the Territory, to succeed W. F. Frear.

HAY. The world's hay crop of 1913 was in general more satisfactory than the crops of 1912 and 1911. While statistics on the world's production are not compiled, data gathered in several of the more important countries and the general reports on the condition of the hay crops during the growing season and at the time of harvest make comparisons of different years possible. In England and Wales, the crop was above the average of the previous ten years, and amounted to 9,052,322 tons, as against 8,125,484 tons in 1912, a difference of 926,838 tons. Of the 1913 crop 2,709,068 tons represented hay from clovers and grasses under rotation ("seeds hay") while 6,343,254 tons were secured from permanent meadows, the average yield of the first being 31.86 cwts. and of the other 25.02 cwts. per acre, or nearly 3 cwts. and 1½ cwts. above the average, respectively. The crop of Germany was made up of 12,300,000 tons of clover hay, 1,830,000 tons of alfalfa hay, 3,020,000 tons from irrigated meadows, and 30,000,000 tons from unirrigated meadows, making a total of 47,150,000 tons. In 1912 the corresponding crops were 8,744,000, 1,642,000, 2,798,000, and 27,652,000 tons respectively. The average yields per acre in 1913 were 2.50 tons of clover, 2.95 tons of alfalfa, 2.50 tons of irrigated meadow, and 2.17 tons of unirrigated meadow hay. According to estimates by the United States Department of Agriculture, the production of hay in the United States in 1913 was 64,116,000 tons, as compared with 72,691,000 tons in 1912, the record year. The area devoted to hay for the two years was 48,954,000 and 49,530,000 acres, respectively. The average rate of yield in 1913 was 1.31 tons per acre and 1.47 tons the year before. The central Mississippi Valley was affected by a severe drouth which caused a reduction in yield. In Missouri, as reported by *American Agriculturist*, the average yield was only .76, in Kansas and Oklahoma .38, and in Kentucky and Illinois .90 of a ton per acre. In many sections the larger part of the timothy and clover crop was harvested before the effects of the drouth became serious.

HAYASHI, COUNT TADASU. Japanese statesman and diplomat, died July 10, 1913. He was born in 1850. As a boy he lived in the house of an American missionary in Yokohama, where he learned English, and was one of the first students sent from the Japanese government to London, where he worked for a time at the University College school. On his return home, he entered the civil service, and became a governor of two of the provinces of Japan. From 1891-96 he was vice-minister in the foreign office; became minister to Peking in the latter year; minister at St. Petersburg in 1898; and in 1899 minister in London. He was promoted to the rank of viscount in 1907, was foreign minister in the first Sioongi cabinet, and was minister of communi-

cations in the second cabinet in 1911-12, and largely responsible for the treaties of alliance between Great Britain and Japan signed in 1902 and 1905.

HAYDN, HIRAM COLLINS. An American educator and theologian, died July 31, 1913. Born in Pompey, N. Y., in 1831, graduated from Amherst College in 1856, and from the Union Theological Seminary in 1859, he was ordained to the Congregational ministry in 1862, becoming pastor of the First Church of Meriden, Conn., in 1862, and serving there for four years. He was subsequently pastor of several churches in Ohio, and in 1887 was appointed president of Western Reserve University. He held this position until 1890, when he resigned, but continued to hold the chair of Old Testament literature in the College for Women at Western Reserve University. His published writings include *The Bible and Current Thought* (1891); *Brightening the World* (1893); *Western Reserve University; from Hudson to Cleveland, 1878-1890* (1905).

HAYNESITE. See CHEMISTRY, INDUSTRIAL, under *Explosives*.

HAYWOOD, WILLIAM D. See SOCIALISM, *United States*.

HAZLITT, WILLIAM CAREW. An English man of letters and bibliographer, died September 7, 1913. He was born in London in 1834, studied law, and in 1861 became a barrister. He also studied civil engineering, but finally adopted the study of literature and archæology. He was a copious writer on historical, literary, and archæological subjects. His published writings include *A Venetian Republic* (1900); *Bibliographical Collections and Notes*, 8 volumes, (1876-1904); *Letters of Charles Lamb* (1886); *Memoirs of William Hazlitt* (1867); *Four Generations of a Literary Family* (1897); *Shakespeare, the Man and His Work* (1908); *Faiths and Folklore* (1905); and *The Hazlitts* (1911).

HEALTH RESORTS. See HYDROTHERAPY, and SARATOGA SPRINGS.

HEARN, GEORGE ARNOLD. An American merchant and art collector, died December 1, 1913. He was born in New York City in 1835. In 1860 he joined his father in a dry goods business which had been established since 1826 under the firm name of James A. Hearn & Son. In 1886, on the death of his father, he became the head of the establishment. The business was successful, and Mr. Hearn amassed a large fortune. While still a young man he became known as an enthusiastic art collector. For many years he confined his purchases to the work of American artists, but in 1885 during a trip abroad, he took more interest in the work of the early English schools. He made nearly every year a trip to Europe to add to his collection. In later years he turned again toward American painting, and made an effort to acquire the latest expression in the art of American painters whose work pleased him. His first large gift to the Metropolitan Museum of Art was made about ten years before his death, and consisted of 22 pictures. In December, 1905, he gave the museum 28 additional pictures, and a present of \$100,000 cash, with the condition that the interest on this should be used to purchase paintings by living Americans. The directors of the museum were also given the authority to dispose of pictures, if they decided that it was not for the benefit of the museum to keep them.

In 1909 he gave 15 more pictures to the museum. These include famous examples of Van Dyke, Sir Joshua Reynolds, Sir Thomas Lawrence, Homer Martin, Winslow Homer, and several other famous Americans. In 1911 he made still another bequest which included pictures by many famous American painters and another gift of \$100,000, the income of which was to be used as before for pictures by American painters. In addition to the pictures which he gave to the museum, his residence was filled with valuable art objects including more than 300 paintings. His collection of miniatures is said to be one of the best in the United States. He also collected bronzes and sculpture in other forms. He made many gifts to the Brooklyn Institute of Arts and Sciences, of which he was a patron. One of the most notable pictures purchased by him was "Lear and Cornelia," by the late Edwin A. Abbey, which he bought on his last trip abroad in October, 1913. See also **PAINTING AND SCULPTURE**.

HEDIOSIT. A white crystalline, odorless powder, having a sweet taste. It is readily soluble in water, slightly soluble in alcohol, and almost insoluble in ether. The aqueous solution is acid toward litmus. The drug is the lactone or inner anhydride, $C_6H_9N_3$, of alpha-glucosheptonic acid, $CH_2OH(CHOH)_4COOH$. It is not poisonous, and when given to diabetic patients does not increase the amount of glucose in the urine, but tends rather to decrease it. Hediosit is said to be useful as a sweetener of the food of diabetic patients, having at the same time a certain food value.

HELIO THERAPY. The utilization of the direct rays of the sun in the treatment of disease was extended greatly in 1913. Tuberculosis in its surgical forms, with bony involvement, was the malady oftenest treated and benefitted, but many other diseases were shown to be cured or helped. According to Aimes, the list of affections in which heliotherapy had been found an extremely useful adjuvant, included varicose ulcers, burns, sprains, and contusions, certain gynecologic affections, atrophied muscles, resolution of inflammatory exudates, and the sequels of phlebitis and conjunctivitis. He said that mucous membranes were less sensitive to sunlight than the skin, and relates that of forty-eight eyes with trachoma, thirty-five were cured by two exposures to the sun's rays. The conjunctiva of the eyelids bears prolonged exposure to the direct sunlight without harm, but no improvement was noted in rheumatic iritis, in mycosis, or in syphilitic affections. When prolonged treatment is required, as in surgical forms of tuberculosis, sun porches should be built, which should preferably face south or east, in order to get the morning sun. Spring and summer are the most favorable seasons for the treatment, because the ultra violet rays, which are particularly beneficial, are more abundant then. The air should be clear, the atmospheric moisture moderate, and the prevailing winds not too strong. Where a choice of climate is possible, all these conditions should be taken into consideration and the patient sent to a high altitude or a warm sunny region. But heliotherapy may be utilized in any country.

HELY-HUTCHINSON, SIR WALTER FRANCIS. A British administrator, died September 23, 1913. He was born in Dublin in

1849; the second son of the fourth earl of Donoughmore, and was educated at Trinity College, Cambridge. In 1877 he began his colonial career as colonial secretary of Barbados. He subsequently served in Malta and the Windward Islands, and in 1903 was appointed governor at Natal. During the South African War he zealously supported the policy of Lord Milner, and in 1901 succeeded the latter as governor of Cape Colony. His administration of this difficult post was eminently successful. In addition to his duties in Cape Colony, he kept a careful watch over British affairs in Australia, in the West Indies, and the Mediterranean, and in other parts of South Africa. He resigned from the governorship of Cape Colony in 1910 with the reputation of being one of the most efficient and faithful of British administrators.

HENDERSON, JOHN BROOKS. A former United States senator from Missouri, died April 12, 1913. He was born in Virginia in 1826, and received an academic education. He studied law and began its practice in 1848. In the same year he was a member of the Missouri legislature, and from 1861-3 a member of the Missouri convention to determine the question of secession. From 1862-9 he was United States senator from Missouri; in 1867 special commissioner to make peace with the Indian tribes of the West; Republican candidate for governor of Missouri in 1872; and in 1875 special United States attorney for prosecuting the "whiskey ring" at St. Louis. During his term in the Senate he was the author of the Thirteenth Amendment to the Constitution, which abolished slavery.

HENRY XIV., PRINCE OF REUSS. A German ruler, died March 29, 1913. He was born in 1833 and achieved something of a reputation as a soldier. The naming of these princes is the result of a curious custom which, however, need not be explained here. Prince Henry XIV. began his reign over the principality in 1867, but since 1892 his duties have been undertaken by a regent. He was succeeded by Prince Henry XXVII.

HEWLEPP, C. RUSSELL. An American educator, died November 11, 1913. He was born in Brooklyn, N. Y., in 1872, and graduated from Columbia University. Three years he studied art in Paris and then returned to New York, where he became a member of the firm of Lord and Hewlepp, architects. In 1907 he was appointed dean of the School of Applied Design at Carnegie Institute of Technology.

HISS, PHILIP HANSON. An American bacteriologist, died February 27, 1913. Born in Baltimore, in 1868, he graduated from Johns Hopkins University in 1891, and from the College of Physicians and Surgeons in 1895. From that year until 1899 he was assistant bacteriologist at Columbia University; from 1899-1903 instructor in hygiene and bacteriology; and in

the latter year became adjunct professor of bacteriology. From 1896-99 he was assistant bacteriologist in the department of health in New York City, and applied his methods of isolating and identifying the typhoid bacillus. His most recent experiments had to do with a method of fortifying the human system against infection, particularly that of pneumonia. The result of his researches was presented to the Congress of Hygiene at Washington in September, 1912. He was the author of many important treatises dealing with the general subject of bacilli, and co-author of Zinssner's *Bacteriology*.

HISTORICAL ASSOCIATION, AMERICAN. The annual meeting of the association was held in Charleston, S. C., beginning December 29, 1913. The session was notable for a number of special conferences in various branches of history. Exceptional interest was shown in the conference on social and industrial aspects of modern history, on which subject a paper was read by Professor W. B. Hall of Princeton University. Other notable papers were those of Professor A. L. Cross, of the University of Michigan, on legal materials as sources for modern English history, and one by J. W. Barnwell on important events in the history of South Carolina. The address of President Dunning was entitled "Truth as History." The meeting for 1914 will be held in Chicago.

HISTORY. See FRENCH LITERATURE; GERMAN LITERATURE; and LITERATURE, ENGLISH AND AMERICAN.

HITCHCOCK, GEORGE. An American artist, died August 4, 1913. He was born in Providence, R. I., in 1850; graduated from Brown University in 1872; and from the Harvard Law School in 1874. His art studies were carried on in Paris and other continental cities. He was one of the best-known American artists, and his work is represented in the Dresden Gallery, in the imperial collection of Vienna, in the Municipal Museum at Alkmaar, Holland, and in many museums and collections in the United States. He was awarded gold medals at the Paris and Chicago expositions and at other exhibitions of paintings. He was an associate of the National Academy of Design, and was a corresponding member of the Paris Society of American Painters.

HOCKEY. The American Amateur Hockey League had an unsatisfactory season in 1913. The New York A. C. and the Wanderers H. C. withdrew, leaving only three teams in the organization. The Irish American A. C. was finally admitted and a schedule of matches arranged. The championship was won by the Hockey Club of New York with 6 victories and 3 defeats. The Crescent A. C., the winner in 1911 and 1912, finished second with 5 victories and 4 defeats. The St. Nicholas S. C. was third with 4 victories and 5 defeats, and the Irish American A. C. last with 3 victories and 6 defeats.

The world's professional championship series were played in New York City for a \$2000 purse. The three teams taking part were all from Canada and included the Wanderers, Ottawa, and Quebecs. The final match was between the Wanderers and the Quebecs, the former winning by a score of 12 to 10.

The professional teams introduced an innovation by having only six players instead of

the customary seven. This caused considerable discord in hockey ranks not only in Canada, the home of the game, but also in the United States. It is noteworthy that the Ontario Hockey Association, the largest hockey organization in the world, refused to accept the change.

Boston and Cleveland were the scene of many hockey matches in 1913, and the Boston A. A. seven was undoubtedly the fastest amateur team in the United States. The Cleveland A. C. played 43 games, winning 26, losing 14, and tying 3. Princeton won the intercollegiate league championship, although it was generally conceded Harvard, not a league member, had the better team.

HODGKIN, THOMAS. An English scholar, died March 2, 1913. He was born in 1831, and was educated at University College, London, later entering business and becoming a partner in the banking firm of Hodgkin, Barnett & Company of Newcastle-on-Tyne. His interest in literature, however, seduced him from business. His chief studies were in ancient classics and his first historical work in independent form was a pamphlet on Claudian. The chief historical work of his life dealt with this period. It was called *Italy and Her Invaders*, and the first volume appeared in 1880 and the remainder between 1885 and 1899. He was a leader of the Quakers, whose communities in Australia and New Zealand he set off to inspect, when seventy-eight years of age. He collected a series of essays in religious and ecclesiastical history which was published in 1911 under the title *The Trial of Our Faith and Other Papers*.

HOGAN, JOHN JOSEPH. An American Roman Catholic bishop, died February 21, 1913. He was born in County Limerick, Ireland, in 1829. In 1848 he removed to the United States and entered the Theological Seminary in St. Louis. He was ordained a priest in 1852. After serving for a time as pastor in small towns in Missouri, he became pastor of St. Michael's Church in St. Louis, in 1855. He served as missionary in charge of northwestern Missouri until his consecration as bishop of St. Louis, in 1868. He was transferred to the new see of Kansas City, Mo., in 1880.

HOG CHOLERA. See VETERINARY SCIENCE.

HOLLAND, EDMUND MILTON. An American actor, died November 24, 1913. He was born in New York in 1848, the son of George Holland, one of the best-known actors of his day. E. M. Holland with his brothers, George and Joseph, began his connection with the stage when a mere child. When he was fifteen years of age he became a member of Mrs. John Wood's company. Although known for years as one of the most accomplished actors on the stage, he gained his first general reputation as "Captain Redwood" in *Jim the Penman*. Among other plays in which he appeared with success were *Colonel Carter of Cartersville* and *Alabama*. For thirteen years he played at Wallack's Theatre, in New York, under the management of Lester Wallack. He was later at the head of Charles Frohman's comedians, and appeared in *Raffles*, *The Measure of a Man*, *The Bishop*, *The Duel*, *The House of a Thousand Candles*, and *The Bishop's Candlestick*. At the time of his death he was appearing in *Years of Discretion*. Mr. Holland was acknowledged to be

one of the most finished actors of his generation.

HOLLEBEN, THEODOR VON. A German public official, formerly ambassador to the United States, died February 1, 1913. He was born in Stettin, Germany, in 1838, and at forty years of age turned from a military career to the diplomatic service. From 1875-85 he was minister to Argentina, from 1885-91 minister to Japan, from 1891-92 minister to the United States, and from 1897-1903 ambassador to the United States. His diplomatic career in Washington was a stormy one. In March, 1902, a sensational attack was made upon him by Emil Witte, who had been employed in the German embassy. Witte charged that Dr. von Holleben had secured complete plans for the naval defenses of the United States and had established a spy system throughout the country. He also alleged that Prof. Hugo Munsterberg of Harvard College was employed by the German government as chief of a secret service bureau to mold public opinion in the United States. Professor Munsterberg denounced Witte's charges as "a mixture of lies, forgery, and gossip." The chief of the United States secret service said that the letters had been offered to him for a price and that the charges they contained amounted to nothing. Dr. von Holleben was also accused of meddling in United States politics, the charge being that he expressed a preference for William Jennings Bryan in the latter's campaign in 1900. This accusation was also traced to Witte. In 1903 he asked for a long leave of absence. This was granted and he did not return to the United States. He was succeeded by Baron Speck von Sternberg.

HOLLIS, HENRY FRENCH. United States senator (Democrat) from New Hampshire, born in Concord, N. H., in 1869, graduated from Harvard University in 1892, and admitted to the bar in the following year. From 1896 to 1899 he was a member of the school board of Concord, unsuccessful candidate for Congress in 1900, and was a candidate for governor in 1902 and 1904. He was elected to the Senate on March 13, 1913, and was the first Democratic senator from New Hampshire since 1852. For the details of his election, see **NEW HAMPSHIRE**. His term expires March 3, 1919.

HOME RULE. See **GREAT BRITAIN**.

HOME RULE, MUNICIPAL. See **MUNICIPAL GOVERNMENT**.

HOMESTEADS. See section so entitled under **CANADA, DOMINION OF**.

HONDURAS. A Central American republic. The capital is Tegucigalpa.

AREA, POPULATION, ETC. The estimated area is 114,670 square kilometers (44,274 square miles). The census of December 31, 1910, returned 553,446 inhabitants, as compared with 500,135 in 1905, 398,777 in 1895, and 350,000 in 1850. The 1910 census, however, was not quite complete, as the inhabitants of certain sections (as in La Mosquitia) were not enumerated. An estimate of December 31, 1911, placed the population at about 566,000. The bulk of the population is Indian. The larger municipalities are (1910): Tegucigalpa, 22,137; Santa Rosa, 10,574; Juticalpa, 10,529; Danté, 8,477; Nacaome, 8,152; Choluteca, 8,065; San Pedro Sula, 7,820. Births in 1910 and 1911, 20,994 and 21,825; deaths, 10,295 and 10,620; marriages, 2,241 and 2,114. In 1911 there were

888 primary schools, with about 30,000 pupils. For secondary education, the government maintains an institute at Tegucigalpa and subsidizes colleges in the departments. A university is maintained also at Tegucigalpa.

PRODUCTION AND COMMERCE. The leading crop is bananas, which are cultivated chiefly along the eastern coast. Next in importance is corn, and other crops include sugar-cane, tobacco, coffee, and coconuts. Cabinet woods, especially mahogany, and rubber are exploited. Grazing is important, and cattle probably number about 500,000. Some gold and silver are mined, but there is little other development of the large mineral resources of the country.

For the fiscal year 1912, imports and exports respectively are reported at 8,265,095 and 7,706,446 pesos silver. Cotton goods and food-stuffs are the principal imports. Principal exports in 1912: Bananas, 3,073,765 pesos silver; minerals (chiefly gold and silver), 2,131,492; coconuts, 485,536; live animals (mostly cattle), 441,894; hides, 325,182; coffee, 205,522; rubber, 159,473. The foreign trade is largely with the United States.

COMMUNICATIONS. Roads are generally poor, and there is little railway. The total length of railway is about 100 kilometers (62 miles); of this, 56 miles extend from Puerto Cortés to San Pedro Sula and La Pimienta, and a continuation is projected to La Brea on the Pacific coast. The Tujilo and Juticalpa Railway, 26 miles in length, was under construction during the year. A concession has been granted for the construction of the Honduran section of the so-called Pan-American railway. Telegraphs (1912): 245 offices, with 3220 miles of wire. Post offices (1912), 278.

FINANCE. The monetary unit is the silver peso, whose weight is 0.723370 oz. of fine silver. The value fluctuates with the price of the metal; at the beginning of 1913 it was about 45.1 cents. For the fiscal year 1913-14, the estimated revenue was 4,714,065 pesos and the estimated expenditure 4,824,000. The principal estimated receipts were: Customs, 2,600,000 pesos; monopolies, 1,400,000; posts and telegraphs, 207,000; stamps, 220,000. Estimates of the larger departmental expenditures were: War, 1,795,887 pesos; interior, 701,244; agriculture and public works, 671,978; public instruction, 510,501; finance, 401,374 (not including 312,820 pesos for the public debt). The external public debt on August 1, 1910, consisted of four loans contracted from 1867 to 1870, amounting to £5,398,570; arrears of interest from 1872, £17,535,305; total, £22,933,875. The internal debt on the same date was 4,053,370 pesos paper.

The budget for the fiscal year 1913-1914 balanced at 4,824,000 pesos. The revenue was derived from import duties, 2,350,000 pesos; export duties, 200,000 pesos; *aguardiente*, 1,400,000 pesos; and sundries, 874,000 pesos. The estimated departmental expenditure was home government, 701,244 pesos; justice, 178,048; foreign affairs, 214,148.50; education, 510,501; *fomento*, 671,978; war, 1,795,886.75; credit, 374,819.75; miscellaneous, 404,374 pesos.

GOVERNMENT. The unicameral congress of 42 members, the president, and the vice-president are elected for four years by direct vote. In April, 1907, Gen. Miguel R. Dávila assumed provisional charge of the presidency (succeeding

Gen. Manuel Bonilla), and he became president early in the following year. An insurrectionary movement, fomented by Bonilla in 1910 brought about the resignation of Dávila, who in March, 1911, turned over the executive office to Francisco Bertrand as provisional president until the end of the year. In November, 1911, General Bonilla was elected president and Francisco Bertrand vice-president. Both were inaugurated for the four-year term on February 1, 1912. On March 21, 1913, Bonilla died at Tegucigalpa and was succeeded by Bertrand for the remainder of the term.

HISTORY. A bill was brought into Congress to establish a free port under the name of Puerto Herrera opposite the village now situated on the eastern bay of the Caratasca Lagoon. The measure, which failed to pass in 1912 on account of insufficient funds, was regarded as highly desirable for the development of the Honduran Mosquitia region, returned to Honduras by the Anglo-Honduran treaty of 1857. The treaty of amity, commerce, and navigation, made January 21, 1887, with Great Britain, was extended to April 6, 1915. A stamp tax was levied in the summer; five-peso stamps were required on all foreign documents used in Honduras, or Honduran documents used abroad. The Congress had under consideration an army bill which would have required military service of all able-bodied males between 20 and 40 years of age. Late in October congressional elections were held in the departments of Ocotepeque, Tegucigalpa, Valle, Intibuca, Voro, Santa Barbara, and La Paz.

HONGKONG. An island at the mouth of the Canton River; a British crown colony, with the addition of a leased strip of the Chinese mainland (376 square miles) and about four square miles of the Kowloon Peninsula, besides some islets. The island contains about 32 square miles. Total population (civil), according to the 1911 census, 456,739 (444,664 Chinese). Chinese laborers, chiefly destined for the Malay States rubber plantations, are passed through the port—in 1911, 135,565 emigrants, 149,894 immigrants (excluding to and from Chinese ports). The city of Victoria (the capital) overlooks the harbor, which covers ten square miles and is one of the finest in the world. An enormous trade flows through Hongkong, for which no statistics are available, as the port is free. A glance at the shipping table below will give an idea of its extent (A=ocean going; B=river steamers; C=steamships under 60 tons; D=steam launches):

	Number		Tonnage	
	1910	1911	1910	1911
British A..	4,262	3,907	8,111,946	7,589,995
Foreign A..	4,312	4,180	8,103,969	7,917,640
British B..	6,483	6,871	4,000,078	4,116,736
Foreign B..	1,334	1,423	706,616	736,057
SS. C.....	3,153	3,263	136,765	130,092
Junks	21,170	25,334	2,100,887	2,572,588
Total.....	40,714	44,978	23,160,256	23,063,108
Local D....	466,014	461,984	10,986,234	10,981,990
“ junks.	40,436	36,608	2,387,871	2,134,054
Total.....	547,164	543,570	36,534,361	36,179,152

The island has practically no cultivable land; but in the leased territories the Chinese carry on extensive agricultural enterprises, raising sugar-cane, vegetables, rice and other grain, and fruits. Hongkong is a manufactur-

ing and ship-building centre. Kowloon is connected by rail with the Chinese frontier, where the line meets the one from Canton. The revenue and expenditure amounted for 1911 to 7,497,231 dollars and 7,077,177 dollars, respectively. The debt is placed at £1,485,732. The governor in 1913 was Sir F. H. May, appointed 1912. A district officer resides at Taipo, the headquarters of the newly leased territory.

HOOKWORM DISEASE (UNCINARIASIS; ANKYLOSTOMIASIS; MINERS' ANEMIA). The work of the Rockefeller Sanitary Commission for the Eradication of Hookworm Disease was set forth in the third annual report. The objects of the commission were to educate the people in prevention, this being accomplished by enlisting physicians in the work, by newspaper articles, by distributing bulletins and letters, by lectures, and by personal visits and demonstrations. A field force of sanitary inspectors, and a laboratory force was also provided, to work in coöperation with State and local health boards. During 1912, 238,755 persons were treated for hookworm at an expense per person of 77 cents, as compared with 140,378 patients treated during the previous year at an average cost of \$1.05 per person. In the three years a total of 393,566 cases of hookworm disease were treated. The commission expended in 1912 \$184,671.60, in addition to \$22,482.44 spent by various counties, \$19,972.52 by States in the campaign, making a grand total of \$227,126.56. The laboratory force made 326,951 microscopic examinations during the year. The use of the microscope in diagnosis was greatly extended, with the result that many cases of uncinariasis were recognized, which, on account of slight clinical symptoms, might otherwise have been overlooked. In this connection it was interesting to note, in the report of Dr. W. C. Billings for 1912 on examination of immigrants in San Francisco, the fact that 1556 cases of hookworm disease were detected in 1912, or over double the number found in 1911. Billings ascribed this increase to the use of the microscope in diagnosis and pointed out that in the Oriental races it was impossible to detect all cases of infection by clinical examination alone. In connection with the field work of the Rockefeller commission, an investigation of 129 cases of amenorrhea due to the hookworm, showed that this disorder was a frequent and unsuspected factor. The method of treatment recommended by the commission is as follows: A dose of Epsom salts is administered on the evening of the first day, or one dose is given at 5 P.M., a light supper at 6 P.M., and another dose of Epsom salts at 8 P.M. On the second day, one-third of the dose of thymol is given at 6 P.M., one-third at 7 P.M., and one-third at 8 P.M. At 10 A.M. another dose of Epsom salts is given. This permits the withdrawal of the last one or two doses of thymol, if unfavorable symptoms supervene. The average dose is 30 grains. It is considered best in giving the Epsom salts to dissolve a tablespoonful of it in a tablespoonful of water, administer this, and then have the patient drink copiously of water. After the morning dose of salts following the thymol, water should not be given so freely. During the administration of thymol, little if any water is allowed. About an hour after the third dose of thymol, a cup of coffee

without milk is permitted, and half an hour after the morning salts, one or two cups of coffee without milk but with crackers. Search was also made for a better remedy than thymol. Although this drug has proved very efficient, when used carelessly it may give rise to serious symptoms of poisoning. Schuffner and Vervoort, after eight months' trial with oil of chenopodium in 1457 cases, believed that this drug is far more efficient than thymol. Compared with eucalyptus oil with a coefficient of 38, naphthol with 68, and thymol with 83, oil of chenopodium surpassed them all with 91. Another great advantage is that it expels ascarides along with the hookworms, thus impressing the minds of patients much more than when the ocularly insignificant hookworms alone are expelled. It is also comparatively pleasant to take.

The quarterly report of the hookworm commission of the North Carolina State board of health showed that during the three months ended March 31, State and county dispensaries for the free examination and treatment of hookworm disease were conducted in twelve counties; that 35,472 persons were microscopically examined for hookworm and 10,684 persons received free treatment for the disease. Up to date, 216,816 persons had been examined in the State, of whom 122,656 had received free treatment. The dispensary work was carried on in sixty-five counties and six additional counties provided for it.

HOPS. The world's hop production in 1913 was estimated at about 1,800,000 cwts. of 110 pounds each, as compared with a harvest of 1,900,000 cwts. in 1912. While the yield in the United States was very satisfactory, the crops in many of the hop regions of continental Europe were reduced by untoward weather conditions and to some extent by insect attacks. The continental crop was reported at 675,000 cwts., the British at 275,000, and the production of the United States at 480,000 cwts. The German crop amounted to 320,000 cwts., as compared with a yield of 460,000 cwts. the year before. The hop crop of Alsace-Lorraine was the smallest in years, but owing to prevailing high prices it was equal to the average total crop value for the last 35 years. Baden produced only about 9000 cwts., as against an average of 12,000 cwts. for the last 10 years. The Bavarian crop amounted to 220,000 cwts., while Württemberg produced 45,000 and Prussia 15,000 cwts. Part of the German crop was of good color and quality and sold well at from \$35 to \$50 per cwt. of 110 pounds. Austria-Hungary produced 260,000 cwts., as compared with 415,000 cwts. in 1912. To the total production Hungary contributed 39,000 cwts. and Bohemia 155,000 cwts. In the famous Saaz region a rainy and cold season retarded growth and the yield was only 90,000 cwts., as against 240,000 cwts. in 1912, which was an exceptionally good year. Belgium and Holland produced 65,000, Russia 60,000, and France 50,000 cwts. in 1913. In the United States the Pacific coast crop was in excess of the yield of the previous year. Oregon yielded 125,000 bales, California 95,000 and Washington 40,000, followed by New York with 35,000 bales, the total being 295,000 bales of 180 pounds each, or 53,100,000 pounds. Owing to the shortage in European crops prices

were good in the fall of the year and by October from 15,000 to 20,000 bales had been exported by the United States at a very satisfactory financial return.

HORSES. See STOCK-RAISING, and VETERINARY SCIENCE.

HORTICULTURE. Taken as a whole the year 1913 was one of short fruit crops, both in Europe and in America, with resulting high prices and a noticeable curtailment of supply in the smaller markets. Decreased production was largely due to late spring frosts, although insects, plant diseases, and in some sections severe droughts prevailed throughout the season. The most serious shortage in Europe was the grape crop, which, except for the Mediterranean districts, was about half of last year's crop. Italy produced a banner crop of grapes. (See LIQUORS under Wine.) Europe produced a fair crop of olives. Reduced yields of such deciduous fruits as prunes, pears, and apples were sufficient to stimulate the export trade of the United States. The Australian fruit crop was a little below normal but prices were good. Similar conditions were reported from Canada, where, however, large crops of peaches and plums were produced, the excess yield helping to make up local shortages in the United States.

In the United States the abundant apple crop in 1912, which was finally figured at 41,770,000 barrels, was reduced to an estimated yield of 26,240,000 barrels in 1913. The crop in Canada was likewise short. As a result of the big freeze in California, that State shipped only 18,085 cars of citrus fruits in 1913, as compared with 40,290 cars in 1912. The damage to the trees was so serious that the 1914 crop will be below normal. On the other hand, Florida again shipped a banner citrus crop of about 25,000 cars in 1913 as compared with about 20,000 cars in 1912. In spite of California's short crop, the returns were over 80 per cent. of those secured in 1912. This is largely due to the use of an improved orange separator through which water is forced by a 4-inch centrifugal pump. The heavy and unfrosted fruit sinks to a lower depth in the swiftly moving current than the light and damaged fruit, is carried out at a different point than the latter fruit, and delivered to the grading machine. Instead of the usual gain California's fresh deciduous fruit crop was a few cars short of last year's shipment, and the cured fruit pack was considerably reduced. The New York State grape districts yielded only 3957 ten-ton carloads in 1913, as compared with 7528 twelve-ton carloads in 1912. There was a very light crop of peaches in the South and an abundant crop in the North. The 1912 canned vegetable pack turned out larger than was expected. The figures for 1912 are 14,022,000 cases of tomatoes, 13,109,000 cases of corn, and 7,307,000 cases of peas. Although considerably less than last year, the onion crop of 4,692,500 bushels and the potato crop of 331,525,000 bushels were sufficient to supply the demand.

EXPORT TRADE. During the fiscal year 1913 the United States exported fruits worth \$36,345,517, as compared with imports worth \$28,657,084. Fresh apples to the value of \$7,898,634 and many fresh pears were shipped abroad. There was also a general increase in exports of canned and dried products; \$7,353,537 worth of

vegetables and \$733,585 worth of nuts were exported, as compared with imports of vegetables valued at \$11,358,761 and nuts to the value of \$13,965,569. Very few potatoes were imported in 1913, and imports of this crop will probably be low for some time. (See *Quarantine Regulations*.)

The Hawaiian canned pineapple crop, most of which comes to the mainland of the United States, was estimated at about 1,600,000 cases in 1913, as compared with 1,318,336 cases in 1912. In order to market this crop, it was necessary to reduce wholesale prices, and to seek a larger outlet in foreign countries which thus far had taken only about ten per cent. of the Hawaiian product. Porto Rico was about to enter into the canned pineapple trade, factories having been established on the island.

A successful shipment of plums was made from Victoria, Australia, to California during the year. Australia now imports in the off season large shipments of fresh apples from the northwestern United States. During 1913 and a year or two previously the pili nut, or Java almond, was introduced from the Philippines into the United States' trade and was received with much favor. The nuts are as large as a medium-sized pecan, somewhat triangular in shape and contain a kernel of fine flavor. There was great activity in Panama in acquiring coconut lands. About 10,000 acres were planted by Americans during 1913. On account of the prevalence of banana diseases in Central America increased planting were being made of the dwarf Chinese or Cavendish banana. This variety is quite disease-resistant, although it is not as compact a shipper as the common Bluefield's or Jamaica banana. The banana industry was being rapidly developed in Cuba, that country now shipping over 2,500,000 bunches to the United States.

Japan was rapidly developing an export fruit trade. Navel oranges were grown in considerable quantities and were successfully competing with California navels in Australian markets. During the year 1913 Japan shipped 1000 boxes of navel oranges to the United States. The Japanese government had taken active steps to encourage the development of the olive oil industry in Southern Japan. In this connection California decided to devote its attention to the ripe pickled olive industry, since it could not compete with foreign olive oil. During 1912 Japan exported about 6000 tons of green peas to Europe.

QUARANTINE REGULATIONS. In addition to the quarantine against fruits from the Hawaiian Islands (see YEAR BOOK for 1912, article HORTICULTURE) the Federal horticultural board of the United States Department of Agriculture quarantined against oranges, grapefruit, sweet limes, peaches, and other fruits coming from Mexico that are capable of harboring the Mexican fruit fly. In addition to an earlier quarantine against potatoes from many foreign countries where the potato wart disease was prevalent, a quarantine against powdery scab and other diseases was temporarily extended on December 24, 1913, to include practically all of Europe and the Dominion of Canada. Provision was made for lifting this quarantine as soon as any country or district could be shown to be free from disease. In such cases potatoes

will be admitted under proper regulation and inspection.

UTILIZATION OF GRAPE SEEDS. Recent investigations by the U. S. Department of Agriculture showed that four commodities, syrup, fixed oil, tannin extract, and meal, could be made from grape and raisin seeds, of which from 3000 to 4000 tons are available annually in the United States. The syrup has the characteristic flavor and taste of the raisin, the fixed oil is adapted to paint and soap manufacture, the tannin extract is well adapted for tanning leather, and the meal has a high protein content and should prove useful as a stock feed. All of these commodities can be produced in important commercial quantities.

LEMON CURING. In some experiments conducted in Cuba, W. Snodgrass and C. D. Abbey found that lemons may be rapidly cured by submitting them to alcohol fumes in a closed room for a period of from two to two and one-half days, after which time the lemons continue to color without more alcohol.

PROLONGING THE SEASON FOR PRESSING OLIVE OIL. As a result of extensive tests, G. Sani, an Italian investigator, found that olives may be picked from the tree at the normal period, placed in cold storage for several weeks, and then pressed without affecting the quality of the oil. When the weather is sufficiently cool the olives can remain on the trees for several weeks after the normal harvest period without materially changing the oil.

CITROUS FRUIT BY-PRODUCTS. As a result of extensive studies relative to the utilization of waste oranges and lemons, the U. S. Department of Agriculture found that lemons which had heretofore been discarded would yield from 15 to 60 pounds of citric acid per ton. Likewise a method was devised by which 60 per cent. of the essential oil from both oranges and lemons could be recovered. A yield as high as 6¼ pounds of essential oil of orange or lemon was obtained from a ton of fruit. The gross maximum income per ton from the best quality of culls by methods thus far devised approximate \$45. Several companies were considering the manufacture of these by-products.

NEW FRUITS AND PLANTS. During the year the U. S. Department of Agriculture announced a number of new or little known native fruits and nuts that were considered worthy of more extensive trial. These included the Eastman, Monocacy, and Summer King apples, Douglas pear, Chesapeake strawberry, Ormond persimmon, Pollock avocado, and Major, Burkett, Havens, and Owens pecans. The limequat, a new hybrid substitute for the lime, fruited for the first time. This fruit was obtained by crossing the West Indian lime with the kumquat. It is very much harder than the lime, having withstood the past three winters in extreme northern Florida. The Rollinia, a valuable new fruit from Brazil, fruited for the first time, at the Miami field station.

The dasheen, which root crop the department is widely advocating as a substitute for the Irish potato in the South, was received with much favor. A carload of the tubers was used in extensive cooking, forcing, and flour-making tests. The plants are easily forced in winter and the blanched shoots make a delicate table vegetable. The rapid growth made by the Japanese

edible bamboo, with stems forty feet high, at the department's bamboo plantations in Louisiana and Florida, demonstrated the promising character of this valuable plant for the South.

M. Gaston Bonnier submitted to the National Agricultural Society of Paris samples of a new vegetable ivory made from the albumen of the fruit of certain small palms (of the genus *Hyphæne*, tribe *Borassus*) growing in the forests of French Sudan. The albumen hardens on exposure to the air and it resembles natural ivory in color and texture. This product is said to resemble the vegetable ivory from another palm (*Phytelphas macrocarpa*) found in equatorial South America.

The leaves and shoots of *Catha edulis*, a plant occurring in large quantities in East Africa, particularly in Abyssinia, recently appeared on European markets as a substitute for tea. The trial culture of tea in South Carolina has now developed to the extent that a crop yielding 14,000 to 16,000 pounds of high-grade tea finds a ready market in competition with imported teas.

PLANT BREEDING AND IMPROVEMENT. As a result of his blueberry investigations (see HORTICULTURE, in YEAR BOOK for 1910) F. V. Coville secured many thousands of promising hybrids. Berries nearly seven-eighths inches in diameter were grown in the greenhouse, and the new method of propagation by "tubering" produced plants 18 inches to 3 feet high at the age of 18 months. In the work of improving and standardizing alkaloid-yielding plants the U. S. Department of Agriculture reported valuable results with belladonna. It seemed practicable to grow belladonna of any desired alkaloid content within normal limits of variation and also to secure uniformity of quality.

In France L. Trabut had developed a new method for the rapid propagation of new varieties of grapes. The grape seedlings are cleft-grafted on green shoots of old vines and produce canes about three yards long during the first season. M. Gard, who has made an extensive study of the sexual elements of grape hybrids, concluded that the deviations from the normal was confined to the male flower. E. Graino-Canina has found that all of our common spray mixtures have a more or less toxic action on the pollen of grapes.

U. P. Hedrick found a new taxonomic character for peaches, namely, peach blossoms showing green inside the calyx cup yield white-fleshed fruit and those showing orange inside the calyx cup yield yellow-fleshed fruit. L. Daniel and J. Delphon reported a graft hybrid between the peach and the almond. The hybrid shoots developed at some distance above the union, and the phenomenon has re-occurred for several years. As a result of his breeding work with nut trees, Dr. R. T. Morris reported the successful growth of butternut seedlings from nuts which were unfertilized by male flowers.

From an extensive study of garden beans, J. A. Harris found strong evidence of varietal differences with respect to mortality. In some strains the heavier, in others the lighter, seeds seem less capable of development. Experiments concluded by the U. S. Department of Agriculture afforded definite evidence that the crossing of two varieties of Indian corn was followed by an increase in the size of the kernels in the same

year that the crossing was done. This increase is not to be confused with the increased yields secured in the year following when the first generation hybrid plants are grown. An extensive study of inheritance in cabbage hybrids conducted at the Virginia station showed that there was very little danger of cabbage varieties mixing in the fields; hence, new and valuable varieties may be perpetuated by pedigree selection alone.

G. W. Oliver described a simple method for successfully transporting cuttings of herbaceous plants from distant places. A layer of cuttings is arranged without crowding on a piece of glass with the upper surfaces of the leaves facing the glass. Two or three inches of damp sphagnum moss is evenly distributed over the cuttings. Another layer of cuttings is then placed on the moss and a second square of glass is placed over these cuttings. The whole package is then pressed down firmly and tied together. By keeping the moss moist and giving all the light possible the cuttings will carry well, and, if the journey is a long one, they will have, in many cases, rooted freely in transit. With the moss only slightly dampened scions and bud sticks of rare plants keep a very long time in good condition under the same treatment.

LITERATURE. Among recent works dealing with some phases of horticulture are: E. Bourcart, trans. by D. Grant, *Insecticides, Fungicides, and Weed Killers* (London, 1913); L. C. Corbett, *Garden Farming* (Boston, Chicago, and London, 1913); J. C. Newsham, *The Propagation and Pruning of Hardy Trees, Shrubs, Miscellaneous Plants, with Chapters on Manuring and Planting* (London, 1913); E. Peet, *Practical Tree Repair* (New York, 1913); P. B. Popenoe, *Date Growing in the Old World and the New* (Altadena, Cal., 1913); F. A. Waugh, *The American Peach Orchard* (New York and London, 1913); H. H. Thomas, *Indoor Gardening in Room and Greenhouse* (London, New York, Toronto, and Melbourne, 1912); E. H. Jenkins, *The Hardy Flower Book* (London and New York, 1913); E. R. Lake, *The Persian Walnut Industry of the United States* (U. S. Department of Agriculture, Bureau Plant Industry Bulletin 254, 1913); *New Garden Plants for the Year 1912* (Royal Botanical Gardens, Kew, Bulletin Miscellaneous Information, 1913, App. 3), contains a descriptive list of all new plant introductions reported in various publications during 1912.

HOSPITALS. Bequests and donations to hospitals during 1913 reached an enormous total. Among the more notable may be mentioned the following: Mt. Sinai Hospital, New York City, \$100,000; New York Infirmary for Women and Children, \$10,000; and a donation for poor convalescents of \$1,000,000, were provided by the will of Mrs. Caroline Neustadter. By the will of Mrs. Elizabeth M. Newton, the Tuberculosis Hospital for Chautauqua County, New York, received \$150,000; the Homeopathic Hospital of Pottstown, Pa., \$25,000 by the will of Dr. Annie M. Hawley; St. Luke's, the German, and Lincoln Hospital, all of New York City, \$25,000 each, and Mt. Sinai \$100,000, by the will of Benjamin Altman; St. Luke's Hospital, New York City, \$50,000, by bequest of H. C. von Post; Johns Hopkins Medical School, Baltimore, \$1,500,000, from John D. Rockefeller; the Boston Lying-In

Hospital over \$500,000 to accumulate for twenty-one years, by the will of Francis Amory. The late Sebastian D. Lawrence bequeathed \$600,000 for a hospital and other charities at New London, Conn. St. Luke's Hospital of New York City, received \$75,000 from the estate of Francis E. Bacon. The Massachusetts General Hospital received \$25,000, and Harvard Medical School \$50,000, by the will of Dr. Arthur T. Cabot. The University Hospital of Philadelphia received one-third, and the Pennsylvania Epileptic Hospital two-thirds of a contingent bequest of \$130,000, from the estate of Mrs. Anna F. Francine. To the Hahnemann Hospital of Chicago, was given \$100,000 by William Wrigley. George W. Elkins donated \$135,000 to the Abington (Pa.) General Hospital. Massachusetts General Hospital, Boston, received \$30,000, the Children's Hospital \$50,000, the Massachusetts Charitable Eye and Ear Infirmary \$10,000, by the will of Harriet O. Cruft. The Presbyterian Hospital, Philadelphia, \$100,000, in memory of Sarah L. Broadhead. Rhode Island Hospital, Providence, \$200,000 for the erection of a building for private patients, by the will of Jane Frances Brown. The Mary Dykeman Memorial Hospital, Logansport, \$100,000 by the will of the late Judge D. D. Dykeman. St. Luke's Hospital, South Bethlehem, Pa., \$35,000, donated by E. B. Cox, Jr. The Presbyterian Hospital, Philadelphia, \$55,000 by the will of Mrs. Jane McKee Norris. The Samaritan Hospital, Troy, N. Y., received bequests and legacies amounting to more than \$100,000 from the estate of Mrs. Charles Knight, \$50,000, donated by F. H. Peabody, and \$50,000 by Mrs. Elida Van Schoonhoven, and two donations of \$20,000 each from Robert B. Cluett and George B. Cluett. Theophilus J. Zurbrugg, of Riverside, Pa., left \$250,000 for the foundation of a new hospital in Riverside, and \$5000 each to the German Hospital, Philadelphia, and the Burlington County (N. J.) Hospital. The sum of \$200,000 was bequeathed to the Champlain Valley Hospital, Plattsburg, N. Y., by the late Loyal L. Smith. The Presbyterian Hospital, Philadelphia, received \$318,000 from the residuary estate of Lady Martha E. Kortright of England. A donation of \$15,000 was made to the Maternity Hospital, Albany, N. Y., by Anthony N. Brady. Cedar Falls, Iowa, City Hospital, received \$25,000 from Joseph Sartori. St. Mary's Hospital, Brooklyn, was given \$100,000 by Mr. and Mrs. James Shevlin, in memory of Bishop Laughlin. The Maine State Sanatorium received \$75,000 by the will of Levi M. Stewart. Bryn Mawr (Pa.) Hospital \$55,000 by the will of Miss Kate Clevenger. Charity, Lakeside, St. John's, and St. Alexis Hospitals, Cleveland, \$35,000, the first installment under the will of Calvary Morris. The Sanatorium for Hebrew Children, Rockaway Park, N. Y., \$20,000 by the will of Caroline Neustadter. St. Luke's Hospital, contingent funds of \$125,000 and \$30,000, and the Women's Hospital of New York City, \$25,000 by the will of S. F. Thompson. The National Jewish Hospital for Consumptives, Denver, was given \$50,000 by Samuel Grabfelder. The Lowell, Mass., General Hospital received \$100,000 for the erection of a hospital for the Care of Incurable Patients, by the will of F. B. Shedd. The Union Hospital, Terre Haute, Ind., \$50,000 from the estate of James McGregor. By the will

of F. H. Thompson, the Mercy Hospital, Chicago, received a bequest of \$100,000 with a contingent bequest of \$200,000.

The new Ithaca (N. Y.) City Hospital was formally opened August 1. The new building of the Italian Benevolent Institution and Hospital, of New York City, with accommodations for 100 patients, was formally opened. A tuberculosis annex and night camp was opened by the New York Nose, Throat, and Lung Hospital, adjoining the present building and containing over fifty beds. The camp is intended for men only, who go there after their day's work is over, and here every detail of their lives is supervised. The New York Ophthalmic and Aural Institute, founded by Dr. Herman Knapp in 1869, moved to its new building at 57th Street and 10th Avenue, on October 1. The new hospital is seven stories high and especially constructed for the care of diseases of the eye, ear, and nose. St. Rose's Free Home for Incurable Cancer was dedicated on December 15, 1912. It has accommodations for 100 patients. In Pennsylvania the new building of the Henry Phipps Institute was dedicated May 10. Mr. Phipps has given about \$1,000,000 for the erection of the institute, and has set aside \$50,000 a year for its support. The institute is for the treatment of tuberculosis, and is five stories high, with a frontage of 132 feet. A new building accommodating 120 diphtheria patients was added to the Hospital for Contagious Diseases, Philadelphia, at a cost of \$122,680. The Monongahela Memorial Hospital Association erected a new building costing \$75,000. In Washington, D. C., a new Eye, Ear, and Throat Hospital was opened. The Frostburg Miners' Hospital, for which the State appropriated \$25,000 and the necessary ground, was opened September 1. The new building of the German Hospital was formally opened February 16. The building cost \$350,000 and accommodates 150 patients. The Sarah Morris Institute for Children, Chicago, was dedicated May 25. The institute was made possible by a bequest of \$300,000 by Mrs. Sarah Morris, and has 125 beds for the care of sick children. The new Cincinnati Hospital was opened for inspection on October 19. In Indiana the Robert W. Long State Hospital, Indianapolis, was completed in November. Funds amounting to \$225,000 were given by Dr. and Mrs. Robert W. Long. The new St. Vincent's Hospital, Indianapolis, was opened February 15. It is a five-story building, occupying an entire block, and containing 325 rooms. The Elkhart General Hospital, erected at a cost of \$80,000, was opened July 26. In Texas a contagious annex to the John Sealy Hospital, Galveston, was completed and the out-door annex to the Physicians' and Surgeons' Hospital, San Antonio, opened May 6. In Louisiana the new Illinois Central Hospital, New Orleans, was opened for patients on March 7. At Jacksonville, Fla., the new St. Luke's Hospital was opened in October. The Montana State Sanatorium for Tuberculosis, at Warm Springs, completed at a cost of \$45,000, was opened. In California, the Universal City Hospital was formally dedicated, August 8, and the new Pomona Valley Hospital, costing \$60,000, was opened late in August. The Henry Phipps Psychiatric Clinic, a department of Johns Hopkins Hospital, Baltimore, established and erected by Mr. Phipps, was opened April 16.

FOREIGN COUNTRIES. In Canada a new hospital, was opened in Ashcroft, B. C., and the new wings of the Winnipeg Hospital, costing \$650,000, were completed. On June 19 the new Toronto General Hospital was opened. This charitable institution dates from the year 1818. Nearly \$3,000,000 was secured for the institution from various sources. There are accommodations for 120 surgical and 120 medical patients, in the main wing, besides 120 beds in the administration building, for special cases. The buildings are so arranged that the grounds are enclosed on all sides, and wide verandas and roof-gardens are conspicuous features. The Royal Victoria, Montreal General, and Montreal Maternity Hospitals, each received \$50,000; the Royal Alexandra Hospital for Infectious Diseases, Montreal, and Ross Memorial Hospital, Lindsey, Ontario, each \$25,000 by the will of Mr. James Ross of Montreal. According to the consular report of August 7, the cabinet of Cuba granted the department of sanitation forty new hospitals for the island. They are to be paid for out of the lottery fund. An appropriation of \$65,000 for establishing a hospital at Guatanamo was also provided for. At Kobe, Japan, the International Hospital was being rebuilt. It was stated that a modern building was to be erected. The king of Siam purchased a large building, known as Himapan Park, with extensive gardens, in the northern part of Bangkok, and presented it to the city for hospital purposes. Funds for construction and maintenance were also to be provided by the king. An institute for medical research in South Africa was being established at Johannesburg. It was to serve the whole of this region and was to be called the "South African Institute for Medical Research." Industrial diseases of the Transvaal, which cause a heavy mortality, were to be investigated. The institute was to be located near the largest hospital in South Africa. *The Modern Hospital*, a new journal devoted to the collection and dissemination of hospital knowledge, was established in 1913, by Dr. Otho F. Ball of St. Louis, Mo. See also GIFTS AND BEQUESTS.

HOT SPRINGS, ARK. See HYDROTHERAPY.

HOT SPRINGS, VA. See HYDROTHERAPY.

HOUSTON, DAVID FRANKLIN. An American educator and public official, Secretary of Agriculture in the cabinet of President Wilson. He was born in Monroe, Union County, North Carolina, in 1866, and graduated from South Carolina College in 1887, taking post-graduate courses at Harvard and at the University of Wisconsin. In 1887 he became tutor of ancient languages at South Carolina College; from 1888-91 superintendent of public schools at Spartanburg, N. C.; and adjunct professor of political science at the University of Texas in 1894. He served in this capacity and as associate professor, professor, and dean of the faculty at the University of Texas until 1902, when he was appointed president of the Agricultural and Mechanical College of Texas. In the latter year he became chancellor of Washington University, St. Louis, and held this position until his selection as Secretary of Agriculture by President Wilson. He is a member of the Southern education board, a trustee of the John F. Slater fund, and a member of the Rockefeller sanitary commission. He is the author of A

Critical Study of Nullification in South Carolina, and other works.

HOWARD UNIVERSITY. An institution of higher learning at Washington, D. C., under the direct auspices of the national government. The students enrolled in 1913 numbered 1443. Of these 300 were in the College of Arts and Sciences, 291 in the School of Medicine, 105 in the School of Law, and 48 in the School of Theology. The remaining number were in the Teachers' College, in the Academy, and in the Commercial College. The faculty numbered 115. New professors added to the faculty during the year were Dr. D. Butler Pratt, professor of church history, Hebrew, and exegesis; Professor G. David Houston, professor of English; and Professor Turner of the teaching of biological sciences. The benefactions received during the year include a gift of \$3000 by John A. Cole, as a donation to the Alvord scholarship fund. The productive funds amount to about \$286,000, and the income for 1912-13 for educational purposes was \$156,426. The library contains about 30,000 volumes. The president is S. M. Newman, A.M., D.D.

HOWLAND, HENRY ELIAS. An American jurist, died November 8, 1913. He was born in Walpole, N. H., in 1836, graduated from Yale University in 1854, and from the Harvard Law School in 1857. He was admitted to the bar and began practice in New York City. He served in the Civil War in 1862 and 1863, leaving the service with a rank of captain, and resumed practice in New York. In 1873 he was appointed judge of the Marine Court. He served as a member of the board of aldermen, and as president of the department of taxes in New York City. In 1892 he was made a fellow of the Yale Corporation, and labored unceasingly for the advancement of the university. He took an interest in charitable and civic work, and for many years was president of the Manhattan State Hospital for the Insane. He was also president of the Society for the Preservation of the Adirondacks, and in 1901 led the fight against the spoliation of the forests by contractors; was the president of the University Club of New York City from 1901 to 1904; and also president of the Century Association and of the New England Society of New York City. He was one of the best-known after-dinner speakers in the United States. He contributed many articles on legal and other subjects to magazines.

HUERTA, VICTORIANO. Provisional president of the republic of Mexico. He was born in 1857 of aristocratic parentage, and in 1875 entered the government military school at Chapultepec. At this institution he spent four years, and after his graduation in 1879 at once joined a coast regiment. Between that date and the year 1891 little is known of his career. Most of these years were spent in routine military service in which he had attained a rank of lieutenant-colonel, and was in command of a military station in the interior of the country. While filling this duty, he became conspicuous for his promptness in putting down the brigands who at this time infested the interior of the country. His success in accomplishing this task came to the notice of President Diaz, and Huerta was ordered to report at the palace in the city of Mexico. On his arrival he is said to have been told by Diaz to choose what post

he liked best under the war department. He asked to be appointed chief of the geographical department, and on his appointment to this position he again left the city, and for ten years was engaged in going from one end of Mexico to the other, studying the location of rivers, plateaus, mountain ranges, and becoming thoroughly acquainted with every section of the country. It is said that in 1902 he possessed more intimate, personal knowledge of Mexico than any other living man. He finished this survey and map-making work with the rank of a brigadier-general, and continued to occupy important positions in the army under President Diaz, on the resignation of the latter, in 1912, becoming one of the strongest supporters of President Madero. He was placed by the latter in command of the national troops in the city of Mexico at the time of the outbreak of the revolution under Felix Diaz (see MEXICO). On the conclusion of an arrangement between him and Diaz, he abandoned Madero, and took command of the movement against the former president. He was elected provisional president of the republic, and shortly after he had come into power, Madero was shot while being transferred from the presidential palace to a prison. Enemies of Huerta placed the direct responsibility of Madero's murder on Huerta's shoulders, while his supporters declared that the occurrence was an accident, in which Huerta had no part. The United States government, however, refused to recognize Huerta as president. (See MEXICO, *History*; and UNITED STATES, *History*.)

HUGHES, RAYMOND MOLLYNEAUX. An American chemist and educator, appointed in 1913 president of Miami University. He was born at Atlantic, Iowa, in 1873, and graduated from Miami University in 1893. From 1895-97 he was fellow in chemistry at the Ohio State University, taking the degree of M.Sc. From 1898 to 1904 he was professor of physics and chemistry at Miami University. From 1904 to his election to the university presidency, he was dean of the College of Liberal Arts, and from 1908 was acting president.

HUGHES, WILLIAM. An American public official, elected United States senator (Democratic) from New Jersey in January, 1912. Born in Ireland in 1872, he moved with his parents to the United States; was educated in the common schools and in a business college; he served in the 2nd New Jersey Volunteers in the Spanish-American War; studied law and was admitted to the bar in 1900; and practiced in Patterson. In 1903 he was elected to the 58th Congress and was reelected to the 60th, 61st, and 62nd Congresses. He was a successful candidate for the senatorship in the senatorial primaries held in September, 1912. In this contest he had the support of Woodrow Wilson, then governor of New Jersey.

HUNGARY. See AUSTRIA-HUNGARY.

HUNTING, WILLIAM. See VETERINARY SCIENCE.

HUSSEIN, NAZIM PASHA. A Turkish soldier and public official, assassinated January 23, 1913. Born in Constantinople in 1848, his military studies were begun in Turkey and finished at St.-Cyr, in Paris. During the Russo-Turkish War he was made chief of staff. A friend of Sultan Abdul Hamid, he still fell un-

der suspicion of taking too lively an interest in politics, and was denounced, arrested, publicly degraded and sentenced to five years' solitary confinement in a fortress. There he studied the literature of his profession and accumulated a store of modern military knowledge. After the expiration of his term of imprisonment, he remained for two years under strict guard, but finally succeeded in escaping, and made his way to Batum, arriving there in time to hear of the outbreak of the revolution of the young Turks in 1908. From Batum he worked his way as a stoker to Constantinople. He was received with open arms by the committee of union and progress, and on the proclamation of the constitution was appointed in command of the 2nd army corps at Adrianople. There he was largely responsible for the strength of the fortifications which enabled the city to hold out so long before surrendering to the Bulgarians. In February, 1909, he was appointed minister of war by Kramil Pasha, taking the place of Ali Riza. This led to a struggle between the committee of union and progress and the Grand Vizier, which resulted in the latter's overthrow. Nazim Pasha had become unpopular with some of the leaders of the Young Turks, who disliked his attempts to keep politics out of the army. It was largely through Nazim's influence that order was maintained in Constantinople during the "counter-revolution" which followed the overthrow of the cabinet of Hilmi Pasha. From this time until the beginning of the war with Italy, the Young Turks were supreme, and Nazim was kept practically a prisoner. He was afterward sent as a Vali to Bagdad. In this city with his customary energy he set on foot a scheme for reorganization. Armed with practically unlimited power and with the help of 150 officers whom he took with him, he restored order in the most vigorous fashion and inaugurated many works of public utility. The Jackson barrage contract, which he was instrumental in bringing about, was not ratified in Constantinople, and Nazim was recalled, in spite of the collective resignations of 125 of his officers, the protests of citizens of Bagdad, and the offer of the sheikhs of Mesopotamia to put their armed forces at his disposal. On his return to Constantinople in May, 1911, the committee of union and progress, realizing their mistake, made him president of the army council, and in June, 1912, he was appointed minister of war in the cabinet of Mukhtar Pasha. At the outbreak of the war with the Balkan states he appointed Abdullah Pasha to the chief command in Thrace, but after the defeat of Lule Burgas decided to command there in person. It was he who resolved on the retirement to the lines of Tchataldja. He showed inexhaustible energy in supervising the defense of the lines. He was not considered a brilliant soldier, but it was universally admitted that he was an honest man. This made him a conspicuous figure in military circles. For details of his assassination, see the article TURKEY.

HUTCHINSON, SIR JONATHAN. An English physician and scientist, died June 2, 1913. Born in 1828, at the age of sixteen he left school and became apprentice to a surgeon in the city of York, under whose direction he attended lectures in the medical school there. In 1850 he became a student in St. Bartholomew's

Hospital, London. After remaining there for four years, he received an appointment at the Metropolitan Free Hospital. He soon became one of the best-known surgeons in London. In 1862 he made known his great discovery that a destructive form of eye disease in children, which had long been called *Stumous ophthotmis*, and was attributed to a supposed scrofulous constitution, was in reality a consequence of inherited syphilis. This discovery was the first step toward the general recognition of the part played by syphilis in producing many forms of diseases. He also made researches in leprosy, and he was the first to associate that disease with the use of badly cured fish. In 1899-1900 he visited South Africa, in 1901 Ceylon, and later other countries in the course of his leprosy researches. In 1889 he was appointed president of the Royal College of Surgeons. His published writings include: *Rare Diseases of the Skin*; *The Pedigree of Disease*; *Illustrations of Clinical Surgery*.

HYDRO-AEROPLANES. See **AERONAUTICS**.

HYDROGEN BORIDES. See **CHEMISTRY**.

HYDROPATHY. The practise of an extinct sect of medicine based upon the substitution of water for drugs. See **HYDROTHERAPY**.

HYDROPLANE. See **AERONAUTICS**.

HYDROTHERAPY. Formerly used to denote the external use of ordinary water in the treatment of disease, hydrotherapy now includes balneology, which covers all use of bathing waters, plain or mineralized, for medical treatment. The use of healing springs dates back to remote antiquity. The ancient temples, dedicated to the worship of Æsculapius, were erected near mineral springs, and these localities became, it is believed, centres of early medical instruction. Peale is authority for the statement that for five centuries mineral waters were the only medicines used in Rome. It is said that in that city alone there were at one time 800 thermæ. Of their existence in Rome we find abundant evidence to-day, in their most interesting and impressive ruins. Remains of Roman baths are found very widely separated in all parts of the former Roman empire.

Many large volumes are devoted to the explanation of methods of employment of water as a remedial agent, in the form of complete and partial baths, ablutions, douches, affusions, compresses, packs, irrigating apparatus, sweat-steam cabinet, hot air, electric light, sand-, or moor-baths, etc. They are variously used in acute infectious fevers; in diseases of the nervous system; of the muscles and of the joints; of the heart and circulatory apparatus; of the digestive organs; of the urinary apparatus; of the genitals; and of the skin.

Mineral springs are of value according to their constituents, for drinking or bathing. Many are thermal (warm or hot), as at Carlsbad, Nauheim, Baden-baden, Vichy, Banff, Las Vegas, Hot Springs, Ark., and Hot Springs, Va. Many are non-thermal (cold), as at Harrogate, Wiesbaden, Franzenbad, Kissingen, Manitou, and Saratoga Springs. Waters of either of these two classes may be divided into alkaline, alkaline-saline, saline, acid, or neutral. These subclasses are susceptible of further subdivision into sodic, lithic, iodic, magnesic, chalybeate, etc., or combinations of these appellations, may

be used, as "sodic-calcic-chalybeate," etc. Many thousands repair annually to the well-known European mineral springs for treatment. In 1911 there were 34,793 visitors at Nauheim; in 1912 there were 118,000 bathers at Vichy; and in 1913 there were 70,000 at Carlsbad. The American spas, with the exception perhaps of Hot Springs, Ark., have had, compared with the English and continental spas, very small patronage, probably for the reason that many of their waters lack carbonic acid gas in any therapeutic amount, or because they are under private control. The United States government developed Hot Springs, Ark., to a limited extent, but not at all to compare with foreign spas. During 1913, however, a renaissance occurred there, the officials having asked the government for \$50,000 to use in studying the therapeutic effect of the waters. Hot Springs, Va., under a private corporation, is a very fashionable resort for those in search of gay life and sports, as well as health; and fashion is a strong competitor of medicine. A new bath house was projected by the management, to be under the direction of Dr. Guy Hinsdale, the well-known climatologist and hydrotherapeutist, and was to be erected in 1914. The most remarkable awakening in the United States occurred at Saratoga, where the State of New York acquired from more than thirty owners over a hundred springs of varying constituency, but all supersaturated with carbonic acid gas, and also a park of 250 acres. See **SARATOGA SPRINGS**.

HYGIENE. SEX HYGIENE. The question as to how far instruction in sex hygiene should be given in the public schools received widespread attention during the year 1913. A special writer in the *Journal of the American Medical Association* for October 18, 1913, summed up public opinion as expressed in the editorial columns and correspondence of various representative newspapers. The general trend seems to be against such instruction. The subject naturally divides itself into three questions: (1) Should children and adolescents be instructed in sex hygiene; (2) if so, should instruction come through parents, through a religious medium, through the public schools, or through books, pamphlets, and leaflets; and (3) what is the best form in which it can be presented to the youthful mind? Among the newspapers voicing disapprobation of such instruction in public schools was the Fort Worth (Texas) *Record*, which seriously doubted the wisdom of any attempt of education in the public schools on this delicate question. It regarded the subject as too sacred to be the topic of careless and common discussion among the bold and irreverent young Americans that make up the school population. The Philadelphia *Ledger* regarded the present agitation as a passing fad, attributable to the zeal of the ultra-progressives who would reform the world by legislation. The *Ledger* summed up its argument against sex hygiene as follows: They (the young) need a healthier attitude on the part of all teachers of biology, hygiene, and physical instruction, but the teachers opposing sex hygiene instruction have a more correct attitude of mind toward these subjects than have the advocates of the plan which the *Ledger* regards as a course "full of perilous and demoralizing possibilities." The attitude

of the Roman Catholic Church was reflected in an editorial in *America*, which characterized the project as "the newest and most dangerous of all educational fads now being daily foisted on us." In the judgment of *America*, improvement must come through bettering social conditions rather than through specific instruction of school children. "Let the hygienists put away the countless seductions which assail mankind and womankind on all sides, and they will effect something. Let the young have less desire, not more knowledge; strength of will, not complete information." A correspondent of the *New York Independent* denounced the idea as the "most vicious of all the wild, indiscreet, and dangerous suggestions made in behalf of the human race." Many newspapers assumed a waiting and philosophical attitude, recognizing that the question was still *sub judice*. The *Chicago Record-Herald's* views on the outcome of reform movements and controversies were especially interesting. It held that sex hygiene as a course of study was undoubtedly coming in this country. The really significant fact was that so many educators, social workers, physicians, and moralists had been converted to the idea in such a short space of time. The results it was willing to leave to the future. The journal's article concluded that, while public interest in the subject was unquestioned, it was not a matter to be settled by heated controversy, but by calm and judicious consideration. Above all, it was not a matter to be controlled by the "fringe of fanatics which hang on the outskirts of every reform movement" in the phrase of Theodore Roosevelt. See also EDUCATION IN THE UNITED STATES, *Sex Hygiene*.

PUBLIC HYGIENE. U. S. Senate Document No. 1072 contains a summary of government expenditures during 1912 for public health and medical purposes, collected in accordance with a resolution introduced by Senator Works. Following is a recapitulation by departments, showing the manner in which the total of nearly twenty million dollars was spent. The State Department is credited with \$36,000 expended for health purposes, but \$19,999.28 went to meet the expenses of the Ninth International Conference of the Red Cross Society, and \$10,163.64 was disbursed for the International Congress for Hygiene and Demography; \$2,830.55 went to maintaining the International Sanitary Bureau, and \$3,015.62 to the International Office of Public Health at Rome. Of the \$1,904,703.04, disbursed by the Treasury Department for health purposes, \$747,638.32 was for salaries and traveling expenses of the medical officers of the public health service, \$14,892.80 went to the hygiene laboratory. Other items were \$367,797.41 for marine hospitals, \$414,592.85 to the quarantine service, \$326,057.38 toward preventing epidemics in the United States, Porto Rico, Hawaii, and the Philippine Islands, \$30,065.11 for the leprosy investigation station in Hawaii. The medical expenditures of the War Department (\$5,714,109.69) were devoted to the work of the medical corps and the construction of army hospitals. The navy bureau of medicine and surgery spent \$3,730,522.88. The Isthmian Canal commission cost \$1,620,391.12. The bureau of Indian affairs is credited with an expenditure of \$395,388.71 for health purposes, although the commissioner says in his report

that the only specific appropriation available for sanitary work among the Indians is \$60,000 for relieving distress among them. The Department of Agriculture spent \$3,090,403.29 in the Department of Animal Industry, while the Bureau of Chemistry, charged with enforcement of the pure food law, spent only \$782,263.02. These sums were all charged to health purposes, although the Bureau of Animal Industry is a commercial organization to increase the value of farm products. The only items in the schedule, according to the analysis in the *Journal of the American Medical Association*, which could fairly be charged against the public health activities of the government in the United States were \$1,533,256.46 of the appropriation for the public health service, which was actually spent for public health purposes; \$782,263.02 spent by the Bureau of Chemistry in enforcing the food and drug act; and \$105,195.47 required to operate the division of vital statistics of the Census Bureau. The fact is, that instead of the Federal government expending \$19,800,086.23 last year for public health purposes, it actually spent \$2,420,614.95.

HYGIENE, SCHOOL. See EDUCATION IN THE UNITED STATES.

HYGIENE, SOCIAL, BUREAU OF. See BUREAU OF SOCIAL HYGIENE.

ICELAND. A Danish crown colony, with an area of about 40,456 square miles, of which only 16,245 square miles are inhabited. The total population of the inhabited regions in 1911 was 85,183. There were in 1910 in the country 44,815 horses, 26,338 cattle, 578,634 sheep, 660 goats. The total imports in 1911 were valued at 14,123,000 kroner (11,480,052 kr. in 1910) and the exports at 15,691,000 kr. (13,510,355). The principal exports in 1910 were salt cod, 6,753,711 kr.; fish oil, 1,646,020; wool, 1,246,242; salt mutton, 966,823; fish other than cod, 714,486; skins, 580,258; refuse from the whale fisheries, 375,528; horses, 252,882; butter, 263,269. Tonnage entered in 1910, 125,155. The responsible executive is the minister for Iceland (1913, H. Hafstein), residing at Reikjavik.

IDAHO. POPULATION. The population of the State in 1910 was 325,594. According to the report of the Bureau of the Census, made in 1913, the population then was 378,818.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1913	14,000	448,000	\$ 305,000
	1912	12,000	394,000	276,000
Wheat	1913	510,000	14,094,000	8,879,000
	1912	510,000	14,566,000	9,613,000
Oats	1913	325,000	15,112,000	4,836,000
	1912	348,000	17,017,000	5,956,000
Rye	1913	3,000	66,000	38,000
	1912	3,000	66,000	40,000
Potatoes	1913	34,000	5,780,000	2,890,000
	1912	35,000	6,475,000	1,878,000
Hay	1913	705,000	22,044,000	14,717,000
	1912	692,000	1,938,000	12,209,000

^a Tons.

MINERAL PRODUCTION. The output of the metal mines of the State in 1913 showed a remarkable increase over the production of the previous years, and exceeded that of the record year, 1906. The value of the gold, silver, cop-

per, lead, and zinc produced was over \$23,500,000, an increase of over \$2,000,000, or nearly 10 per cent. over the production of 1912, when the total value of the mineral products of the State was \$21,816,390, as compared with \$19,441,545 in 1911. In 1913 record productions were made in silver, lead, and zinc, and substantial increases were made in the output of all metals except gold, which made close to the yield of 1912, the production for 1913 being \$1,373,000. The mine yield silver output increased 20 per cent., or from 8,294,745 ounces in 1912 to about 9,970,000 ounces in 1913. The copper output increased from 7,492,152 pounds in 1912 to about 9,312,000 pounds in 1913, an increase of over 24 per cent. The lead mine production increased from 284,000,000 pounds in 1912 to about 311,000,000 in 1913, or over 9 per cent. The zinc ore produced increased the spelter output from 13,905,502 pounds in 1912 to about 23,594,000 pounds in 1913, an increase of nearly 70 per cent.

The gold production of the State in 1912 was valued at \$1,381,214, compared with \$1,372,387 in 1911. The deep mines produced \$749,185 in gold, chiefly from gold and gold-silver siliceous ores, but also as a by-product from lead and copper ores. The placers produced \$632,029, of which about 76 per cent. was obtained by dredging. Boise County led in the gold output with \$502,277, and was followed by Owyhee County with \$289,255.

The production of silver in Idaho in 1912 increased to 8,294,745 fine ounces, from 8,196,136 ounces in 1911. Considerable increase was made in the output of copper ores, and a large decrease from siliceous ore. The bulk of the output of silver in Idaho is from the lead ore of the great Cœur d'Alène mines in Shoshone County, which in 1912 produced 6,650,000 ounces of silver.

In 1912 there were 7,182,185 pounds of blister copper produced in the State, compared with 4,514,117 pounds in 1911. The State has made a small and irregular output of copper since 1884, but only since 1903 has it been a steady and important producer. To the close of 1912 it had a recorded output of 66,253,985 pounds. The Cœur d'Alène district furnished most of the copper output of 1912, and was the most productive copper district in the State. The State contains many promising copper districts, but owing to the lack of development or poor transportation facilities they have not been active.

Idaho produces a small amount of coal. The total production in 1912 was 2319 short tons, valued at \$6663. This is mined from a few scattered lignite beds, and is used locally.

TRANSPORTATION. The total mileage of all the railways in the State on January 1, 1913, was 2642. The railways having mileage of 100 miles and over are the Oregon Short Line, 1227; Northern Pacific, 329; Chicago, Milwaukee, and Puget Sound, 180; Oregon-Washington Railroad and Navigation Company, 135; Spokane International Railroad Company, 122; Great Northern Kootenai Valley Railway, 105. The total valuation of the railway systems in the State in 1913 was \$84,506,573.

EDUCATION. The total enrollment in public schools in 1912 was 84,902. The average daily attendance was 66,359. The teachers num-

bered 2710. The average salary of men and women teachers was \$78.04 monthly. There are in the State, in addition to the common schools, an Academy of Idaho, which is the technical school of the State; the Albion State Normal School; State School for the Deaf and Blind; the Idaho Industrial Training School; the Lewiston State Normal School; and the University of Idaho (q.v.).

FINANCE. There was a balance on January 1, 1913, of \$1,171,794. The receipts for the fiscal year 1913 were \$2,659,207, and the disbursements \$2,658,551, leaving a balance at the close of the fiscal year of \$1,171,451. The chief expenditures were for expenses of the State government and the maintenance of State institutions. The chief sources of income were from general tax levies, receipts from the secretary of State's departments, interest on current funds, and receipts from sundry other departments. The bonded indebtedness of the State on December 31, 1913, was \$2,421,450.

CHARITIES AND CORRECTIONS. The only correctional institutions in the State are the Idaho State Penitentiary at Boise, and the Industrial Training School at Saint Anthony. The State maintains no charitable institutions entirely, but cooperates with the Children's Home Finding Society, at Boise.

POLITICS AND GOVERNMENT. The State legislature met in 1913, and passed a number of important measures which are noted in the section *Legislation* below. The term of the governor expires on January 4, 1915, and the next State election will be held on November 3, 1914. On January 14 William E. Borah was reflected to the United States Senate.

More than local interest was aroused by the conviction and sentence to imprisonment for contempt of court of the editor of the *Boise Capital News* on January 2. This conviction was the result of the publication in this paper of a severe criticism of the decision of the Supreme Court, which in 1912 prevented the Progressive party from putting on the official ballot the names of their candidates. The decision resulted from a peculiarity of the Idaho election law. This law does not in any way mention the subject of presidential electors. The lists of Republican and Democratic electors for the election of November 5, 1912, were put upon the ballot under a provision dealing with the election of "constables and other officers." The court in its decision held that the electors were not State officers, and that decisions of the United States Supreme Court had declared that they were not national officers. The statute was construed by the Idaho court in a manner which prevented the Progressive candidates for national electors being put on the ticket by petition. The only way in which citizens could vote for Progressive presidential electors was to write in their names on the ballot. This decision resulted in widespread criticism, and the *Boise Capital News* published a communication from Mr. Roosevelt, written before the election, in which he commented adversely on the decision. The publication of this comment, together with other criticisms made in this paper, resulted in the conviction and fining of the editor.

LEGISLATION. The legislature met in 1913 and passed many important laws. These in-

cluded a measure creating a public utilities commission; an act providing for mothers' pensions; a measure permitting a commission form of government for cities of over 15,000 inhabitants; a law providing for non-partisan judiciary primary elections; the insurance law of the State was revised; a blue-sky law was passed, and a State highway commission was created. The legislature provided for a constitutional amendment to be submitted to the people. This provides for five justices of the Supreme Court instead of three. At the election of November, 1912, amendments to the constitution providing for initiative and referendum were carried, and also recall, except as to judicial officers. Acts to carry these measures into effect were passed by the legislature. Contrary to the action of California and Arizona legislatures, the legislature of Idaho repealed sections of the existing law prohibiting Chinese or persons of Mongolian descent, not born in the United States, from acquiring land. An eight-hour law for workmen of public works was passed by the legislature. The two houses of the legislature joined in a memorial to Congress, reciting the letter written by President Taft on October 11, 1912, to the governors of States, showing that farmers pay an average of eight and one-half per cent. interest on borrowed capital in the United States, as against three and one-half or four and one-half per cent. in Europe. The memorial requested Congress to enact a law permitting the organization of national land-mortgage banks with the power to guarantee debenture bonds of coöperative credit associations, with such limitations and restrictions as will insure practical uniformity in the laws of the States in the matter of establishing rural credit banks and similar institutions. For liquor legislation, see LIQUOR REGULATION.

STATE GOVERNMENT. Governor, John M. Haines; Lieutenant-Governor, H. H. Taylor; Secretary of State, W. L. Gifford; Treasurer, O. V. Allen; Auditor, F. L. Huston; Attorney-General, J. H. Peterson; Superintendent of Education, Grace M. Shepherd—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, George H. Stewart, Rep.; Associate Justices, James F. Ailshie, Rep.; Isaac N. Sullivan, Rep.; Clerk, I. W. Hart.

STATE LEGISLATURE, 1913. Republicans: Senate, 21; House, 56; joint ballot, 77. Democrats: Senate, 3; House, 4; joint ballot, 7. Republican majority: Senate, 18; House, 52; joint ballot, 70.

The State representatives in Congress will be found in the section *Congress* in the article UNITED STATES.

IDAHO, UNIVERSITY OF. A State institution founded at Moscow, Idaho, in 1892. The total enrollment for the year 1912-13 was 763. The faculty including lecturers, extension workers, and teaching force numbered 73. In 1913 the university in common with the other higher educational institutions of the State was placed under the control of a newly constituted State board of education and particularly under the State commissioner of education. The United States Department of Agriculture in 1913 designated the university as the location of one of its laboratories for the investigation of forest by-products, and has appointed an expert chemist to assist the university department of forestry

in research along this line. The endowment of the university in 1912-13 amounted to \$789,005, and the total receipts for the year to about \$254,539, all of which was derived from legislative grants, from interest on endowment, and from the Federal government. The library contains about 32,000 volumes. The president is Melvin Amos Brannon, Ph. D.

ILKESTON, WALTER FOSTER, First Baron. An English baron and physician, died January 31, 1913. He was born in 1840; educated at Trinity College, Dublin; from 1868 to 1892 was professor of medicine at Queens College, Birmingham; and from 1868 to 1890 physician to the general hospital in that city. In 1885-6 he was a member of Parliament from Chester. In 1887 he again entered Parliament and retained his seat until 1910, in which year he was created baron. His published writings include *The Use of Sphygmograph in Heart Diseases* (1886); *Method and Medicine* (1870); *Clinical Medicine* (1874); *Political Powerlessness of the Medical Profession* (1883); *Public Aspects of Medicine* (1890).

ILLINOIS. POPULATION. The population of the State in 1910 was 5,638,591. According to the report of the Bureau of Census, made in 1913, the population in that year was 5,904,043.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1913	10,450,000	282,150,000	\$177,754,000
	1912	10,658,000	426,320,000	174,791,000
Wheat	1913	2,240,000	41,888,000	36,024,000
	1912	1,183,000	9,819,000	8,641,000
Oats	1913	4,375,000	104,125,000	39,568,000
	1912	4,220,000	182,726,000	54,818,000
Rye	1913	49,000	808,000	525,000
	1912	48,000	768,000	538,000
Potatoes....	1913	125,000	5,750,000	5,118,000
	1912	137,000	13,837,000	8,302,000
Hay	1913	2,500,000	a 2,450,000	34,545,000
	1912	2,512,000	3,266,000	41,152,000
Tobacco....	1913	800	b 560,000	64,000
	1912	900	684,000	62,000

a Tons. b Pounds.

MINERAL PRODUCTION. The total value of the mineral products of the State in 1912 was \$123,068,867, compared with \$106,275,115 in 1911. The total coal production in 1912 was 59,885,226 short tons, valued at \$70,294,338. This production was the largest ever attained in the State, and exceeded the previous maximum, 53,679,118 tons made in 1911, by 6,206,108 tons. The biennial shut-down of the mines for the adjustment of the wage scale took place on April 1, 1912. The miners were given an advance of five cents a ton, and work was generally resumed after an idleness of from 30 to 60 days. Illinois ranks third among coal-producing States in value; however, the coal produced in Illinois ranks second, for although it was surpassed in 1912 by West Virginia, 6,941,461 tons, the value of the output of Illinois exceeded that of West Virginia by 7,502,104 tons. There are more coal-producing counties in Illinois than in any other State of the Union. Half of the 102 counties in the State are producers of coal, and the coal miners of Illinois are probably better organized than those of any bituminous coal-

mining State. The result of this has been the establishment throughout the coal-mining region of the eight-hour day. Notwithstanding nearly half the coal produced is mined by machines, the total number of men employed in the mines in 1912 was 78,098. These worked an average of 194 days. Idleness due to strikes or suspensions affected the total of 60,505 men who lost an average of 33 days. According to the United States Bureau of Mines, the number of fatalities in and about the State in the coal mines in 1912 was 159, compared with 172 in 1911. Of the 159 killed in 1912, 141 were underground, three were in shafts, and seven on the surface. The coal output of the State in 1913 was estimated by the United States Geological Survey to have exceeded the production of 1912 by approximately 7 per cent. The increase would have been considerably larger but for the exceptionally mild weather in the latter part of the year, which lowered the demand for household fuel. The increased output was due in part to the strike in Colorado, which caused a movement of Illinois coal farther west during the last three months of the year. Labor conditions in the State were generally less troublesome than in 1912, although a number of small strikes occurred during the year.

The petroleum production declined in 1912 to 28,601,308 barrels from 31,317,038 barrels in 1911. The maximum production was in 1908, when 33,686,238 barrels were produced. Indications pointed to the discovery of new fields in Lawrence County. In August, 1912, a 600-barrel well was drilled near Allendale in Wau-bash County. The total number of wells completed in the State in 1912 was 1260.

Illinois ranks third in the manufacture of pig iron. There were in 1912 2,887,359 long tons, compared with 2,108,002 in 1911.

Illinois is one of the chief States in the manufacture of clay products. The total value of this product in 1912 was \$15,210,990, an increase of \$877,979 over 1911. The principal product is common brick.

EDUCATION. The school population of the State, ages 6 to 21, on June 30, 1913, was 1,582,180. The enrollment in the public schools was 1,010,215. The total number of teachers was 30,565, of whom 24,956 were women and 5609 were men. The average annual salary for men teachers was \$772.70, and for women teachers, \$643.70. The amount expended for all school purposes was \$37,923,943. The legislature of 1913 passed many important measures relating to education. These included a million-dollar addition to the State distributive fund, making a total of \$3,000,000; a certificating bill which placed Illinois in the front rank; a free high school tuition bill; and a law permitting local school boards to levy two per cent. instead of one and a half per cent. for operating expenses, when authorized by vote of the people. The position of State high school inspector was also created by this legislature.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State with their population in 1913 are as follows: American State School and Colony, 1516; Soldiers' Orphans' Home, 323; Kankakee State Hospital, 3045; Dunning State Hospital, 2466; Soldiers' Home, 1587; Anna State Hospital, 1657; Jacksonville State Hospital, 1711; School for the

Deaf, 371; School for the Blind, 193; Elgin State Hospital, 1678; Chester State Hospital, 621; Industrial School for the Blind, 104; Eye and Ear Infirmary, 210; Watertown State Hospital, 1504; Geneva School for Girls, 417; St. Charles School for Boys, 541; Soldiers' Widows' Home, 77; Peoria State Hospital, 2195. There has also been authorized by the legislature a State hospital for the insane at Alton. The construction had not begun in 1913. A colony for epileptics was also created by the legislature in 1913. The location has not yet been settled upon. The total appropriations for the institutions mentioned above for the two years beginning July 1, 1913, were approximately \$13,000,000. The charities of the State are under the control of the Illinois State Charities Organization.

FINANCE. The total receipts from all sources for the fiscal year ending September 30, 1913, amounted to \$14,040,736. The disbursements for the same period were \$14,424,363. At the beginning of the fiscal year there was in the treasury a balance of \$5,499,210, and at the close of the fiscal year a balance remaining, \$5,115,583. The chief sources of revenue are State tax, inheritance tax, Illinois Central Railway, and fees collected by the different State departments. The chief expenditures are for the national guards, for the University of Illinois, for normal schools, for State charitable and penal institutions, for the salaries of State officers and employees, and members of the legislature. The State has no bonded debt.

TRANSPORTATION. The total mileage including main lines and branches in the State on June 30, 1913, was 12,094. The total mileage for railways included in and passing through the State was 77,838. During 1913 36.02 miles was added to the mileage.

POLITICS AND GOVERNMENT. The legislature passed an unusual number of important measures. These are mentioned in the section *Legislation* below. There was no election for State officers in 1913, as the term of Governor Dunn does not expire until January, 1917. The next State election is November 3, 1914. As the result of the election in November, 1912, the House of Representatives in 1913 was composed of 52 Republicans, 73 Democrats, 25 Progressives, and 3 Socialists. The Progressives held the balance of power, and as a result, there was a deadlock in the election of officers which lasted from January 1 to the last week in that month. The result was the election of William McKinley, the speaker, by a combination of Democrat and Republican votes. He received 46 of the 50 Republican votes. Mr. McKinley has been identified with the Democratic State machine, of which the leader is Roger Sullivan. He had the reputation, however, of being free from entangling alliances, and he was endorsed by the voters' league. He established himself under a policy of reform under the rules of the House. Another deadlock in the legislature resulted from an attempt to elect two United States senators, one to succeed Senator Cullom, whose term expired on March 4, and the other as successor to Senator Lorimer, who was excluded from the Senate in 1912. The deadlock resulted from the fact that no one party had a majority as the Progressives had elected a sufficient number of members of both

houses to prevent such a majority. A situation was thus created which made it necessary for party lines to be obliterated if there were to be any election. Compromise was finally arranged on March 26, by which James Hamilton Lewis, Democrat, was elected for the long term of six years from March 4, 1913, and Lawrence Y. Sherman, Republican, was elected for the unexpired portion left vacant by the exclusion of Senator Lorimer. Mr. Sherman is known as a Progressive Republican, and it was thus possible for him to be a successful compromise candidate. On May 5 the Senate passed a measure giving women in the State the right to vote for certain officers. On June 11, this bill was passed by the House and was signed by the governor. The bill gives to all women who are citizens of the United States and 21 years old, the right to vote for nominees of all officers in the State who are created by statute. Its limitations prevent women from voting for governor, United States senators, representatives to Congress, members of the legislature, and nearly all judges. Leaders of the woman suffrage movement in the State at once began efforts to bring about a constitutional convention, by which these limitations may be removed.

A committee of the Senate headed by Lieutenant-governor O'Hara carried on investigation into wages paid to women. The conclusions of this committee created much discussion. In general, the committee decided that low wages was the main cause of vice among women. During the continuance of these investigations charges of morality were brought about Lieutenant-governor O'Hara, but he was exonerated. On September, 1913, primary elections for judiciary candidates were held. These showed in general a falling off in the Progressive vote. At the judiciary elections held on October 20, Judge Puterbaugh, Republican, candidate for the fifth district, was defeated largely through the voting of women. C. C. Craig was the successful opponent. At the local option elections held on November 3, 18 out of 24 cities and towns voted "no license." The results were largely brought about by votes of women who voted four to one against saloons. As a result of the local option election held in the preceding April, 70 per cent. of the State became dry.

CHICAGO. Elections for minor city officers were held in 1913. On February 25, candidates of the Democratic machine controlled by Roger Sullivan, were elected. Investigations in alleged corruption in the police department were conducted in the early part of the year, and on January 4, police were found guilty of forming a bribe fund. A court for delinquent girls was organized on March 4. On June 26, the board of education voted against school lectures on sex hygiene. Investigation carried on during the first six months of the year resulted in the establishment of the fact that an arson trust, similar to that found in New York City, existed in Chicago. Members of this alleged trust were indicted on July 28. On August 1, Mayor Harrison appointed women on the police force. A strike of the street cleaners was begun on July 3. On December 10, members of the board of education refused to elect Mrs. Ella Flagg Young superintendent of schools. The removal of Mrs. Young aroused great indignation. On December 12, the resignation of

five members who voted against her were accepted by the mayor. At another meeting of the board of education, Mrs. Young was reinstated on December 3. On October 4, announcement was made that the surface car lines of the city were to be merged under one control. During December, there were an unusual large number of unemployed in the State. Inquiries were carried on by a committee of unemployed men appointed by Governor Harrison, showing that many employees were laid off and on half time, as a result of business conditions.

LEGISLATION. The legislature met in 1913 and enacted several important measures. Perhaps the most important of these was the measure extending the suffrage to women to the extent of voting for presidential electors, university trustees and various county, township, and municipal officers. Measures were passed also providing for mothers' pensions and the municipal ownership of public utilities. A public utilities commission was created. This supersedes the board of railroad and warehouse commissioners, and it is modeled in general after the New York public utilities commission. A new workmen's compensation act was passed, and primary election laws were amended in many respects, including provision for presidential preference, primaries, and for the selection of members of controlling committees of political parties and delegates to political conventions. See also LIQUOR REGULATION.

STATE GOVERNMENT. Governor, Edward F. Dunne; Lieutenant-Governor, B. O'Hara; Secretary of State, Harry Woods; Treasurer, J. Ryan, Jr.; Auditor, James J. Brady; Attorney-General, P. J. Lucey; Adjutant-General, Frank S. Dickson; Superintendent of Public Instruction, Francis G. Blair; Superintendent of Insurance, Rufus Potts—all Democrats except Blair, Rep.

JUDICIARY. Supreme Court: Chief Justice, George A. Cook, Democrat; Associate Justices, Alonzo K. Vickers, Republican; Wm. M. Farmer, Democrat; F. K. Dunn, Republican; Chas. C. Craig, Democrat; James H. Cartwright, Republican; O. N. Carter, Republican; Clerk of the Court, J. McCan Davis, Republican.

STATE LEGISLATURE, 1913. Republicans: Senate, 25; House, 52; joint ballot, 77. Democrats: Senate, 24; House, 73; joint ballot, 97. Progressives: Senate, 2; House, 25; joint ballot, 27. Socialists: House, 3; joint ballot, 3.

The representatives in Congress will be found in the section *Congress*, article UNITED STATES.

ILLINOIS, UNIVERSITY OF. A State university for higher learning at Urbana and Chicago, Ill., founded in 1867. The total enrollment in all departments of the university in the autumn of 1913 was 5259. Colleges of liberal arts and sciences, engineering, agriculture, music, law, and the graduate school are at Urbana. The colleges of medicine, dentistry, and pharmacy are in Chicago. In the school of liberal arts and sciences there were 1516; in the school of engineering 1151; the school of agriculture 908, and the school of music 78. In the law school were 106; in the graduate school 268; in the school of medicine 445; in the school of dentistry 94; and in the school of pharmacy 255. The faculty numbered 700. In 1912-13 Thomas Jonathan Burrill, professor of botany and vice-president of the university,

retired on a pension of the Carnegie Foundation. Samuel W. Shattuck, professor of mathematics and comptroller, also retired on a pension of the Carnegie Foundation. Guy Stanton Ford, professor of European history, resigned to become dean of the graduate school of the University of Minnesota. Kendrick Charles Babcock, formerly specialist in higher education in the Bureau of Education at Washington, was appointed dean of the college of liberal arts and sciences. There were several other important changes in the faculty during the year. The total income of the university in 1913-14 was estimated at \$2,744,231, of which \$2,286,500 is from State appropriations. The university received during the year the entire capital stock of the College of Physicians and Surgeons in Chicago, a private corporation which formerly owned the site (land and buildings) on which the university conducted its college of medicine and dentistry. By this donation the ownership of the property was transferred to the University of Illinois. Another gift received during the year 1912-13 was one of \$12,000 from Hon. William B. McKinley. This is to be used as a loan fund to undergraduates. The library contains 215,000 volumes. The president is E. J. James, Ph.D., LL.D.

IMMIGRATION AND EMIGRATION.

The immigration into the United States for the fiscal year ended June 30, 1913, was 1,197,802 aliens, compared with 838,172 in 1912. The increase occurred chiefly in the months from July to November, 1912, each of these months recording more than 50 per cent. increase. Some increase, however, was shown for each month of the year, the smallest being 6 per cent. in March, 1913. In addition to the 1,197,892 aliens of the immigrant class, there were 2,293,335 of the non-immigrant class, making a total of 1,427,227. The non-immigrants are those whose stay in the United States is temporary. The departures during 1913 numbered 611,924 aliens, 308,190 of whom were emigrant and 303,734 of the non-emigrant class. A net gain in population by immigration, therefore, was 815,303, compared with 401,863 for the fiscal year 1912 and 512,085 for the fiscal year 1911. While immigration increased in 1913 43 per cent. over the total for the preceding year, the rejections for the former year were 19,938, compared with 16,057 for 1912.

CLASSIFICATION OF ALIENS. The occupations of aliens entering and leaving the country are divided into three groups—professional, skilled, and miscellaneous. Of common, unskilled laborers, 25,542 entered and 278,115 departed, as against arrivals of members of skilled trades aggregating 192,978 and departures of the same aggregating 74,449. Of the total number of immigrant aliens admitted in 1913, 808,144 were males and 389,748 females; 986,359 were between ages of 6 and 14, and 44, while 147,158 were under 14 and 74,379 were 45 or over. Of those admitted, 269,988 could neither read nor write, and 5386 could read but not write. The percentage of admitted aliens shown by these figures to be illiterate is, therefore, 26 per cent.

SOURCES OF IMMIGRATION. The sources of immigration in 1912 and 1913 are shown in the table at top of next column.

From this table it will be noted that in 1913, 182,886 immigrants came from northern and

western Europe, and that 896,553 came from eastern and southern Europe and western Asia.

SOURCES OF IMMIGRATION IN THE FISCAL YEARS

1912 AND 1913		1912	1913
Race or People			
African (black)	6,759	6,634
Armenian	5,222	9,353
Bohemian and Moravian (Czech)	8,439	11,091
Bulgarian, Servian, and Montenegrin	10,657	9,087
Chinese	1,608	2,022
Croatian and Slovenian	24,366	42,499
Cuban	3,155	3,099
Dalmatian, Bosnian, and Herzegovinian	3,672	4,520
Dutch and Flemish	10,935	14,507
East Indian	165	188
English	49,689	55,522
Finnish	6,641	12,756
French	18,382	20,652
German	65,343	80,865
Greek	31,566	38,644
Hebrew	80,595	101,330
Irish	33,922	37,023
Italian (north)	25,443	42,534
Italian (south)	135,830	231,613
Japanese	6,172	8,302
Korean	33	64
Lithuanian	14,078	24,647
Magyar	23,599	30,610
Mexican	22,001	10,954
Pacific Islander	3	11
Polish	85,163	174,365
Portuguese	9,403	13,566
Rumanian	8,329	13,451
Russian	22,558	51,472
Ruthenian (Russniak)	21,965	30,583
Scandinavian (Norwegians, Danes, and Swedes)	31,601	38,737
Scotch	20,293	21,293
Slovak	25,281	27,234
Spanish	9,070	9,042
Spanish-American	1,342	1,363
Syrian	5,525	9,210
Turkish	1,336	2,015
Welsh	2,239	2,820
West Indian (except Cubans)	1,132	1,171
Other peoples	3,660	3,038
Total	838,172	1,197,892

From Italy came 265,542; from Russia, principally southern Russia including Finland, 291,040; from Austria, 137,245; from Hungary, 117,580; from Greece, 222,817; from Turkey in Europe, 14,128; and from Turkey in Asia, 23,955; from England came 43,363; from Ireland, 28,876; from Scotland, 14,220; and from the German Empire, 34,229. During 1913 10,629 aliens, physically, mentally, or morally below the legal standard, were returned to the country of origin. Of these, 2564 had grave physical defects, 750 grave mental defects, 4208 physical or mental defects not so serious, but affecting ability to earn a living, and 1474 morally defective. During the year 1624 alien contract laborers were debarred.

JAPANESE IMMIGRATION. The number of Japanese admitted to continental United States in 1913 was 6771, and to Hawaii 4901; compared with 5358 admitted to continental United States and 3231 to Hawaii in 1912. In 1913, 6859 applied for admission to continental United States, of whom 288 were debarred. Those admitted consisted of 2837 former residents, 3083 parents, wives, or children of residents, and 739 new arrivals.

CHINESE EXCLUSION. During 1913 5662 Chinese were admitted, as compared with 5374 in 1912. At San Francisco, 3896 Chinese arrived; at Seattle, 1286; at Vancouver, 407; and at Honolulu, 797.

New immigration stations were completed

during the year at Galveston, New Orleans, and Charleston.

RESTRICTION OF IMMIGRATION. The elaborate measure designed to restrict and improve immigration, which was passed by the Sixty-second Congress, was vetoed by President Taft. The President's objection to the bill was its inclusion of the so-called illiteracy test. According to the provision of the bill any alien immigrant physically capable of working and otherwise eligible must, before being admitted to the United States, read in the presence of an immigration official forty words in some language or dialect. The reading test provided was such that the alien would not know in advance what forty words he would be expected to read. Certain aliens were to be excused from this provision. These included political refugees and certain members of an eligible immigrant family. The question over which there was much discussion both by the public press and in the arguments before President Taft was whether such a test was beneficial to the country. The objection to the literacy test was not that it tended to limit immigration, but that it failed to provide any method by which the desirable immigrants were differentiated from the undesirable ones. It was argued that the ability to read forty words was not proof of intelligence, and that inability to read forty words was not proof of unintelligence. The opponents of the test argued further that a literacy test is not a test of moral character, and that it would exclude many hard-working, industrious men who could add to the country's wealth by their labor, and admit many undesirable persons who were of a higher order of mental attainment. This was the view taken by President Taft, and for this and other reasons, which he stated in full, he vetoed the bill. The veto of the President was sustained by Congress. In the Senate his objections were overruled by more than the two-thirds vote required, but in the House the vote was 213 to 114, which was five less than the required two-thirds. As the opponents of the bill on its original passage were fewer than half of those who voted against it on the question of sustaining or overruling the President's veto, it was evident that the House was strongly affected by the arguments against a test of literacy.

This measure was again introduced in the Sixty-third Congress, but no action had been taken at the end of the year.

CASTRO AND MYLIUS. The case of two aliens aroused much interest during the early part of the year. Both of them attempted to enter the United States, and both were for a time prevented by the public authorities from so doing. One of these was Cipriano Castro, a former president of Venezuela, who had been in exile from his own country as a result of a revolution which drove him from power. In addition to political matters in which he was involved, he was charged with having directed the killing of a man named Peredes. Castro was detained at Ellis Island for several weeks, pending an examination into the facts of the case and the interpretation of the immigration laws as regarded him. According to the immigration authorities before whom the hearing was held, he virtually acknowledged the truth of the accusation of murder by refusing to answer questions. The immigration officials therefore declared that he was not admissible and excluded him. Castro secured counsel, and an appeal was taken to the

United States District Court. This court reversed the decision of the immigration authorities, and decided that under the law Castro was admissible, and should not be excluded.

The other case was that of Edward T. Mylius, who had been convicted in England of the crime of libeling King George by the publication of a statement alleging that the latter had been married prior to his marriage to Queen Mary. As he had been convicted of a crime, the question in his case was whether the crime he committed involved moral turpitude. The immigration authorities decided that he was inadmissible, but the District Court on appeal reversed this opinion. The court in its decision did not deny that the circulation of a libelous story about a man involves moral turpitude; but it declared that a man who publishes a paper that circulates such a libelous story may not know that the paper contained such a story, and therefore, though he may be convicted of libel, he may be guilty merely of negligence and not of a crime. It may be stated that Mr. Mylius was the publisher of a Socialist paper which contained the libelous statement, but that he himself had not written it. The court did not say that Mylius was ignorant of what his paper published, but merely that the immigration authorities could take into consideration only the fact of his conviction, and could not go behind the returns to ascertain the nature of the particular crime he committed.

In both these cases the court practically stated that the immigration authorities could not go behind the returns, and that since neither Castro nor Mylius made explicit admission of crime, it was beyond the power of the officials to accept their silence and behavior under examination as equivalent to such admission.

INDIA, BRITISH. British India is that part of East India governed by the British sovereign (as emperor of India) through the governor-general of India in council. India, as defined by the British Parliament, includes British India and the native states under British suzerainty. The seat of government of British India was removed from Calcutta to Delhi in 1912.

AREA AND POPULATION. The area of India, that is, the area covered by the last census (1911), is stated at 1,802,192 square miles. British territory is divided into fifteen local, or rather provincial, governments. Interprovincial transfers of territory, and transfers from native to British territory, and *vice versa*, occasionally take place, so that censuses as originally reported are subject to adjustment. The table below shows in detail the area of British India and the native states, and the population according to the censuses March 15, 1901, and March 10, 1911. The population returned at these censuses, and the areas, have been adjusted, as far as possible, to allow for subsequent interprovincial transfers. Manipur state, which was included under British territory in 1901, is included under native states in the 1911 census. The tribal areas in the North-West Frontier Province are now shown under native states. Sikkim, which in 1901 was classed un-

der Bengal states, is now shown separately. The area newly included within the scope of the 1911 enumeration had a population (for the most part estimated) of 1,731,116; of this number, 1,604,265 were returned from the agencies and tribal areas of the North-West Frontier Province. The province of Eastern Bengal and Assam (erected from Eastern Bengal and the province of Assam October 16, 1905) and the province of Bengal were reconstituted and erected into three provinces April 1, 1912. These provinces are Bengal (which received the style "presidency"), Bihar and Orissa, and Assam. Still another new province, Delhi, was erected October 1, 1912, out of the division of Delhi in the Punjab; its area is stated at 557 square miles, and its population 391,828 (these figures subject to revision).

The population of the French and Portuguese settlements is not included in the table. A French census of March 10, 1911, returned 282,472 inhabitants. A census of the Portuguese settlements was taken December 31, 1910, showing a population of 604,930. The independent Himalayan states of Nepal and Bhutan (the foreign relations of Bhutan are under British control) are geographically a part of India; their population is not known with certainty, but may be estimated at 3,000,000 for the former and 250,000 for the latter. If these figures be included, the population of India becomes about 319,270,000; or, if Burma and Aden be included as not being geographically a part of India, the total is about 307,109,000. The approximate accuracy of these totals is in considerable doubt on account of the widely varying estimates for Nepal.

The area censused on March 10, 1911, and the population on that date, as compared with the census returns of March 15, 1901, are as follows (the figures being adjusted, as far as possible, to subsequent interprovincial transfers):

	Sq. m.	Population	
		1901	1911

* Included in the Bombay Presidency. † Included in the United Provinces. ‡ Included in the Madras States.

From 1891 to 1901 the increase of population in British India was 4.7 per cent., while in the native states there was a decrease of 5 per cent.; there being for India an increase of 2.5 per cent. From 1901 to 1911 there was an increase in British India of 5.5 per cent. and in the native states 12.9 per cent.; the increase for India being 7.1 per cent. The largest decrease, as shown by the 1911 census, was in the Baluchistan states—7.5 per cent.; this, however, is only apparent, as the figures for 1901 were based on an estimate which now appears excessive. The largest increase was in the North-West Frontier Province agencies and tribal areas—1831.9 per cent.; this enormous percentage is due to extension of the censused area. The greatest decrease in British India, as shown by the 1911 census, was in Coorg—3.1 per cent.; and the greatest increase in the Central Provinces and Berar—16.2 per cent. Oudh showed a decrease of 2.1 per cent., and Burma and Assam increases of 15.5 and 14.9 per cent., respectively. If the Baluchistan states and the North-West Frontier Province agencies and tribal areas be omitted as not being representative of the facts, the only decrease, in the population of native states as shown in 1911, was in the Punjab states—4.8 per cent. The greatest increase was in Sikkim—49.0 per cent. The Central Province states showed an increase of 29.8 per cent., and Hyderabad and the Bihar and Crissa states increases of 20.0 and 19.0 per cent., respectively. Of the total population in 1911, about 78 per cent. was in British India, and about 22 per cent. in the native states. Males numbered 161,326,110, and females 153,806,427.

The census shows the population according to civil condition in the case of 312,643,693 persons; of these, the unmarried numbered 78,384,686 males and 52,516,947 females; married, 72,906,881 and 73,704,162; widowed (including divorced), 8,709,755 and 26,421,262. As returned by the 1911 census, married males up to the age of five numbered 151,518, and married females 302,425; between five and ten years, 810,577 and 2,219,778; between 10 and 15 years, 2,403,136 and 6,555,424; between 15 and 20 years, 4,364,438 and 10,087,024. The widowed included 6668 males and 17,703 females up to the age of five; between five and ten years,

35,098 and 94,270; between 10 and 15 years, 91,995 and 223,042; and between 15 and 20 years, 177,694 males and 466,834 females. Among the Hindus, the total widowed numbered 6,421,463 males and 20,030,136 females; almost one female in each five was a widow; among the Christians and Buddhists, the average was somewhat over one in nine.

The population of the larger cities, cities having over 100,000 inhabitants, with percentage of increase or decrease in the decade, was returned by the 1911 census as follows: Calcutta (Bengal), 896,067 (5.7 per cent. increase); Calcutta with suburbs, including Cossipur-Chitpur, Manicktola, Garden Reach, and Howrah, 1,222,313 (10.4); Bombay (Bombay), 979,445 (26.2); Madras (Madras), 518,660 (1.8); Hyderabad (Hyderabad), including Secunderabad, Bolaram, and the Residency Bazzars, 500,623 (11.6); Rangoon (Burma), 293,316 (19.5); Lucknow (Oudh), 2,9,798 (1.6 per cent. decrease); Delhi (Delhi), 232,837 (11.6 increase); Lahore (Punjab), 228,687 (12.7); Ahmedabad (Bombay), 215,835 (16.1); Benares (Agra), 203,804 (4.4 decrease); Bangalore (Mysore), including civil and military station, 189,485 (19.1 increase); Agra (Agra), 185,449 (1.4 decrease); Cawnpore (Agra), 178,557 (12.0 decrease); Allahabad (Agra), 171,687 (0.2 decrease); Poona (Bombay), 158,856 (3.6 increase); Amritsar (Punjab), 152,756 (6.0 decrease); Karachi (Sind), 151,903 (30.2 increase); Mandalay (Burma), 138,299 (24.8 decrease); Jaipur (Rajputana), 137,098 (14.4 decrease); Patna (Bihar and Orissa), 136,153 (1.0 increase); Madura (Madras), 134,130 (22.2 increase); Bareilly (Agra), 129,462 (2.8 decrease); Srinagar (Kashmir), 126,344 (3.0 increase); Trichinopoly (Madras), 122,028 (16.5 increase); Meerut (Agra), 116,227 (1.6 decrease); Surat (Bombay), 114,863 (3.7 decrease); Dacca (Bengal), 108,551 (21.0 increase); Nagpur (Central Provinces), 101,415 (20.6 decrease); Jubbulpore (Central Provinces), 100,651 (11.2 increase); Howrah, included above with the Calcutta suburbs, 179,006 (13.6 increase). At the time of the 1911 census, plague was raging in Cawnpore and Nagpur, and many of the inhabitants were absent; the provisional returns of a new census taken after the epidemic had subsided showed the population of Cawnpore to be 195,498 and of Nagpur 134,712. In respect of the large increase shown above for Bombay, it should be noted that plague was raging there when the 1901 census was taken; the returns of a special census taken in 1906 showed a population of 959,537.

RELIGION. Population by religion according to the censuses of 1901 and 1911 is shown in the table below. That the 1911 total is 313,523,981 instead of 315,132,537 (the figure for total population returned by the census), is due to the fact that religion was not recorded in the case of 1,608,556 persons in the North-West Frontier Province.

	1901	1911	Inc.
Hindus	207,147,026	217,586,900	10,439,874
Sikhs	2,195,339	3,014,466	819,127
Jains	1,334,148	1,248,182	—85,966
Buddhists	9,476,759	10,721,449	1,244,690
Parsis	94,190	100,100	5,910
Mohammedans...	62,458,077	66,623,412	4,165,335
Christians	2,923,241	3,876,196	952,955

	1901	1911	Inc.
Jews	18,228	20,980	2,752
Animists	8,584,148	10,295,168	1,711,020
Others and unspecified	174	37,128	36,954
Total	294,361,056	313,523,981

Of the 3,876,196 Christians recorded in 1911, there were 1,490,864 Roman Catholics, 492,317 Anglicans, 413,142 Romo-Syrians, 336,596 Baptists, 225,190 Jacobite Syrians, 218,499 Lutherans, 181,128 Presbyterians, 171,754 Methodists, 135,264 Congregationalists, 75,848 Reformed Syrians, 52,407 Salvationists, and 18,780 Chaldean Syrians. Of the Christians, 199,776 were recorded as Europeans, 101,657 as Anglo-Indian (Eurasian), and 3,574,830 as native. Most of the Buddhists—10,384,579—were in Burma. The census calls attention to its classification of Hindus and Animists. It points out that the term Animistic denotes the primitive forms of belief found among the jungle tribes, Mundas, Santals, Bhils, etc. There is no name for these beliefs in any Indian vernacular, and in practice it is difficult to draw the line between Hinduism and Animism. Persons who did not profess to belong to any recognized religion were entered under the name of their caste or tribe. In the course of tabulation all such persons were treated as Hindus if they belonged to a recognized Hindu caste, however low it might be. Those who belonged to jungle tribes outside the caste system, e.g. Bhils, Khonds, Garos, Todas, etc., were classed as Animists.

EDUCATION. In respect of literacy the 1911 census recorded 313,415,389 persons, as shown in the following table:

	Total	Males	
		Literate	In English
Hindus	110,865,731	11,223,134	1,013,596
Sikhs	1,734,773	184,163	11,490
Jains	643,553	318,585	13,030
Buddhists	5,286,142	2,134,381	21,767
Parsis	51,123	39,995	25,334
Mohammedans	34,709,365	2,389,766	176,051
Christians	2,010,724	688,570	252,591
Animists	5,088,241	53,833	1,521
Others and unspecified	28,818	6,388	2,981

Animists	5,129,303	2,987	74
Others and unspecified	29,263	2,908	1,533
Total females...	152,996,919	1,600,763	152,026
Total	313,415,389	18,539,578	1,670,387

Corresponding totals for 1901:

Males	149,442,106	14,154,602	1,021,819
Females	143,972,800	883,565	103,912
Total	293,414,906	15,038,167	1,125,231

The recent development of schools in British India is shown in the following figures relating to March 31, 1907, and March 31, 1912, respectively (figures for British Baluchistan are not

included). Total public educational institution, 121,407 and 136,422; scholars, 4,750,081 and 6,135,351 (of whom females, 562,000 and 876,367). Private institutions, 41,283 and 40,025; scholars, 647,781 and 656,504 (of whom, females 60,490 and 77,622). Total public and private, 162,690 and 176,447 institutions; scholars, 5,397,862 and 6,791,855 (of whom, females 622,490 and 953,989). Public primary schools, 112,984 and 123,638; pupils, 3,940,706 and 4,990,668 (of whom, females 495,895 and 785,868). Public secondary schools, 5914 and 6392; scholars, 715,750 and 928,183 (of whom, 61,358 and 63,761). Public arts colleges, 137 and 141; students, 19,259 and 29,698 (of whom, females 160 and 279). Private elementary institutions, 37,572 and 37,388; pupils, 586,298 and 601,089 (of whom, females 59,317 and 75,722). Private advanced institutions, 3711 and 2637; scholars, 61,483 and 55,415 (of whom, females 1173 and 1900). Expenditure on public education in 1906-07, £3,734,207; in 1910-11, £4,801,578; in 1911-12, £5,250,922.

AGRICULTURE. In British India in 1912, out of a total area of 618,605,938 acres, the area under forest was 80,851,369 acres; not available for cultivation, 149,605,179; cultivable waste other than fallow, 114,700,370; fallow land, 54,982,321; net area sown with crops, 215,981,683; area irrigated, 40,679,142. In 1912 the area under food grains was 195,097,434 acres (of which, rice 76,636,887 and wheat 25,025,236); oilseeds, 16,494,865; cotton, 14,568,189. The area under opium declined from 383,335 acres in 1911 to 220,164 in 1912.

The figures as returned for production are not strictly comparable with the areas sown, as they include crops in certain of the native states. Some of the more important yields for 1910-11 and 1911-12, respectively, are officially estimated as follows: Rice (cleaned), 557,938,000 and 521,992,000 cwt.; wheat, 10,040,500 and 9,813,500 tons; tea (calendar years), 263,605,240 and 268,823,436 lbs.; cotton, 4,303,000 and 3,925,000 bales (of 400 lbs.); jute, 7,932,000 and 8,234,700 bales (of 400 lbs.); linseed, 563,600 and 641,200 tons; rape and mustard, 1,233,200 and 1,271,000 tons; sesamum, 511,800 and 371,400 tons; groundnuts, 503,200 and 542,200 tons; indigo, 46,000 and 48,700 cwt.; cane sugar, 2,217,800 and 2,390,400 tons.

MINERALS. As officially reported, the value in 1911 and 1912 and the quantity in 1912 of the chief minerals produced in British India and the native states are shown in the following table:

	1911	1912	1912
Coal	£2,502,616	£3,310,365	14,706,339 tons
Gold *	2,238,143	2,271,806	590,565 oz.
Petroleum... ..	884,398	975,278	249,083,518 gals.
Manganese ore	648,801	† 762,699	† 708,081 tons
Salt *	429,296	452,580	1,310,921 tons
Mica †	207,718	341,349	66,574 cwt.
Rubies	67,594	69,547	323,245 kt.
Jadestone §..	29,815	4,483	348 cwt.

* The figures for 1912 are provisional. † The figures represent exports by sea in 1912-13. ‡ The figures represent exports by sea in fiscal years. § The figures represent exports by sea and land in fiscal years.

Of the coal produced in 1912, the value of £1,813,408 is credited to Bihar and Orissa, and £1,063,437 to Bengal; of the gold, £2,158,362 to Mysore; of the petroleum, £962,907 to Burma,

as well as the value of all the rubies and jade-stone; of the mica, £292,645 to Bengal.

COMMERCE. The foreign trade of India, for years ended March 31, has been valued as follows, in thousands of pounds sterling:

	1908	1911	1912	1913
Sea-borne Trade				
Imports:				
Private mdse.....	86,670	86,236	92,383	107,344

Total exports...	4,645	4,950	5,886	6,986

As in the preceding year, the import and export values in 1912-13 were of unprecedented magnitude. The total sea-borne trade increased over 11 per cent. Imports of cotton goods and sugar advanced notably. In the export trade, rice exceeded all records, taking first place over raw cotton. The bulk of the imports are manufactured articles, while about three-fourths of the exports consist of food and raw materials.

Values of the leading sea-borne imports of private merchandise in the fiscal years 1911-12 and 1912-13, respectively, were as follows, in thousands of pounds sterling: Cotton goods, 30,519 and 37,583; cotton yarn, 2527 and 2965; sugar, 7955 and 9537; iron and steel, 6717 and 7671; railway material, 2958 and 4269; machinery and millwork, 2838 and 3905; mineral oils, 2828 and 2505; hardware, cutlery, implements, etc., 2379 and 2434; apparel, 2355 and 2431; woolen goods, 2272 and 2039; silk goods, 1769 and 2035; copper, 1853 and 1581; provisions, 2127 and 2566; raw cotton, 1391 and 1483; carriages, carts, etc., 1056 and 1266; glass and glassware, 1029 and 1169; raw silk, 706 and 1143; spices, 1029 and 1087; instruments, apparatus, and appliances, 920 and 986; paper and pasteboard, 785 and 964; coal, coke, etc., 342 and 778; mineral dyes,

760 in 1912-13; drugs and medicines, 693 and 704; matches, 584 and 656. Among the imports of government stores were railway material 1680 and 1695, and metals 404 and 474.

Values of the principal sea-borne exports of Indian produce and manufacture were as follows in 1911-12 and 1912-13, respectively, in thousands of pounds sterling: Rice, 19,367 and 21,705; raw cotton, 19,683 and 18,741; cotton yarn and cloth, 6519 and 8134; raw jute, 15,038 and 18,034; jute manufactures, 10,871 and 15,247; seeds, 17,960 and 15,167; wheat and wheat flour, 9430 and 12,513; hides and skins, 9286 and 10,914; tea, 8631 and 8863; opium, 8726 and 7481; pulse, millets, etc., 5509 and 5982; raw wool, 1724 and 1756; lac (of all sorts), 1343 and 1409; coffee, 897 and 1043; wood and manufactures, 636 and 810; fodder, etc., 1140 and 757; manures (chiefly animal bone), 774 and 646; spices, 619 and 622; coal, coke, etc., 514 and 589; oils, 1072 and 572. Re-exports included: Cotton yarn and cloth, 1224 and 1098; raw wool, 250 and 448; sugar, 1155 and 145; metals, 153 and 133.

Percentages of imports and exports of merchandise by countries in the year 1912-13: United Kingdom, 63.0 per cent. of the imports and 25.1 per cent. of the exports; Germany, 6.4 and 10.1; United States, 3.2 and 7.8; China (including Hongkong), 1.9 and 8.4; Japan, 2.5 and 7.7; France, 1.3 and 6.5; Belgium, 1.9 and 5.4; Java, 5.8 and 1.3; Straits Settlements, 1.9 and 3.7; Austria-Hungary, 2.2 and 2.9; Ceylon, 0.5 and 3.7; Italy, 1.0 and 2.8; Mauritius, 2.0 and 0.6; all other countries, 6.4 and 14.0.

SHIPPING. The total number of vessels, including native craft, which entered, with cargoes and in ballast, from foreign countries at ports in British India in 1911-12 was 4481, of 8,354,877 tons; cleared to foreign countries, 4387, of 8,261,558 tons; total entered and cleared, 8868 vessels, of 16,616,435 tons. Total entered and cleared in 1912-13, 8737 vessels, of 17,451,985 tons. Of the latter tonnage, about 51 per cent. was from or to the United Kingdom and British possessions; and 77 per cent. of the total trade was under the British flag.

COMMUNICATIONS. The length of railway open to traffic in British India and the native states has been as follows, at the end of each year: 1900, 24,752 miles; 1902, 25,930 miles; 1907, 30,010 miles; 1911, 32,839 miles; 1912, 33,484 miles. There were under construction or sanctioned on the latter date 2455 miles. Of the railway open to traffic at the end of 1912, 17,189 miles were on the $5\frac{1}{2}$ -foot gauge, 14,165 miles on the meter gauge, and 2130 miles on special gauges ($2\frac{1}{2}$ feet and 2 feet). Nearly all the railways are owned by the state and administered by a railway board, though many are leased to and operated by companies. Up to December 31, 1912, the capital outlay on lines open to traffic was £310,100,000 (against £300,045,000 at the end of 1911). Gross earnings in 1912 were: £41,100,000; working expenses, £20,106,000; net earnings, £20,994,000; percentage of working expenses to gross earnings, 48.92 (52.17 in 1911); percentage of net earnings on capital outlay, 6.77 (against 5.87 in 1911, 5.86 in 1907, 4.92 in 1902, and 4.99 in 1900). After charging to expenditure interest on capital outlay of lines under construction or provided for, the net gain to the state from the working of the railways was £5,489,000 in 1912 (against £2,713,000 in

£1911, 2,552,000 in 1907, £136,000 in 1902, and £58,000 in 1900). Rates are very low; in 1912 the average rate charged per passenger per mile was: first class, 1.19d.; second class, 0.55d.; intermediate class, 0.26d.; third class, 0.19d.; season and vendors' tickets, 0.12d. For freight, the average rate charged per ton per mile was 0.39d.

The mean mileage of the railways of India was, in 1913, 33,509, an increase of 989 miles. During the year there was a decrease in the earnings of some of the railways, notably the North-Western State, the East Indian and the meter-gauge portion of the Bombay, Baroda, and Central India. There were, however, substantial increases on the broad-gauge portion of the last-named line, and on the Eastern Bengal State Railway, the Great Indian Peninsula Railway, and the Burma Railway. In Eastern Bengal the state had constructed four lines including the approach to the Lower Ganges Bridge, amounting to 84 miles; and in the Northwestern district four lines, comprising 195 miles, with a train ferry on the trans-Indus line. There were under construction on the Oudh and Rohilkhand, the Cawnpore-Bandah, with the Sumnerpore-Batala branch of 140 miles, making a total of 419 miles for state railways. The private companies showed a construction as follows: Two lines in Assam-Bengal, 72 miles; Bengal and North-Western, three lines, 102 miles; Bengal and Nagpur, seven, making up a total of 453 miles; the Bengal-Nagpur and East Indian, the second section of the Bokaro-Ramgarh line, 30 miles; the Bombay, Baroda, and Central India, two lines, 80 miles; the East Indian Railway, the Katna-Barharwa, of 103 miles; and a short nine-mile branch also had been constructed. The Great Indian Peninsula Railway Company was completing its Itarsi-Nagpur line and a branch to the Pinch Valley coalfields, and other lines, totaling 385 miles. One 16-mile line was being constructed by the Rohilkhand-Kumaon Company, and a 113-mile line through the Jullundur Doab by the Southern Punjab, while the Dwari Theria, a line 19 miles in length, was building. The Jhenidah and Taranga lines were constructing two lines 37 and 18 miles, respectively, while a line 55 miles in length, which was characterized as a famine feeder was under construction from Dharmapuri to Hosur. In the native states the Gaek-war of Baroda was building some short lines aggregating 199 miles, while there were under construction the Bari-Tantpur line, 17 miles in length, on the Dolphur-Durbar Railway, and the Jodhpur-Phalodi, 80 miles in length, on the Marwar-Durbar system. In Burma the Southern Shan States Railway, 105 miles in length, was in progress.

On March 31, 1912, the government telegraphs aggregated 76,578 miles of line, with 299,343 miles of wire (including cable). The increase during the fiscal year was 1750 miles of line, with 7342 of wire. The capital expenditure up to March 31, 1912, was £7,639,201; the percentage for the fiscal year of net revenue on capital outlay was 1.70 (0.89 in 1910-11). Post offices on March 31, 1912, numbered 18,801; revenue for the fiscal year £2,134,279, expenditure £2,008,470.

FINANCE. The standard coin is the British sovereign, par value \$4.86656; the current coin is the rupee, par value 32.444 cents (15 rupees to the pound sterling). For British India, the

gross revenue and the expenditure charged to revenue, in thousands of pounds sterling, were as follows in years ended March 31 (revised estimates for 1913):

	1903	1908	1910	1911	1912	1913
Revenue...	65,297	71,003	74,593	80,682	82,836	87,052
Expenditure...	62,229	70,697	73,987	76,746	78,895	83,659

In addition to expenditure charged to revenue, there is an expenditure on railways and irrigation (and since 1911-12 on the new seat of government at Delhi) charged against capital. This has been as follows in fiscal years, in thousands of pounds sterling: In 1903, 5128; in 1908, 11,413; in 1910, 7374; in 1911, 10,119; in 1912, 8523.

Gross revenue in years ended March 31 (revised estimates for the fiscal year 1913), in thousands of pounds sterling:

Principal Heads of Revenue:	1910	1911	1912	1913
Land revenue.....	21,332	20,878	20,765	21,326

* Direct demands on the revenue, viz.: refunds and drawbacks, assignments and compensations, and collection charges, including production costs in the salt and opium monopolies. † The working expenses of railways are treated not as expenditures, but as a deduction from revenue.

Net revenue and expenditure charged against revenue are shown by deducting departmental receipts, which are a set-off against expenditure, and interest charges and working expenses of railways and irrigation works, refunds and assignments, cost of cultivating and manufacturing opium, etc. Net revenue and net expenditure in years ended March 31, (revised estimates for the fiscal year 1913) have been as follows, in thousands of pounds sterling:

	1903	1910	1911	1912	1913
Net revenue....	43,209	49,620	55,147	56,987	60,685
Net expend....	40,141	49,013	51,211	53,047	57,291
Surplus	3,068	607	3,936	3,940	3,394

The liabilities of British India on March 31, 1912, were: In England, £182,986,597; in India, Rs. 180,24,89,919 (£120,165,994); total, £303,152,501. The permanent debt, included in the foregoing, was: In England, £178,486,597; in India, Rs. 139,96,36,205 (£93,309,080). Total interest paid on all obligations in 1911-12, £9,884,812; of this, the interest on the debt was £9,282,229. From the latter amount should be deducted amounts chargeable to railways, £6,664,910, and amounts chargeable to irrigation, £1,182,867; whence the interest on the ordinary debt is £1,435,152. Interest on other obligations, £602,583.

ARMY. There is maintained in India an army consisting of British regular forces, Indian regular forces, various local corps, British volunteers, Indian army reserves, imperial service troops, and military police. In 1913-14 the British regular army was represented by the following units serving in India: Nine regiments of cavalry; 11 horse artillery batteries; 42 field artillery batteries; 3 howitzer batteries; 8 mountain batteries; 21 garrison artillery companies; 6 heavy batteries; 21 ammunition columns; 52 battalions of infantry; details of the royal engineers; the royal army medical corps, etc., the total strength aggregating 77,318. The native army consists of three regiments of body guards, 39 regiments of cavalry, and the Aden troop; the corps of guides; 12 mountain batteries; one frontier garrison company; 26 companies of sappers and miners; 117 infantry battalions and 20 battalions of gurmhas. The Indian army had in its second line, the volunteers, about 35,400 strong, the imperial service troops maintained by the native states, the frontier militia on the southwest frontier, and the military battalions on that frontier, and in Assam and Burma. The imperial service troops are under the superintendence of British officers and are trained for service by feudatory princes. Thirteen states keep up forces of cavalry, 8 infantry, 3 sappers, 2 camel corps, and 6 transport corps, while in addition there are large armies in the native states which are considered of uncertain value, and are more or less irregular, both in organization and service. An approximate estimate of the total strength of the military forces available in India is as follows: British regular forces, 75,800; Indian regular forces, 162,000; volunteers, 35,400; Indian army reserves, 25,000; imperial service troops, 21,000; local corps, 5000; military police, 28,500; total, 352,700. The two great commands were the Northern army, under Lieutenant-General Sir James Willcocks, K. C. S. I.; K. C. M. G., and the Southern army, under Lieutenant-General Sir John Nixon, K. C. B.

GOVERNMENT. The king of Great Britain and Ireland is emperor of India. King George V. was crowned emperor at Delhi, December 12, 1911. In England the administration of Indian affairs is intrusted to the secretary of state for India (a member of the British cabinet), who is assisted by a council. In all matters he can impose orders on the government in India, and no expenditure from Indian revenue is legal unless sanctioned by the secretary of state in council. In respect of the relations of the Indian government to foreign powers or to the native states, in making peace and war, and in other matters that may require secrecy, the secretary of state may act independently of the council. The secretary of state for India in 1913 was the Marquis of Crewe (from November, 1910). In India the supreme executive authority, in both civil and military affairs, is the governor-general in council, known as the "government of India." In 1913, the governor-general, who is appointed by the crown for five years, was Baron Hardinge of Penshurst, who succeeded the Earl of Minto, November 23, 1910. The governor-general's council consists of six members (appointed by the crown) besides himself and the commander-in-chief of the army. One of the members (since 1909) is an Indian. The governor-general's legislative council, in accordance with the Indian councils act of 1909, consists of 28 official and 32 non-official members (including 27 elected), in addition to ex-officio members. The governors of Madras, Bombay, and Bengal, and the lieutenant-governor of Bihar and Orissa have each an executive council of three members (including one Indian); and legislative councils similar to the governor-general's legislative council are established in these provinces and in the Punjab, the United Provinces of Agra and Oudh, Burma, Assam, and (since November, 1913) the Central Provinces and Berar. British India is divided into fifteen local governments and administrations, viz: Under governors (who are appointed by the crown), the provinces of Madras, Bombay, and Bengal (properly styled presidencies); under lieutenant-governors (who are appointed by the governor-general, with the approval of the secretary of state), the provinces of Bihar and Orissa, the United Provinces of Agra and Oudh, the Punjab, and Burma; under chief commissioners (who are under the immediate authority of the governor-general in council), the Central Provinces and Berar, Assam, Ajmer-Merwara, Coorg, British Baluchistan, the North-West Frontier Province, Delhi, and the Andamans and Nicobars. The chief local governments have a large measure of financial and administrative independence, which was further extended in 1912. The governors of Madras, Bombay, and Bengal have precedence over the other provincial executives, being alone permitted to communicate directly with the secretary of state.

The native states are governed by their princes, ministers, or councils, but the government of India, through British residents or agents, exercises control in varying degrees and does not permit the states to maintain external relations. The states are not allowed to make war or peace, but are entitled to British protection. British-Indian law does not obtain in them, and they are not under the jurisdiction of the British provincial courts.

PLOTS AGAINST THE GOVERNMENT. Rarely has a year passed in which so much has been written on the subject of British rule in India; the plans for an Indian educational system, the administration of the civil service, the fiscal policy of the government, the attempt to Europeanize Indian politics, the alleged inefficiency of British officials—all have been subjected to keen and caustic criticism. Why? Because in spite of the magnificent irrigation works, in spite of the railways, in spite of school subventions, in spite of commerce, in spite of all the material benefits of European civilization, and in spite of the best efforts of university-bred British officialdom, the mass of the Indian people remain ungrateful and in their midst the work of revolutionary propagandists is ceaselessly carried on. There are Mohammedans, who resent the spoliation of Turkey and blame Great Britain for consenting to it; more numerous but less active are the Hindus who fear lest their ancient traditions and institutions will be destroyed by British railways, British soldiers, and British schools; and then there are men of either or neither religion who call themselves nationalists and hope to see India a proud, independent nation rather than a country under foreign masters. The Indians are not grateful; they would often prefer to live in their villages undisturbed by railways, and they feel that the material benefits of foreign rule are enjoyed mostly by the not wholly altruistic foreigners.

These disquieting considerations were brought to the fore by a number of incidents, among which the most prominent was the attempted assassination of the viceroy on the occasion of his state entry into Delhi, December 23, 1912. It was not astonishing that Lord Hardinge should have been seriously wounded, but it is significant that the crowd allowed the assassin to escape. Perhaps it is even more significant that instead of regarding the incident as closed, the Legislative Council thought it necessary to pass a conspiring bill for the punishment of future offenders. On his next visit to Delhi, Lord Hardinge was more cautious. His soldiers and agents cleared the streets, strangers were not allowed to approach him, and guards were stationed along the railway for a hundred miles.

It is unnecessary here to mention the "dacoities" or gang-robberies, and the murders of police-officers; they are nothing new in India. An instance of Mohammedan unrest is worth noting, however, especially since the misfortunes of their brother Mohammedans, the Ottoman Turks, have awakened the liveliest sympathy among the Indian Mohammedans. At Cawnpore the authorities decided that in order to improve a roadway a couple of religious edifices must be partially demolished. One of these, a Hindu temple, was spared because of protests. The other, a mosque, could be saved by no entreaties. On July 1 the road-builders proceeded to tear down the vestibule or annex of the Machli Bazaar Mosque, while police with fixed bayonets held off an angry crowd. On July 17 the Mohammedans held an indignation meeting to petition Lord Hardinge, the viceroy, for the restoration of the building. Nothing was done, however, and while the agitation was

spreading all over India, the Mohammedans of Cawnpore grew bolder. On August 3 they started to replace the bricks of the mosque vestibule, and refused to be driven away until the police fired a volley into the crowd, killing thirteen and wounding twice as many. In an attempt to soothe the outraged feelings of the Mohammedans, Lord Hardinge visited Cawnpore, made a conciliatory speech, released the 100 rioters who had been imprisoned, and told the Mohammedans that in place of the old structure, they could build an arcade over the street. The compromise was well-meant, but not entirely satisfactory; as the Mohammedans of Calcutta later declared, the question at stake was not the convenience of a few worshippers at Cawnpore, but the right of the state to encroach upon and to profane religious property.

THE BUDGET. In March, Sir Guy Fleetwood Wilson presented his financial statement to the Legislative Council and announced that the surplus had exceeded his estimates by £2,000,000. Out of abnormally large receipts from opium, extraordinary grants of £460,000 and £2,157,800 had already been made in aid of education. In the budget for 1913-14 he counted upon a surplus of £1,311,200 over an estimated expenditure of £33,850,000; although the opium revenue is certain to fall off and poor crops, or a business panic, might seriously impair the other items of income. It is interesting to note in this connection, that including the provision in the present budget, the government will have invested about £35,000,000 in large irrigation works. By the end of 1913 50,000 miles of canals had been constructed to irrigate 48,500,000 arable acres, and a return of £1,793,300 had been secured on the capital invested.

IMPERIAL PREFERENCE. A notable discussion of the possibility of establishing a preferential tariff for India took place on March 17 in the Legislative Council. Commenting on the Unionists contention—that "Preference would offer to India free entry for her tea, coffee, sugar, wheat, etc., into the United Kingdom and the colonies (which, by the way, absorb 75% of India's commerce); while to Great Britain it would mean that India's import duties on some British manufactures would be abolished or reduced"—Sir Guy Fleetwood Wilson seriously questioned the value of a protective tariff for India, inasmuch as it must press with uncompensated weight on the agricultural poor. Should the United Kingdom join the movement for imperial preference, and India find it advisable to follow, a readjustment of the tariff for revenue would be necessitated and would quite possibly involve the raising of a higher tariff wall against non-imperial imports.

EDUCATION. A desire to see "spread over the land a network of schools and colleges" had been expressed by the emperor on January 6, 1912; and that desire lay at the basis of the policy enunciated by the newly organized Department of Education in its resolution of February 21, 1913. In a general way, the government intended generously to subsidize the provincial educational systems, without interfering too much with the traditions and preferences of the provincial authorities. Grave concern was felt for the moral influence of the schools, and religious instruction was recognized as essential to the making of good citi-

zens; nevertheless the government, being neutral in religious affairs, could initiate no definite policy in religious instruction. To be sure, aid was to be given certain native schools of a religious character, but chiefly because of the financial impossibility of establishing new schools everywhere. Compulsory primary education was not at present to be thought of; on a voluntary basis, however, the widest possible extension was desired. Secondary schools were to be encouraged and subsidized, but left under private management with governmental supervision. In regard to the education of girls, the government solicited advice. And finally, the colleges were to be encouraged, so that it would be unnecessary for the young men of India to get their higher training abroad.

INDIANS IN THE DOMINIONS. The inferior status of Hindu immigrants in Australia, Canada, and South Africa caused much resentment in India. Hindu settlers in Canada are frugal and thrifty, and cannot understand why Canada should not grant them the franchise or allow them to send for their wives. They disliked the continuous journey clause of the Canadian alien law by which Indian immigrants are practically though not explicitly excluded. In South Africa the unwillingness of the Indians to be treated as "undesirables" led to a strike of the Asiatic laborers in Natal, which is discussed in the article on **SOUTH AFRICA, History**. The strikers received hearty sympathy, and the more substantial aid of some \$30,000 from the home country. In fact, so vigorous was the movement in India for equal rights for Indian emigrants, that the viceroy repeatedly remonstrated with the imperial government against the policy of South Africa and Canada, and in a speech at Madras said that "they [the strikers in Natal] have the deep and burning sympathy of India and also of those who, like myself, without being Indians sympathize with the people of the country."

OTHER EVENTS. A punitive expedition sent against the head-hunters of the Naga Hills destroyed three native villages. The Mysore government created a new department to encourage industrial and commercial enterprise. Mian Jogindra Singh succeeded Bhawami Sen as Rajah of Mandi State, one of the most important of the Hill States within the Punjab.

INDIANA. The population of the State in 1910 was 2,700,876. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 2,760,782.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1913	4,900,000	176,400,000	\$105,840,000
	1912	4,947,000	199,364,000	83,733,000
Wheat	1913	2,150,000	39,775,000	35,002,000
	1912	1,280,000	10,080,000	9,374,000
Oats	1913	1,700,000	36,380,000	13,824,000
	1912	1,990,000	79,799,000	23,940,000
Rye	1913	102,000	1,566,000	971,000
	1912	64,000	928,000	631,000
Potatoes.....	1913	75,000	3,975,000	2,339,000
	1912	87,000	9,918,000	4,959,000
Hay	1913	1,800,000	21,800,000	25,380,000
	1912	1,885,000	2,582,000	29,435,000
Tobacco.....	1913	15,900	511,925,000	1,812,000
	1912	18,700	14,960,000	1,846,000

a Tons. b Pounds.

MINERAL PRODUCTION. The total value of the mineral products of the State in 1912 was \$42,239,193, compared with \$37,430,187 in 1911. Coal was produced in the State to the amount of 15,285,718 short tons, valued at \$17,480,546. This was an increase over the production in 1911, which was 14,301,355 short tons, valued at \$15,326,808. The number of men employed in the coal mines of the State in 1912 was 21,651. These worked an average of 182 days, compared with 21,182 for the same number of days in 1911. About 54% of the coal produced is mined by machines. Strikes and suspensions in 1912 resulted in the idleness of 15,400 men for an average of 52 days. The total time lost was equivalent to 20% of the time made. According to the United States Bureau of Mines, forty lives were lost by accident in the coal mines of the State in 1912. Of these thirty-nine were underground, and one on the surface. One-half the deaths was due to falls of roof. The coal production of the State in 1913 was rather in excess of that of 1912, according to the United States Geological Survey.

The Indiana oil fields form a part of the Lima-Indiana fields. The production in Indiana itself in 1912 was 970,009 barrels, a decrease from the production in 1911 which was 1,895,289 barrels. A decline which had been noticeable for several years continued in 1912 not only in the heavy-oil district of the northeastern portion of the State, but in the Pike and neighboring counties in the southwest. The total number of wells completed in Indiana in 1912 was eighty-nine. Indiana is one of the most important clay-working States, ranking sixth in this respect. The total value of these products in 1912 was \$7,935,251, an increase of \$934,480 over 1911. Drantile is the principal clay product of the State.

EDUCATION. The school population of the State in 1913 was 762,927, and the enrollment was 537,500. The average daily attendance in the schools was 425,675. The total number of teachers employed was 18,085. The general assembly of 1913 passed a number of important measures relating to education. Many of these referred to the raising of funds. Provision was made for the establishment of township high schools, and for public playgrounds and public baths. A minimum wage for teachers was established and the qualifications for teachers were revised. Amendments were made to the law providing for compulsory education, and vocational education laws were amended.

FINANCE. The report of the treasurer for the fiscal year ending September 30, 1913, shows a balance in the treasury at the beginning of that fiscal year of \$339,404. At the end of it the disbursements and receipts balanced at \$12,032,600. The chief receipts are from taxes, and the chief expenditures for education, State officers, and State institutions. The total State debt at the end of the fiscal year was \$1,470,163. Of this, \$1,064,548 was domestic debt, and \$405,615 foreign debt.

CHARITIES AND CORRECTIONS. The institutions in the care of the State with their population in 1913 are as follows: Central Hospital for Insane, Indianapolis, 1516; Eastern Hospital for Insane, Richmond, 831; Northern Hospital for Insane, Logansport, 911; Southern Hospital for Insane, Evansville, 788; South-eastern Hospital for Insane, Madison, 1044;

Soldiers' Home, Lafayette, 933; Soldiers' and Sailors' Orphans' Home, Knightstown, 466; School for Feeble-Minded Youth, Fort Wayne, 1252; Village for Epileptics, New Castle, 208; Tuberculosis Hospital, Rockville, 113; School for the Deaf, Indianapolis, 296; School for the Blind, Indianapolis, 128; State Prison, Michigan City, 1185; State Reformatory, Jeffersonville, 956; Woman's Prison, Indianapolis, 141; Indiana Girls' School, Clermont, 285; Indiana Boys' School, Plainfield, 555. (The total number of inmates of these institutions was 11,608.) On September 30, 1913, these institutions had 12,929 inmates enrolled. For the fiscal year 1911-12, the total cost of the State for these institutions was \$2,318,347. Under a law enacted in 1909, these institutions were all operated under a uniform plan of administration. The governor appoints a bi-partisan board of four trustees of each institution; these boards appoint their respective superintendents; superintendents appoint and discharge their subordinates, who, under the law, must be selected on account of their fitness, without regard to their political or religious affiliations. All these charitable and correctional agencies are under the supervision of the State board of charities, created by the legislature in 1899. Its purpose is the supervision of the whole system of the public charities of the State, and its duty is to see that every inmate of every public institution receives proper care, that the public funds are properly expended, that the institutions are properly conducted, and that their management is protected from unjust criticism.

POLITICS AND GOVERNMENT. The legislature met in 1913 and passed a number of important measures. These included a public utilities commission bill, under the title of public service commission; a bill for an inheritance tax law; a bill for industrial and agricultural education under which the State advances in each county an amount equal to the local appropriation for these two interests and appoints a supervising instructor; a bill for a new housing law, the result of a long crusade; and a bill making unusually large appropriations for State, educational, penal, and reform institutions. There was no election for State officers during the year. The term of Governor Ralston expires in January, 1917. The next State election is on November 3, 1914. Governor Ralston was inaugurated on January 13, 1913. On March 22 he vetoed a "blue-sky" bill which had been passed by both houses of the legislature. The constitutional amendment providing for the direct election of United States senators was ratified by the legislature in January. The State suffered severely in the great floods in March, April, and May. (See FLOODS.) On August 27 Governor Ralston suppressed racing at the race tracks at Porter. In the elections of November 4, which were almost entirely for municipal officers, the Democrats practically swept the State. Of the total number of mayors elected, 41 were Democrats, 21 Republicans, 4 Progressives, and 10 Independents. The Democrats won generally on local issues and by reason of the hopeless division of the opposition. On November 28, Samuel L. Shank, mayor of Indianapolis, resigned his office, following dissatisfaction with his course in the street car strike and the strike of teamsters in that city. (See STRIKES.)

Mayor Shank had won a more than local fame from his method of procedure in regard to the public markets. He inaugurated a system of these markets, and sold the produce himself on many occasions, with the avowed purpose of reducing the high cost of living. He went from the mayor's office to the vaudeville circuit.

LEGISLATION. The legislature met in 1913 and passed several important measures. These include the following: An act providing for the incorporation and State supervision of rural savings and loan associations; a measure providing for a public utilities commission; a measure providing for vocational education in the public schools; a graduated inheritance tax law; a loan-shark law; measures providing for a penal farm; a tenement house bill; an act providing for hospitals for tuberculosis; a uniform negotiable instruments act; a measure creating a commission to investigate the employment of women; an act reducing the time for appeal to Supreme and Appellate Courts from one year to six months. See also **LIQUOR REGULATION.**

STATE GOVERNMENT. Governor, Samuel M. Ralston; Lieutenant-Governor, William P. O'Neill; Secretary of State, L. G. Ellingham; Treasurer, William H. Vollmer; Auditor, William H. O'Brien; Attorney-General, Thomas Honan; Superintendent of Education, Charles A. Greathouse—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, Douglas Morris, Dem.; Justices, Charles E. Cox, Dem.; Quincy A. Myers, Rep.; J. W. Spencer, Dem.; R. K. Erwin, Dem.; Clerk of the Court, J. Fred France, Dem.

STATE LEGISLATURE, 1913. Republicans: Senate, 9; House, 4; joint ballot, 13. Democrats: Senate, 40; House, 95; joint ballot, 135. Progressives: Senate, 1; House, 1; joint ballot, 2. Democratic majority: Senate, 30; House, 90; joint ballot, 120.

The representatives in Congress will be found in the section *Congress*, article **UNITED STATES.**

INDIANA UNIVERSITY. An institution of higher learning at Bloomington, Ind., founded in 1820. The enrollment in all departments of the university in 1913-14 was 2530. The faculty numbered ninety-six. At the beginning of the college year 1913-14, a department of domestic science was organized, with three teachers. The endowment fund of the university amounts to about \$700,000. The total income is about \$600,000. Of this amount, \$40,000 is from fees, \$43,200 from the interest on permanent endowment, and the remainder from funds granted by the State. The library contains about 91,653 volumes. The president is William L. Bryan, Ph.D., LL.D.

INDIANS. The bureau of Indian affairs of the United States government probably combines in its administrative duties more varied and intricate problems than any other bureau of the government. It deals not only with material questions involving the expenditure of vast sums, but with human problems connected with the working out of the civilization of a race of people alien to our form of government and the customs of white men. Throughout the Indian service there are 6000 employees distributed over twenty-six States, handling property approximately valued at \$1,000,000,000. In the early days of the existence of the bureau, the Indians were dealt with as several large

bodies corresponding to the Indian reservations. At the present time, however, the Indian office is engaged in distributing this vast estate to the individual owners, having due regard to the material and moral welfare of the individuals concerned. Of the 324,000 Indians now within the confines of the United States, a large number are as yet unfitted to assume the duties of full citizenship.

One of the most important tasks undertaken by the bureau is the determination of the heirs of deceased Indian allottees. It is estimated that there were in 1913 more than 40,000 heirship cases representing estates, valued at approximately \$60,000,000. Another large work is the completion of the allotments of land to individual Indians. It is estimated that there are probably more than 120,000 unallotted Indians on the reservations throughout the United States, and there have been allotted about 180,000, covering an area of about 34,000,000 acres. In addition to these branches of the work of the bureau, others include the education of the Indian youth, the preservation of the health of the population, the development of agricultural stock-raising, and other industrial pursuits, the procuring of employment for the graduates of Indian schools, and the furnishing of educational facilities.

Agriculture and stock-raising as employment for the Indians are receiving special attention. The reservations are largely divided into farm or stock districts under the immediate charge of farmers or stockmen, and in connection with the agricultural work, experimental farms are being operated on some of these reservations, including Pima, San Juan, Shoshone, Pala, Colville, Soboba, San Xavier, Shivwits, and Leupp, and all the reservation Indian school farms are being used to demonstrate to the older Indians the possibilities of the soil in the several sections of the country. These farms also produce an income which is used in support of the school plant.

MINING. Mining on Indian lands, particularly for oil, received increased impetus during 1913, as a result of the discovery of additional oil pools in the Osage nation and on Indian lands west and south of this. During the fiscal year, more than 49,176,000 barrels of oil were sold from the territory of the five civilized tribes in Oklahoma. These produced a revenue of \$1,496,179.

HEALTH CONDITIONS. The health conditions on Indian reservations are such as to warrant increased activity to bring about remedies for existing evils and to carry forward with greater rapidity the improvements now being inaugurated. It is reported that there are approximately 25,000 Indians suffering from tuberculosis, while available hospital facilities will accommodate but a few hundred. During the fiscal year 1913, 1905 Indians were reported as having died from this disease, and this probably represents not more than 75 per cent. of the total number who were its victims. During the year the Indian office was engaged in making a careful study of the housing conditions of the Indians, and improvements along this line will greatly facilitate the checking of tuberculosis. Another disease to which the Indians seem particularly susceptible is trachoma, which is infectious, and inasmuch as the Indians are living to a considerable extent

among the white population, the checking of this disease becomes a serious problem in which the white citizens are much concerned.

FIVE CIVILIZED TRIBES. The citizenship rolls for these tribes were closed by law on March 4, 1907, and the work of allotment is practically completed with the exception of the delivery of certain allotment deeds and other minor details. These tribes include the Cherokee, Choctaw, Chickasaw, Seminole, and Creek nations. Allotments to the 3119 citizens of the Seminole nation have been completed. The remaining unallotted land, 280 acres, was sold during the year. Allotments have been made to 18,716 citizens of the Creek nation, and nearly all the remaining unallotted land has been sold. Land was allotted to 41,696 citizens of the Cherokee nation. All the unallotted land in this nation has been disposed of with the exception of 925 acres. In the Choctaw and Chickasaw nation the allotments have been completed to all the 37,685 citizens. In all the five civilized tribes there was disposed of during the fiscal year a total of 900,175 acres of unallotted land, the purchase price being \$4,494,683, making the total sale, since the first sales in 1910, 1,849,722 acres, at a purchase price of \$10,745,495. The expenses of the tribal government consists of a principal chief, or governor, with such clerical force as is necessary. Practically no governmental functions are being exercised, the principal duties being to look after the interests of the tribes generally, until such time as tribal affairs are finally closed and the tribal government can be dispensed with entirely.

EDUCATION. Of the \$300,000 carried by the Indian appropriation act on August 24, 1912, \$292,176 was paid to 2284 school districts in which were enrolled 23,442 Indian pupils and 2284 freedmen pupils. This appropriation was made by Congress to assist the public schools of the State of Oklahoma within the territory occupied by the five civilized tribes. A similar appropriation was contained in the Indian appropriation act of June 30, 1913. The superintendent of education urgently recommends a more aggressive policy for the education of Indian children. See also **ANTHROPOLOGY**.

INDUSTRIAL RELATIONS COMMISSION. Following an act of Congress providing for a commission to inquire into all phases of American industrial life, President Taft, on December 17, 1912, had sent to Congress his nine nominees for the three representatives each of the public, employers, and labor to constitute that commission. His appointments were objected to by the social workers and others who had conducted the campaign to have the com-

mittee established; and they failed of confirmation. On June 26 President Wilson named the following for the commission on industrial relations: To represent the public: Frank P. Walsh, chairman, attorney for the board of public welfare, Kansas, Mo.; John R. Commons, economist of the University of Wisconsin, member of the Wisconsin industrial commission; and Mrs. J. Borden Harriman of New York City, member National Civic Federation; to represent employers: Frederick A. Selano, Chicago, receiver and former president of the Wabash Railroad; Harris Weinstock, San Francisco, merchant and publicist; and S. Thurston Bullard, Louisville, Ky., manufacturer; to represent organized labor: Austin B. Garretson, Cedar Rapids, Ia., president of the Order of Railroad Conductors; John B. Lennon, Philadelphia, treasurer of the American Federation of Labor; and James O'Connell, District of Columbia, head of the metal trades department of the American Federation of Labor.

The scope of activities of this commission as stated in the Hughes-Borah act creating it is to inquire into the following: The general condition of labor in leading industries, including agriculture; existing relations between employers and employees; the effect of industrial conditions on public welfare and the powers of the community to deal therewith; sanitation and safety in industry; the growth of employers' associations and trade unions and their effects; the extent, methods, and results of collective bargaining; foreign methods of maintaining industrial peace; the scope, methods, and resources of existing bureaus of labor and means of increasing their usefulness; the entry of Asiatics; and the underlying causes of dissatisfaction in the industrial situation. Congress appropriated \$100,000 for expenses.

In October the commission outlined four fields of investigation, and chose Mr. W. Jett Lauck as director of investigations. Mr. Lauck had served the immigration commission and the tariff board as an investigator. One inquiry will cover public agencies dealing with the labor problem with a view to suggesting "ways and means to coördinate their work, eliminate duplication, insure coöperation, and in general, promote economy and efficiency of effort." Mr. F. H. Bird, of the University of Wisconsin, and formerly of the Wisconsin industrial commission, was placed in special charge of this inquiry. A second will deal with trade disputes, with special reference to organized labor. A third, of which Mr. Basil M. Manly, special agent of the bureau of labor statistics, was given charge, will deal with unorganized labor and labor questions outside the scope of the regular unions. The fourth will take up the constitutional and legal aspects of industrial relations, the courts, and the workers. For this, Mrs. Crystal Eastman Benedict, a New York lawyer, who investigated industrial accidents for the Pittsburgh survey, was given charge. The commission planned to hold hearings at which representatives of every phase of the industrial movement will have opportunity to state their cases.

INDUSTRIAL WORKERS OF THE WORLD. This is a radical labor organization which has risen to great prominence in the United States during the past few years. It was formed at Chicago in 1905, by a combina-

tion of the Western Federation of Miners, the United Metal Workers, the American Labor Union, and the Socialist Trade and Labor Alliance. A split in the organization in 1908 resulted in two branches with headquarters respectively at Chicago and Detroit. The former is the more revolutionary, having eliminated from its principles all reliance on political action. It has been conspicuous in strikes at Lawrence and Little Falls in 1912 and at Paterson in 1913. In the latter struggle, led by William D. Haywood, 25,000 strikers were defeated after five months resistance and a loss of over \$5,000,000 in wages. The strike was very remarkable for absence of violence; it was marked by a most unreasoning opposition to the I. W. W. by the mill owners, the press, and public officials; and was unsuccessful largely because of this alienation of public support. Due consideration of the claims of the workers was not given because of a fierce determination to defeat the I. W. W. leaders. This opposition was in part due to the creed of direct action and the defense of sabotage by some of the leaders, thus placing the stamp of syndicalism (q.v.) on the movement. (See STRIKES AND LOCKOUTS.)

SEATTLE INCIDENT. As the result of misquotation of remarks by Secretary of the Navy Daniels, there occurred, in July, in Seattle, an attack on Socialist and I. W. W. headquarters by sailors of the Pacific coast reserve fleet. The secretary, in an address before the Rainier Club of Seattle, had paid a tribute to the United States flag and declared that the red flag meant danger. This was played up by the *Seattle Times* and incited the sailors. In the rioting \$8000 worth of property was destroyed. The mayor ordered the *Times* to cease publication temporarily and closed fourteen saloons.

CONVENTION. The annual convention of the organization was held at Chicago late in September. Reports showed that the paid-up membership was 14,310. In addition there were estimated to be about 25,000 dues-paying members of local bodies and a non-dues paying enrollment of 50,000 to 60,000. Evidence showed that the membership of locals fluctuated greatly. Thus, immediately after the strike at Lawrence, Mass., in 1912 a membership of 14,000 was claimed; in 1913 the number was only 700, and some of these were threatening to withdraw to the American Federation of Labor. At Akron, O., at the time of the strike in the rubber industries early in 1913, about 6000 paid the initial membership dues; but not over one-third of these had paid dues up to September. During the year 99 locals went out of existence; and there were others, some of them strong ones, which were at cross purposes with the central organization.

Much of the time of the two-weeks convention was consumed in the contests of those who favored an increase and those who favored a decrease in the power of the central authority of the organization. The decentralization faction favored complete local autonomy. It therefore sought to abolish the general executive board, to reduce the support of the general organization and thus cripple it, to provide for general legislation by referendum, to place organizers under the direct control of members, and to make the general officers mere correspondence secretaries. While they were not successful in thus demoralizing the central au-

thority, this internal conflict revealed a serious weakness of the movement.

Professor R. F. Hoxie (*Journal of Political Economy*, November, 1913) finds three great weaknesses in the organization. In the first place there is a lack of financial resources. Although the I. W. W. theorists are prone to boast of their superiority to trade unions, Socialists, and labor parties in this respect, their own practical experience shows repeated failures for lack of funds to hold workers together at critical moments. In the second place there is a lack of able and steady leadership. The organization has not shown capacity to develop far-sighted leaders who might place the organization on an effective permanent basis. Some of its strongest men have either left or been driven out of it. It therefore lacks constructive ability. In the third place, the conflict within the organization itself is a source of great weakness. This conflict is due to different philosophies of the labor movement. One party believes in industrial unionism carried on by a well-organized, soundly financed, and sanely directed organization of all laboring men. The other party believes in revolutionary syndicalism carried on by irresponsible, loosely-formed local bodies seeking merely to undermine the present industrial order by making it unprofitable. INFANTILE SPINAL PARALYSIS. See POLIOMYELITIS.

INITIATIVE AND REFERENDUM. See ELECTORAL REFORM.

INJUNCTION. During many years the trade unions of the country have expressed open hostility to the existing laws governing the issuance of injunctions. The leaders of the American Federation of Labor especially have promoted legislation in Congress designed to place limitations upon the use of injunctions in trade disputes. The famous Buck's Stove and Range Company case, leading to contempt of court proceedings against the officers of the federation served to give point and bitterness to the controversy. (See LABOR, AMERICAN FEDERATION OF.) Every move made by the unions was opposed both in and out of Congress by the National Association of Manufacturers. President Taft maintained a consistent and determined opposition to any lessening of the discretion of the courts. Nevertheless, in the last session of Congress of his administration a bill was passed by the House of Representatives embodying the trade-union demands.

The disputed sections of this bill provided that no injunction should be granted in disputes between employers and employees regarding terms and conditions of employment unless necessary to prevent irreparable injury to property or to property right for which there is no adequate remedy at law; any such property or right must be described with particularity in the application for a writ of injunction. The bill provided that no writ should be issued restraining any person from terminating employment, or from recommending or persuading others to do so; or from peaceful picketing; "or from ceasing to patronize or to employ any party to such dispute; or from recommending, advising, or persuading others by peaceful means so to do; or from paying or giving to, or withholding from any person engaged in such dispute any strike benefits or other moneys or things

of value; or from peacefully assembling at any place in a lawful manner or for lawful purposes; or from doing any act or thing which might lawfully be done in the absence of such dispute by any party thereto."

These provisions were most strenuously objected to on the ground that they constituted class legislation by giving trade unions special exemptions from restraints imposed on other organizations, and by permitting them to violate contracts, and to employ unusual methods in enforcing their demands. Opponents pointed out that the oft-repeated criticisms of legal technicalities and delays do not apply to injunctions which are prompt and direct. In theory the injunction is a defense of the weak against the strong: it is designed to prevent irreparable injury. It does this by enforcing a peaceable settlement of differences and preventing long drawn out suits for recovery of damages after injury has been done, in which suits the parties may be unequally able to carry their case to the court of last resort. Thus it was argued that injunctions should be issued in trade disputes to prevent injuries for which adequate recovery could not be made subsequently.

INSANITY. The number of insane patients under care, in countries that keep accurate statistics, increases annually. The increase in the incidence of lunacy may be only apparent, and due to the fact that nearly all cases formerly treated and concealed at home are now placed in public or private institutions.

The New York State hospital commission (formerly State commission in lunacy) reported on September 30, 1913, the number of committed insane and voluntary cases in State hospitals together with committed insane in licensed private retreats as 16,714 men and 18,318 women, making a total of 35,032 patients; of which number, 1403 were inmates of Danemora and Matteawan, the criminal institutions, and 1030 were in private retreats. There were 861 on parole from civil hospitals. The net increase for the year was 975, against 573 for 1912, and 606 for two years ago. During the year, 1352 were returned to other States or deported to foreign countries, against 1753 the previous year, and 1100 two years ago. The total number admitted to civil hospitals during the year was 7677, of which number 6075 were first admissions, and 1602 were readmissions. From the 14 civil hospitals, 1597 were discharged as recovered, 1515 as improved; and 2890 died during the twelvemonth. The amount disbursed for maintenance was \$6,458,924. Upon new buildings, extraordinary repairs or equipment, or emergencies was expended the sum of \$995,680. The annual *per capita* for maintenance was \$206.08, omitting calculation of the cost of lodging, against \$203.45 last year. The ratio of the insane was 1 to 277 of the estimated population of New York State. The chief contributing cause, next to heredity, was alcohol, and syphilis was the determining cause in a large percentage of cases. These two preventable causes were the precipitating factors in over 40 per cent. of the cases in New York State. Over 40 per cent. were of foreign birth.

The Massachusetts State board of insanity reported on September 30, 1912 (the latest published report), a total of 13,365 patients, in-

cluding 6544 males and 6821 females; of which number 13 men and 303 women were under family care, in the "boarding out" system. Of the total mentioned, also, 127 men and 218 women were in private institutions. The increase for the year was 451, against 340 for the previous year, and 522 two years previously. The average annual increase for 5 years was 519. The increase of insane under private care was 16, compared with 9 last year. Court commitments totaled 3093, against 2970 the previous year. Voluntary admissions were 254 in number, compared with 206 the previous year. Of the total of 3350 admissions, 2660 were first cases, and of these 44.40 per cent. were of foreign birth, and 67.89 per cent. were born of foreign parentage. Alcohol was a causative factor in 17.4 per cent., syphilis in 6.28 per cent. of first admissions. In the first cases manic-depressive insanity occurred in 13.01 per cent., and dementia precox in 21.77 per cent. The recovery rate for the State was 15.08 per cent. of the commitments, compared with 13.47 the previous year. The ratio of insane persons to the estimated population of the State was 1 to 262. During the year, Dr. Elmer E. Southard, professor of neuropathology in Harvard Medical School, and formerly pathologist to the board, was made director of the Psychopathic Hospital the new departmental unit of the Boston State Hospital for the Insane, which serves as a reception hospital for the insane of Boston, and as an observation and treatment hospital for special classes of the metropolitan district.

The report of the commissioners in lunacy for England and Wales for January 1, 1913, stated that the number of notified insane under care was 138,377, which exceeded that recorded a year ago by 2716. Of this number, 4852 men and 6501 women were called "private patients," including those in county and borough asylums, in registered establishments (including idiots), in licensed houses (including idiots), and in naval military hospitals, and "private single patients." Of the total stated, 125,841 (58,508 men and 67,333 women) were classed as "paupers," and 1183 (903 men and 280 women) were classed as criminals. In May, 1912, 853 of these criminal insane were in Broadmoor, and 55 were in Parkhurst, in July, 1912. The number of insane in England and Wales was as 1 to 267 of the estimated population, against 1 to 269 last year, and 1 to 275 two years ago. The number discharged, recovered, in 1912, reached 7345; discharged, "relieved," or "not recovered," 2182; while 10,353 died. These figures excluded 73 patients who had to be re-certified as transfers. The recovery rate, reckoned upon total admissions, was 32.74 per cent.; the rate for females being 36.10, and for males 29.08 per cent. In borough asylums the recovery rate was 32.3 per cent.; in hospitals, 42.4 per cent.; in licensed houses, 37.3; and in "single care," 33.0 per cent.

The inspectors of lunatics for Ireland reported on January 1, 1913, 12,962 men and 11,877 women, or in all 24,839 insane under care, representing a net increase of 184 during the year. Of this total, 880 were in "licensed houses and mental hospitals," 162 in Dundrum (the criminal institution), and 146 were chancery cases and other patients in unlicensed private houses. Of the total, 2735 (1449 men and 1286 women) comprised the first admissions.

Alcohol was assigned as principal or contributory cause in 374 cases, or 13.4 per cent. The percentage of recoveries based on admissions was 40.3, or 0.4 less than a year ago. The deaths numbered 1424, including 758 males and 666 females. The ratio of the insane of Ireland to the estimated population was 1 to 176.4.

Probably the most notable advance in the field of insanity of the year, was the finding of the *spirochæta* in the brains of general paresis. Although Ehrlich and Jessen discovered a relationship between paresis and syphilis in 1857, it was reserved for very recent investigators to demonstrate that the *spirochæta* was directly and actively concerned in paresis. Noguchi and Moore, of the Rockefeller Institute, New York City, found *spirochæta pallida* in cases of general paresis, distributed through the gray substance of the convolutions, and not related to the meninges or the lesions. The organism was present in 17 to 24 per cent. of the typical cases. This important etiological finding was confirmed by Marinesco and Minea, and also by A. Marie. Technical reasons sufficed to explain the smaller percentage of Noguchi and Moore's findings; for Levaditi, Marie and Bankowski demonstrated the spirochete in the freshly obtained brains of 8 out of 9 cases of typical paresis. Nichols and Hoff of Washington, D. C., also corroborated the work of Noguchi and Moore, as also Flexner. Berger inoculated 20 rabbits with material from the brains of 20 patients with pronounced paresis, and in 3 rabbits positive results were obtained. We may now say that paresis, or general paralysis of the insane, is the result of actual syphilitic infection of the brain.

Many foci of pellagra (see also under PELLAGRA) had been discovered in the hospitals for the insane of the United States, in all about 50,000 cases of the disease having occurred within the last 6 years, with a mortality of about 39 per cent. According to the zeistic hypothesis, which prevailed especially in Italy, pellagra was a dietetic disease, depending upon an undue preponderance of maize in the diet, or upon the use of spoiled maize. No experimental evidence supported this view. According to the antizeistic hypothesis, the malady was an infectious disease, the infecting agent being unknown. Sambon, of Rome, felt that certain species of *Simulium* (sand fly, black fly) were carriers of pellagra virus, but again experiment failed to confirm the view. The Illinois pellagra commission considered that the disease might be due to an infection of the intestinal canal, and that a diet insufficient in animal protein might predispose to its development. The diet of the Italian peasantry which had suffered so much from the disease was rather low in animal protein. Marked gastro-intestinal inflammation and intestinal ulcerations occur in pellagra, and lend color to the Illinois conception, which is worthy of study, with experiments upon the diet of the pellagrous insane.

April, 1913, saw the opening of the psychiatric clinic and hospital attached to Johns Hopkins Hospital, Baltimore, the gift of Henry Phipps, Esq., of Pittsburgh, and under the directorship of Dr. Adolf Meyer, for many years at the head of the Psychiatric Institute of the New York State Hospitals for the Insane, at Wards Island. Dr. Meyer planned the building after special study of Swiss, German, French,

Austrian, and Italian hospitals for the insane. The architect was Grovesnor Atterbury, of New York.

INSECTS AND PROPAGATION OF DISEASE. See ENTOMOLOGY; INSANITY, *Pellagra*; and MEDICAL PROGRESS, *passim*.

INSURANCE. LIFE INSURANCE. *Statistics.* According to the report of the superintendent of insurance of New York State there were doing business in that State on December 31, 1912, 34 companies, of which 11 were New York State companies, and 23 were companies of other States. These companies had a total of 7,001,913 policies in force, insuring \$13,527,000,000. This was an increase during the year of 380,000 in the number of policies, and \$725,000,000 in the amount of insurance. The policies were classified as follows: whole life, 4,284,966, insuring \$8,683,000,000; endowment, 2,073,181, insuring \$3,064,000,000; term and irregular policies, 643,766, insuring \$1,683,000,000. The gross assets of all the companies were \$4,173,953,000, an increase of \$231,809,000 as compared with the previous year. Of the total assets, New York State companies had \$2,371,000,000; and companies of other States \$1,803,000,000. The total liabilities, exclusive of surplus and special funds amounting to \$231,775,000, were \$3,942,000,000, of which the New York State companies had about 56 per cent. The total income of all companies was \$795,282,000, an increase of \$40,748,000 over the preceding year. The net excess of income over disbursements for 1912 was \$227,764,000, almost exactly the same as in 1911. The total income from premiums alone for 1912 was \$597,202,000. The total disbursements for the year were \$567,517,000, an increase of merely \$41,000,000, as compared with 1911. There were paid for claims \$246,459,000; for lapsed and surrendered policies, \$84,600,000; in dividends to policy holders \$89,171,000; in dividends to stock holders \$1,130,000; for commissions \$53,511,000; for salaries and medical examiners' fees \$49,658,000. In other words, there was paid to policy holders \$423,019,000; while the cost of management was \$144,497,000. The total number of policies issued during the year was 898,027, insuring \$1,716,000,000; and the policies terminated numbered 511,770, insuring \$981,412,000. The proportion of policies terminated by principal causes was about as follows: death, 12 per cent.; maturity, 5 per cent.; expiry, 12 per cent.; surrender, 29 per cent.; lapse, 42 per cent.

Policy Loans. At their annual meeting at New York, in December, the national convention of insurance commissioners adopted a resolution calling for the passage of laws restricting policy loans. They proposed that hereafter every insurance policy contain a clause giving the company the right to defer for at least 60 days the granting of a policy loan or cash surrender value. Statistics were presented to show that the ratio of policy loans had risen in 25 years from 3 per cent. to 25 per cent. Total loans outstanding were estimated at \$1,500,000,000. It was stated that 120 companies which obligate themselves to make loans or pay cash surrender value on demand have actual cash on hand of only 1 per cent. of such obligations. They would, therefore, have great difficulty in meeting demands in time of panic.

Postal Life Insurance Company. This com-

pany was formed a few years ago and became of substantial size through the reinsurance of the business of the economic life, the mutual reserve fund life, and the provident savings life. It is unique in that it has no agents, but gets in touch with prospective insureds through newspaper and magazine advertisements and does its soliciting by mail, direct from the main office. It was subjected to a seven months' examination by the New York insurance department, covering the period to June 30, 1912. The voluminous report stated that it was as yet impossible to state accurately the expense of getting business by the postal's method; but during 1911 the advertising expense was \$25,661, and the new premium income, \$26,578. During the first 6 months of 1912 the advertising and medical expenses were 54 per cent. of the new premium income. The superintendent of insurance stated that the company has no litigation arising out of its own business; that there is merit in the medical department of the company; that the company claimed an addition of \$40,000 to surplus between June 30 and December 1, 1912; and that the company was succeeding well with the solution of numerous problems arising from taking over the business of the Provident Savings Life Assurance Society.

State Supervision vs. State Insurance. Since the great insurance scandals of nearly a decade ago there has been much favor expressed in this country for insurance to be issued by State government. Massachusetts, in 1910, instituted a plan for issuing industrial life insurance through savings banks. In 1912, Wisconsin undertook the issue of standard life insurance in competition with private companies. Following the growth of a more intelligent public opinion as to the nature and functions of life insurance the companies have accepted a vastly greater amount of regulation and supervision as the most feasible means of preventing an effective movement for State insurance. Superintendent of Insurance William T. Emmet, of New York, declared in January, before the Association of Life Insurance Presidents, that the only way to save the business for private companies is through State supervision carried even to premium rates and all other details. Pointing to the elaborate public insurance systems of England and Germany and the recent inauguration of schemes by some of the States, together with the Socialistic tendencies of the day, he stated his belief that the movement toward a State system is bound to continue. He said this movement is based on "the fundamental proposition that insurance is a universal need, an absolute public necessity." He thought that effective supervision would check only temporarily the demand for a State system.

Others pointed out that insurance is a co-operative effort; is motivated in part by a strong sentiment; and that, therefore, its exploitation for profit is obnoxious.

The opponents of State insurance declared that it would prove ineffective because it made insufficient provision for soliciting; and because it would become the spoils of party politics. The first of these arguments was answered by the statement that the State could provide an ample system of educating the public; and the second by pointing to the post office and the educational system.

INDUSTRIAL INSURANCE. The report of the New York State superintendent of insurance showed that the four great industrial insurance companies, Metropolitan, Prudential, John Hancock, and Colonial, had in force, on December 31, 1912, 24,558,837 policies, insuring \$3,432,767,000. Of the total number of policies, the Metropolitan had 48 per cent.; the Prudential, 42 per cent.; and the John Hancock nearly all the remainder.

FIRE INSURANCE. The report of the superintendent of insurance of New York showed that on December 31, 1912, there were doing business in that State 131 American joint-stock, 28 mutual, and 52 foreign joint-stock fire and fire marine insurance companies. These 211 companies showed aggregate resources of \$641,917,000, an increase of \$47,818,000 over 1911. Their total liabilities, excluding capital, were \$342,911,000. Their capital amounted to \$81,175,000, of which \$25,954,000 was charged to the American branches of foreign companies. The total income from all sources was \$358,712,000; 181 companies showed an excess of income over disbursements \$37,280,000, whereas 30 companies showed a deficit of \$2,381,000. The disbursements aggregated \$323,814,000, of which \$157,923,000 was for fire losses, \$68,537,000 for commissions, \$25,931,000 for administrative expenses, \$9,045,000 for taxes, and \$19,708,000 for dividends. During the year 1912 the companies assumed fire risks of \$43,135,188,000, charging thereon premiums aggregating \$454,943,000. The total fire risks in force at the close of the year were \$51,202,402,000.

In mid-summer, Superintendent Emmet of the New York department issued a report showing that the rates fixed by the New York Fire Insurance Exchange, controlling rates in Greater New York, were excessive. He found that in 13 years the companies had made an underwriting profit of 14 per cent. and an investment return of 2 per cent., or gross average profit of 16 per cent., exclusive of interest on capital and surplus. On the other hand, in May, at the annual meeting of the National Board of Fire Underwriters, statistics were presented showing that in 10 years, 1903-1912, 183 principal companies doing most of the business in this country had received in premiums a total of \$2,550,000,000, and had paid out in fire losses, expenses and increased liabilities, \$2,553,000,000. These figures were designed to show that on the whole the companies were living on their income from investments.

Arson. Following several conspicuous cases of incendiarism, Fire Commissioner Johnson of New York City declared that twenty-five per cent. of the fires of that city were of incendiary origin; that there existed an organized band of incendiaries constituting an "arson trust"; and that the insurance companies were to blame in part for not inspecting more carefully the risks offered them. He said that through collusion dishonest brokers, solicitors, and adjusters of the city succeeded in burning and securing insurance for \$4,000,000 worth of property annually. This position was in part supported by others who called attention to the court records and the activities of State fire marshals. Moreover, the findings of legislative committees in New York, Wisconsin, and Illinois had shown that incendiarism was encouraged by the greed of companies for a large volume of business and the agency system both leading to over-insur-

ance. Commissioner Johnson proposed that thorough inspection and appraisal precede the issue of an insurance policy; but this was said by insurance experts to be impracticable on account of the cost. It was therefore proposed that agents should be required to certify that they know the property and its owner, that the owner is worthy, and that the insurance is not excessive. Then provide that, if it should be shown later that the property was over-insured, the agent should forfeit his commission thereon. This would work no harm to honest owners or honest agents, and would safeguard the lives and property of innocent persons. But, on the other hand, it was asserted that the extent of arson was grossly exaggerated; that nearly all agents were honest; and that companies do not consciously tempt the criminally inclined by permitting over-insurance.

American Union Fire Insurance Company. This Philadelphia company failed early in the year, its failure being one of the most serious in the fire insurance world in many years. The cause of its collapse was said to be incompetency on the part of principal officers and neglect by the directors. The State insurance examiners found that the December 31, 1912, report was grossly false. Assets were about \$603,000, or only one-half the sum reported, plus \$456,000 uncollectable premiums. Unearned premium liabilities were about \$680,000, and unpaid losses about \$173,000. Before failure, plans had been almost carried out to have the company's business taken over by a strong New York company; but this was prevented by sudden receivership proceedings. The insurance department of Pennsylvania acted as liquidator. Commentators pointed out that this failure showed the insufficiency of the usual State supervision of insurance companies to protect the policy-holder; more confidence must be placed in the integrity of the company management than in official inspection.

Missouri Experience. Early in 1913 the Missouri legislature enacted an anti-trust law known as the Orr law. This law declared that it should be *prima facie* evidence of guilt for any representative of one insurance company to use the same rate as that used by any representative of any other insurance company. On April 30 and shortly thereafter nearly every fire insurance company declared its intention of transacting no further business in that State while the law was in force. The superintendent of insurance then announced that he would revoke the license of any company taking such action; and the attorney-general instituted injunction and *quo warranto* proceedings against the companies. These proceedings were upheld by the State Supreme Court June 28. This trouble really began under the Oliver law of 1911, whereby under the discretionary power of the superintendent of insurance considerable reductions in rates and hence in premium income of the companies was enforced. Thus the loss ratio in Missouri increased from 59.3 per cent. in 1909 to 72.5 per cent. in 1912. These ratios contrast with that of 36.66 per cent. for 65 large companies outside the State during the ten years 1903-1912. Following the withdrawal of the companies the principal bureaus of fire insurance agents suspended business. Soon thereafter the attorney-general in a written opinion declared his belief that the objectionable fea-

tures of the law were unconstitutional, and agreed to dismiss the court proceedings.

This experience of the State of Missouri in endeavoring to enforce competition in insurance rates attracted wide attention. It was the prevailing opinion, particularly among those who favor the ultimate adoption of State insurance as the most reasonable solution of the insurance problem from the social standpoint, that not only is competition in fire insurance impossible, but it is positively undesirable. They contend that, if it could be actually enforced, there would eventually result increased fraud and less actual protection for the public.

MARINE INSURANCE. There were at the close of 1912 doing business in New York State thirty-two domestic and twenty-eight foreign companies writing marine insurance. All of the American companies did in addition a fire insurance business. During 1912 the aggregate marine and inland risks underwritten amounted to \$15,781,957,000. Of this the foreign companies wrote sixty per cent. The total marine and inland insurance in force in these companies at the close of 1912 aggregated \$1,171,740,000, of which two-thirds was credited to the domestic companies. See also SAFETY AT SEA.

CASUALTY, CREDIT, AND TITLE. Some slight indication of the extent of casualty, fidelity, surety, and credit insurance is shown by the reports of companies doing business in these lines in the State of New York. In 1912 there were 63 companies with total assets of \$162,406,000, total liabilities of \$88,736,000, and combined capital and surplus of \$73,669,000. They had a total income in that year of \$122,125,000; they paid claims of \$43,197,000, dividends of \$5,864,000; and had expenses of \$60,029,000. In the same State at the same time there were 11 title and mortgage insurance companies, with aggregate assets of \$52,410,000, and income during the year of \$6,865,000.

FRATERNAL INSURANCE. According to the report of the superintendent of insurance in New York State, seventy-five fraternal orders making reports in 1912 claimed assets of \$121,524,000. During the year they received from members \$80,461,000 and from other sources \$6,184,000; they paid out to members \$64,091,000, and in expenses \$10,386,000. They had in force at the close of 1912, 5,151,526 certificates, with a total insurance in force, amounting to \$6,163,020,000. There were in addition over 300 minor organizations mostly fraternal, but including assessment life and accident associations, which made no report. These figures, while they include perhaps 60 per cent. of the fraternal insurance of the better orders of the entire country and thus show clearly the enormous extent of the fraternal movement, do not throw any light on the hundreds of minor and often misleading societies which spring into existence here and there for short periods.

The great problem confronting fraternal insurance in recent years has been that of the soundness of their actuarial principles. Fraternal societies are designed to afford not only financial protection, but also social opportunities. They are due mainly to a demand for insurance at lower cost than that supplied by old-line companies. This they have often been able to afford because of less expensive machinery; moreover the assessment principle makes it possible for the contributions of many to

pay the benefits accruing to the few. But as the orders have expanded, and especially as their membership has attained a higher average age with consequent increase in the number of deaths, the necessity of sounder actuarial principles and of more experienced financial management has been enforced upon them. The Mobile bill, drawn up at a conference of fraternal bodies and insurance commissioners in 1910 and providing a sounder basis for fraternal insurance, has been enacted in sixteen States. In December, 1912, a similar conference proposed an amendment permitting societies to continue their existing membership on existing rates, but empowering the State to require a sufficient number of assessments annually to pay all claims as they accrue. The amendment also requires, full publicity at stated intervals to each member. The adoption of this amendment would prevent any fraternal order from gradually approaching bankruptcy.

TAXATION. Much attention has been given in recent years to the subject of taxation of insurance companies, especially following the corporation tax law of 1909. The discussion was renewed with vigor preceding and following the passage of the income tax provisions of the new tariff law. In both acts the dividends of insurance companies were taxed. Statistics were presented to show that the taxes paid by insurance companies reporting to the New York department amount to over \$12,000,000 per year; and that in 33 years, 1877-1909, these companies paid in a total of \$148,940,000 in taxes. This was near 21 per cent. of the entire dividends returned to the policy holders during that period. The taxation of dividends by the income tax law was therefore vigorously resisted, mainly on the ground that its only effect would be to make insurance more expensive. This would tend to reduce the amount of insurance taken and the number of persons insured, whereas there would be great social advantage in increasing the extent of insurance.

In a case testing the constitutionality of the corporation tax law the Circuit Court of Appeals held that where a dividend of a mutual insurance company is applied in reducing the premiums for the ensuing year, for increasing the amount of insurance or for diminishing the time it is not a true dividend taxable under the corporation tax law. The Supreme Court of the United States in December practically affirmed this opinion by denying a writ of certiorari to review this decision. It was estimated that under this decision the government must refund about \$1,500,000 collected during the four preceding years from insurance companies.

In December the Supreme Court also sustained the right of the State of Montana to tax net receipts of life insurance companies in each county. The contention of the New York Life Insurance Company that such taxation constituted an interference with interstate commerce was overruled.

Where the question of the taxation of insurance companies is under discussion, one general and concluding consideration is in place, namely, that it is not by any means universally recognized here that participating insurance is really a coöperative undertaking with the purpose of obtaining insurance at cost. The recognition of this fact in England is shown by the fact that a

deduction from taxable income is made in the case of sums paid for insurance.

INTERNAL COMBUSTION ENGINES. Both on land and sea the internal combustion engine first successfully developed by Diesel, continued to receive increased attention and application. The capacity of such engines for use with ships had reached a point where units aggregating 6000 horse power were turned out, as will be found described under shipbuilding (q.v.). In central station work a maximum of about 2000 kilowatts capacity at the outside has been set for these prime movers as certain difficulties connected with the large sizes of cylinder still remain to be overcome. Progress was expected, however, especially with the turbine form of constructing large units, as the simplicity of construction, economy of operation, and general availability characteristic of the smaller size undoubtedly could be secured in larger machines, though difficulties of construction do arise and lower efficiency is manifested. The problem of cooling becomes quite serious in connection with the very large units. The accepted specific consumption for the heavy oil engine was stated as 0.4 pounds of fuel per horse power hour under full load and favorable conditions of operation, which fact alone was sufficient to insure its installation under favorable circumstances and to lead to further attempts to overcome unfavorable conditions.

American manufacturers had been slow about installing gas engines, especially in comparison with European plants, but in the summer of 1913 the Ford Motor Company, at Detroit, installed a 5000-horse power gas engine. In spite of the fact that the United States is the leading source of petroleum, large size engines for the use of crude oil have been neglected and practically every other nation in the world has led the United States in their use. During the year, however, arrangements were made by a large steam engine manufacturing company in the United States to undertake the manufacture of a Swedish type of Diesel engine for both stationary and marine service. The matter was one of increasing importance in the United States on account of the rise in the cost of gasoline and the necessity of employing crude oil fuel for power purposes.

An interesting machine which was being developed experimentally in England by Low, was an internal combustion engine into which coal is fed directly. As first designed this machine derived its gas from the effect of heat on tubes containing coal. The coal was pushed forward by spiral conveyors which extended

through the tubes, but owing to the high temperature these conveyors lost their rigidity and had to be abandoned. In the later model Dr. Low employs larger feed pipes arranged vertically so that the coal is fed forward by its own weight.

Professor Hopkinson, the well-known worker in the field of internal combustion engines, devised a method of cooling gas engine cylinders by the direct injection of water on piston and exhaust valves, which was attracting considerable attention. During the year the Humphrey gas pumps for the Metropolitan Water Board of London were completed and put in operation. See PUMPS.

During the year a patent was granted to Hiram Percy Maxim, of Hartford, Conn., for a silencer for gas engines based on much the same principle as the silencer on fire arms of the same inventor. It consists of a series of wide cylindro-spiral shells reversely directed, eccentrically arranged, and nested in such a way as to provide a series of alternately reversible spiral-whirl pumps which gradually expand regularly from the admission end and gradually contract towards a constricted discharge throat, together with cooperating supporting means. No extensive use of this device had been attempted during the year, but it occasioned considerable interest.

DIESEL LOCOMOTIVE. The success of the Diesel high compression oil engine for stationary units suggested its application to the railway locomotive and during 1913 an express locomotive destined for service on the Berlin-Magdeburg line was constructed by Sulzer Brothers of Winterline, Switzerland. In this locomotive there is a driving engine direct-coupled to the driving axles and an independent auxiliary engine which serves to generate compressed air for operating the main engine in starting, on heavy grade, etc., with high charges, while there is a system of storage tanks that can be drawn upon when the auxiliary engine is not in operation, or even while it is working. The new locomotive is 54.46 feet in length between the buffers and weighs 95 tons in full working order. The driving wheels which are coupled are 5 feet 29 inches in diameter and the energy is transmitted from a loose shaft to the coupled wheels by coupling rods. The driving engine is in the centre of the machine and has a reversible four-cylinder, single-acting Sulzer motor, working on the two-cycle principle. There are four cylinders set by pairs at an angle of 95° to one another, with each pair at an angle of 45° to the planes of the track. The bore of the cylinders is 14.96 inches and the length of stroke is 21.65 inches. There are two cranks set at 180° designed to run at 304 revolutions per minute at a traveling speed of 100 kilometers per hour. The engine can be controlled at either end and has a complete mechanism for starting, reversing, operating the brakes, whistles, and other gear.

On its preliminary trial a fast freight train with its steam locomotive was hauled at a speed of 44 miles per hour and the traveling speed varied between 12.43 and 49.7 miles per hour. The engine was considered most successful and further developments along this line were looked for.

GAS TURBINE. A gas turbine rated at 1000 horse power was reported during the year, de-

signed and constructed by Holzwarth of Mannheim, Germany. This machine was stated to have operated successfully with a high thermal efficiency and marked a step in advance for machines in this field. The gas turbine, of course, has the advantage of direct rotary motion, as compared with the reciprocating motion of the ordinary internal combustion engine. Such machines, however, in 1913, were in an early stage and much remained to be done, both experimental and practical, in connection with their development.

IOWA. POPULATION. The population of the State in 1910 was 2,224,771. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 2,222,472.

AGRICULTURE. The area, production, and value of the principal crops in 1911-1913 are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1913	9,950,000	338,300,000	\$202,980,000
	1911	9,850,000	308,850,000	181,836,000
Wheat	1913	795,000	16,395,000	12,460,000
	1911	647,000	10,622,000	9,348,000
Oats	1913	4,880,000	168,360,000	57,242,000
	1911	4,950,000	128,225,000	51,752,000
Rye	1913	60,000	1,092,000	655,000
	1911	30,000	540,000	416,000
Potatoes.....	1913	150,000	7,200,000	5,904,000
	1911	174,000	12,876,000	9,399,000
Hay	1913	3,000,000	64,440,000	42,624,000
	1912	3,537,000	4,952,000	47,044,000

a Tons.

MINERAL PRODUCTION. The total value of the mineral products of the State in 1912 was \$22,900,350, compared with \$21,112,896 in 1911.

The total production of coal in the State in 1912 was 7,289,529 short tons, valued at \$13,152,088. Iowa was one of the few States in which there was a decrease in the coal production in 1912. The production in 1911 was 7,331,648 tons, valued at \$12,663,507. The decrease was due to the fact that most of the mines were shut down during April and the greater part of May, pending the adjustment of the wage scale. The coal mines suffered also from car shortage. The number of men employed in the coal mines of the State in 1912 was 16,370. These worked an average of 188 days, against 16,599 for an average of 203 days of Mines, there were 19 men killed in the coal in 1911. According to the United States Bureau

mines of the State, compared with 40 in 1911. All the fatalities in 1912 occurred underground, and 11 of them were due to falls of roof and coal.

The total value of the clay products in 1912 was \$4,522,326, an increase of \$89,452 over 1911. The State is the first in the manufacture of drain tile.

EDUCATION. The total school population in 1913 was 671,016, and the enrollment was 507,846. The average daily attendance was 369,874. The total number of teachers employed was 27,432. The total expenditures for the common schools for the year ending June 30, 1913 was \$16,442,528. The value of the school houses in the State was \$30,422,000.

TRANSPORTATION. The total mileage of railways in the State in January 1, 1913, was for steam railways, 9975 miles, and for inter-urban railways 449 miles. There has been no railway construction of any account in the State in several years.

FINANCE. The total receipts from all sources for the fiscal year 1913 amounted to \$5,423,110. The disbursements for the same period were \$5,084,769. At the beginning of the fiscal year there was a balance in the treasury amounting to \$1,041,486, leaving the balance at the end of the fiscal year 1913 of \$1,375,827. The chief sources of revenue are from the general property tax, from the tax on insurance companies, from the collateral inheritance tax, from fees from corporations, from the motor vehicles tax. The State has no debt of any kind.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions under the control of the States, with their populations in 1913, are as follows: The Reformatory, Anamosa, 669; Cherokee State Hospital, Cherokee, 1025; Clarinda State Hospital, Clarinda, 1166; School for the Deaf, Council Bluffs, 216; Soldiers' Orphans' Home, Davenport, 559; Industrial School for Boys, Eldora, 409; State Penitentiary, Fort Madison, 558; Institution for Feeble-minded Children, Glenwood, 1362; Independence State Hospital, Independence, 1193; State Hospital for Inebriates, Knoxville, 174; Soldiers' Home, Marshalltown, 814; Industrial School for Girls, Mitchellville, 140; Mount Pleasant State Hospital, Mount Pleasant, 1109; State Sanatorium, Oakdale, 117. The total expenditure for State institutions in 1912 was \$10,822,311.

POLITICS AND GOVERNMENT. There was no election for State officers during the year. The term of Governor Clarke expires when the legislature organizes in January, 1915. The next State election is on November 3, 1914. The legislature on January 21 reelected William S. Kenyon United States senator. The House passed, on March 7, a resolution for the submission of an amendment providing for woman suffrage which must be repassed by the legislature of 1915 before the amendment can be voted on by the people.

LEGISLATION. The legislature met in 1913 and passed several important measures. These include the following: Employers' liability and workmen's compensation law; a measure creating a State highway commission; a measure providing for the submission of a woman suffrage amendment to the people; a measure providing for the submission of initiative and referendum

amendments to the people; the presidential primary act patterned after the California law; acts providing for a prevention of unfair competition and discrimination; a measure providing for a non-partisan judiciary; a blue-sky law; and a measure providing for the arbitration of industrial disputes. See also LIQUOR REGULATION.

STATE GOVERNMENT. Governor, George W. Clarke; Lieutenant-Governor, W. L. Harding; Secretary of State, W. S. Allen; Treasurer, W. C. Brown; Auditor, J. L. Bleakly; Attorney-General, George Cosson; Superintendent of Education, A. M. Deyoe; Adjutant-General, Guy E. Logan—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, Scott M. Ladd; Judges, F. R. Gaynor, Wm. D. Evans, Horace E. Deemer, B. W. Preston, S. M. Weaver, W. S. Withrow; Clerk, Burgess W. Garrett—all Republicans.

STATE LEGISLATURE, 1913. Republicans: Senate, 33; House, 66; joint ballot, 99. Democrats: Senate, 17; House, 42; joint ballot, 59. Republican majority: Senate, 16; House, 24; joint ballot, 40.

The State representation in Congress will be found in the section *Congress*, article UNITED STATES.

IOWA, STATE UNIVERSITY OF. A State institution for higher education, founded at Iowa City, Iowa, in 1847. The total enrollment in all departments in the autumn of 1913 was 2629, of whom 1476 were in the College of Liberal Arts, and others in the professional schools. The faculty numbered 203. During 1913 the title of the School of Education was changed to that of College of Education, and two new professors were added. A course in home economics with Miss Ruth Wardell was established. There was also organized an extension fund, including the bureau of public administration, the bureau of municipal information, the bureau of social welfare, and other bureaus. The College of Applied Science was developed, and two new chairs were established in the College of Homeopathic Medicine. The productive funds of the university amount to about \$250,000, and the income from these to about \$12,000. The library contains 100,000 volumes. The president is John G. Bowman.

IRELAND. See GREAT BRITAIN.

IRIDIUM. See PLATINUM.

IRON AND STEEL. The production of iron ore, pig iron, and steel showed a noteworthy increase in 1912 as compared with 1911. The quantity of iron ore mined in the latter year did not quite equal that of the year 1910, but the tonnages of pig iron and steel manufactured in 1912 both exceeded the output of these metals in 1911. The quantities of iron ore mined in the United States in 1912 amounted to 55,150,147 long tons, as compared with 43,876,552 long tons in 1911, an increase of 11,273,595 long tons, or 25.69 per cent. In 1912 nearly 85 per cent. or \$46,483,798 long tons, were produced in the Lake Superior district, which includes Michigan, Wisconsin, and Minnesota. The production in this district in 1911 was 35,672,804 long tons. In the southeastern district, including Maryland, the Virginias, Kentucky, Tennessee, North Carolina, Georgia, and Alabama, 5,665,386 long tons were produced in 1912, nearly the same quantity as in 1911. The northeastern district, including Massachusetts, Connecticut, New York, New

Jersey, Pennsylvania, and Ohio, produced 2,139,058 long tons in 1912, a slight increase over the production in 1911.

Iron ore was mined in twenty-seven States in 1912 as in 1911. Of these States, four, Idaho, Montana, Nevada, and Utah, produced ores for fluxing only. Part of the production of Colorado was for fluxing and part for pig iron. Michigan produced a small quantity for flux and a small quantity was produced in Missouri for special fluxing use. The remaining States produced iron ore for blast-furnace use only. The rank of the five States producing the largest quantity of iron ore—Minnesota, Michigan, Alabama, New York, and Wisconsin—remained unchanged in 1912. The Minnesota iron ranges produced five-eighths of the total. There were mined in Minnesota in 1912 34,431,768 long tons; in Michigan, 11,191,430; in Alabama, 4,563,603; in New York, 1,216,672, and in Wisconsin, 860,000. The following tables show the production of iron in the United States by States in 1911 and 1912:

State	Rank	1911	
		Mined Quantity, in long tons	Percent- age of total
Minnesota	1	24,645,105	56.17
Michigan	2	10,329,039	23.54
Alabama	3	3,827,791	8.72
New York	4	1,061,279	2.42
Wisconsin	5	698,660	1.59
Virginia	6	614,023	1.40
Pennsylvania	7	537,606	1.23
New Jersey	8	466,234	1.06
Tennessee	9	463,835	1.06
Georgia	10	203,889	.46
Missouri	11	65,325	.15

In 1912 382 iron ore mines were active, as compared with 374 mines in 1911.

IMPORTS. The imports of iron ore in the United States in 1912 amounted to 2,104,576 long tons, valued at \$6,499,690. Of this, Cuba produced approximately 66 per cent. of the ore; Sweden 16 per cent.; Newfoundland and Labrador 7 per cent.; Canada 5 per cent.; Spain 4.4 per cent.; and smaller quantities from Russia, Germany, United Kingdom, Netherlands, and other countries. The quantity of ore exported in 1912 amounted to 1,195,742 long tons, valued at \$3,537,289.

WORLD PRODUCTION. The table below shows the production of iron ore in the principal countries in 1909-12, where statistics are available.

PIG IRON. The production of all kinds of pig iron in the United States in 1912 was 29,726,937 long tons, compared with 23,649,547 tons in

^a Bureau of Statistics of the American Iron and Steel Institute.

The old number of furnaces in blast on December 31, 1913, was 313, compared with 266 on July 30, 1913, and 231 on December 31, 1911. The production of the chief grade of pig iron in 1912: Bessemer and low phosphorous, 11,664,015 long tons; basic (mineral fuel), 11,417,886 long tons; foundry and ferrosilicon, 5,073,873 long tons.

STEEL. The production of Bessemer steel ingots and castings in the leading States in 1912 was 10,327,901 long tons; of open-hearth steel ingots and castings, 20,780,723 long tons, or a total production of 31,251,313 long tons. Ohio was the largest producer of Bessemer steel, followed by Pennsylvania and Illinois. Pennsylvania produced the largest amount of hearth steel or 12,408,109 long tons, out of the total amount produced. Ohio ranked second, Indiana third, Illinois fourth. The total electric production of steel in 1912 was 18,309 long tons, as compared with 29,105 tons in 1911,—a decrease of 10,796 tons. In 1912 there were thirteen plants which made steel by the electric process, as compared with a total of nine in 1911.

IRON. According to the estimates of the United States Geological Survey, the quantity of iron ore mined in the United States in 1913 was between 58,000,000 and 60,000,000 long tons. This is the highest record of iron production since its beginning. In the Lake Superior district, where about 85 per cent. of the domestic iron ore is mined, the increase was about 8 per cent. over the production of 1912, or about 50,000,000 long tons. In the Birmingham district of Alabama, the production was about 10 per cent. greater than that of 1912. In Tennessee there was a slight decrease, and in North Carolina, a slight increase. New Jersey and New York both showed slight increases, while Pennsylvania showed a slight decrease. In

the Rocky Mountain district of Wyoming, Colorado, and New Mexico, there was a slight decrease. See also **METALLURGY**.

IRRIGATION. Throughout the world generally the year 1913 was one of considerable activity in the extension of irrigation to new areas but in the United States few new enterprises were undertaken, and little progress was made in settling lands under enterprises previously begun. The progress of the year in different parts of the world is summarized below:

UNITED STATES. Work on the projects of the U. S. reclamation service, begun in former years, was continued throughout the year. The annual report of the U. S. reclamation service for the year ending June 30, 1913, showed that on March 31, 1913, the total receipts credited to the reclamation fund amounted to \$80,323,817.44, to which should be added a loan from the treasury of \$20,000,000, making the total fund \$100,323,817.44. Of this there had been expended up to June 30, 1913, \$86,444,087.80. The area included in the government projects on that date was 2,973,048 acres, to 1,290,107 acres of which the service was prepared to furnish water for the season of 1913. The area covered by water-right applications and rental agreements,—that is the area for which the land holders had entered into agreements to pay water-right charges—were 942,272 acres, and the acreage estimated to have been irrigated in 1913 was 721,410 acres. There was, therefore an area of 347,835 acres for which water was ready which was not covered by agreements, and an area of 568,697 acres for which water was ready which was not irrigated in 1913. Under an order dated December 13, 1913, the administration of the Reclamation Service was reorganized and placed in the hands of a board of five members, each of whom had charge of one of the divisions into

which the work was divided: (1) Scientific, statistical, and historical division; (2) engineering and technical division; (3) law division; (4) fiscal and accounts division; and (5) operation and maintenance division.

The limited operations under the Carey act (August 18, 1894, granting desert lands to the States on condition that they provide for their irrigation) indicated further the lack of activity in new irrigation enterprises. During the year ending June 30, 1913, there were applied for under this law 298,689 acres, there was segregated under these and previous applications 395,161 acres, and there was patented to settlers but 35,171 acres. From the date of the passage of this law to June 30, 1913, the area applied for was 7,773,359 acres; the area segregated was 3,685,993 acres; and the area patented was 430,048 acres.

The year 1913 witnessed considerable advance in irrigation legislation. California and Texas adopted codes providing for public control of diversions from streams; Oregon and Washington adopted laws looking to State participation in the construction of irrigation works, and several States amended their laws in various particulars. The Supreme Court of South Dakota rendered a decision (*St. Germain Irrig. Co. v. Hawthorne Ditch Co.*, 143 N. W., 124) which largely nullified the irrigation code of that State.

The dry season of 1913 caused a widespread interest in irrigation in sections of the United States where it had not been practiced previously, and many pumping plants for supplying water for irrigation were installed throughout the eastern part of the country.

FOREIGN COUNTRIES. In the western provinces of Canada the situation was much the same as that in the United States. There was very little activity in the extension of irrigation to new territory. The Canadian Pacific Railway, however, was building a dam across the Bow River, which was part of a project for irrigating a large area.

The federal government of Brazil was building storage dams for irrigation in the northwestern states of Brazil, and, under the decree of December 28, 1911, was contributing one-half the cost of other dams built by individuals and syndicates.

The Peruvian government provided for a bond issue of \$10,000,000 to furnish funds for building irrigation works. The land to be irrigated lies in the coastal plain, and the scheme includes the colonization of the reclaimed land with white settlers, whose agricultural equipment is to be admitted free of duty.

The Chilean government completed plans for the irrigation of 63,000 acres in the province of Linares, at a cost of \$1,100,000. Private parties also were active in irrigation construction.

The Argentine government completed surveys on the Rio de los Sauces for the irrigation of 79,000 acres, at a cost of \$3,397,000, and approved the construction of works in the department of La Paz to cost \$50,000; and the department of Corboda asked legislative permission to issue bonds to the amount of about \$50,000 to be used for the construction of irrigation works.

The acreage of irrigated land in Spain was estimated at about 3,000,000 acres. The gov-

ernment was engaged in the construction of works in the valley of Guadalquivir for the irrigation of 25,000 acres, and had drawn plans for the irrigation of 700,000 acres in the district of Aragon at a cost of \$30,000,000.

In Italy irrigation development was quite active. The royal commission of irrigation had approved projects for the irrigation of 150,000 acres in Puglia and Liguria, and projects on the Sila River in Calabria and on the Tirso River in Sardinia which were to cost something over \$17,000,000. In its new possessions in northern Africa the Italian government was exploring for underground water. In the region lying between the Mediterranean and the Atlas Mountains water was found at depths ranging from 15 to 150 feet, and it was believed that a large part of this tract could be irrigated from wells.

In Rumania plans were prepared for the irrigation of some 3,000,000 acres between Bucharest and the Danube. This area long had been waste land.

In Asiatic Turkey the plans for the reclamation of Mesopotamia, begun in former years, were being carried out, and works for the irrigation of 125,000 acres in the plains of Konia were being built by a German company. These latter works were about ready to be turned over to the government, which was to operate them, making a charge for the water furnished. Durum wheat was the principal crop to be grown.

The government in India was extending its irrigation systems to new territory. Near the city of Mysore on the Cauvery River a project was under construction which would provide for the irrigation of 150,000 acres at a cost of \$3,000,000, and there was a project for the irrigation of 400,000 acres in the delta to the same stream, which was estimated to cost \$10,000,000.

The government of Siam decided on the irrigation of the Menam Valley. The cost was estimated at \$10,000,000, which was to be raised by a government loan.

In French Indo-China a loan of \$17,500,000 was authorized to be used principally for the construction of irrigation works.

In Australia the state of Victoria was proceeding with the settlement of the lands under its works already built, and the state of New South Wales was carrying out the construction of its project on the Murrumbidgee River.

It will be noted from the above summary that practically all construction of irrigation works throughout the world, with the single exception of the western provinces of Canada, was being done by government agencies; and in Canada it was being done by a railway company which in some respects is analogous to a government agency. This is significant since, as shown by the Thirteenth Census, about 97 per cent. of the land irrigated in the United States in 1909 was supplied with water by private agencies. It is a well-known fact that, in the United States, almost without exception large private irrigation enterprises have been financial failures, and this has tended to discourage private enterprise. Judged by the same standard—the direct returns on the capital invested—government enterprises in the United States have been financial failures also. However, a government expenditure cannot be judged by this standard, for the indirect benefit from such

expenditure may far outweigh the direct benefit and justify enterprises which would be entirely impracticable for private agencies. The same thing is true of the railroad irrigation enterprises. The indirect returns in the shape of passenger and freight tolls may more than repay the entire investment although direct returns are small. In the United States a large part of the money invested in irrigation works has been an involuntary contribution to the general good, made in the belief that the investment would pay. Experience seems to prove, however, that such investments will not pay directly, and throughout the world they are being made by agencies which can get their returns from the indirect benefit arising from the development of previously waste territory.

ISATOPHAN is a lemon-yellow crystalline powder melting at 216 C., soluble in alcohol and alkalies, but insoluble in water or ether. It is tasteless and possesses a slight odor resembling atophan, for which drug it is intended as a substitute. The substance has the same therapeutic effects as atophan, and is therefore used as an anti-rheumatic and uric-acid eliminator, but has the advantage of being tasteless. Its chemical formula is given as, $\text{CH}_3\text{O.C}_6\text{H}_4\text{N.C}_6\text{H}_4\text{COOH}$.

ITALIAN LITERATURE. Contemporary Italian literature is not unaffected by modern movements of thought and by passing affections and fads. The year 1913 has brought out, for instance, a brand-new futurist poet, Paolo Buzzi, who promises in *Versi Liberi* to strive as valiantly for notoriety as his colleague Marionetti. The readings of Buzzi and the lectures of Marionetti in public at Milan, Venice, and Rome have been attended usually by riots. The interest in morbid sex psychology, which D'Annunzio stimulated with *L'Innocente*, *Il Piacere*, etc., reappears in *Il figlio vostro* of G. Chiggiato, a romance of the Nietzschean-Tolstoian type. Social problems of radical hue, which in Italy are not so "modern" as in the United States, are treated in such plays as the *Spine dentro il nido* of E. Rivalta, the *Porta chiusa* of Marco Praga, *Intorno al lume* of T. Monicelli, and *La donna moderna* of Nino Bernini. Imported from Paris is even a feminist play of M. Donnay, *Le illuminatrici*. Special aspects of Italian society—the stock in trade of ordinary production—are reflected in E. L. Morselli's drama *La prigioniera*, which shows the aristocracy of blood grappling with the financial question, just as D. Nicodemi, who is enjoying some vogue in Paris, treats the economic features of "high-life" in *L'Aigrette* and *Requins*, which have appeared also in Italy. In *La diversa vita* of E. Rivalta and *Il romanzo dello sdegno* of Valcarengi we have a novel of general psychological analysis, a genre that has recently produced several works of note: *Il banchetto di Lazzaro* of V. Picardi, Ugo Ojetti's *L'Amore e suo Figlio*, Maria di Borio's *La fiamma che temprò*, and *Il Cuore in gioco* of Carola Prosperi, all collections of tales. Among novels of intricate plot, with an appeal to the sense of the wonderful, the most noteworthy are *Mio zio il Diavolo* of A. Varaldo, Persio Falchi's *Novelle del demonio*, and a curious study in mental aberration by R. Artuffo, *Il profeta delle rose*. Lino Feriana's *Mamma benedetto* is an interesting collection of tales for children.

But there are portions of the contemporary

output that reflect the deeper instincts of the Italians and are more essentially national in character. One of the most surprising features of the Italian consciousness to-day is its unabated interest in antiquity. It would be unjust to refer to an atavistic principle the great vogue of the historical drama and romance, so true is it that this reworking of historic themes shows vital modern aspirations looking toward the future. There is to be sure much static romanticism in Sem Benelli's latest triumph, *La Gorgona*, a drama of love and death on the background of twelfth-century Pisa. Here the historical motive is at best superficial. But Hellenism in its noblest form inspires the *Drammi satireschi* of E. Romagnoli. There is some serious work behind the *Nerone* of G. Bonaspetti, which centres on the murder of Agrippina and the resulting effects on Nero's conscience. Of much the same subject is the *Agrippina minore* of Pelaez d'Avoine. D. Tumiati continues with two historical plays: *Guerrin Meschino*, for mediæval chivalry, and *Alberto da Guisano* for the patriotism of the revolution. Ettore Moschino has published a *Cesare Borgia*, and Amico-Rosso a *Savonarola*, R. Pentini a *Tiberio Gracco*. The Rome of the eighteenth century peers through the humor of Jondolo's *Goethe a Roma*. Of the next century are the *Giacobina* of G. Marcotti and the *Giovanni Frangipani* of V. Buonmartini. Of national inspiration are *Le sette leggende* of A. Orvieto, narrations in verse, and the *Novelle drammatiche* of G. Morpurgo. Not only the glamor of a great name, but richness of detail as well, lend special interest to the *Pisanella* of D'Annunzio, a study of Byzantine character and costume in mediæval Cyprus. Here, on a groundwork of wide scholarship of the same thoroughness for which he is noted, D'Annunzio integrates all the elements of Hellenism, Oriental intensity, and Latin passion with the extraordinary lyric splendor which is the essence of his art. It is, on the other hand, rather the narrower aspect of D'Annunzian sensualism that reappears in his most recent *Ferro*. Meanwhile the vogue of *Parisina* shows no decline. The diary of D'Annunzio, *Memoranda*, and several novelettes, among them *Leda senza il cigno*, have appeared. The enthusiasm aroused by these works testifies to the fact that advertisement plus genius still maintains the poet of Pescara in the front rank of contemporary Italian letters.

With similar assiduity the Italians are cultivating what is possibly the most fibrous branch of current literature, the analysis of regional life. This, studied in its minute and most essential characteristics, still recognizes Fucini, for Tuscany, and Salvatore di Giacomo, for Naples, as its most masterly interpreters. Grazia Deledda, for Sardinia, has had a prolific year in the tales *Chiaroscuro* and the romances *Canne al vento* and *Colombi e sparvieri*. Beltramelli, for Umbria, has published *Le novelle della guerra* and a volume of verse, *Sollicchio*. Pirandello, Pastonchi, and Zuccoli have been issuing at least one tale a month. C. Carozzi, for the Italian Alps, has published *Su per L'erta*, while sailor-life is studied in *I marinari* of R. Piva. Ability of much promise has appeared in a newcomer, Paola Driga with *La Fortuna*. Her tales, like the *Mirti all'ombra* of Contri, are studies of sombre outline,

while in *La vita di tutti* of Giulio Caprin there is a lighter humorous touch. The region of Trieste is reflected in the newly collected *Scritti vari* of Giglio Padovan. For Venice, Antonio Pilot, a passionate cultivator of Venetian memories, who has just published a remarkable *Antologia della lirica veneziana*, comes out as a poet himself in *Cocolezzi sempiezzi mitezzi in lingua veneziana*. G. C. Santini has some rollicking Roman dialect verse in his *Napoleone*. It is Florence that inspires the *Rime del Marzocco* of Rina Pierazzi and a four-act play of A. Novelli, *La cupola*.

It will be seen then that the historical drama and the regional tale are the characteristic representatives of current Italian interests. Meanwhile there is a rich scattered production, especially in the lyric, along individual lines. Milly Dandolo, a girl of eighteen, has published some promising poems. The *Canti* of Maria Cardini and *La Scomparsa* of Maria Stella show well-defined personality. L. Zambarelli in *Fràte Francesco* continues his remarkable religious poems. A new aspect of the scholar A. Serena is shown in his *Versi*, while some noteworthy results are obtained by P. Briganti in *Canti del meriggio*, in *Il mazzo di carte* of G. Giusta; *La Lucerna* of G. Zucca and *Canti di Trifoglieto* of E. Fabretti. During the year public testimonials have been offered to Arturo Colautti and Aurelio Costanzo. Special tribute has been paid to Alfredo Oriani, whose collected theatre is now available, and to Mariello Taddei, the Florentine journalist and poet, who died at twenty-five. Graf, De Gubernatis, and Padovan died during 1913.

ITALIAN SOMALILAND. An Italian colony and protectorate in northeast Africa, separated from the British East Africa Protectorate by the river Juba. The area is 365,400 square kilometers (141,081 square miles), and the population is estimated at 300,000. The imports in 1912 were valued at 5,533,462 lire, and the exports at 2,055,018. The budget for 1912-13 was estimated to balance at 6,534,856 lire. A civil governor administers the country—in 1913, Salvago (Marquese) Raggi—residing at Mogadisho.

ITALY. A constitutional monarchy of southern Europe, hereditary in the male line of the house of Savoy. It includes the Apennine Peninsula and the islands of Sicily and Sardinia. The capital is Rome.

AREA AND POPULATION. In the table below will be found the compartimenti into which Italy is divided, the number of provinces in each compartimento, the area in square kilometers, and the *de facto* population February 10, 1901, and June 10, 1911 (final returns):

	P.	Sq. kms.	1901	1911
Piedmont	4	29,367	3,317,401	3,424,450
Liguria	2	5,278	1,077,473	1,197,231
Lombardy	8	24,085	4,282,728	4,790,473

Calabria	3	15,075	1,370,208	1,402,151
Sicily	7	25,739	3,523,799	3,672,258
Sardinia	2	24,109	791,754	852,407
Total	69	286,682*	32,475,253	34,671,377

* 110,682 square miles.

The total population as estimated January 1, 1912, was 34,813,975. The total *de jure* population in 1911 was 35,845,048 and in 1901 32,965,504. The marriages in 1912 numbered 264,457 (260,198 in 1911); births, 1,181,560 (1,141,036); deaths, 683,124 (790,302); still-births (included in the foregoing), 47,574. Oversea emigration (1912), 403,306; to Europe and other countries by way of the Mediterranean, 308,140; total, 711,446. Total 1911, 533,844 (262,779 oversea); 1910, 651,475 (402,779); 1909, 625,437 (399,282); 1908, 486,674 (238,573); 1907, 704,675 (415,901). To the United States came, in 1912, 267,637; 1911, 191,087; 1910, 262,554; 1909, 280,351; 1908, 131,501; 1907, 298,124. Immigrants 1911, 218,998; 1910, 161,148; 1909, 134,210; 1908, 300,834; 1907, 248,428. The communal population of Naples (1911) was 678,031; Milan, 599,200; Rome, 542,123; Turin, 427,106; Palermo, 341,088; Genoa, 272,221; Florence, 232,860; Catania, 210,703; Bologna, 172,628; Venice, 160,719; Messina, 126,557.

AGRICULTURE. The rich soil yields fruits in abundance. Wine is produced in quantities for consumption and export. From Tuscany, Liguria, and the province of Bari come olives and olive oil. In the table below are to be found area in thousands of hectares under main crops in 1912, and production, in thousands of quintals, for consecutive years, 1913 figures subject to slight revision:

	1000 ha.	1912	1910	1911	1912	1913
Wheat	4,755	41,750	52,362	45,103	58,352	58,352
Rye	123	1,382	1,346	1,343	1,420	1,420
Oats	508	4,148	5,947	4,109	6,310	6,310
Barley	244	2,065	2,349	1,330	2,352	2,352
Corn	1,594	25,839	23,796	25,063	27,500	27,500
Rice	146	4,380	4,792	4,395	5,433	5,433
Beans	598	5,098	5,168	4,022

Olives	2,313	9,357	13,529	6,097

* Sugar beets. † Production of fibre. ‡ Production in hectoliters of wine.

The horses in the country (1908) numbered 849,723; mules, 388,337; cattle, 6,198,861; buffaloes, 19,266; sheep, 11,162,926; goats, 2,714,878; swine, 2,507,798. The value of forest products was given in 1909 at 124,132,000 lire.

Sericulture is a wide-spread industry. The average annual output of cocoons being estimated at 52,563,000 kilograms, and the output of silk at 5,654,000 kilos.

MINING, ETC. The number of iron mines in operation in 1911 is reported at 31, with 2055 work people, and an output of 373,786 metric tons of ore, valued at 6,767,519 lire; ferramanganese, with 78 workers, 6842 tons, 58,338 lire; manganese 9, with 165 workers, 3515 tons, 110,120 lire; 9 copper, 797 workers, 68,136 tons, 1,225,593; 88 zinc, lead, and lead and zinc, 14,318 workers, 139,719 tons zinc (15,369,972 lire), 38,458 tons lead (6,540,149 lire), and 550 tons lead and zinc (24,500 lire); 1 silver, 43 workers, 2441 tons, 81,644 lire; 9 mercury, 949 tons, 83,200 lire; 3 argentiferous antimony, 304 workers, 2441 tons, 81,644 lire; 9 mercury, 949 workers, 97,803 tons, 4,664,597 lire; 10 iron and copper pyrites, 2142 workers, 165,273 tons,

3,141,044 lire; 35 coal, etc., 3061 workers. 557,137 tons, 5,021,506 lire; 352 sulphur, 19,293 workers, 2,682,766 tons, 31,097,336 lire; 18 asphalt and bitumen, 1861 workers, 188,681 tons. 3,065,027 lire; 12 boric acid, 442 workers, 2648 tons, 1,006,240 lire. The quarries employed 70,767 work people in 1911, and their total output was valued at 61,048,203 lire; the lime and brick kilns employed 99,354 workers, and their output was valued at 173,595,764 lire.

FISHERIES. The value of the fisheries output was given in 1909 at 22,407,000 lire (tunny-fish, 3,485,000 lire).

COMMERCE. In the table below are shown imports for consumption and exports of domestic produce, with imports and exports of coin and bullion (including all precious metals), for consecutive years, values in thousands of lire:

	Imports		Exports	
	Mds.	C. & B.	Mds.	C. & B.
1908.....	2,913,275	28,052	1,729,263	21,012
1909.....	3,111,710	18,001	1,866,890	54,063
1910.....	3,246,976	31,066	2,079,977	48,116
1911.....	3,389,298	28,896	2,204,272	42,092
1912.....	3,604,104	25,906	2,396,145	41,745

The transit trade in 1911 amounted to 78,754,000 lire; in 1910 to 77,878,000; 1909, 67,050,000; 1908, 54,101,000. Some of the principal articles of import and export in 1911 are shown below:

Imports	1000 lire	Exports	1000 lire
Cereals.....	397,800	Silk.....	350,400
Cotton.....	348,100	Cotton textiles.....	183,300

* Other than citrous.

The principal countries of origin and destination follow, values (1911) in thousands of lire: Germany, 550,200 imports and 301,200 exports; United Kingdom, 509,800 and 22,800; United States, 415,300 and 247,200; France, 327,200 and 206,200; Austria-Hungary, 288,900 and 184,800; Russia, 234,800 and 50,900; Rumania, 120,900 and 23,400; British India, 172,200 and 21,900; Argentina, 106,800 and 166,200; Belgium, 82,000 and 51,900; China, 53,200 and 2100; Switzerland, 77,600 and 203,600; Brazil, 50,300 and 42,600; Egypt, 41,500 and 61,000; Japan, 31,300 and 2100; European Turkey, 34,400 and 54,300; Spain, 29,900 and 16,400; Tunis, 22,500 and 9500; Asiatic Turkey, 19,900 and 44,100.

The total vessels entered in the 1911 trade numbered 173,437, of 56,056,306 tons. Of these, 159,647 of 35,924,881 tons (66,546 seamen, of

32,990,606 tons) were Italian and 13,790, of 20,131,425 tons (12,665 steamers, of 20,008,751 tons) were foreign. Cleared, 173,353 vessels, of 56,082,448 tons; of these, 159,552, of 35,945,206 tons (66,518 steamers, of 33,004,937 tons) Italian, and 13,801, of 20,137,242 tons (12,663 steamers, of 20,014,104 tons) foreign.

The merchant marine included January 1, 1912, 5470 vessels, of 1,107,985 tons (757 steamers, of 696,994, and 4713 sail, of 410,991).

COMMUNICATIONS. There were in operation March 1, 1913, 17,634 kilometers of railway lines, of which 13,769 were operated by the state, which actually owned 13,632 kilometers. There were 5150 kilometers of tramways. During the year there was in progress the improvement and re-location of the Rome-Naples connection, with the result that 22½ miles were to be saved. The station at Naples was being considerably increased. The Italian electric system was being extended by a second Giovi line from Sampierdarena to Ronco, and a tunnel was being constructed to connect Genoa at the new Brignole station with the east side of the port. In November a railway line from Soverato to Sanvenero was started. The new line was to be about 75 miles in length and a contract representing about one-sixth of the entire distance was begun. It will connect Soverato with Chiarazalle, and run through mountainous country with many engineering difficulties. Telegraph lines (June 30, 1911), 51,172 kilometers; wires, 311,584 kms.; state stations, 5874; railway and other, 1994. Marconi stations, 20; on board, 125. Length of urban telephone lines, 12,089 kms.; wires, 192,838 kms.; interurban lines, 31,354 kms.; wires 60,905. Post offices, 11,089.

FINANCE. The lira (whose par value is 19.295 cents) is the unit of value. In the table below are shown actual revenue and expenditure for consecutive years, in lire:

	1909-10	1910-11	1911-12
Revenue.....	2,602,163,326	2,833,164,212	2,682,640,373
Exp'diture.....	2,551,286,013	2,753,625,043	2,623,425,632

The budget estimate for 1912-13 was 2,645,994,671 lire revenue and 2,630,172,684 lire expenditure. The budget for 1913-14 (as accepted July 17, 1913) estimated the ordinary revenue at 2,397,733,541 lire, derived as follows: 56,091,495 from state domains, railways, etc.; 500,800,000 from direct taxes; 334,750,000 from taxes on transactions (stamps and registration, mortgages, etc.); 1,123,722,990 from indirect monopoly 327,030,000, salt monopoly 89,000,000, quinine monopoly 2,700,000; 196,792,000 from revenue-earning administrations (posts 122,000,000, telegraph and telephones 40,300,000, etc.); 87,265,324 from repayments; 34,247,500 from various and 64,064,235 from special sources. Extraordinary revenue, 259,262,429 lire; making the total revenue, ordinary and extraordinary, 2,656,995,970 lire. Ordinary expenditure, 2,126,662,936 lire, distributed as follows: 638,624,948 treasury (359,639,029 interest on the consolidated debt, 133,709,972 floating debt, etc.), 328,269,413 finance (expenses of administration and collection of taxes, etc.), 363,652,430 war, 226,707,951 marine, 137,364,714 instruction, 132,990,829 interior, 132,198,171 posts and telegraphs, 58,215,416 public works. 55,476,780 jus-

tice, 27,735,532 agriculture, industry, and commerce, 25,156,747 foreign affairs.

The total capital of the debt stood July 1, 1912, at 13,429,360,000 lire (consolidated 10,052,311,000, redeemable 3,971,568,000, treasury bonds 207,268,000, current accounts 72,947,000, paper money 479,054,000; total 14,783,148,000, minus 1,353,788,000 gold in treasury). Interest, 523,075,574; amortization, 1,921,047.

The budget, as presented by Sr. Tedesco on December 20, showed a surplus of 25,000,000 lire, which would be applied on the cost of the war in Tripoli, together with a surplus of 112,500,000 lire for 1912-13, and 37,500,000 lire for 1913-1914. The cost of the war thus far was estimated at 950,000,000 lire.

NAVY. The number and displacement December 1, 1913, of warships built and building, of 1500 or more tons, and of torpedo craft of 50 tons and over, were as follows: 2 battleships (dreadnought type) having a main battery of all big guns (11 inches, or more in calibre), of 40,940 tons, built, and 7, of 172,760 tons, building; 8 battleships (pre-dreadnought type), of 96,100, built; 9 armored cruisers, of 74,020 tons, built; 7 cruisers, of 20,030 tons, built, and 3, of 6223 tons, building; 28 torpedo-boat destroyers, of 10,987 tons, built, and 19, of 13,730 tons, building; 68 torpedo boats, of 11,584 tons, built, and 2, of 240 tons, building; 19 submarines, of 5475 tons, built. Total tonnage built, 259,136; building, 192,953—in all, 452,089 tons. Excluded from the foregoing are ships over twenty years old, unless reconstructed and re-armed within five years; torpedo craft over fifteen years old; transports, colliers, repair ships, torpedo depot ships, and other auxiliaries. Italy ranks seventh in the list of the eight great naval powers. The personnel of the navy is composed of 37,101 officers and men, including 1 admiral, 18 vice-admirals, 14 rear admirals, 131 captains and commanders, and 1011 other line officers. Air craft April 7, 1913: 8 military dirigibles on hand and 2 ordered, and 100 military aeroplanes (including monoplanes, biplanes, and hydro-aeroplanes) on hand and 30 ordered. See also **AERONAUTICS.**

Italy has a shipbuilding programme extending to the year 1917-18. A certain sum is allowed each year for new construction and maintenance. As the number and type of vessels to be laid down each year is determined by the minister of marine, it is not known what the construction for the year will be until the navy department has made its decision. The minister of marine is responsible to the Parliament, and is aided by an under-secretary of state.

If construction now under way proceeds without delay, Italy will have by 1916 ten dreadnoughts in commission—the *Dante Alighieri*, completed 1912; the *Conte di Cavour*, the *Leonardo da Vinci*, and the *Giulio Cesare*, to be completed 1914; the *Andrea Doria* and the *Caio Duilio*, launched March 30 and April 24, 1913; the *Dandolo*, the *Morosini*, the *Mazzini*, and the *Mameli*, reported to have been begun in 1913. The second-class cruiser under reconstruction under the name *Libia* was originally the *Drama* ordered for Turkey and seized by Italy during the Turko-Italian War. The *Marsala* and the *Nino Bixia*, now building at Castellamare, are smaller cruisers of the type of the *Quarto* completed 1912. The *Basilicata* and the *Campania*, building for protection and patrol duty, are third-class cruisers.

Two days after the death, on December 20, 1913, of General Vittorio Cuniberti (q.v.), called by the *London Times* "the father of the dreadnought," the ministry of marine adopted his plans, opposed for years by Italian naval experts, for four new battleships—the *Vittorio Emanuele*, *Regina Elena*, *Roma*, and *Napoli*. These vessels will combine high speed with heavy armament, for use within a limited area. Italy has lagged behind the nations in acknowledging officially the naval genius of Cuniberti. Great Britain, Germany, Russia, Japan all consulted him and adopted his ideas; he assisted in German naval development, helped to build up the Japanese fleet, and reconstructed the Russian navy after the war with Japan. Dead, Italy mourns him and approves his projects. (See also **BATTLESHIPS** and **NAVAL PROGRESS.**)

GOVERNMENT. Under the constitution of 1848, as subsequently amended, the king is the executive acting through a responsible council. The legislative power rests with the king and a parliamentary body composed of a senate (whose members are the princes of the royal house over twenty-one years of age, and an unlimited number—about 390—of eminent men nominated by the king for life) and a chamber of 508 deputies popularly elected for five years.

The reigning king (1913), Victor Emmanuel III., was born November 11, 1869; in 1896 he married Princess Hélène of Montenegro. He succeeded to the throne upon the assassination of his father July 29, 1900. Heir-apparent, Prince Humbert, born September 15, 1904.

The ministry (as constituted October 1, 1913) was as follows: G. Giolitti, premier and minister of the interior; A. (Marchese) di San Giuliano, foreign affairs; P. Bertolini, colonies; C. Finocchiaro-Aprile, justice; F. Tedesco, treasury; General P. (Conte) Spingardi, war; Rear-Admiral Millo, marine; L. Credaro, instruction; E. Sacchi, public works; F. S. Nitti, agriculture, etc.; posts and telegraphs, F. Tedesco, acting.

HISTORY

IMPERIALISM AND THE SOCIAL DEMOCRATS. The militaristic and imperialistic enthusiasm which had made the Turco-Italian War possible subsided rapidly after the conclusion of the Treaty of Lausanne (October 15, 1912; see 1912 YEAR BOOK); and the high cost of living, coupled with the prevalence of unemployment, was an active agency in stimulating resistance to the increased financial and military burdens. The occupation of Libya might be gratifying to Italian patriotism, but it cost about \$200,000 a day. Then in addition to the enormous military expenditure, millions must be spent on harbors, docks, railways, and improvements, if the newly-acquired province was to be worth anything, and over and above the cost of garrisoning and improving Libya, millions more would be demanded to make Italy's navy and army impressive enough to comport with her new dignity and strong enough to defend her new position. Altogether it was an expensive undertaking. Other parties were willing to make the sacrifice, or at least to ask the taxpayers to make the sacrifice, for the glory of Italy, but the Social Democrats set themselves squarely against all further expenditure on the conquest of Libya. On June 14 the majority of the Chamber voted the 101,000,000 lire (\$20,200,000) demanded by the

ministry for the subjugation of the Arabs, but it was plain that socialist criticisms had annoyed the government. On June 1 the premier had been driven to say that, "If it becomes necessary an appeal to the country will be made in the interest of national defense. It is the firm intention of the government to demand nothing from the lower classes, but to levy new taxes on the solid basis of real wealth." The Socialists, however, continued to find fault, and alleged that in order to obtain funds for the Libyan expedition the ministry had resorted to disguised loans, and appropriated the anticipated excess of the income-tax receipts as far in advance as 1930. Vice-Admiral Pasquale Leonardi Cottolica, who as minister of marines had been subjected to criticism on account of the proposed naval increases, resigned on July 28, ostensibly on account of overwork, and was succeeded by Vice-Admiral Enrico Millo, the leader of the famous raid on the Dardanelles of July, 1912.

THE GENERAL ELECTION. In calling a general election for October 26, Premier Giolitti gave out a statement of policy which emphasized the benefits of colonial expansion and the need for military occupation of the interior of Libya. He declared that the armament of Italy was to be strengthened, and urged that measures be taken for the regulation of labor disputes, the provision of accident insurance for workmen, and the institution of educational and hygienic reforms. With this programme Signor Sonnino, leader of the Constitutional Opposition, found little fault; but in a manifesto to his supporters he advocated an extension of old age pensions in addition to the reforms projected by the government. There was not so much interest in these formal programmes, however, as in three other features of the election: (1) in what way the extension of suffrage would affect the result, (2) to what degree the Socialist anti-imperialistic propaganda would be successful, and (3) to what extent the Catholics would participate in the polling.

The electoral reform law of 1912, as noted in the last YEAR BOOK, enfranchised all males over 21 years of age, save those illiterates, under 30, who have not served in the army. The number of eligible voters was thus increased from 3,247,722 to 8,635,148. Considerable anxiety was felt about the effect of enfranchising the great mass of ignorant soldiers, but the results were reassuring. To be sure, some rioting occurred at Cesovia, Aversa, Amalfi, Catania, Bari, and Palermo; but in general the balloting was orderly. By no means all of the new electors took advantage of their right to vote; in many districts the percentage of abstentions rose as high as 50 per cent., and in two districts of Rome hardly more than one-fourth of those eligible voted. It was natural that the Socialists and Radicals should gain by the enlargement of the electorate. The large towns, with the notable exception of Rome, gave the Radicals and Socialists large gains. The Socialist representation rose from 41 to 78; but still remained an insignificant minority in the Chamber. This fact might be interpreted as an indication that popular sentiment continued to favor the annexation of Libya; or again, it might mean that only a small part of the population approved the extreme anti-clericalism of the Socialists.

The third, and probably the most interesting

feature of the election, was the part played in it by the Catholics. Hitherto a great number of loyal Catholics had refrained from voting at the express desire of the Pope. Pope Pius IX., it will be remembered, had ordered that while the government refused to recognize the rights of the papacy, Catholics should not take active part in politics. This prohibition, the *non expedit* as it is called, enforced by Leo XIII., was not maintained in all its vigor by Pius X., and in the present election remained operative in only 178 districts. In the remainder of the 508 districts many Catholics exercised the suffrage, and in one place the bishop was the first elector to cast his ballot. In most of these districts the Liberal, or Constitutional-Democratic candidate was supported against Socialists or Republicans; elsewhere, in order to prevent the election of an anti-clerical, the Catholics put up and elected a candidate of their own, with the result that 33 avowed clericals were returned. The support given to Liberal candidates gave rise to a rumor that the government had reached an understanding with the clericals, and Count Gentiloni, president of the Catholic Electoral Union, was quoted in the *Giornale D'Italia* as saying that in almost 280 districts the Catholics had voted for moderate candidates who promised to oppose anti-clerical legislation, that over 100 of those elected had given pledges in writing to Count Gentiloni, and that in the new Chamber 230 of the 508 votes would be controlled by the Catholic party. The statements were subsequently denied, and there seemed to be no indication that the Catholics would abandon their purely defensive attitude; nevertheless, the anti-clerical press was loud in its protests against clericalism. The new Chamber is composed as follows: Nationalists and Catholics, 35 (gain, 14); Liberals or Ministerialists, 260 (loss, 72); Constitutional Democrats, 48 (gain, 8); Radicals, 70 (gain, 19); Reformist and Organized Socialists, 78 (gain, 37); Republicans, 17 (loss, 6). It may be noted that the famous ex-priest, "Father" Murri, was defeated, as well as the director of the rabidly anti-clerical journal, *l'Asino*. Ex-minister Nunzio Nasi was triply elected from Sicily, where he is still regarded as a hero, despite the fact that he has been convicted of corrupt practices.

The Senate of Italy is appointive rather than elective. Thirty-nine appointments were made by the king with the consent of the council; of the 39, 3 were Socialists. See also SOCIALISM.

THE NEW PARLIAMENT. The new Parliament assembled to hear the speech from the throne on November 27. In the speech, the government emphatically reiterated its determination to complete the work of pacification in Libya, and expressed the hope that the new colony would attract Italian emigrants. The church was to be free in its religious functions, but not to interfere with the state. For the extension of education and for the maintenance of defense, new taxation would be needed, but no new taxes would be imposed on the poor. On the following day the Chamber elected the Liberal, Signor Marcora president, by 304 out of 474 votes, Signor Prampolini (Socialist) receiving the next highest number of votes (81); and then proceeded to discuss the speech from the throne. The debates that followed were heated and often disorderly. Once the sitting was suspended af-

ter Sr. Ciccotti (Socialist) had recounted Sr. Giolitti's somewhat dubious relations with the Banco Romano some years ago. On another occasion the Socialists shouted "Down with the House of Savoy," and sang the "Internationale." At last, on December 19, the Right Centre, and Radical Left united to give the ministry a vote of confidence. Against the 362 affirmative votes, 90 Republicans and Socialists registered their useless negatives, and 13 Radicals abstained. During the course of his explanations before the Chamber, Premier Giolitti made the important announcement that he personally favored divorce, although he believed the country was not yet ready for a divorce law. He promised, however, to bring in a bill to provide that civil marriage must precede the religious ceremony. A Republican resolution in favor of divorce was rejected by 228 to 123 votes.

FOREIGN POLICY. In December, Signor San Giuliano made a full statement of Italy's foreign policy. In retrospect, he observed that the powers of the Triple Alliance had acted in harmony throughout the Balkan crisis, and that the independence of Albania was sincerely desired by Italy. He went on to say: "As for the Egean Islands, which we at present occupy, we shall base our actions on the Treaty of Ouchy [Lausanne, see 1912 YEAR BOOK, TURCO-ITALIAN WAR]. . . . Italy continues to affirm and maintain the principle that no great power should profit by the present Oriental crisis to extend its territory. The maintenance of the territorial *status quo* and of the present equilibrium, therefore, continues to be the steadfast purpose of Italian policy. . . . To this end, the integrity and strength of Turkey must be assured; Italy is, therefore, disposed to lend effective aid to the Ottoman empire, and to participate in its future economic development." "The day for a policy of renunciation on the part of Italy is past, and cannot return. But in her days of prosperity and puissance, Italy will abide by the promise that once in less happy days she made to Europe. In short, Italy hopes to be in Europe, in the Mediterranean, and in the entire world, an element of order, equilibrium, and peace."

OTHER EVENTS. The old grievance against Austria-Hungary was revived in September by an unpleasant incident in Trieste, a town still claimed for Italy by the "irredentists." The Austro-Hungarian governor of Trieste issued a decree, based on an old law of 1867, expelling from the province of Trieste all foreigners engaged on the public works. "Foreigners," of course, meant Italians, and the Italian press was bitter in its complaints. Only a week previous, the Italian general, Caneva, warmed by his cordial reception in Vienna, had declared "*Irredentism* in Italy is dead." In November, there was a fight between Austrian and Italian students at the University of Gratz. In Rome the defeat of the Radical-Republican-Socialist combination caused the resignation of Mayor Nathan. The minister of posts and telegraphs, Signor T. Calissano, died on September 21. Charges of corruption, in connection with the construction of the new palace of justice occupied much attention in May, and in July resulted in the resignation of two deputies, Tomaso Mosca and Riccardo Luzzato. See also articles on **ARBITRATION**, **INTERNATIONAL**; **LIBYA**; **ROMAN CATHOLIC CHURCH**; **TURKEY AND THE BALKAN PEOPLES**.

IVORY, VEGETABLE. See **HORTICULTURE, under New Fruits and Plants**.

IVORY COAST. A colony of French West Africa (q.v. for area, population, etc.). A delimitation committee proceeded in 1909 in conjunction with Dutch officers representing the Liberian government to determine the boundaries; as the results are not yet published it is impossible to give other than a tentative area for the Ivory Coast. The inhabitants are Agni, fetishists and polygamists, of the same family with the Ashanti; Mandé, part Mohammedan, part pagan; the indigenes of the lagoons, and various tribes of the southwest grouped under the name Kroumen. There are two well-defined regions—the lower forest zone, peopled thinly by pagan tribes of low grade; the upper savannah zone, where Islam has exercised a civilizing influence. Mahogany and other woods, palm nuts and oil, rubber, manioc, and peanuts are produced. Stock-raising is ill developed, the animals being half wild and poorly cared for. The geology of the country is little known and the mining industry is embryonic. The total imports for 1911 were valued at 20,566,940 francs, and the exports at 18,242,832 francs (mahogany, 23,812,368 kilograms; palm nuts, 5,251,426 kg.; palm oil, 6,625,498 kg.; rubber, 1,263,345 kg.). Vessels entered (1910), 344, of 741,439 tons. A railway from Abidjan reaches the N'Zi at Dimbokro (183 kilometers). Thence a line completed, September 1, 1912, departs for Bouaké (316 km.), whence it is to be extended north to the frontier. Bingerville is the capital, with 78 European and 780 native inhabitants; Lahou has 78 and 3050; Bassam, 164 and 2832; Abidjan, 110 and 613. The governor in 1913 was G. Angoulvant.

JACKSON, JOSEPH COOKE. An American lawyer and soldier, died May 22, 1913. Born in Newark, N. J., in 1835, and a graduate of Yale College, he studied law at New York and Harvard Universities, and in 1860 began the practice of law in New York. On the fall of Fort Sumter he volunteered for service; in 1862 was promoted to be captain for gallantry, and in the same year was commissioned lieutenant-colonel of the 26th New Jersey Infantry. In 1865 he was breveted brigadier-general for faithful and meritorious services in the field. He resigned from active service January 5, 1863. During the war he was appointed by Secretary Stanton special war department commissioner of the United States Naval Credit, and established 1900 naval enlistments. In 1864 he was admitted to the United States Supreme Court, and resumed general law practice. For nearly thirty years he was attorney and counsel for many corporations, and was an officer in philanthropic and patriotic societies. He was authority for important military reports and records, and was the author of occasional orations, addresses and essays on legal, historical, literary, and business topics. Several of these were published in pamphlet form.

JACKSON, WILLIAM PURNELL. United States senator (Republican) from Maryland. Born in Salisbury, Md., in 1868, he was educated in the public schools, and at the Wilmington Conference Academy. His father was engaged in the lumbering business and in 1887 Senator Jackson became a partner. He took a prominent part in politics in Maryland, and was a member of the 59th and 60th Congresses.

He is an officer or director of many important financial institutions. He was appointed to succeed the late Senator Rayner, on November 29, 1912.

JAMAICA. A British crown colony; the largest of the British West Indian islands. Area, 4207½ square miles; population (1911), 831,383 (15,605 white, 163,201 colored, 630,181 black, 22,396 East Indian). Capital, Kingston (57,379 inhabitants). Area under sugar cane (1911-12), 34,766 acres; coffee, 24,473; bananas, 82,435. Cotton and cinchona are grown, and St. Ann's, Hanover, Westmoreland, and St. James cattle are raised. Imports in 1911 amounted to £2,865,553 (£2,614,943 in 1910); exports to £2,948,067 (£2,568,221). The principal articles of export (values for 1911) are bananas (£1,456,581), sugar (£247,413), coffee (£154,131), dyewoods (£107,277), cacao (£101,448), rum (£85,916), pimento (£83,252), ginger (£58,886), oranges (£46,984). Railways in operation, 184.35 miles (Kingston to Montego Bay, 112.69; Spanish Town to Ewarton, 17.16; Bogwalk to Port Antonio, 54.50). There are excellent roads. There are internal and external telegraphs and an efficient telephone service. Tonnage entered and cleared (1911), 4,319,112. The revenue and expenditure for 1911-12 were, £1,356,092 and £1,350,551 (£1,169,543 and £1,169,991 in 1910-11). The public debt stood March 31 1912, at £3,910,620. Governor appointed 1913, Sir W. H. Manning.

Turks and Caicos Islands, Cayman Islands, Morant Cays, and Pedro Cays are administratively attached to Jamaica.

JAMES, OLLIE M. An American public official who took his seat in the Senate from Kentucky in the Sixty-third Congress (see KENTUCKY). He was born in Crittenden County, Ky., in 1871, and received an academic education. He was admitted to the bar in 1891, took an active interest in politics, was a delegate to the Democratic national convention in 1896, a delegate-at-large in 1904 and 1908, and in each year chairman of the delegation. In 1903 he was elected to the Fifty-eighth Congress, and reelected to successive Congresses up to and including the Sixty-second. In 1908 he seconded the nomination of William J. Bryan for President, and he was elected United States senator on January 10, 1912, for the term 1913-20. Mr. James was prominent in the Democratic national convention which nominated Woodrow Wilson for the presidency. He was elected permanent chairman of the convention.

JAPAN. A Far Eastern constitutional empire. The capital is Tokyo.

AREA AND POPULATION. The principal islands of Japan proper have an area of 24,352.25 square ri; these and their adjacent islets total 24,794.36 square ri (147,657 square miles). An estimate of 1912 placed the population at 52,200,685. The Japanese dependencies have an area of 18,664.02 square ri (111,150 square miles): Chosen (Korea), 14,123 sq. ri, or 84,106 sq. mi.; Taiwan (Formosa), 2,324.11 sq. ri, or 13,841 sq. mi.; Hokoto (Pescadores), 7.99 sq. ri, or 48 sq. mi.; Karafuto (Japanese Sakhalin), 2208.92 sq. ri, 13,155 sq. mi. To these should be added the Manchurian leasehold of Kwanto (Kwantung), with an area of 1221 sq. mi. The population of the dependencies as estimated in 1912 was about 18,000,000. The following table shows for Japan proper the area of principal islands, of adjacent islands, and

total area; with total legal population on December 31, 1908:

Prin. Islands	Square miles		Total pop.
	Prin. Isls.	Adj. Isls.	
Honshiu	86,305	470	86,775
Shikoku	6,856	175	7,031
Kiushiu	13,768	1,820	15,588
Hokkaido	80,114	162	80,276
Chishima *	6,024	...	6,024
Sado	335	...	335
Oki	130	...	130

Tsushima	262	4	266
Riukiu †	934	...	934
Ogasawara ‡	27	...	27
Total	145,024	2,633	147,657
			49,588,801

* 31 islands. † 55 islands. ‡ 20 islands.

The population of Japan, which for many years prior to the overthrow of the Shogunate was almost stationary, now appears to be increasing by nearly 700,000 per annum. The urban population is increasing much more rapidly than the rural; from 1903 to 1908 the average increase in cities of over 20,000 was 20.5 per cent., while the increase for the country as a whole was 6.1 per cent. Living birth rate in 1909, 34.20; death rate, 2.19. Marriages in 1909 per thousand inhabitants, 8.73; divorce, 1.18. In 1910, of the legal population, there were 1,726,522 living births; 1,073,732 deaths; 157,392 still-births; excess of births 652,890; marriages, 442,498. The number of foreigners at the end of 1910 was 15,154, of whom 8462 were Chinese, 2471 British, and 1665 American. On December 31, 1908, there were 97 cities and towns (*shi* and *cho*) having over 20,000 inhabitants. Population of the largest of these was as follows (the district in which the city is situated is given in parenthesis): Tokyo (Tokyo), 2,186,079; Osaka (Osaka), 1,226,647; Kyoto (Kyoto), 442,462; Yokohama (Kanagawa), 394,303; Nagoya (Aichi), 378,231; Kobe (Hiogo), 378,197; Nagasaki (Nagasaki), 176,480; Hiroshima (Hiroshima), 142,763; Kanazawa (Ishikawa), 110,994; Kure (Hiroshima), 100,679; Sendai (Miyagi), 97,994; Okayama (Okayama), 93,421; Sasebo (Nagasaki), 93,051; Otaru (Hokkaido), 91,281; Hakodate (Hokkaido), 91,281; Fukuoka (Fukuoka), 82,106; Wakayama (Wakayama), 77,303; Yokosuka (Kanagawa), 70,964; Sapporo (Hokkaido), 70,084.

EDUCATION AND RELIGION. There is a thorough educational system, and primary instruction is compulsory. The following statistics for public and private schools relate to March 31, 1911: Elementary schools, 25,947, with 152,230 teachers (of whom, 111,201 men) and 6,868,142 pupils (of whom, 3,542,965 boys; middle schools (for boys), 309, with 5857 teachers and 121,612 students; normal schools, 80, with 1479 teachers (of whom, 1287 men) and 25,391 students (of whom, 18,053 male); special and technical schools, 6647, with 8091 teachers (of whom, 7166 men) and 349,858 students (of whom, 298,595 male); superior schools for girls, 192, with 1647 teachers (of whom, 1243 men) and 90,960 students; various schools, 3068, with 9325 teachers (of whom, 5865 men) and 203,114 students (of whom, 116,639 male). The foregoing figures disclose a large proportion of male teachers, remarkable when compared with the proportion of male teachers in the feminized American system. On March 31, 1911, the Im-

perial University of Tokyo had 363 teachers and 5098 students; the Imperial University of Kyoto 191 and 1375; the Imperial Northeast University 86 and 793. There are various other institutions for higher and professional education. Expenditure on public educational institutions in the year 1910-11, 76,636,443 yen, of which 56,258,359 on primary schools.

The principal religious forms are Shintoism and Buddhism. On December 31, 1910, Shintoism had 13 administrative heads of sects, 74,559 preaching priests, 14,527 monks, 171 state temples and temples of superior rank, 51,113 district temples and temples of inferior rank, and 85,850 other (non-distinguished) temples. Buddhism had 56 administrative heads of sects, 51,830 high priests, 891 high priestesses, 73,047 preaching priests, 50,401 monks, 71,819 regular temples and 36,743 other temples. The Buddhist priesthood continues to show a small increase in number, and the Shintoist a small decline. The Christian priesthood, on December 31, 1910, consisted of 2046 ministers (1342 Japanese, 704 foreign), against 1833 in 1905; churches and chapels numbered 1245, against 1158 in 1905. In 1910 Roman Catholic churches numbered 180, Orthodox 129, Presbyterian 216, Congregationalist 126, Episcopal of Japan 199, Baptist 66, Methodist 166.

AGRICULTURE. On January 1, 1911, the taxed land owned by private persons and local corporations amounted to 14,538,528 cho, of which 5,253,363 cho were under cultivation, 7,577,470 under forest, and 1,301,044 open field. (One cho=2.4507204 acres, or very nearly one hectare.) The areas of the principal crops under cultivation in 1911, with production, were as follows: Rice, 2,973,073 cho, 51,694,883 koku (one koku=4.9620141 bushels); wheat, 499,205 cho, 5,009,840 koku; barley, 598,566 cho, 9,385,818 koku; rye, 667,234 cho, 7,505,811 koku. The following are reported for 1910: Peas, 478,138 cho, 3,396,716 koku; adzuki (*Phaseolus radiatus*), 141,075 cho, 965,796; millet, 189,474 cho, 2,092,699; hie (a variety of millet), 58,337 cho, 775,315 koku; kimi (proso), 33,613 cho, 422,860 koku; buckwheat, 156,592 cho, 1,311,575 koku; colza, 138,446 cho, 1,048,051 koku; potatoes, 68,484 cho, 179,397,660 kwan (one kwan=3.2673297 pounds); sweet potatoes, 293,207 cho, 832,877,987 kwan; cotton, 3340 cho, 721,281 kwan; hemp, 12,317 cho, 2,430,210 kwan; tobacco, 29,725 cho, 11,344,307 kwan; indigo plant, 9223 cho, 5,232,850 kwan. In 1911 the production of tea was 6,178,914 kwan; bancha, 2,501,588 kwan; total, 8,680,502 kwan, against 8,342,446 in 1910 and 7,161,901 in 1901. In the year 1910-11, 20,062 cho were under sugar cane, yielding 219,870,982 kwan; sugar production amounted to 109,547,141 kin (one kin=1.3227727 pounds), against 98,024,518 kin in 1909-10.

In 1912 the area under rice was 2,978,277 hectares, production 71,573 metric quintals; wheat, 492,232 ha., 6,992,325 qs.; barley, 1,267,602 ha., 21,679,699 qs.; oats, 46,552 ha., 798,219 qs.; corn, 55,967 ha., 974,726 qs.; flax, 4848 ha., 26,519 qs.; tobacco, 29,135 ha., 433,602 qs.; cotton, 2400 ha., 6300 qs.

Livestock December 31, 1911 and 1912, respectively: Cattle, 1,405,026 and 1,399,498; horses, 1,576,146 and 1,518,743; swine, 298,709 and 308,970; sheep, 3736 and 3308; goats, 100,081 and 101,475. In 1908 about 60 per cent. of the inhabitants were dependent on agriculture.

MINING. The more important mineral products have been as follows:

	1900	1909	1910
Gold (ounces).....	38,304	126,485	140,426
Silver ".....	1,890,636	4,114,740	4,553,104
Copper (kwan).....	6,484,578	12,224,343	13,153,025
Iron ".....	6,624,447	14,450,984	17,924,537
Pyrites ".....	4,310,931	5,735,683	21,246,926
Lead ".....	500,813	914,336	1,041,924
Mang. ore ".....	4,221,524	2,359,280	3,012,997
Zinc ore ".....	5,119,288	5,852,003
Sulphur ".....	3,850,271	9,839,876	11,692,586
Coal (tons).....	7,370,667	14,908,008	15,532,116
Petroleum (koku †).....	767,508	1,657,036	1,608,016

* One kwan=8.2673297 pounds. † One koku=39.703313 gallons (1.8039068 hectoliters).

The production of salt in 1910-11 was 946,192,025 kin, against 995,058,080 in 1909-10 and 1,038,048,628 in 1908-09.

FISHERIES. The value of the take in 1910 was as follows: Fresh fish and marine plants, 78,286,386 yen; dried fish, 20,563,434; salted, 2,221,625; fish oil, 482,052; manure, 6,165,367; other products, 9,073,789; total, 116,792,553 yen, as compared with 104,201,855 yen in 1909 and 79,334,893 in 1900.

MANUFACTURES. The development of manufacturing, after western methods, has been especially notable in the textile and the iron and steel industries. There is a large government foundry at Wakamatsu (a town in Fukuoka district, with about 28,000 inhabitants in 1908), and at Nagasaki are important shipbuilding works. At the end of 1910 33,219 men and 752,219 women were employed in the textile industry. At the end of 1910, cotton-spinning mills numbered 88, with a capital of 59,315,626 yen, 91,519 employees, 1,896,601 spindles, and a yarn output for the year of 56,396,939 kwan; against 50,034,490 kwan in 1909. The value of tissues produced in 1910 was as follows: Silk, 108,610,043 yen; silk and cotton mixed, 24,829,652; cotton, 119,251,259; hemp and linen, 3,642,020; other, 3,611,512; total, 259,944,486 yen, against 241,107,166 in 1909 and 147,212,656 in 1905. In addition, in 1910, sash tissues were produced to a value of 8,789,061 yen. Other manufactures in 1910: Paper, 36,187,557 yen (of which, European paper 16,405,637); matches, 12,610,503; matting, etc., 10,090,352; porcelain and pottery, 13,269,995; lacquer ware, 7,866,780; colza oil, 8,193,886; other vegetables oils, 2,929,328; vegetable wax, 3,716,252.

COMMERCE. In 1912 the record for imports made in 1911 and the record for exports made in 1910 were exceeded. Imports of merchandise for home consumption, of total merchandise, of coin and bullion, and total imports have been as follows, in yen:

	Mdse.*	Total mdse.	C. & B.	Total imps.
1902...	269,103,211	271,731,259
1907...	490,963,404	494,467,346	8,246,503	502,893,849
1910...	460,896,672	464,233,808	17,671,797	481,905,605
1911...	509,868,665	513,806,705	6,163,268	519,973,973
1912...	618,992,277	11,544,351	630,536,628

* For home consumption.

Exports of merchandise, domestic and total, of coin and bullion, and total exports, in yen:

	Mdse.*	Total mdse.	C. & B.	Total exps.
1902...	255,675,017	258,303,065
1907...	428,503,942	432,412,873	18,759,285	451,172,158
1910...	455,091,860	458,428,996	25,175,091	483,604,087
1911...	442,996,848	447,433,888	24,398,286	471,832,174
1912...	526,981,842	28,325,153	555,306,995

* Japanese produce.

The leading imports of foreign produce in 1911 and 1912, respectively, were as follows, in thousands of yen: Cotton (ginned and in the seed), 146,783 and 200,824; iron and steel manufactures, 21,237 and 35,918; rice, 17,721 and 30,193; oil cake, 29,362 and 27,646; iron and steel, 13,550 and 23,543; machinery, 20,958 and 21,357; wool, 11,263 and 16,334; sugar, 9157 and 16,021; kerosene, 13,065 and 12,433; ammonium sulphate, 10,588 and 12,164; woolen yarn, 4783 and 8329; soy beans, 10,306 and 8271; cotton goods, 12,212 and 7518; phosphorite, 6306 and 7458; woolen goods, 11,619 and 5904; pulp for paper-making, 2757 and 4380; steamships, 3645 and 3949; wheat, 3729 and 4410; rubber and gutta percha and their manufactures, 4044 and 4104; hemp, jute, and manila hemp, 2983 and 6225.

Principal domestic exports in 1911 and 1912, respectively, in thousands of yen: Raw silk, 128,875 and 150,321; cotton yarn, 40,213 and 53,681; cotton goods, 25,768 and 43,907; silk goods, 34,758 and 31,834; copper ingots and slabs, 20,003 and 24,921; coal, 17,990 and 20,285; straw manufactures, 10,207 and 13,924; tea, 14,379 and 13,464; matches, 10,073 and 12,044; silk waste, 7786 and 10,543; sugar, 6789 and 8477; porcelain and pottery, 5378 and 5452; oils and waxes, 4368 and 6034; paper and manufactures, 3977 and 4748; sulphur, 5140 and 3410; dried fish, 2576 and 3808; camphor, 3143 and 2827; rice, 3941 and 4368.

Imports and exports of merchandise by countries, in thousands of yen:

SHIPPING. In 1911 there entered at the ports, in the foreign trade, 9000 vessels, of 20,053,569 tons; in 1912 9386 vessels, of 21,700,268 tons. Of the latter, Japanese vessels numbered 5780, of 10,276,438 tons; British 2063, of 6,632,254 tons; German, 430, of 1,548,845 tons; American, 183, of 1,340,061 tons; other, 930, of 1,902,667 tons. Merchant marine January 1, 1913: Vessels of European construction, 3042 steamers, of 1,442,566 tons, and 10,269 sail, of 495,322 tons; vessels of Japanese construction, 21,309 sail, of 282,200 tons.

COMMUNICATIONS. On March 31, 1911, the reported length of state railway in operation in Japan proper was 4869.56 miles; under construction, 652.45 miles. Private railway in operation on the same date, 511.21 miles; under construction 183.06 miles. Total in operation, 5380.77 miles; under construction, 835.51 miles. On March 31, 1910, there were in operation in Taiwan 271.24 miles of railway; in Karafuto, 25.24 miles; in Chosen, 640.71 miles; total 937.19 miles; under construction in Chosen 156.39 miles. The Japanese railways in South Manchuria at the end of March, 1911, aggre-

gated 707.02 miles in operation and 3.06 under construction.

Telegraphs, as reported for 1912: 4657 offices, with 39,256 kilometers of line and 174,210 of wire; 31 wireless stations and 20 on board ship. Post offices, 7790.

FINANCE. The monetary system is on a gold basis; the monetary unit is the yen, par value 49.846 cents. Revenue increased from 260,220,758 yen in the fiscal year 1904 to 857,083,818 in the fiscal year 1908 and 794,037,200 in 1909—the latest year for which the definitive account is available; expenditure was 249,596,131 yen in 1904, 602,400,959 in 1908 and 636,361,093 in 1909. The transitory account shows for the fiscal year 1911 revenue of 672,820,903 yen, and expenditure of 569,154,027. The budget balanced for the fiscal year 1912 at 568,903,916 yen, and for the fiscal year 1913 at 575,976,995 yen. For the latter year, the ordinary estimated revenue was 502,597,196 yen, and the ordinary estimated expenditure 412,073,863 yen. For the fiscal year 1914 the budget balanced at 586,807,598 yen, the ordinary estimated revenue and expenditure being 529,755,649 and 422,018,355 yen, respectively. Estimated ordinary revenue for the fiscal year 1914 included: Excise, 130,156,745 yen; land tax, 75,335,046; monopolies, 63,850,547; posts and telegraphs, 58,992,678; customs, 55,906,687; income tax, 35,471,676; stamps, 29,071,227; patents, 25,059,190; forests, 10,762,740. Estimated disbursements: Finance, 188,910,285 yen ordinary and 42,576,551 yen extraordinary (including 154,635,552 yen for the public debt); war, 78,155,403 and 19,780,673; navy, 42,236,215 and 54,845,591; communications, 61,677,852 and 16,440,730; interior, 12,490,801 and 19,770,353; justice, 12,393,799 and 648,137; agriculture and commerce, 7,708,243 and 9,375,189; public instruction, 9,547,453 and 1,058,843; foreign affairs, 4,298,305 and 293,165; civil list, 4,500,000; total, 586,807,598.

On March 31, 1912, the internal debt was 1,304,730,716 yen; foreign debt, 1,437,449,203; total public debt, 2,742,179,919 yen, as compared with 2,780,381,215 in 1911, 2,454,471,415 in 1907, and 559,164,258 in 1903.

ARMY. In connection with the colonial possessions of Japan and policies involved in Manchuria, the need of colonial garrisons was also a question under discussion, and the position of Japan was likened to that of Italy. These garrisons must be organized on a national army basis, as often their service is serious and necessary. The military organization of Japan includes an active army available for foreign service, a national army for home defense primarily, but available, as was shown in the case of the war with Russia, for foreign service, and a militia. Service is compulsory between the ages of 17 and 40, but the ordinary age of enlistment is 20, the conscript being liable for two years' service in the infantry, and three years in other arms in the active army, or *Geneki*, with the colors. Then seven and one-third years to complete the period in the first reserve, or *Yobi*. This is formed by ten years' enrollment in the second reserve, or *Kobi*, and the remaining period of life is passed in the national army, or *Kokumin*. The peace strength of Japan is about 280,000, and the war strength is estimated at about 1,400,000.

The strength of the Japanese army in 1911 was 13,711 officers and those ranking as officers;

2336 ranking non-commissioned officers and ensigns; and 212,521 petty officers and men. The army was divided into 39 brigades of infantry formed of 80 regiments or 248 battalions and 4 brigades of cavalry of 27 regiments with 89 squadrons. There were 3 brigades of 25 regiments of 50 three-battery battalions of field artillery, 2 batteries of horse artillery, and 3 battalions of 11 batteries of mountain artillery. The heavy artillery included 2 brigades with 6 regiments and 24 battalions of 64 batteries, while there was 1 brigade of engineers formed of 24 battalions of 75 companies and 19 battalions of train. In 1911 450,000 young men were examined by the recruiting officers, and of these 256,864 were considered good for service, 103,784 were called to the colors, and 153,080 were included in the *Hoju*, or recruiting reserve.

The active army and the guard are organized in 19 divisions. In 1913 new guns were being introduced for the horse and mountain artillery. The emperor is supreme head of the Japanese army, but responsible to him are the general staff and war ministry, while independent of both is the inspectorate of military training. The war council, consisting of the minister of war, the naval minister, the chiefs of the general staff, and the naval staff, is maintained. See also MILITARY PROGRESS.

NAVY. Number and displacement of warships of 1500 or more tons, and of torpedo craft of 50 or more tons, built and building, December 1, 1913: Dreadnoughts (battleships having a main battery of all big guns, that is, 11 or more inches in calibre): built, 2, of 41,600 tons; building, 4, of 120,000 tons. Predreadnoughts (battleships of about 10,000 or more tons, whose main batteries are of more than one calibre): built, 13, of 191,380 tons; building, none. Coast-defense vessels: Built, 2, of 9086 tons; building, none. Battle cruisers (armored cruisers having guns of largest calibre in main battery and capable of taking their place in line of battle with the battleships): Built, one, of 27,500 tons; building, 3, of 82,500 tons. Armored cruisers: built, 13, of 138,483 tons; building, none. Cruisers (unarmored warships of 1500 or more tons): built, 14, of 60,995 tons; building, none. Torpedo-boat destroyers: built, 54, of 22,356 tons; building, 2, of 1200 tons. Torpedo boats: built, 28, of 3127 tons; building, none. Submarines: built, 13, of 2672 tons; building, 2, of 1200 tons. Total tonnage: built, 497,199; building, 204,900. Excluded from the foregoing: Ships over 20 years old from date of launch unless reconstructed and rearmed within five years; torpedo craft over 15 years old; transports, colliers, repair ships, torpedo depot ships, and other auxiliaries; vessels not actually begun or ordered, although authorized. Japan is fifth among the nations in amount of warship tonnage built and also in the aggregate of tonnage built and building.

Officers and men in 1913, 49,435, including 3 admirals of the fleet, 8 admirals, 18 vice-admirals, 38 rear-admirals, 259 captains and commanders, and 1915 other officers.

In the above list of warships, the *Satsuma* and *Aki*, completed in 1910, are classified as predreadnoughts, though in some classifications they are placed with the dreadnoughts. The battle cruiser *Kongo*, launched at Barrow, May 18, 1912, proceeded to trial in April, 1913, ex-

ceeding her designed speed of 27 knots. Her principal characteristics are: Displacement, 27,500 tons; length between perpendiculars, 502 feet; beam, 73 feet; draft, 25 feet; battery, eight 14-inch guns and sixteen 6-inch guns; torpedo tubes, 8; maximum thickness of armor belt, 11 inches. The dreadnought *Fuso*, building at Kure, and the battle cruiser *Hiyei*, building at Yokosuka, are due for completion in 1914. (See also BATTLESHIPS and NAVAL PROGRESS.)

GOVERNMENT. Under the constitution of 1889, the Parliament or imperial diet, consists of the House of Peers (366 members) and the House of Representatives (379). Representatives are elected by male subjects having reached the age of twenty-five and possessing certain property qualifications. The executive authority is vested in the emperor, who acts through a cabinet of ministers appointed by and responsible to himself. The emperor Mutsuhito died at Tokyo July 30, 1912, and was succeeded by his son Yoshihito. The new emperor was born at Tokyo August 31, 1879; he married May 10, 1900, Sadako, fourth daughter of the late Prince Kujo Michitaka. Heir-apparent, Hirohito, born at Tokyo April 29, 1901.

HISTORY

THE FALL OF KATSURA. The small and aristocratic circle of elder statesmen or *Genro* which put Prince Katsura in the office of premier in December, 1912, against the will of a parliamentary majority, found itself unable to keep him in office when the country at large protested. The Saionji cabinet, supported by a *Seiyukai* (Constitutionalist) majority, had been overturned by the military party and by the *Genro* because it refused to increase the Korean garrison. Prince Katsura, who as keeper of the privy seal and chief counselor to the emperor enjoyed the special confidence of the monarch, attempted to prepare a programme which would not antagonize the *Seiyukai*, and to divert attention from domestic to foreign affairs. The Diet, which had been prorogued since December, met on February 5 in no amiable mood. The Constitutionlists were determined to have a ministry of their own party; they had agitated the question outside of the Diet in January; they were now ready to declare their lack of confidence in Prince Katsura, now the ministry was in no wise bound to obey the will of the Diet; for the Japanese system, modeled after the German constitution, makes the ministers responsible only to the emperor. An intractable Diet might be inconvenient, however, and Prince Katsura wisely proclaimed a new prorogation of five days. Other methods failing, the emperor ordered Marquis Sainji to induce his Constitutionalist colleagues to withdraw their resolution of no confidence. Even their respect for the divine antecedents of their ruler would not avail against the determination of the Constitutionlists. When the Diet met on February 10 they were still hostile to the government. An excited crowd assembled around the government buildings at Tokyo to hiss the ministry and cheer the opposition. Fifteen were wounded by the police. But when it became known that the Diet was again prorogued, popular indignation knew no bounds. The mob stoned the police, then rushed off to burn the offices of the ministerial organs, *Miyako*

Shimbu and *Kokumin Shimbu*. The residences of Prince Katsura and other ministers would have been destroyed, had not the police appeared, reinforced by soldiers, to quell the riot. The rioters were worsted and dispersed after several of their number had been killed and scores wounded.

THE YAMAMOTO MINISTRY. The popular agitation succeeded in its object. Prince Katsura resigned. Count Yamamoto, a Constitutional-ist and a popular naval officer—it was to his work as minister of marine that Japan owed much of her success in the Russo-Japanese War—secured the support of a coalition of the *Seiyukai* (Constitutional Unionists) and the *Kokumin-To* (Nationalists) for a cabinet constituted as follows: Admiral (Count) Yamamoto, premier; Baron Takahashi, finance; Viscount Kei Hara, interior; Matsuda Masahisi, justice; M. Okuda, communications; Baron Motoda, education; Baron Makino, foreign affairs; Baron Kikoshi, war; and Baron Saito Minoru, marine. The coalition ministry adopted a policy in which adequate provision for national defense was not to interfere with the lightening of the tax burden as proposed by the Saionji government, and railway construction was to be promoted in accordance with the demands of the Constitutionalists. In the budget passed by the Diet on March 15 the government claimed to have effected a saving of \$25,000,000. In June Count Yamamoto announced that almost 5000 useless officials would be discharged in the interest of economy. Economy in the army, however, was loudly denounced by the army party, and rumors of trouble were confirmed when General Kikoshi tendered his resignation on June 24. The new minister of war, General Kusunose, was reputed able and willing to carry the policy of economy into effect.

OTHER EVENTS. In November a fleet of 55 Japanese warships was reviewed at Yokosuka by Emperor Yoshihito. The case of the 106 Korean "conspirators" was appealed to a higher court, and all but six were acquitted. The case was discussed at length in the 1912 **YEAR BOOK.** A conspiracy was detected in Formosa in November; the leading conspirators, 13 in number, were publicly executed at Taihoku on December 31. Prince Keiki Tokugawa (q.v.), the last of the Shoguns, died on November 22. A less picturesque personality but of greater political importance was that of the ex-premier, Prince Katsura (q.v.), who died on October 10; his position as party leader was taken by Baron Takaaki Kato. A "Three Religions Conference" of Shintoists, Buddhists, and Christians was held in February at the suggestion of the vice-minister of home affairs, M. Tokunami. Late in December reports were received of a severe famine in the provinces of Aomori and Hokkaido.

For subjects not dealt with here, see especially *CHINA, Japanese Demands; UNITED STATES, Foreign Relations.*

JAVA. See **DUTCH EAST INDIES.**

JAYNE, HORACE. An American scientist and educator, died July 9, 1913. He was born in Philadelphia in 1859; graduated from the University of Pennsylvania in 1879; studied medicine, and in 1882 received the degree of M.D. In the same year and the one following, he carried on biological studies at the universities of Leipzig and Jena. In 1883-4

he studied at Johns Hopkins University, and at the same time was assistant in biology at the Wistar Institute of Anatomy. He became professor of vertebrate morphology in 1884, and professor of zoölogy and director of this institution in 1894, serving until 1905. From 1884 to 1889 he was secretary of the biological faculty at the University of Pennsylvania, and was dean of the collegiate faculty of that university from 1889 to 1894. He resigned this position to become a member of the trustees of the Drexel Institute. He was a prolific writer, and among his published works are: *Mammalian Anatomy; Revision of the Dermestids of North America; Abnormalities Observed in North American Coleoptera*. He was a member of many scientific and learned societies.

JOHNS HOPKINS UNIVERSITY. An institution for higher education at Baltimore, Md., founded in 1876. The students enrolled in the several departments in the autumn of 1913 were 1356. Of this number, 846 were full-time students in regular courses, and 168 were in afternoon courses for teachers and others. There were 347 in the summer courses, including 70 in the Medical School. The faculty numbered 224, of whom 207 were residents and 17 were lecturers. In the autumn of 1913 a department of engineering was begun with three professors. The amount of the productive funds of the university was about \$6,000,000, and the income from all sources in 1912-13 was \$382,688. The library contains about 175,000 volumes. The president is Ira Remsen, LL.D., Ph.D.

JOHNSON, CHARLES EDWARD. An English landscape painter, died February 12, 1913. Born in Stockport, England, in 1832, his art studies were carried on in the schools of the Royal Academy. In 1864 he took up his residence in Edinburgh, and continued to live there for many years. Among his best-known paintings are "Glencoe"; "Ben Nevis in Winter"; "The Wye and the Severn"; "Fingal's Cave"; "The Timber Wagon"; and "A Corner of Old England." He was a member of the Royal Institute of Water Colors, and the Society of Oil Paintings.

JOHNSON, HERRICK. An American clergyman, educator, and writer, died November 20, 1913. He was born in 1832; graduated from Hamilton College in 1857; and studied at the Auburn Theological Seminary, graduating in 1860. In the same year he was ordained to the Presbyterian Ministry and became pastor in Troy, N. Y. He afterwards served as pastor in Pittsburgh and Philadelphia. From 1874-80 he was professor of homiletics and pastor of theology at the Auburn Theological Seminary. He then served as pastor of the Avenue Church of Chicago from 1880-83. In the latter year he was appointed professor of homiletics at McCormick Theological Seminary. He filled this chair until 1905. In 1882 he was moderator of the Presbyterian General Assembly, and was president of the Presbyterian board of education and board of college aid. His published writings include *Christianity's Challenge* (1881); *Revivals from Place and Power* (1882); *Plain Talks About the Theatre* (1883); *Presbyterian Book of Form* (1889);

From Love to Praise (1903); *The Ideal Ministry* (1909).

JOHNSTON, JOSEPH FOENY. An American public official and United States senator from Alabama, died August 8, 1913. He was born in North Carolina in 1843. He left school to join the Confederate army as a private in 1861 and served throughout the war. He was four times wounded, and rose to the rank of captain in the Confederate army. After the war he practiced law for 17 years, and then for 10 years engaged in banking. In 1896 he was elected governor of Alabama, and was reelected in 1898. He was unanimously elected to the United States Senate by the legislature in 1907, receiving the Republican as well as the Democratic vote, to fill out the unexpired term of Senator E. W. Pettus (q.v.). (See ALABAMA.) In 1909 he was reelected for the term ending 1915.

JOHNSON, MORTIMER LAWRENCE. An American rear-admiral, retired, of the U. S. navy, died February 14, 1913. He was born at Nahant, Mass., in 1842, and graduated from the United States Naval Academy in 1862. He served throughout the Civil War; in 1864-5 was a member of the South Atlantic blockading squadron; and was in all engagements under Admirals DuPont and Dahlgren. He also participated in both attacks on Fort Fisher. In 1866 he was appointed lieutenant-commander. He served as commanding officer of many vessels. He has been commander of the navy yards at Portsmouth and Boston; president of the Naval War College; and commandant of the naval station at Port Royal. His last assignment was commandant of the navy yard at Boston, 1901-4. In the latter year he was retired with the rank of rear-admiral.

JOHORE. A native state at the southern end of the Malay Peninsula, bounded on the northwest by Malacca and on the north by the Negri Sembilan and Pahang. The foreign relations of the state have been under British control since 1885, and since 1910 a British adviser has been stationed at the court. The estimated area of the state is about 9000 square miles. Much of the interior is little known to white men. The population in 1911 is reported at 180,412, of whom about one-half are Malays and about one-third Chinese. The population of the capital, Johore Bharu, situated on the strait opposite Singapore, was returned at 9359. The only other town of importance is Bundar Maharani, in Muar. The principal products are gambier, pepper, sago, and tapiooca. In recent years rubber has been extensively planted. There is some tin mining, and iron occurs in abundance, but on account of lack of coal it is not worked. A state railway, opened in 1909, extends from Johore Bharu 120½ miles northwest to Kuala Gemas, on the Negri Sembilan border, where it connects with the Federated Malay States railways. In 1912 the revenue was 4,348,641 Straits Settlements dollars; expenditure, 3,231,406; debt, 10,463,578, Sultan in 1913 (and since 1895), Ibrahim; British adviser (since 1910), Douglas Graham Campbell, C. M. G.

JONES, CHARLES HENRY. An American jurist and soldier, died January 26, 1913. He was born in Talbotton, Ga., in 1848, and at the age of fifteen he entered the Confederate army and served under General Johnston, to be transferred to the naval department. He re-

moved to New York, where he lived from 1865-81, and edited the *Eclectic Magazine*, and *Appleton's Journal*. In 1881 he established the *Florida Daily Times* of Jacksonville, Fla., which was consolidated in 1882 as the *Times-Union*. In 1885 he removed to St. Louis, and was editor of the *Missouri Republican*, later the *St. Louis Republican*, and managing editor of this paper until 1893, when he became editor of the *New York World*, remaining in this position for two years. From 1895-97 he edited the *St. Louis Post-Despatch*. He was a member of the World's Colombian Commission; originated the idea of the Louisiana Purchase Exposition, of 1904; and wrote the Chicago platform of 1896 and the Kansas City platform of 1900. In 1885 he was president of the National Editorial Association, and was one of the leaders in organizing the American Newspaper Publishers' Association. His last years were spent in Paris.

JONES, EDWARD FRANC. An American soldier, public official, and manufacturer, died August 14, 1913. He was born in Utica, N. Y., in 1820. At the age of sixteen he removed to Boston and began work in a wholesale dry goods store. He became colonel of the famous 6th Massachusetts Regiment, which under his command was the first regiment in the country to respond to the call of President Lincoln for 75,000 men. This regiment, which passed through New York and Pennsylvania in advance of the New York and Pennsylvania troops, was attacked by a mob in Baltimore. This historical event was the one conflict between northern troops, and southern sympathizers. Several men were killed in this affair. It is generally conceded by historians that, had not this regiment arrived in Washington on the day it did arrive, the city would have been captured by the Confederates. Colonel Jones afterwards recruited the 26th Massachusetts regiment which was attached to General Butler's division, organized for the purpose of capturing New Orleans. At the close of the war, he was elected a member of the Massachusetts House of Representatives, and in the same year he removed to Binghamton, N. Y., where he established the Jones scale works, his scales becoming famous throughout the country partly by reason of the phrase he used in his widespread advertising—"Jones of Binghamton—He pays the freight." In 1885 he was elected lieutenant-governor of New York on the Democratic ticket, and in 1888 was reelected. He was a member of many patriotic and historical societies. During the last years of his life he was totally blind. He was brevetted brigadier-general of volunteers in 1865.

JOURNALISM, SCHOOL OF. See UNIVERSITIES AND COLLEGES.

JUDAISM. There are no recent authoritative figures of the number of Jews in the world or in the United States. Estimates comparatively accurate, however, have been made. One of these by the *American Jewish Year Book*, gives the total number of Jews in the world in 1910 at 12,867,856. Of these, there were in that year in the United States, 2,044,762; in Austria-Hungary, 2,099,228; in Russia, 6,243,712. These were the only countries in which the Jews numbered over 1,000,000. There were in the British Empire, 433,229; in Germany, 607,862; and in Turkey, 463,686, of whom 78,000 were in Palestine.

RITUAL MURDER CASE. The most important event in the history of Judaism during the year was the trial for ritual murder of Mendel Beiliss. The trial and the circumstances which led up to it, attracted world-wide attention.

On March 25, 1911, a boy thirteen years of age, named Andrew Yushchinaki, living in the city of Kieff, suddenly disappeared on his way to school. Over a week later his body was found much disfigured in a cave in the suburbs of the city. With it were his school books and all the articles which he had with him when he started from home. The body when found was partly undressed, was almost bloodless, and had been pierced or stabbed in more than forty places with some sharp-pointed instrument. There were no traces of blood in the vicinity, and it was evident that the boy had been killed elsewhere and his body brought to the cave some hours before life had been extinct. There had been no attempt to prevent identification of the body. The nature and number of the wounds with the other circumstances, suggested a crime of unusual character. The reactionaries and the members of the "Black Hundreds," the bitter enemies and oppressors of the Jews, at once brought the accusation of ritual murder against the Jews, and proclamations were issued in the anti-semitic press and in the Duma to the effect that the Jews had killed the boy as they had previously killed many other Russian children, in order to get Christian blood to be used in their ceremonies. Mendel Beiliss, a Jew, and a workman in a brickyard near the spot where the body was found, was accused of the murder, and the authorities at once began to seek evidence against him.

The accusation of ritual murder led to a bitter controversy which was carried on for two years or more in Russia by various organizations opposed to Jews on the one side, and the Jews, the liberal press, the opposition parties in the Duma, and the enlightened people of the empire in general, on the other. The controversy soon attracted the attention of the whole civilized world, and protests against the "blood accusation" as a revival of a medieval myth, were made by 800 Jewish rabbis and over 1000 representatives, citizens, and leaders of thought in Russia; by the universities of Oxford, Cambridge, Liverpool, London, Glasgow, and Dublin; by the International Congress of Orientalists, and the International Medical Congress; by associations of psychologists and psychiatrists; and by many thousands of the world's most distinguished scholars and statesmen in Germany, France, England, and the United States.

Beiliss in the meantime was thrown into prison, and the effort to obtain evidence against him was carried on for two years. It is asserted that but for the personal initiative and insistence of the czar, the prosecution would have abandoned the ritual murder theory and would have set Beiliss at liberty. The czar, the court, and the ministry of justices, however, it is said, were determined to make out a case against the Jews. Beiliss was kept in prison in confinement, and was denied even the privilege of consulting his lawyer. It was said that a former chief of the secret police at Kieff, who conducted independent investigation and came near to discovering the real perpetrators of the crime and laying bare the motives of the conspirators, was suspended from office, tried

on some pretended charges, and imprisoned.

Beiliss was out on trial on October 8, before four judges and a jury. At the beginning of the trial, his lawyers were for the first time permitted to confer privately with him. Many witnesses were examined, but no testimony given connected Beiliss even indirectly with the murder. On November 11 Beiliss was acquitted of the murder by the jury's verdict, but the reactionary elements partly accomplished their purpose by so stating the questions which the jury had to consider, that it was made to appear that the murder was committed at the brick works where Beiliss was employed, and that while he might not have been implicated, there was such a thing as the practice of ritual murder. This verdict, while it freed Beiliss, further inflamed anti-semitic feeling, and it was followed by many outbreaks against the Jews.

POLAND. The condition of the Jews in Russia was not improved in 1913. In the Polish provinces of the empire, where the greater part of the Jews live, and where heretofore they have been as a rule treated well, the leaders of the reactionaries have succeeded in creating an atmosphere of racial and religious hatred. The anti-semitic journals carried on a commission, which was largely successful to bring about a boycott against the Jews. All business and social intercourse throughout Poland between Poles and Jews practically ceased by the end of the year, and it was reported that the animosity had reached such a stage that firemen in Warsaw refused to rescue a Jewish family from a burning house.

RUMANIA. The conditions in Rumania, which for many years have borne severely upon the Jews as a result of restrictive measures against them, were not improved in 1913. The American Rumanian Jewish emancipation committee was organized to ameliorate conditions. Appeals were made to European powers, and a special message was sent to the German emperor. Many other Jewish organizations of the United States also carried on campaigns to assist the Rumanian Jews. The United States government suggested the inclusion in the Balkan peace treaty of a clause assuring the religious and civil liberty of the Jews. This suggestion was rejected. At a meeting of the American Rumanian Jewish emancipation committee, held in October, resolutions were adopted denouncing the treatment of the Jews in Rumania, and a letter was directed to be forwarded to King Charles. Speeches were made by Bainbridge Colby, Senator Clapp, Senator Poindexter, and others. Resolutions were introduced into the House of Representatives, protesting against the treatment of Jews in Rumania.

ENGLAND. In England, Dr. Joseph H. Hertz, formerly in New York, was elected chief rabbi on February 6.

ZIONISM. The Zionist conference was held in Vienna in September. Addresses were made by Professor Warburg, who reported on the number of Zionists and their funds. He declared the attitude of Turkey toward the Zionists to be favorable. A proposal was made for the establishment of a Jewish university in Palestine. One hundred thousand dollars was subscribed for this purpose. The Turkish ambassador in Vienna gave assurance of the sympathy of the Turkish government with the plan for the colonization of Palestine.

JUTE SUBSTITUTES. See **CHEMISTRY, INDUSTRIAL.**

JUVENILE COURT. Since 1898, when the first special court for children was established at Chicago, the movement for a separation of court proceedings against children from those against adults has wrought great transformations in judicial methods in all civilized nations. Private hearings by a high-minded judge, with an efficient corps of probation officers, make possible an individualization of treatment and an application of intelligence and sympathy not possible under previous methods. Below are noted the more important developments of the year.

CHICAGO. The juvenile court of Chicago has been the model for the world. It made the innovation early in the year of providing a woman judge, Mary M. Bartelme, for delinquent girls. She had served for eighteen years as public guardian of Cook County and was chosen by the judges of the Circuit Court to serve as assistant to Judge Pinckney of the Juvenile Court.

DENVER. The reflection of Judge Ben B. Lindsey of the Denver Juvenile Court was marked by a most acrimonious campaign. The interests hostile to Judge Lindsey sought to discredit him by charging that in sex cases involving girls he had allowed the men to go free or had punished them very lightly. These charges were countered by a full and accurate statement of all the facts, whereby it was shown that the Juvenile Court had been nearly three times as successful in securing convictions (12.8 per cent. as against 44.6 per cent. of cases filed) as had the city Criminal Court. Not only so, but Judge Lindsey had succeeded in winning the confidence of all parties and had thus been able to repair damage done instead of driving the young persons in error farther toward a criminal record. The controversy clearly established the great value of the probation system and especially of private hearings by a wise and sympathetic judge.

NEW YORK. In April a law was passed giving the County Court of Ontario County exclusive jurisdiction throughout the county over cases of neglected and delinquent children, and concurrent jurisdiction in certain offenses against children. A competent probation officer was chosen by civil service examinations. This was the second county children's court in New York, that of Monroe County having been created in 1910.

NEW YORK CITY. On January 1 several changes were instituted in the four children's courts of Greater New York. The judges, who previously had been shifted frequently, were assigned to a court for continuous service there; and one judge rotated about among the four courts unifying and standardizing their activities. The number of probation officers paid by the city was increased from twenty to forty. During 1913 there was under construction a \$250,000 four-story children's court building for the borough of Manhattan. At the laying of the corner stone on August 11, many distinguished citizens were present. Borough President McAneny in an address laid great emphasis on the growing conviction that thorough-going curative treatment of juvenile offenders should replace primitive measures. Justice Russell also made an address setting forth the ideals of the new theory of child correction.

MINNEAPOLIS. A department of research was

instituted in connection with the Hennepin County Juvenile Court. It aimed to learn who was responsible for each child's delinquency; to what extent parents were to blame; whether both parents were alive and living together; the family income; the parents' sense of responsibility; the social causes; the relation of the school to the delinquent; the success or failure of the probation system. The investigations are under the direction of an expert physician and an experienced psychologist and educator. A nurse also is retained, and all three work in conjunction with the presiding judge. Every delinquent is given a thorough physical examination and in cases of need adenoids are removed, eyeglasses are supplied, ears and teeth are treated, and even circumcision is performed. Detailed individual records are kept, including data relating to parents, home life, living conditions, schooling, and other social influences. The nurse cares for children who have been operated on and by following them into their homes is able to set many influences at work to raise the level of home life.

EUROPE. At the second international congress of Juvenile Court judges and workers in Munich near the close of 1912 the recent progress in the treatment of juvenile delinquents was brought out. Nearly every European country has advanced toward a more intelligent handling of the problem of the youthful criminal, but a large majority of the delegates to the congress still advocated the use of punishment rather than reliance upon educational and reformatory methods. The ideas at the basis of the Juvenile Court, special judges, separate and private hearings, separation of adult and juvenile prisoners, and the suspended sentence and parole have been adopted to a greater or less extent and with varying success in Russia, Germany, France, and Italy. In Germany a special juvenile code has been drafted. Persons under eighteen years are considered juveniles. In each judicial district is established a juvenile court presided over by a judge and two laymen chosen from educators. The public attorney decides in each case whether education or punishment shall be the mode of treatment. Juveniles and adults must be separated before trial and in prisons. The court must take account of the physical and mental development of youths over fourteen. A corps of paid and volunteer probation officers is provided.

KAISER-WILHELMS-LAND. That part of German New Guinea (q.v.) which is in New Guinea Island.

KAMERUN. A German protectorate between Nigeria and French Equatorial Africa, occupying, together with the territory ceded by France under the terms of the Franco-German convention of November 4, 1911, an area estimated at 790,000 square kilometers (305,000 square miles), carrying a native population of some 3,500,000. White inhabitants January 1, 1912, 1537, of whom 1359 were German. The acquisition of the ceded territory gives to Kamerun egress on the Ubangi and Congo Rivers and a new outlet on the Atlantic south of the Spanish colony of Rio Muni. Imports for 1911 were valued at 29,317,000 marks (Germany, 23,047,000); exports, 21,251,000 (Germany, 18,471,000). Principal articles of export in 1911 were rubber, 11,030,000 marks; palm laurels, 4,168,000; cacao, 3,307,000; palm oil, 1,424,000; ivory, 581. Totals for 1910: 25,581,000 marks im-

ports and 19,924,000 marks exports. Vessels entered (1911), 536, of 1,551,058 tons. Railways in operation at end of 1912, 241 kilometers; under construction, 279 kms. The 1913-14 budget balanced at 15,344,624 marks (1912-13, 17,634,680), of which 2,803,696 marks was imperial subvention and 2,000,000 from loans. Herr Ebermaier was governor in 1913, with headquarters at Buša.

KANSAS. POPULATION. The population of the State in 1910 was 1,690,949. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 1,762,573.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

Corn	1913	7,320,000	23,424,000	\$18,271,000
	1912	7,575,000	174,225,000	69,690,000
Wheat	1913	6,710,000	86,983,000	68,717,000
	1912	5,956,000	92,290,000	68,295,000
Oats	1913	1,760,000	34,320,000	15,444,000
	1912	1,720,000	55,040,000	19,284,000
Rye	1913	45,000	680,000	472,000
	1912	30,000	477,000	324,000
Potatoes.....	1913	73,000	2,920,000	2,657,000
	1912	70,000	5,740,000	4,190,000
Hay	1913	1,500,000	21,350,000	16,875,000
	1912	1,627,000	2,440,000	18,544,000

a Tons.

MINERAL PRODUCTION. The total value of the mineral products of the State in 1912 was \$26,554,967, compared with \$25,237,043 in 1911.

In 1912 the total production of coal in the State was 6,986,182 short tons, valued at \$11,324,130. This was an increase over the production of 1911 to 6,986,182 tons, valued at \$11,324,130. The increased production of Kansas, as in other southwestern States, may be attributed to the diminished supply of fuel oil, natural gas from the mid-continent field. In 1912 the total of 11,346 men were employed in coal mines. These worked an average of 202 days, compared with 11,357 men who worked for an average of 390 days in 1911. There were 28 fatal accidents in the coal mines of the State in 1912, compared with 42 in 1911. Of the men killed in 1912 26 met death underground, and of these 11 were killed by falls of roof or coal.

The Kansas oil fields form a part of the Kansas-Oklahoma fields. The total output in Kansas in 1912 was 1,593,796 barrels, an increase over the production of 1911, which was 1,278,819 barrels. The total number of completed wells in the State in 1912 was 949.

The total value of the clay products in 1912 was \$2,036,500, an increase of \$323,762 over 1911. Vitrified brick is the principal clay product of the State.

EDUCATION. The total school population of the State in 1913 was 510,273. The total enrollment in public schools was 395,064, and the average daily attendance was 298,128. The male teachers employed numbered 2639, and the female 11,364. The average salary of teachers both male and female, was for teachers in rural schools, \$52.11 monthly; in graded schools, \$67.25 monthly. The State superintendent of education at the session of the State Teachers' Association on November 7, 1913, made the following recommendations: A larger unit of school organization and government; the standardism of rural schools, and the accrediting of high schools under the authority of the State

board of education; free tuition in high schools for all boys and girls; a reorganized system of normal institutes; and the establishment of agricultural high schools. These resolutions were unanimously endorsed by the organization, and will be urged upon the legislature by its executive committee. The legislature of 1913 made practically no changes in the existing school laws.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions under control of the State with their populations in 1913 are as follows: Topeka State Hospital, 1522; Osawatimie State Hospital, 1349; a State Hospital for Epileptics at Parsons, 473; State School for the Feeble Minded at Windfield, 480; State Orphans' Home at Atchinson, 200; State Penitentiary at Lansing, 890; Industrial Reformatory for Young Men at Hutchinson, 380; Boys' Industrial School at Topeka, 259; Girls' Industrial Schools at Beloit, 169; State Soldiers' Home at Port Dodge, 233; Mother Bickerdyke Home, Annex at Ellsworth, 87; a State hospital under construction at Larned, and a State tubercular sanitarium at Norton.

FINANCE. The total receipts for the fiscal year 1912 were \$7,758,025, and the disbursements \$7,891,099. There was a balance at the beginning of the year of \$1,423,283, leaving a balance at the end of the year of \$1,289,209. The chief receipts are from the general revenue fund and from the Topeka Fiscal Agency. The chief expenditures are for education, for the maintenance of State institutions, and for the expenditures of State government. The bonded indebtedness of the State amounts to about \$370,000.

TRANSPORTATION. The total railway mileage operated in the State on June 31, 1912, was 12,167. Railways having the longest mileage are the Atchison, Topeka, and Santa Fe, 3733; Missouri Pacific, 2840; Chicago, Rock Island, and Pacific, 1491; Union Pacific, 1533; Missouri, Kansas, and Texas, 684; St. Louis and San Francisco, 903.

POLITICS AND GOVERNMENT. The legislature, Democratic in both branches, met in 1913 and passed a number of important measures noted in the section *Legislation* below. There was no election for State officers during the year, as the term of Governor Hodges and the other State officers does not expire until January 10, 1915. The next State election will be held on November 3, 1914. Governor Hodges was inaugurated on January 14. On January 28 the legislature elected William H. Thompson as United States senator. Senator Thompson was the choice of the people at the primary election held in November, 1912. The House of Representatives on February 2 rejected a provision for the recall of public officers. The Senate on February 4 voted against the initiative and referendum amendments to the constitution, but on February 7 passed a State initiative and referendum bill.

The expiration of the term of Senator Bristow on March 3, 1913, and the election of his successor in 1914, began to have political importance in December of 1913. Senator Bristow was elected in 1909 as a Progressive Republican, and he was one of the most aggressive leaders of the Progressive wing of the Republican party in the succeeding years. He supported Theodore Roosevelt in 1912. In December, 1913, he announced that he was a can-

didate for reelection to the Senate on the Republican ticket. This was followed by an immediate announcement by Victor Murdock, a leader of the Progressive party in the House of Representatives, that he was a candidate for the senatorial nomination on the Progressive party ticket. William Allen White and other leading Progressives of the State announced at the same time that they would support the candidacy of Mr. Murdock.

LEGISLATURE. The legislature met in 1913 and passed many important measures. Acts were passed putting into effect the woman suffrage constitutional amendment adopted in the election of November, 1912. Measures were passed submitting to the people constitutional amendments providing for the recall of all public officers whether elected or appointed. The inheritance tax law was repealed. The State tuberculosis sanitarium was established. A measure was enacted restricting the granting of injunctions in labor disputes. An eight-hour law for workmen on public works was passed. A State department of public industries was created. A white slave law was enacted. A commission form of government was provided for certain cities. A measure providing for civil service of cities of the first-class was passed, and measures regulating primary elections in cities of the first and second class were enacted. A concurrent resolution was passed which requested Congress to pass an act providing a plan whereby an adequate part of the national funds should be used for loans to resident land-owners at a low rate of interest, in view of existing conditions, under which agriculturists must pay an excessive rate of interest on loans.

On the eve of the adjournment of the legislature, Governor Hodges sent a message containing a proposal so far unique in the history of American State government. In this message he asserted that the government by a two-chambered legislature was cumbersome and inefficient, and he recommended that it be superseded in Kansas by a State commission to be made up of eight, or at the most sixteen, members which should act as a board of directors for the State. The governor said: "In common with a large and growing number of thoughtful people, I am persuaded that the instrumentalities for legislation provided for in our State constitution have become antiquated and inefficient. Our system is fashioned after the English Parliament, with its two houses based upon the distinction between the nobility and the common people, each house representing the divers interests of these classes. No such reason exists in this State for a dual legislative system, and even in England, at the present time, the dual system has been practically abandoned and the upper house shorn of its importance; and I believe that we should now concern ourselves in devising a system for legislating that will give us more efficiency and quicker response to the demands of our economic and social conditions and to the will of the people." The governor said that he had been led to this conclusion as a member of the State Senate. He pointed out that under the existing system there is a congestion of business accumulating for each legislative session; that the legislature with its two large independent houses is a most inefficient organization for transacting business; and that the outcome is apt to be inaction on highly important measures and hasty and ill-considered

action on hundreds of minor bills. He suggested that the State commission should be made up of one or two members from each congressional district; that the members be paid large enough salaries to enable them to devote all of their time to the work; and that they meet in frequent session and be elected for terms of four to six years, subject to the recall. He added: "A legislative assembly such as I have suggested could give ample time to the consideration of every measure, not only in relation to its subject matter, but to the drafting of it in plain, concise, and easily understandable language. It would be ready at any time to deal with new conditions, and to provide relief in emergency cases; and, with time to inform itself about conditions and to study the needs of the people and of our State institutions, there seems to me to be no question but what it would be vastly more efficient than our present system, as well as vastly more economical." The governor did not ask the legislature to act on his recommendation, but urged its members to encourage its discussion with a view to submitting a constitutional amendment on the subject in 1914.

STATE GOVERNMENT. Governor, George H. Hodges, Democrat; Lieut.-Governor, S. Ingalls; Secretary of State, Charles H. Sessions; Treasurer, Earl Akers; Auditor, W. E. Davis; Attorney-General, John S. Dawson; Superintendent of Education, W. D. Ross; Superintendent of Insurance, Ike S. Lewis; Commissioner of Agriculture, F. D. Coburn—all Republicans, except governor.

JUDICIARY. Supreme Court: Chief Justice, Wm. A. Johnston; Associate Justices, Judson S. West, Silas Porter, Clark A. Smith, Rousseau A. Burch, Henry F. Mason, and Alfred W. Ben- sen—all Republicans; Clerk, D. A. Valentine.

STATE LEGISLATURE, 1913. Republicans: Senate, 17; House, 51; joint ballot, 68. Democrats: Senate, 23; House, 72; joint ballot, 95. Socialists: House, 2; joint ballot, 2. Democratic majority: Senate, 6; House, 19; joint ballot, 25.

The State representation in Congress will be found in the section *Congress*, article UNITED STATES.

KANSAS, UNIVERSITY OF. A State university for higher education at Lawrence, Kan., founded in 1866. The enrollment in all departments in the autumn of 1913 was 2610. The faculty numbered 188. There were no noteworthy changes in the faculty during the year, and no notable benefactions. The university has an endowment of about \$150,000. In addition to its income from this fund, the legislature appropriates about \$510,000 annually for its support. The library contains 84,000 volumes. The president is F. Strong, LL.D.

KATSURA, PRINCE TARO. A Japanese statesman, died October 10, 1913. He was born in 1847 at Samurai, of the Choshu clan. He was twenty years of age when the civil war of the Restoration broke out, and he so distinguished himself with the imperialist forces that he was selected in 1870 to go to Germany for the purpose of studying military science. From that time for the twenty-five years following, his public career was devoted solely to the profession of arms. His career as a soldier ended with his services in the Chinese War. When in 1900 the cabinet of Prince Ito failed, and that statesman withdrew from official office, Prince Katsura became prime minister. He

took office under exceptional difficulties. The Parliament was hostile, and his ministry was regarded at the outset as a mere makeshift. He nevertheless achieved the longest tenure of power on record, and his name is associated with the two greatest events in the history of modern Japan—the conclusion of the Anglo-Japanese alliance, and the war with Russia. The popularity which Katsura won during the successful war with Russia was lost to a large extent as a result of the terms of the treaty of Portsmouth, which were regarded as unfavorable by the mass of the Japanese people. As a result of this feeling, Katsura was driven from office. He returned to power in 1908, however, when the country was suffering severely from the economic depression which followed the war, and at once introduced into Parliament a series of important financial measures which were passed and which went far toward relieving financial conditions and restoring public confidence. After the annexation of Korea, Katsura was made a prince. Early in 1911 he found himself obliged to modify his attitude toward the political parties, which had been one of neutrality, and he associated himself more closely with the Seiyu-kai party. The country, however, was becoming impatient of a bureaucratic rule. There was also dissatisfaction at Katsura's financial measures. His position became increasingly difficult, and in August, 1911, he resigned, recommending the appointment of Marquis Saionji as his successor. In the following year he visited St. Petersburg, and though not entrusted with a formal mission, the conversations which he had with Russian statesmen prepared the way for an understanding between Russia and Japan, with regard to their respective interests in Mongolia and Manchuria. On the death of the old emperor, one of the first acts of his successor was to appoint Katsura grand chamberlain and keeper of the great seal, and from this time on his position was that of one of the elder statesmen. He was persuaded to become prime minister again on the fall of the Saionji cabinet, four months after the accession of the new emperor. He found circumstances, in the shape of public hostility to bureaucratic government, too strong, and when a vote of censure was brought forward by the Diet, and riots broke out in Tokyo, Katsura and his colleagues resigned. While Katsura lacked the arts by which politicians achieved popularity, his vigorous intellect, his courage, and his strength of character, made him one of the most conspicuous statesmen of modern Japan.

KEDAH. A native Malaysian state under British protection. Area, 3150 square miles. Population (1911), 245,986—80 per cent. Malays, over 13 per cent. Chinese, 3.3 per cent. Siamese, 2.5 per cent. East Indians. The native sultan administers native affairs. British adviser (1913), W. G. Maxwell.

KEENER, WILLIAM ALBERT. An American jurist and educator, died April 22, 1913. He was born in Augusta, Ga., in 1856; graduated from Emory College in 1874, and from the Harvard Law School in 1877. After practicing for several years he was elected justice of the Supreme Court of the State. From 1883 to 1888 he was assistant professor of law at Harvard University, from 1888 to 1890 was Story professor. In 1890 he was appointed professor of law at Columbia University, becoming Kent pro-

fessor in 1892, and from 1891-1901 was dean of the Law School of Columbia University. He wrote *Treatise on Quasi-Contracts*, and edited *Cases on Contracts*; *Cases on Equity Jurisdiction*; *Cases on Quasi-Contracts*; and *Cases on Corporations*.

KELANTAN. A native state on the eastern side of the Malay Peninsula; under British protection. Area (latest estimate), 5870 square miles; population (1911), 286,752, of whom 268,707 were Malays. Kota Bharu, the seat of the British resident as well as of the native rajah, has about 12,000 inhabitants. Imports (1911), SS\$2,237,820; exports, SS\$1,505,795; revenue, SS\$487,674; expenditure, SS\$574,850. The debt is a loan from the Federated Malay States and amounts to SS\$150,000. British adviser (1913), J. E. Bishop (acting).

KENNY, WILLIAM JOHN. An American Roman Catholic bishop, died October 23, 1913. He was born at Delhi, N. Y., in 1853, ordained priest in 1878, and made rector at Jacksonville, Fla., in 1879. After filling other pastorates in that State, he was appointed vicar-general in 1889, administrator in 1901, and in 1902 was consecrated third bishop of the diocese of St. Augustine.

KENSICO DAM. See DAMS.

KENTUCKY. POPULATION. The population of the State in 1910 was 2,289,905. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 2,336,277.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1913	3,650,000	74,825,000	\$56,867,000
	1912	3,600,000	109,440,000	60,192,000

a Tons. b Pounds.

MINERAL PRODUCTION. The total value of the mineral products of the State in 1912 was \$22,452,984, compared with \$19,296,614 in 1911.

The total coal production in the State in 1912 was 11,490,521 short tons, valued at \$16,854,207. This was the largest amount of coal ever produced, and exceeded the production in 1911 by 2,440,818 tons. The increased production was due chiefly to the new developments in eastern Kentucky. The number of men employed in coal mines of the State in 1912 was 24,304. These worked an average of 201 days. In 1911 21,921 men worked the same number of days. Over 66 per cent. of the coal mined in 1912 was produced by machines. There were no labor troubles of any significance during the year. There were 51 fatalities in and about the coal mines of the State in 1912; 41 underground, 2 in shafts, and 8 on the surface. Of the deaths underground, 20 were due to falls of roof and coal, and 10 to explosions of gas and dust. The production of petroleum in the State in 1912 was 484,368 barrels, compared

with 472,458 barrels in the preceding year. The influence of the steadily rising prices stimulated drilling during the year, and aroused the usual interest in oil operations throughout the State. A 200-barrel gusher was drilled in Ohio County on July 3, 1913, and in October two wells were obtained in Allen County. The wells of the State at the end of 1912 numbered 136, of which 112 were in oil. The value of the clay product of the State in 1912 was \$2,443,740, an increase of \$75,646 over 1911. The leading clay product is fire brick.

TRANSPORTATION. The total steam railway mileage of the State on June 30, 1913, was 3798.95. There were also 183.05 miles of inter-urban railroad.

EDUCATION. The total school population of the State in 1913 was 596,351. The enrollment was 459,056, and the average daily attendance was 270,445. These figures are for rural schools only. The number of male teachers was 3814 and female teachers 6002. The average salary of male teachers was \$53.47 per month, and female teachers \$42.92.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State with their populations in 1913 are as follows: Eastern State Hospital, Lexington, 1093; Central State Hospital, Lakeland, 1554; Western State Hospital, Hopkinsville, 1180; Feeble-minded Institute, Frankfort, 310.

POLITICS AND GOVERNMENT. There was no session of the legislature in Kentucky in 1913. The sessions are biennial, and the last was held in 1912. There was no election for State officers during the year, as the term of Governor McCreary and other State officials does not expire until December 12, 1915. The next State election will be held on November 2, 1915. As the result of violation of the State anti-trust laws by the Imperial Tobacco Company of England and of Kentucky, these companies were fined on November 28. Elections for municipal officers and other representatives to the legislature were held on November 3. The Democrats elected a mayor in Louisville by a majority of 5009. As the result of the elections, both houses of the legislature are overwhelmingly Democratic, the Republican minority in the lower house being reduced.

GOVERNMENT. Governor, James B. McCreary; Lieutenant-Governor, Edward J. McDermott; Secretary of State, C. F. Crecelius; Treasurer, Thomas S. Rhea; Auditor, Henry M. Bosworth; Attorney-General, James Garnett; Superintendent of Public Instruction, Barksdale Hamlett; Commissioner of Agriculture, John W. Newman; Commissioner of Insurance, M. C. Clay—all Democrats.

JUDICIARY. Court of Appeals: Chief Justice, J. P. Hobson, Dem.; Justices, W. E. Settle, Dem.; C. C. Turner, Dem.; J. B. Hannah, Dem.; John D. Carroll, Dem.; T. J. Nunn, Dem.; Shackelford Miller, Dem.; clerk, Robert L. Greene, Dem.

STATE LEGISLATURE, 1913. Democrats, Senate, 32; House, 81; joint ballot, 113. Republicans, Senate, 6; House, 18; joint ballot, 24. Fusion, Senate, 0; House, 1; joint ballot, 1. Democratic majority, Senate, 26; House, 62; joint ballot, 88.

The State representation in Congress will be found in the section *Congress*, under UNITED STATES.

KEOKUK DAM LOCK. See CANALS.

KIAMIL, PASHA. A Turkish statesman, died November 15, 1913. He was born in the island of Cyprus about 1826, in the early days of Sultan Mahmud. In his youth, he removed to Cairo, where he became a student in the Military Academy. His politics won favor with those in authority, and he was chosen to accompany one of the Egyptian princes on a European tour, and was afterwards appointed interpreter at the palace. During this period he first began his careful study of European politics. On the death of the Khedive Mehmet Ali, the reforms which had been begun in Egyptian administration failed to be pressed, and Kiamil, realizing that he might find a better field for his abilities in other parts of the Turkish empire, left Cairo for Constantinople. There, entering the government service, he rose rapidly, and was in 1885 appointed grand vizier. While in this office he endeavored to pursue a policy of fairness toward the non-Mussulman elements of the empire, and to keep on good terms with the great powers. In these efforts he found himself checked by the interference of the court. He finally prepared and submitted to Abdul Hamid, plans for a series of reforms which so shocked that ruler, that Kiamil was immediately dismissed from office. From this year, 1891, to 1895, he remained in disgrace, but in the latter year he was again appointed grand vizier. The great question of that time was the policy to be adopted toward the Armenians, and Kiamil advocated repressing and punishing outrages upon them. These proposals were distasteful to the sultan and Kiamil was soon banished as Vali of Aleppo. Through the influence of foreign ambassadors he was given a similar position at Smyrna, and he remained there for many years. In 1907 complaint of outrages by brigands became so frequent as to lead to complaints by foreign representatives, and Abdul Hamid seized the opportunity to depose Kiamil and to order him into banishment at Rhodes. Kiamil took refuge at the British Consulate-General, which he refused to leave until he was assured of his personal liberty and safety. He thereupon returned to Constantinople, where he lived in strict retirement until the revolution of 1908 recalled him to office as grand vizier. He was confronted with a stupendous task of completely organizing the whole internal administration of the empire, and in an attempt to do this was bitterly opposed by members of the reform committee. As a counterpoise to this body, he encouraged the Liberal Union. This organization, however, had little backing in the country, and its support only further alienated Kiamil from the committee. His difficulties were increased by the publication of a telegram from King Edward to the sultan, speaking in the warmest terms of the grand vizier. This was resented by the Turks, who were opposed to anything like foreign interference. It was also distasteful to those who feared that a too close friendship with England would involve the hostility of other powers. In spite of these difficulties, however, Kiamil received a great ovation from the Parliament in December, 1908, and a vote of confidence in his government was carried unanimously and with great enthusiasm. In the following February, however, he broke with the committee, feeling himself sufficiently secure to attempt a *coup d'état*. This failed, and Kiamil withdrew from political life for

more than a year. On the resignation of Ghazi Mukhtar as grand vizier on October 29, 1912, just before the beginning of the Balkan War, Kiamil again became grand vizier and was at the head of affairs during the disastrous period of the war. When the Bulgarians appeared before Tchataldja he was obliged to agree to an armistice on terms most unfavorable to Turkey. He made a strong attempt to obtain some modification of the terms of peace which the allies sought to impose, but after a grand council of the nation held on January 22, 1913, he seemed willing to accept the advice contained in the collective note of the powers. He was, however, spared the humiliation of surrender, for on January 23 he was overthrown by a dramatic *coup d'état* engineered by Talaat Bey and carried on by Enver Bey. His colleague, Nazim Pasha, was murdered by the conspirators, but Kiamil himself was allowed to depart for Egypt, where he remained until April, when he removed to his native island, Cyprus.

KIAOCHOW. A German dependency on the east coast of the Chinese province of Shantung, composed of a harbor, town, and district leased for ninety-nine years from March, 1898. The district was in April, 1898, declared a German protectorate. Exclusive of the bay, the area is 552 square kilometers (213 square miles); native population in 1913, about 192,000. Whites in 1912, 4470. Imports and exports at Tsingtau (the port of Kiaochow) in 1910-11, 69,375,000 and 60,561,000 marks, respectively; in 1911-12, 114,938,000 and 80,295,000. Vessels entered at Tsingtau in 1910-11, 614, of 1,071,000 tons. The Shantung Railway (434.4 kilometers) goes as far as Tsinan in Shangtung. The budget for 1913-14 balanced at 16,787,625 marks (9,507,780 marks imperial subvention). The dependency is administered under the department of the marine by a governor, Captain Meyer-Waldeck, in 1913, residing at Tsingtau.

KING, JOSEPH ELIJAH. An American clergyman and educator, died June 4, 1913. Born in Laurens, N. Y., in 1823, graduated from Wesleyan University in 1847, he was ordained in 1848 to the Methodist Episcopal ministry. From 1847-53 he was principal of the Newberry (Vt.) Seminary; and in 1854 was chosen president of the Fort Edward (N. Y.) Collegiate Institute, where he remained until the time of his death. He was one of the oldest Methodist Episcopal clergymen in the United States. Since 1848 he had been a trustee of Wesleyan University.

KOENIG, GEORGE AUGUSTUS. An American chemist, died January 15, 1913. He was born in Willstatt, Germany, in 1844, and studied at the University of Heidelberg, at the University of Berlin, and elsewhere. In 1868 he removed to the United States. From 1872 to 1879 he was assistant professor of chemistry and mineralogy at the University of Pennsylvania, in the last-named year being appointed full professor in these branches. In 1892 he went as professor of chemistry to the Michigan College of Mines, and in this position served until the time of his death. He discovered several new minerals. One of the most notable of his discoveries was the existence of diamonds in meteoric iron. He contributed to technical and scientific journals at home and abroad, many articles embodying the results of original and valuable research, and he has taken out patents for various processes of his own invention.

KÖNIG EXPEDITION. See **POLAR EXPLORATION, Antarctic.**

KOREA, or officially **CHOSŌN**. The peninsula between the Sea of Japan and the Yellow Sea; formerly an independent monarchy, it became a Japanese protectorate March 2, 1906, and was annexed to Japan August 29, 1910. The capital is Seoul.

AREA, POPULATION, ETC. The area is estimated at 14,123 square ri (84,606 square miles), or nearly the area of Virginia and Tennessee combined. The population on December 31, 1911, is stated at 14,055,869; of whom, Koreans 13,832,376 (7,271,526 males, 6,560,850 females); Japanese 210,689 (114,759 males, 95,930 females); foreigners, 12,804 (11,709 males, 1095 females). Of the total population, 7,397,994 were males, and 6,657,875 females. Of the foreigners, 11,837 were Chinese and 568 Americans. The population of Seoul has been estimated at 278,958; the native population was reported for the end of 1911 at 223,381; native population of Fusan, 72,947. Among the upper classes, Confucianism prevails, and there is a considerable number of Buddhist monasteries in the country. The number of native Christians in 1910 has been reported at about 250,000.

EDUCATION. The Japanese have undertaken the reorganization of the primary school system and the establishment of industrial and technical schools.

PRODUCTION, COMMERCE, ETC. Agriculture is the only productive occupation of importance, but the methods of cultivation are primitive and transportation facilities very inadequate. The chief crops are rice and other cereals, beans, tobacco, hemp, ginseng, and cotton. Gold mining is carried on with some success. Besides gold, various minerals occur, including copper, iron, silver, graphite, and coal.

Imports and exports of merchandise have been valued as follows, in thousands of yen:

	1907	1908	1909	1910	1911	1912
Imps....	40,050	41,026	36,649	39,783	54,088	67,115
Exps....	17,002	14,113	16,249	18,914	18,857	20,986

In 1909 imports of specie and gold and silver bullion amounted to 921,125 yen, and exports 6,959,349 yen; in 1910, 2,376,120 and 9,199,638; in 1911, 4,739,245 and 12,857,023. Leading imports are cotton piece goods, cotton yarn, timber and lumber, kerosene, sugar, coal, cigarettes, wheat and flour, mattings, etc., galvanized iron, rails, and salt. Chief exports in 1910 and 1911, in thousands of yen: Rice, 6278 and 5284; beans, 5663 and 4606; cattle hides, 1005 and 1069; live animals, 634 and 704; fertilizer, 372 and 374; coal, 362 and 376; iron and copper ore, 344 and 280; raw cotton, 225 and 237; gold ore, 517 and 235; fresh fish, 173 and 134; dried fish, 83 and 96; salt fish, 60 and 53; *bêche de mer*, 88 and 95; ginseng, 180 and 70 (855 in 1909); graphite, 114 and 182. Principal exports in 1912: Rice, 7525; beans, 5216; cattle hides, 1032; raw cotton, 435; fish, 421; iron and copper ore, 312; live animals, 208. Imports and exports of merchandise by countries in 1912, in thousands of yen: Japan, 40,756 and 15,369; China, 7032 and 4058; United States, 6460 and 96; United Kingdom, 9798 and 198; Germany, 1592 and 6; Russia in Asia, 73 and 1245; other, 1404 and 14; total, 67,115 and 20,986.

Reported length of railway in operation in 1913, 1345 kilometers (836 miles); telegraph

wire in 1912, 13,323 kilometers; post offices in 1912, 485.

FINANCE. The monetary unit is the yen, whose par value is 49.846 cents. For the fiscal year 1912 the budget balanced at 48,741,782 yen; for 1913, 52,892,209 yen; for 1914, 57,989,680 yen. Each of these budgets included a subvention of 12,300,000 yen from the imperial treasury. Estimated ordinary revenue for the fiscal year 1913, 26,732,332 yen (including proceeds of government enterprises, etc., 13,047,468 and taxes 11,347,536). Estimated ordinary expenditure for the same year, 30,232,490 yen; extraordinary, 22,659,719. Debt at the end of 1912, 43,850,012 yen.

GOVERNMENT. Formerly an independent monarchy, Korea was annexed to Japan August 29, 1910, and placed under the administration of a governor-general, General Viscount (later Count) Terauchi Masakata, who continued to hold the office in 1913. Civil governor-general, Yamagata Isaburo. Each of the thirteen divisions, or provinces, of the country is under a governor.

For the year's history in Korea, see **JAPAN, History.**

KREUPP SCANDAL TRIALS. See **GERMANY, History.**

KURIA MURIA ISLANDS. Attached to Aden (q.v.).

KWANGCHOW-WAN. Certain territory leased by China to France for ninety-nine years from April 11, 1898, taken partly from the subprefecture of Soui-Tai and partly from that of Out-Chouan, in the province of Kwantung. It forms a division of French Indo-China (q.v.). The regions around the bay are densely populated; but as the inhabitants have a curious reluctance to declare their numbers, estimates given are of necessity approximate only. The administrative centre of the first conscription is Tche-kam. The European centre of the territory is Fort-Bayard. The local budget for 1912 balanced at 218,950 piasters. The French administrator-in-chief in 1912 was M. Cail-lard.

KWANTUNG. A Japanese leasehold in the southern part of the Liaotung peninsula (Manchuria). Kwantung is the Chinese name, the Japanese name being Kwanto. Area, 1221 square miles. The population at the end of 1910 was 462,399; or (including certain persons in Manchuria, who, though outside of Kwangtung were regarded as residents thereof) 519,836, as compared with 495,848 in 1909 and 384,755 in 1906. Of the 1910 population, 62,338 were Japanese, and 453,377 Chinese (or Manchus). Of the total, 303,316 were males, and 216,520 females. The population within the limits of Kwantung was estimated at 501,767 in 1913. In 1910, Dairen, the chief port, had 40,758 inhabitants; Ryojun (Port Arthur), 16,797. The agricultural products include cereals, beans, tobacco, and hemp. Some salt is produced. In 1910 imports were valued at 28,732,797 yen, and exports 38,797,925; in 1911, 42,274,722 and 47,416,047; in 1912, 58,198,000 and 55,306,000. The trade is chiefly with Japan. Kwantung forms a customs district under the Chinese maritime customs. About eighty miles of the South Manchurian Railway are in the territory. Estimated revenue and expenditure for the fiscal year 1912, 5,250,216 yen (including Japanese subvention 3,283,090 yen); for 1913, 5,246,887 yen (subvention 3,122,500); for

1914, 5,739,684 yen (subvention 3,047,800). The territory is administered by a governor-general (Lieutenant-General Baron Fukushima in 1913, resident at Ryojun).

"**L. I.**" AND "**L. II.**," **DESTRUCTION OF.** See **AERONAUTICS.**

LABOR. The year 1913 was not less notable for memorable features of the labor movement than the years immediately preceding. In the United States there were several labor struggles, among which the most significant were those in the coal mining region of West Virginia, in the copper mines around Calumet, Mich., and the silk strike at Paterson, N. J. See **STRIKES AND LOCKOUTS.** Radical theories continued to be presented in the United States by the Industrial Workers of the World (q.v.), and abroad by various brands of Syndicalism (q.v.). In the trade union movement there was no recession, but rather a decided growth in numbers and strength, together with an increasing momentum toward the formation of industrial unions. See **TRADE UNIONS.**

Among the most notable features of the labor histories of the year were the great successes attending efforts to protect child and women workers. See **CHILD LABOR, MINIMUM WAGE, and WOMEN IN INDUSTRY.**

Other phases of the labor problem will be found under: **ARBITRATION AND CONCILIATION, INDUSTRIAL; BOYCOTT; WORKMEN'S COMPENSATION; INJUNCTION; INDUSTRIAL RELATIONS COMMISSION; FACTORY INVESTIGATING COMMISSION; LABOR, AMERICAN FEDERATION OF; LABOR LEGISLATION; OCCUPATIONAL DISEASES; OLD-AGE PENSIONS; and WELFARE WORK.** Other cross references will be found under these articles. Labor conditions in the United States Steel Corporation are treated under that heading.

DEPARTMENT OF LABOR. On March 4, 1913, the President signed a bill creating a Department of Labor. This action had been demanded by labor leaders for a number of years. The act merely transferred to the new department the bureau of immigration service, the bureau of immigration and naturalization, the division of information, the division of naturalization, the bureau of labor, the children's bureau, and the commissioner of labor previously included in the Department of Commerce and Labor. The old department was named the Department of Commerce; and the bureau of labor became the bureau of labor statistics. The Secretary of Labor was authorized to act as mediator or to appoint commissioners of conciliation to secure the settlement of labor disputes, this being probably the most important of the powers and duties of the new department. The creating act gave the department the function of fostering the welfare of wage-earners, improving their working conditions, and advancing their opportunities for profitable employment. Mr. William B. Wilson, formerly secretary-treasurer of the United Mine Workers of America and member of Congress from Pennsylvania, was appointed the first Secretary of Labor.

SOUTHERN LABOR CONGRESS. The first annual session of this body, which is a labor organization affiliated with the American Federation of Labor, was held at Nashville, November 17. Representatives were present from twelve Southern States, and reports were made on the labor legislation favored by the organized labor of each. Among its policies and principles are:

The encouragement of organization among workers; the dissemination of literature bearing on trade unionism; the assistance of public agitation for labor reforms, especially the short-hour movement; the adoption of the initiative, referendum, and recall in both State and municipal governments.

INTERNATIONALISM. One of the features of the growing international sympathy of wage earners is the increasing frequency of international conventions of trade unionists and the growing custom whereby trade unionists of one country send representatives to the national conferences of trade unions in other countries. The American Federation of Labor, for example, customarily now sends representatives to the British Trade Union Congress and to the Canadian Trades and Labor Congress. It also frequently sends representatives to Continental conventions.

The American Federation was represented at the Eighth International Conference of the Representatives of National Trade Centres which met at Zurich, Switzerland, September 16-18. This is known as the international secretariat, Mr. Carl Legien being the secretary. The bodies affiliated with the National Trade Centres represented in this conference reported a total membership of 7,121,000, an increase of 550,000 over their members in 1911. Among the topics of discussion were: Measures for the abolition of night work and a wider adoption of the legal eight-hour day, as proposed by Sweden; and measures to make the May-day demonstration more truly economic and international in character, as proposed by France. Upon the initiation of the American representatives the organization changed its name to the International Federation of Trade Unions. This body guarantees the autonomy of the organizations of each country. It was voted to hold the next congress in San Francisco in 1915.

Following the adjournment of the foregoing congress there was held at the same place the first Conference of International Trade Union Secretaries. They met to discuss uniformity of reports, and uniformity of trade union statistics.

LABOR, AMERICAN FEDERATION OF. This is the most comprehensive body among organized labor in the United States, founded in 1881. Its fundamental principles include organization along trade lines with the greatest possible degree of individual trade union autonomy. In recent years it has therefore vigorously opposed Socialism, Syndicalism, and the Industrial Workers of the World. Among the policies which it now favors are the following: Free schools, free textbooks, and compulsory education; reduction of the powers of the courts in the issuance of injunctions in labor disputes; an eight-hour day; one day's rest in seven; the abolition of the contract system on public work; municipal ownership of public utilities; the abolition of the sweat-shop; sanitary inspection of factory, mine, and home; nationalization of telegraph and telephone; the protection of child labor; equal woman suffrage; plentiful play grounds in all cities; the initiative, referendum, and recall; the prohibition of interstate trade in convict-made goods; old age pensions for all civil service employees; prohibition of so-called scientific management schemes in public service; minimum wage legislation.

For the year ending September 30, 1913, it had an average paid-up and reported membership of 1,996,004, an increase of 222,859 over the preceding year. The membership dues for the month of September indicated a total of more than 2,000,000 members. This membership was distributed among 111 national and international unions and 659 local trade and Federal labor unions, with 20,046 local unions. The total expenditures of the federation in 1913 were \$258,703. Unions affiliated with the federation publish more than 500 weekly and monthly periodicals. The official publication is the *American Federationist*. The principal officers include Samuel Gompers, president; James Duncan, first vice-president; John B. Lennon, treasurer; and Frank Morrison, secretary. The federation includes a building trades department with James A. Short as president; a metal trades department, with James O'Connell as president; a union label department, with John F. Tobin as president; a mining department, with Charles H. Moyer as president; and a railroad department, with H. B. Perham as president. The general offices are in Washington, D. C.

For a number of years the Federation has made a great effort to secure legislation from Congress limiting the power of the courts to issue injunctions, and to secure the exemption of trade unions from the operations of the trust law. (See **TRADE UNIONS**.) In the Senate and House investigations of lobbying during the summer and the early fall the Federation and the

National Association of Manufacturers were shown to have strenuously opposed each other not only in Washington, but also in the elections of Congressmen. (See TRUSTS.) It has supported the United Hatters in the famous boycott case of *Loewe vs. Lawler*. (See *BOYCOTT*.) For this purpose it has levied a two-cent and a one-cent assessment, the latter on August 4. From these funds were paid out for this case \$19,566 in the fiscal year ending September 30. In addition it has supported various strikes and lent great strength to the demands of constituent unions. According to the 1913 report of the Federation 63 international organizations paid during the year \$1,956,893 in death benefits. Those paying the largest totals were: Brotherhood of Carpenters, \$307,069; Cigar Makers, \$273,852; Typographical Union, \$234,457; Switchmen, \$181,125; Street Railway Employees, \$132,300; and Painters, \$113,125. In addition, 9 organizations paid \$58,420 in death benefits on account of members' wives. Sick benefits paid by 26 bodies aggregated \$816,336; Cigar Makers alone, \$402,775; and the Molders, \$459,434. Traveling benefits were paid by the Cigar Makers to the amount of \$33,113. Unemployment benefits paid by 8 unions amounted to \$69,445, of which the Cigar Makers paid \$42,911, and Spinners paid \$13,000. The same report showed that there were 55 unions using labels and 10 using cards, as means of furthering the interests of the organization. In addition there were nearly two score unions using the label of the federation itself. The extent of the propaganda carried on by the federation is shown by the payment of \$86,699 for organizing expenses during the 12 months.

CONTEMPT CASE. In December, 1907, the Buck's Stove and Range Company, of St. Louis, had secured an injunction from Justice Wright of the Supreme Court of the District of Columbia restraining the officers of the federation from prosecuting a boycott. This injunction was strongly objected to by those enjoined, on the ground that it denied them the right of free speech guaranteed to them by the Constitution of the United States. In December, 1908, Messrs. Gompers, Mitchell, and Morrison, principal officers of the federation, were found guilty of contempt of court because of failure to respect certain features of the injunction. Justice Wright sentenced them to twelve, nine, and six months' imprisonment respectively. These sentences were affirmed in November, 1909, by the highest court of the District, one of the justices dissenting. The case was then taken to the Supreme Court of the United States. Meanwhile the federation and the Buck company had come to an agreement. The court therefore in May, 1911, dismissed the original injunction suit brought by the company; but, while declaring the sentences in the contempt case to be excessive, ruled that the dismissal of the injunction suit should not prejudice the right of the original court to punish any contempt committed. After investigation by a committee appointed to inquire whether contempt had been committed, Justice Wright in June, 1912, reimposed the sentences of twelve, nine, and six months. The case was then taken once more to the Court of Appeals of the District of Columbia. On May 5 that court, in a divided opinion, sustained the lower court in finding Messrs. Gompers, Mitchell, and Morrison guilty of contempt, but modified the sentences to thirty

days in jail for Gompers and \$500 fine for each of the others. In the latter part of May counsel for the three defendants filed a petition in the Supreme Court of the United States for a writ of certiorari to obtain a review of the case. About the same time the Supreme Court of the District of Columbia filed a petition asking the same court to reverse that portion of the decision of the Court of Appeals which reduced the penalties imposed. On June 19, the petition for a review of the case was granted. The appeal was heard during the session beginning in October.

LABOR LEGISLATION. Some labor legislation was enacted in nearly every State in 1913 and by the national Congress. It is impossible to give here more than a general indication of the character of this great volume of laws. In addition to the topics treated in the following paragraphs material on the labor legislation of the year will be found under **CHILD LABOR**; **MINIMUM WAGE**; **ARBITRATION AND CONCILIATION**; **INDUSTRIAL**; **OLD-AGE PENSIONS**; **PENSIONS FOR MOTHERS**; **WOMEN IN INDUSTRY**; and **WORKMEN'S COMPENSATION**. See also **TRADE UNIONS** for the exemption of labor organizations from the anti-trust law. There are special articles on the **INDUSTRIAL RELATIONS COMMISSION** and the **FACTORY INVESTIGATING COMMISSION OF NEW YORK**. See the article **LABOR** for the law creating the Department of Labor.

ADMINISTRATION. For several years the conviction has grown that wise legislation and its efficient enforcement requires an extension of the principle of enforcement by means of administrative orders. Experience has shown that, owing to the great diversity of industrial conditions in even the smallest States, it is far better for the legislature, instead of prescribing laws for all situations, to lay down general rules and principles and authorize a board or commission to apply them to particular cases. In 1907 Massachusetts created a board of boiler rules; and in 1911 Wisconsin created its industrial commission with very extensive powers including jurisdiction over trade disputes, workmen's compensation, unemployment, and the health, safety, and well-being of all workers. In 1913 this plan in modified form was adopted in Massachusetts, where the State board of labor and industries was given very considerable administrative power. In Ohio an industrial commission of three members appointed by the governor at \$5000 each was created. The power and duties of this commission as described below are about the same as those of the Wisconsin commission. In Oregon and California commissions of three or five were created to regulate wages, hours, and conditions of work for women and children, and in Colorado, Minnesota, Nebraska, and Washington, to regulate wages and conditions of work. In New York and Pennsylvania the labor departments were reorganized and enlarged, and particularly in New York extensive administrative discretion was granted. (See below and **FACTORY INVESTIGATING COMMISSION OF NEW YORK**.) Arkansas, Montana, and Vermont created labor departments; Delaware and Florida provided special inspectors for child and women workers; and numerous other States reorganized or enlarged their previously established departments.

ACCIDENTS AND DISEASES. Laws requiring

the reporting of accidents were enacted in 14 States. In Florida, Illinois, Maine, Missouri, Montana, New Hampshire, and Pennsylvania laws required the report of accidents from railroads and other public service corporations. The reporting of accidents in factories was required or strengthened in five States; and accidents in mines must now be reported in Colorado, Iowa, and Michigan. The reporting of occupational diseases was required in Maine, Minnesota, New Hampshire, and Ohio. A Massachusetts law gave the State board of labor and industries power to require similar reports. In Connecticut and New York, where reports regarding certain diseases was already required, brass and wood-alcohol poisoning were added to the list. In Missouri, Ohio, and Pennsylvania cases of disease found in monthly medical examinations in lead-using establishments were required to be reported. In addition California, Illinois, Maryland, Michigan, New Jersey, New York, and Wisconsin, in 1911 or 1912, required the reporting of certain occupational diseases. For compensation for industrial accidents, see **WORKMEN'S COMPENSATION**.

In New York State the factory investigating commission (q. v.), created in 1911, submitted its preliminary report in three volumes (1986 pp.) This report in addition to a summary of the commission's work contained recommendations regarding fire hazards, factory inspection and sanitation, occupational disease and industrial poisoning, bakeries, tenement house manufacturing, the employment of women and children. Largely as a result of this report a law was enacted reorganizing the State Department of Labor. This provided for increased inspection and investigation, regulation of working conditions by departmental rules, and an increase in educational work. The number of inspectors was increased, larger salaries provided, and a larger staff of experts created. A new division of industrial hygiene, consisting of a physician, a mechanical engineer, a chemical engineer, a civil engineer, and ten investigators, was established. More important yet there was created an industrial board of five members including the commissioner of labor as chairman, having power to issue rules and regulations for the protection of life, health, and safety. This form of regulation follows the European custom, also that of the State of Wisconsin, and replaces the more cumbersome form of legislative enactment. The bureau of labor statistics received the title of bureau of statistics and information.

In Ohio an industrial commission of three members to be appointed by the governor was created. This commission combined the functions of the following offices: The State liability board of awards; commission of labor statistics; inspection of mines; inspection of workshops and factories; examiner of steam engineers; board of boiler rules; State board of arbitration and conciliation. The commission was given extensive powers to investigate and to issue executive orders. It may prescribe safety devices, and safeguards for every employment and place of employment to carry out the intent of the existing law; it may establish standards of factory construction and maintenance and enforce reasonable orders for the protection of life, safety, and health of employees. It is expected to promote volun-

tary arbitration and conciliation, to investigate the extent and causes of unemployment, and adopt means for its avoidance and relief. Any employer affected by a commission order may obtain a hearing on its reasonableness before the commission; but any action to set aside the orders of the commission may be commenced only in the Supreme Court.

MISSISSIPPI TEN-HOUR LAW. In March, 1912, the Mississippi legislature enacted a law limiting to ten hours per day the employment of men and women in manufacturing. The law was contested by the Newman Lumber Company as regards the employment of men, but was sustained by two opinions of the State Supreme Court late in 1912 and early in 1913. This decision is very notable as the first in the United States upholding a general limitation of the hours of men in industry. The Utah eight-hour law applying to mines and smelters had been upheld by the United States Supreme Court in 1898 on grounds of health. But in the famous *bake-shop case*, *Lochner vs. New York*, the same court had declared unconstitutional a law limiting the hours of bakers on the ground that the occupation is not a dangerous one. But the Mississippi decision lays much stress on the fatigue and tendency to nervous exhaustion resulting from mechanical and manufacturing trades; and upholds the ten-hour limitation as a reasonable act of legislation. The court after stating that many cases had been prosecuted to preserve the "inalienable rights of labor," made the remarkable statement that "Some day, perhaps, the inalienable right to rest will be the subject of litigation."

LABOR LEGISLATION, AMERICAN ASSOCIATION FOR. This is the American branch of the international association of like name. It has branches in leading industrial States and promotes legislation designed to better labor and industrial conditions.

PROGRAMME. The legislative programme of the association for 1913 included the following: (1) One day's rest in seven, no matter how continuous the industry; (2) protection of all workers against lead-poisoning; (3) extension of uniform reporting of industrial accidents and diseases and the adoption of standard schedules therefor; (4) revision of the Federal employees' compensation act and inclusion therein of compensation for industrial diseases; (5) additional State legislation on workmen's compensation; (6) encouragement of State and national investigations of industrial hygiene and safety; (7) effective legal safeguards for working women; (8) more efficient factory inspection and labor law enforcement.

ANNUAL MEETING. The seventh annual meeting of the association was held in Washington, December 30-31, in joint session with the American Political Science Association. The programme opened with a paper on "The Federal Industrial Relations Commission," by Frank P. Walsh, chairman of that commission. He was followed by a paper on "Labor Law Enforcement Through Administrative Orders," by Charles H. Crownhart, chairman of the Wisconsin industrial commission. Other topics of the programme were as follows: "The Philosophy of Labor Legislation," by W. F. Willoughby, president of the association; "The Practicability of Compulsory Sickness Insurance in America," by Joseph P. Chamberlain of New

York; "Sickness Benefit Funds Among Factory Employes," by W. L. Chandler, a manufacturer of Indiana; "Trade Union Sickness Insurance," by James M. Lynch, New York State commissioner of labor; "Work Periods in Continuous Day and Night Occupations," by Basil M. Manly, special investigator of employment in the iron and steel industry for the United States Bureau of Labor; "Eight Hour Shifts in the Milling Industry," by S. Thurston Ballard, a miller of Kentucky; "Long Hours in Railroading," by Austin B. Garretson, president of the Order of Railway Conductors; and "Constitutional Aspects of Hour Legislation for Men," by Ernst Freund, University of Chicago Law School.

COMMITTEE ON SOCIAL INSURANCE. The association early in the year appointed a committee on social insurance with Edward T. Devine as chairman. The other members were expert statisticians and economists. This committee was expected to make a comprehensive and exhaustive inquiry into the subjects of compensation for industrial injuries and for occupational diseases, sickness insurance, provision for old-age, unemployment, and all other causes of dependency which thrifty workers may provide against by insurance methods.

This committee arranged a conference on social insurance at Chicago, June 5 and 6. Compensation for accidents, insurance against unemployment, sickness, and old-age, and the widows' pension movement were the topics of discussion. The three methods of providing workmen's compensation, through casualty insurance companies, employers' mutual associations, and State insurance funds, each had its advocates. The general philosophy of social insurance was developed by Prof. W. F. Willoughby of Princeton, who gave as its essentials the protection of workers against all those accidents and misfortunes which may undermine normal standards of work and living, and the assumption of the cost by the entire community. Sickness insurance on the German plan as found in Germany, Austria-Hungary, Luxemburg, Norway, Great Britain, and Russia, was discussed by Dr. I. M. Rubinow, who advocated compulsory sickness insurance with equal contributions by employe, employer, and the State. In the discussion of unemployment insurance Prof. Charles R. Henderson of the University of Chicago pointed out the defects of the Ghent scheme of subsidies to trade unions and advocated the plan of compulsory insurance as illustrated in the British law protecting 2,500,000 men in the building and engineering industries. Dr. Edward I. Devine strongly opposed the widows' pension idea on the ground that it was the old-time disreputable out-door relief under a new guise. As to old-age pensions, both the continental plan of compulsory insurance and the British plan of public non-contributory pensions were defended.

LABOR LEGISLATION, INTERNATIONAL ASSOCIATION FOR. Under the auspices of this association an international conference met at Berne, Switzerland, in September, 1913. The subjects for discussion were international treaties providing for the prohibition of night work for young persons and for a ten-hour maximum working day for women and young persons. Preparatory to this conference memoranda were drawn up, the English translations of which appeared as bulletins of the United

States Bureau of Labor Statistics, Miscellaneous Series, Numbers 2 and 3.

The programme of the International Association provides the following with reference to night work of young persons: General prohibition for young persons under eighteen years of age, absolute prohibition for all persons under fourteen; night rest of eleven hours which shall include the periods from 10 P. M. to 5 A. M. Provision is, of course, made for periods of transition from existing conditions to those the association would establish. The memorandum pointed out the following advantages of the prohibition of night work of persons under eighteen: An extension of the period of education; a reduction in the proportion of young persons and an increase in the employment of women and men; the exclusion of young persons from dangerous trades, and a consequent reduction in the number of industrial accidents; improvement in the physical and intellectual efficiency of adult workers; a removal of the damage to the inclination to work and the mental and moral development of young persons due to long hours. With reference to transitional measures the memorandum held five years to be a sufficient time to raise the age limit from fourteen or fifteen to eighteen years. The exception of night work of young persons over sixteen in the glass industry was declared to be purely temporary. It was pointed out that for twelve years many Prussian glass works have employed no children, and in France for many years the work of children has been done by mechanical carriers.

With reference to the maximum working day for women and young persons the programme calls for an international agreement limiting such to ten hours, such limitation to be introduced by degrees. The memorandum, after reciting the experiences of England, France, Germany, Netherlands, Switzerland, Austria, Russia, and Italy, declared four years to be sufficient time to introduce a ten-hour day. This transition period was considered ample to prepare public opinion and to permit employers to make proper accommodations, as well as to enable administrative measures to be adopted.

LABRADOR. A peninsula in the northeastern part of British America, attached partly to Newfoundland (q.v.) and partly to Canada.

LABUAN. See STRAITS SETTLEMENTS.

LACROSSE. The Crescent A. C. retained its supremacy in lacrosse in the United States, and made an excellent showing in contests with teams from Canada, the home of the game.

The Crescents played a long schedule, their principal matches and results being: Crescent 7, University of Pennsylvania 3; Crescent 10, New York L. C., 4; Crescent 2, Boston L. C. 0; Crescent 8, New York L. C. 4; Crescent 7, Carlisle Indians 1; Crescent 4, Toronto University 4; Crescent 4, St. Simon L. C. of Toronto 3; Crescent 9, Prescott L. C. of Toronto 9; Crescent 3, Montreal A. A. 4.

The victors in the intercollegiate league were Harvard in the northern division, and Johns Hopkins in the southern division. These teams did not meet to decide the championship.

LADD, HERBERT WARREN. An American public official, former governor of Rhode Island, died November 29, 1913. He was born in New Bedford, Mass., in 1843, and educated at the public schools of that city. During the Civil War he acted as correspondent for the *New*

Bedford Mercury. He engaged in business at the close of the war, and established one of the largest dry goods houses in Providence, acquiring a large fortune. He gave an astronomical observatory to Brown University; and he was elected governor of Rhode Island in 1890; and again in 1891.

LAFAYETTE COLLEGE. An institution for higher education founded at Easton, Pa., in 1832. The enrollment in 1913 was 582. The faculty numbered 59. There were no noteworthy changes in the faculty during the year and no notable benefactions were received. The productive funds of the university amount to about \$625,000, and the annual income to about 130,000. The library contains about 40,000 volumes. The president is Rev. E. D. Warfield, LL.D.

LA FONTAINE, HENRI. A Belgian publicist, who received in 1913 the Nobel Peace Prize. He was born in Brussels in 1854. In 1878 he became secretary of a model technical school for girls, and in 1889 was appointed secretary of social and political studies. This prepared the way for the revision of the Belgian Electoral law in 1903. He joined the Socialist party in 1891 and two years later founded *La Justice*. In 1894 he took part in founding Brussels University and was appointed Professor of International Law in that institution. From 1895 he sat continuously in the Belgian Parliament, with only two years intermission. From his earliest manhood, he espoused the cause of internationalism, and has been one of the world's most active pacificators. He was a member of the Interparliamentary Union, and attended international congresses of arbitration and peace. In 1910, in cooperation with Paul Otlet, he founded the Union of International Associations. He was the author of several important works dealing with international peace and arbitration. See NOBEL PRIZES.

LAKE MOHUNK CONFERENCE ON INTERNATIONAL ARBITRATION. See ARBITRATION, INTERNATIONAL.

LAMONT, SIR JAMES. An English explorer, died July 29, 1913. Born in 1828, and educated at Rugby and at the Edinburgh Military Academy, from 1846 to 1848 he served in the British army. In 1856 he made a voyage to Spitzbergen. After returning from a second voyage to the same region, he entered Parliament, where he occupied the seat from 1865-68. In the latter year he abandoned his seat in Parliament and built a vessel designed to embody all requirement for Arctic navigation. This vessel was launched in 1869, and in it he made several voyages to Spitzbergen and Novaya Zemlya.

LAMPS, ELECTRIC. See ELECTRIC LIGHTING.

LANCE, SIR FREDERICK. A British major-general, died January 13, 1913. He was born in 1837 and in 1856 was gazetted to the 55th Bengal Native Infantry. Transferred in the following year to the 16th Punjab Infantry, he saw much service in the Indian Mutiny; and he took part in several campaigns in India and in the Afghan campaign of 1870-80. He retired from active service and in 1899 was appointed lieutenant-general.

LAND POLICY, LIBERAL. See GREAT BRITAIN.

LANDS, PUBLIC. During the fiscal year 1913, the so-called "three-year homestead law" was in effect. This reduced from five to three years the residence period on a homestead taken

from the public domain, and otherwise improved conditions under which title of land is proven.

The number of patents written during the year was 63,296, compared with 67,475 in the previous year. The total area of public and Indian lands originally entered and allowed during the year was 15,867,222 acres, an increase of 1,292,533 acres compared with 1912. The area patented during the fiscal year was 12,678,076 acres, an increase of 2,542,601 acres compared with the previous year. Of the above area 7,320,067 acres were patented under the homestead law.

Progress in 1913 was made in the investigation of lands of different character, and the circumstances under which they have been acquired. As a result of such investigations in oil lands in California, a number of suits were instituted during the year by the Department of Justice to recover lands patented as agricultural which in fact were oil lands in character.

During the year field investigations were completed in connection with 1129 Alaska coal claims. Proceedings were taken in 99 of these coal claims, which brings the total up to 399 on which hearings have been ordered.

In the year 1913, 12 national forests were enlarged and 27 reduced. At the end of the year there were 163 national forests embracing 168,616,648 acres. The withdrawals for power-site purposes during the year numbered 89, embracing 152,136 acres, and 68,034 acres hitherto withdrawn were restored. In December, more than 1,678,000 acres of withdrawn lands in the Western States were restored to entry, and about 50,000 acres were withdrawn, leaving a net decrease in outstanding withdrawals in the public land of the States of nearly 1,630,000 acres. This action was based on recommendations to the Secretary to the United States Geological Survey. The States most affected were Montana, in which 220,000 acres heretofore included in phosphate lands were shown to be not phosphate bearing and were therefore restored to entry; North Dakota, in which the withdrawals of coal lands were reduced by over 646,000 acres, and Washington and Wyoming, where there were reductions of nearly 500,000 and 400,000 acres respectively in coal-land withdrawals. The principal ores withdrawn were in California and Wyoming. In California, public-water reserves aggregating 36,000 acres were created, and in Wyoming more than 12,000 acres were withdrawn for the same purpose. The net result of these transactions was to reduce the entire output withdrawn in the public land States from somewhat less than 67,900,000 acres at the beginning of December, to a little less than 66,270,000 acres at the end of the month. This area withdrawn may be compared with approximately 88,000,000 acres that have thus far been classified under the several mineral-land laws. During the month of December, somewhat less than 2,000,000 acres were classified as non-irrigable, and by order of the Secretary of the Interior, were open to entry under the enlarged-homestead act. This makes a total of about 207,375,000 acres of land that have been classified as non-irrigable since the passage of the act. The total area of lands that have been classified in the Western States up to the end of December, 1913, aggregates nearly 295,700,000 acres. The Secretary of the Interior in his annual report for 1913 makes several recommendations for

legislation. These include the modification of the present form of appropriations for public service; an amendment of the act of June 2, 1874, by which its protection will be extended to include desert-land, entrymen as well as homesteaders; and the consolidation of the Carey act, by which several acts and amendments may be brought together. In relation to Alaska, he recommends the enlargement of certain privileges and modifications of the Homestead law, the amendment of legislation regulating a 60-foot roadway along the shores of navigable rivers, and the provision for the utilization of mineral or medicinal springs.

WATER POWER SITES. Walter L. Fisher, former Secretary of the Interior, made a statement relative to water power conditions before the meeting of the American Forestry Association in January. This statement was widely commented upon. Mr. Fisher affirmed that water power on the public domain may be developed in one of two ways. "We can," he said, "either turn over that water power to private development and ownership, absolutely untrammelled, unrestrained and unregulated, except as we can hereafter regulate it, like any private business, as it were, from the top; or we can dispose of it by a permit which, by the very terms of the statute, is revokable the moment after it is granted. Neither of these methods is satisfactory at the present time. Our natural resources have been tied up, which is a great disadvantage. This," he said, "we cannot offset by employing fuel resources which are destroyed in the use, whereas the water power that we might harness and develop is perpetual and continual. Its use is the most living and vital example of conservation in every sense of the word." Mr. Fisher declared that the majority of the water power people believe that the time has come when the power interests should frankly recognize the public interests involved in their business. Those public interests should impose upon private companies the payment of compensation to the Federal government. At first this payment should be nominal, but at the beginning of each successive ten-year period the Secretary of the Interior should have the right to readjust such compensation, and there should be complete publicity of records and regulations of rates and services as may be prescribed by the proper authorities, the grant being subject to revocation on violation of its conditions. Such a contract has been entered into with the Great Falls Power Company of Montana, which controls the important power development of the Great Falls of Missouri in that State. The significance of this particular grant is twofold: (1) it marks the first step toward the electrification of a part of the transcontinental railways of the United States; (2) it is the latest example of making effective the regulations regarding large power interests for which those interested in conservation have long contended.

LANDSCAPE GARDENING. During the year 1913 increased attention was given to the beautifying of public parks and gardens and of private estates and plots in city suburbs. The principal works in progress at the close of the year included the Botanical Garden for Brooklyn, N. Y., the development of South Philadelphia, including League Island Park; public play grounds in Boston, Mass., and New London, Conn.; a park system and civic centre for

Denver Col.; parks and play grounds for Little Rock, Ark., and Schenectady, N. Y.; the Arroyo Seco Parkway, at Los Angeles, Cal., for which the land alone was to cost \$1,100,000; parks in Buffalo, N. Y.; South Shore Park for Milwaukee, Wis.; and a park system for Gary, Ind. Many other small towns had plans of the same kind under consideration. The so-called garden suburb was a recent development near the larger cities, and of those which had been undertaken and were partly completed at the close of the year may be mentioned Forest Hills Gardens, N. Y., Torrance, an industrial town near Los Angeles, Cal., and Neponset Garden Village, a copartnership housing plan at Walpole, Mass.

The main characteristic of landscape gardening during the year was the production of effects with the minimum of artificial device of either design or planting, in public work as well as in the development and improvement of private estates, large and small. Landscape gardeners produced their results by making permanent plantations showing distinctive characteristics and fitting American conditions; and while in specific instances it was necessary to introduce exotic plants and trees and to use Japanese or other foreign "motifs," the prevailing note in recent work was natural simplicity. In certain parts of the United States, for instance, the use of the native cedars, spruces, and other evergreens indigenous to the locality became very usual in making landscape effects, replacing foreign shrubs, or plants set in stiff conventional designs. More discriminating taste in the use of fountains, sun dials, pergolas, and the like, was shown by adapting them more strictly to the locality, the surrounding scenery, and the architectural style of the nearby buildings.

THE AMERICAN SOCIETY OF LANDSCAPE ARCHITECTS, which was formed in 1899, held its regular annual meeting in Chicago in May, 1913. The officers of the society in 1913 were: Executive committee, Warren H. Manning, president; James Sturgis Pray, vice-president; Alling S. DeForest, secretary; Henry V. Hubbard, treasurer.

THE BOSTON SOCIETY OF LANDSCAPE ARCHITECTS was organized in May, 1913, in that city with a membership limited to those practicing their profession in the New England States.

EDUCATION. In addition to courses of study in this subject open to women at Cornell, there was at Groton, Mass., the Lowthorpe School of Landscape Architecture, Gardening, and Horticulture for women, which has been in operation since 1901, and had graduates practicing in several States, including Massachusetts, Rhode Island, Pennsylvania and California. The school offered a complete two years' course, comprising planting, designing, horticulture, green house work, object lessons in agriculture, architectural drawing, topographical maps, and surveying and engineering. In addition to this, students had free use at all times of the Arnold Arboretum of Harvard University at Cambridge, and could work there under the tuition of Professor Sargent. The school itself had a tract of 17 acres of land, meadow and pasture, in addition to a fruit orchard and flower and vegetable gardens where the students received practical instruction.

LANE, FRANKLIN KNIGHT. An American public official and Secretary of the Interior in the cabinet of President Wilson. He was born

in Prince Edward Island in 1864 and graduated from the University of California in 1886. In 1889 he began the practice of law in San Francisco, and from 1897-1902 was corporation counsel for that city. The latter year he was a candidate for governor of the State, and in 1903 he received the votes of the Democratic members of the California legislature for United States senator. Appointed in 1905 a member of the Interstate Commerce Commission, he served as its chairman until his selection as Secretary of the Interior by President Wilson.

LANE, HARRY. United States senator (Democrat) from Oregon. He was born in Corvallis, Benton County, Ore., in 1855, and was educated in the public schools. He received his degree in medicine in 1876, and from 1887 to 1891 was superintendent of the Oregon State Insane Asylum. He was mayor of Portland from 1905 to 1909; received the Democratic nomination for senator in the primary election held November, 1912, and was elected by the legislature in 1913. His term of office expires March 3, 1919.

LANGUAGE, INTERNATIONAL. The ninth convention of Esperantists, celebrating the twenty-sixth anniversary of the birth of Esperanto, took place in Berne, Switzerland, from August 24 to August 31. About 1100 delegates from 33 different nationalities were present. Plans were offered for a system of international propaganda to supplement the work which had hitherto been done exclusively by national organizations. A new feature of the convention was an oratorical contest in Esperanto in which the first prize was won by M. Pichon of Paris, and the second by M. Mahn, of Breslau. The next congress will take place in Paris, in 1914. There are no really new developments in the feud between Esperantists and Idists or other advocates of artificial language systems. The attack made upon the claims of all international languages by Professor Danzat of Paris, in his *Défense de la langue française*, should, however, be mentioned.

LAOS. The French territory of Laos, a division of French Indo-China (q.v.), contains only about a third of the country known as the Laotian Principalities; and is in the most barren and sparsely peopled portion. Mountain masses covered with impassable forests occupy the northern regions; in the south, between long chains of hills, are fertile plains more or less undulating. Cardamoms, rice, benzoin, wax, rubber, resins, etc., are exported. The trade is included with that of French Indo-China. The capital is Vientiane. The local budget for 1912 balanced at 898,729 piasters. The kingdom of Luang-prabang is the most considerable native agglomeration; other principalities or provinces have native chiefs. The French resident in 1913 was Bourcier Saint-Chaffray.

LARKIN, JAMES. See GREAT BRITAIN, *History*; *Socialism*; and *Strikes*.

LARRABEE, WILLIAM HENRY. An American editor and writer on scientific subjects, died May 13, 1913. He was born in Alfred, Maine, in 1829; graduated from Depauw University in 1845; and was admitted to the bar. From 1862-65 he was assistant editor of the *Methodist* in New York City, and from 1865-70 associate editor of the *Brooklyn Daily Union*. He contributed to several reviews and encyclopædias of scientific and religious subjects. His

published writings include *How the World was Made* and *Earthquakes and Volcanoes* in the *Library of the Great World*; *Education through the Agency of Religious Organizations*; and many articles and reviews and translations in various publications.

LATHBURY, MARY ARTEMISIA. An American author and hymn writer, died October 21, 1913. She was born in Manchester, N. Y. in 1841, for several years taught art, and then engaged in editorial work. From 1874 until the time of her death she was occupied with general literature and illustration. Best known as the author of *Chautauqua Songs and Hymns in Church Collections*, she also wrote, and illustrated: *Out of Darkness into Light* (1880); *Seven Little Maids* (1882); *Twelve Times One* (1885); *Story of the Bible* (1898), etc.

LAWN TENNIS. DAVIS CUP MATCHES. The capture of the Davis International Challenge Cup by an American team was the most important happening in the tennis world in 1913. This cup, which is emblematic of the world's championship, had been wandering about Australasia and Great Britain since 1903 despite the efforts of the United States players to regain possession of it. That the Americans finally achieved success was due to the wonderful playing of Maurice E. McLoughlin of California. Eight countries—the United States, Germany, France, Great Britain, Canada, Australasia, Belgium, and South Africa—took part in the international matches.

A preliminary round contested by Germany and France at Wiesbaden, Germany, resulted in a victory for the Germans, who won four matches and lost one. The German team comprised Oscar Kreuzer, F. W. Rahe, and Herman Klein-Schroth. The French players were Andie H. Gobert, Max Decugis, and M. Gernnot. While the Wiesbaden matches were taking place, the United States and Australasia were battling in another preliminary round on the courts of the West Side Tennis Club, New York City. The United States team, made up of M. E. McLoughlin, R. Norris Williams, and Harold H. Hackett, defeated the Australasian players—Stanley N. Doubt, A. B. Jones, and Horace Rice—by four matches one. A third preliminary round was fought on the courts of the Queens Club, London, with the Canadian and South African teams as contestants. The Canadians were Robert B. Powell and Bernard P. Schwengers, who defeated the South Africans, R. F. LeSueur and V. R. Gauntlett, three matches to one. The next step in the international struggle was the semi-final round on the courts at Nottingham, England, between the United States and Germany. The United States players defeated the German team which had been strengthened by the addition of Otto Froitzheim five straight matches. In another semi-final round at Folkestone, England, the Canadians defeated the Belgians—Chevalier Paul de Borman, A. G. Watson, and W. H. DeVivier—five straight matches. In the final round at Wimbledon, England, the United States defeated the Canadians by winning the three matches played and by so doing became the challenging aggregation.

The British tennis experts were confident

their country's players would retain possession of the cup. They counted on C. P. Dixon and H. Roper Barrett to win the doubles and J. C. Parke to capture one of the singles events. McLoughlin, however, upset their hopes by a wonderful rally when the English were within one stroke of victory.

A summary of the various rounds in the international matches follows:

Davis Cup preliminary round, at West Side Club, New York City: Singles—Maurice E. McLoughlin, United States, defeated Horace Rice, Australasia, 6-1, 6-3, 6-3; R. Norris Williams, United States, defeated Stanley N. Doubt, Australasia, 6-4, 6-4, 1-6, 7-5. Doubles—Stanley N. Doubt and A. B. Jones, Australasia, defeated Harold H. Hackett and Maurice E. McLoughlin, United States, 6-2, 2-6, 7-5, 2-6, 9-7. Singles—Maurice E. McLoughlin, United States, defeated Stanley N. Doubt, Australasia, 6-4, 6-4, 6-2; R. Norris Williams, United States, defeated Horace Rice, Australasia, 1-6, 4-6, 6-1, 9-7, 6-2.

Preliminary round, at Wiesbaden, Germany: Singles—O. Kreuzer, Germany, defeated Andre H. Gobert, France, 1-6, 6-4, 6-2, 6-3; Max Decugis, France, defeated F. W. Rahe, Germany, 2-6, 6-4, 2-6, 8-6, 7-5. Doubles—H. Kleinschroth and F. W. Rahe, Germany, defeated Max Decugis and M. Germot, France, 7-5, 6-4, 4-6, 9-7. Singles—O. Kreuzer, Germany, defeated Max Decugis, France, retired; F. W. Rahe, Germany, defeated Andre H. Gobert, France, 6-1, 6-1, 6-1.

Preliminary round, at Queen's Club, London: Singles—Robert B. Powell, Canada, defeated R. F. La Sueur, South Africa, 6-3, 4-6, 3-6, 7-5; V. R. Gauntlett, South Africa, defeated Bernard P. Schwengers, Canada, 11-9, 6-3, 6-0. Doubles—Robert B. Powell and Bernard P. Schwengers, Canada, defeated V. R. Gauntlett and R. F. Le Sueur, South Africa, 7-5, 6-3, 3-6, 6-3. Singles—Bernard P. Schwengers, Canada, defeated R. F. Le Sueur, South Africa, 6-3, 6-2, 6-3; other match not played.

Semi-final, at Nottingham, England: Singles—R. Norris Williams, United States, defeated Oscar Kreuzer, Germany, 6-4, 6-2, 4-6, 6-1; Maurice E. McLoughlin, United States, defeated Otto Froitzheim, Germany, 5-7, 2-6, 6-4, 6-2, 6-2. Doubles—Harold H. Hackett and Maurice E. McLoughlin, United States, defeated Herman Kleinschroth and Frederick Wilhelm Rahe, Germany, 6-4, 2-6, 6-3, 8-6. Singles—R. Norris Williams, United States, defeated Otto Froitzheim, Germany, 5-7, 6-1, 6-3, 6-1; Wallace F. Johnson, United States, defeated Oscar Kreuzer, Germany, 7-5, 6-4, 5-7, 6-4.

Semi-final, at Folkestone, England: Singles—Robert B. Powell, Canada, defeated Chevalier Paul de Borman, Belgium, 6-2, 6-1, 6-1; Bernard P. Schwengers, Canada, defeated A. G. Watson, Belgium, 6-4, 6-1, 6-0. Doubles—Robert B. Powell and Bernard P. Schwengers, Canada, defeated A. G. Watson and W. H. du Vivier, Belgium, 6-2, 6-2, 6-2. Singles—Bernard P. Schwengers, Canada, defeated Chevalier Paul de Borman, Belgium, 4-6, 6-4, 6-2, 6-2; Robert B. Powell, Canada, defeated A. G. Watson, Belgium, by default.

All Comers' Championship. Upon McLoughlin's return to the United States he entered the all comers' championships at New-

port, R. I., and successfully defended his title as single champion by defeating Williams in the final round. McLoughlin and T. C. Bundy retained the doubles title, winning their matches with J. R. Strachan and Clarence J. Griffin, both of California. The Pacific Coast produced another great player during the year in the person of William M. Johnston, 17 years old, who won the Longwood singles and the New York State championship. Watson M. Washburn, a Harvard player, captured the metropolitan championship while J. R. Strachan won the national clay court title. Miss Mary Browne of California retained the women's championship and with Mrs. R. H. Williams of Chicago won the doubles event. Miss Browne and W. T. Tilden were victors in the mixed doubles match.

A summary of the principal tournaments in the United States, Canada, and Europe follows:

All Comers' National Championship, at Newport, R. I.: Men's singles, final and championship round—Maurice E. McLoughlin defeated R. Norris Williams, 6-4, 5-7, 6-3, 6-1; men's doubles, challenge round—Maurice E. McLoughlin and Thomas C. Bundy, holders, defeated John R. Strachan and Clarence J. Griffin, challengers, 6-4, 7-5, 6-1.

Women's National Championship, at Philadelphia: Singles challenge round—Miss Mary Browne, holder, defeated Miss Dorothy Green, challenger, 6-2, 7-5; doubles, final round—Miss Mary Browne and Mrs. R. H. Williams defeated Miss Edna Wildey and Miss Dorothy Green, 12-10, 2-6, 6-3; mixed doubles—Miss Mary Browne and W. T. Tilden defeated Miss Dorothy Green and C. S. Rogers, 7-5, 7-5.

National Clay Court Championship, at Omaha: Men's singles, final round—John R. Strachan defeated Walter Merrill Hall, 6-0, 6-4, 4-6, 6-4; doubles, final round—John R. Strachan and Clarence J. Griffin defeated Walter Merrill Hall and Fred H. Harris, by default.

Men's National Indoor Championship, at New York City: Singles, final round—Gustave F. Touchard defeated George C. Shafer, 6-4, 3-6, 6-3, 6-4; doubles, final round—Wylie C. Grant and George C. Shafer defeated Gustave F. Touchard and W. B. Cragin, jr., 6-2, 6-2, 6-4.

Women's National Indoor Championship at New York City: Singles, final round—Miss Marie Wagner defeated Mrs. Charles N. Beard 6-1, 6-1; doubles, final round—Miss Wagner and Mrs. Kuthoff defeated Miss Fannie Fish and Miss Alice Fish, 10-8, 6-2.

Pacific Coast Championship, at Delmonte, Cal.: Men's singles, final round—William M. Johnston defeated John R. Strachan, 6-1, 6-1, 3-6, 4-6, 6-4; men's doubles, final round—William M. Johnston and Elia Fottrell defeated John R. Strachan and Clarence J. Griffin, 10-8, 6-0, 2-6, 6-3; women's singles, final round—Miss Van Vliet defeated Mrs. Nicholas, 6-2, 6-1; women's doubles, final round—Miss Meyers and Miss Van Vliet defeated Miss Cully and Miss Herron, 6-1, 6-2.

Meadow Club Cup Tournament, at Southampton, N. Y.: Men's singles, final round—William J. Clothier defeated Gustave E. Touchard, 6-2, 6-1, 6-3; men's doubles, final round—J. S. Strachan and Clarence J. Griffin defeated William A. Larned and William J. Clothier, 3-6, 6-4, 2-6, 6-3, 6-2.

Sivanoy Open Tournament, at Mount Vernon, N. Y.: Men's singles, final round—G. A. L. Dionne defeated H. Fraser Campbell, 6-2, 6-0, 6-4; men's doubles, final round—M. I. L. Galvao and A. Jolliffe defeated E. F. Leo and A. J. Ostendorf, 6-4, 6-3, 4-6, 8-6; women's singles, final round—Miss Marie Wagner defeated Miss Margaret Grove, 6-2, 6-4; women's doubles, final round—Miss Marie Wagner and Miss Fish defeated Mrs. C. N. Beard and Miss Handy, 9-7, 6-3.

Lake George Championship, at Hotel Sagamore: Men's singles, final and championship round—C. L. Johnston, Jr., defeated C. E. Bacon, 4-6, 6-2, 6-3, 9-7; men's doubles, final and championship round—C. L. Johnston, Jr., and F. H. Gates defeated R. W. Bacon and C. E. Bacon, 11-9, 6-3; women's singles, final and championship round—Miss Helen Simpson defeated Mrs. E. P. Townsend, 6-2, 9-7.

National Intercollegiate Championship, at Haverford, Pa.: Singles, final round—R. Norris Williams, Harvard, defeated Watson M. Washburn, Harvard, 6-4, 3-6, 6-4, 6-1; doubles, final round—Washburn and J. J. Armstrong, Harvard, defeated Williams and E. H. Whitney, Harvard, 4-6, 4-6, 7-5, 8-6, 6-2.

English Championship, at Wimbledon, London: Men's singles, final round—Maurice E. McLoughlin defeated S. N. Doust, 6-4, 6-4, 7-5; challenge round—Anthony F. Wilding, holder, defeated Maurice E. McLoughlin, challenger, 8-6, 6-3, 10-8; men's doubles, final round—F. W. Rahe and H. Kleinschroth defeated A. E. Beamish and J. C. Parke, 6-3, 6-2, 6-4; challenge round—C. P. Dixon and H. Roper Barrett, holders, defeated F. W. Rahe and H. Kleinschroth, challengers, 6-2, 6-4, 4-6, 6-2; women's singles, challenge round—Mrs. Lambert Chambers, challenger, defeated Mrs. Lecombe, holder, by default; women's doubles, final round—Mrs. McNair and Miss Boothby defeated Mrs. Sterry and Mrs. Lambert Chambers, 4-6, 2-4, default.

Canadian International Championship, at Niagara-on-the-Lake: Men's singles, final and championship round—Clarence J. Griffin defeated E. H. Whitney, 9-7, 1-6, 6-2, 9-7; men's doubles, final and championship round—Clarence J. Griffin and William M. Johnston defeated R. C. Seaver and E. H. Whitney, 6-2, 6-3, 6-3; mixed doubles, final round—Miss Mary Browne and William M. Johnston defeated Mrs. Robert H. Williams and Clarence J. Griffin, 4-6, 6-3, 6-4; women's singles, final round—Mrs. Robert H. Williams defeated Miss Mary Browne, 8-6, 3-6, 6-4.

Hard Court Championship of the World, at St. Cloud, France: Anthony F. Wilding defeated Andre H. Gobert, 6-3, 6-3, 1-6, 6-4; men's doubles, final round—H. Kleinschroth and Baron von Bissing defeated Otto Froitzheim and Anthony F. Wilding, 7-5, 0-6, 6-3, 8-6; women's singles, final round—Miss M. Rieck defeated Miss M. Broquedis, 6-3, 4-6, 6-4; mixed doubles, final round—Miss E. Ryan and Max Decugis defeated Mrs. Golding and Anthony F. Wilding by default. See RACQUETS.

LAW SCHOOLS. See UNIVERSITIES AND COLLEGES.

LEACH, SIR EDWARD PEMBERTON. An English soldier, died April 25, 1913. He was born in Londonderry, Ireland, in 1847. In 1886 he entered the Royal Engineers. He

served in the Looshai expedition in 1871-72, in the Afghan War in 1879-80, in the Sudan in 1885, and was subsequently promoted to be colonel and commanded the troops at Korosko and the British brigade at Assuan. In 1897 he was made major-general, from 1900-5 was commander at Belfast, and shortly after that he became commander-in-chief in Scotland, a position which he held for four years.

LEAD. The production of lead in the United States from domestic ores in 1912 was 415,395 short tons, valued at \$37,385,550, a gain of 9532 tons in quantity, and \$875,880 in value over 1911. The lead-smelting industry in 1912 did not fully share the general prosperity of the metal industries. Though the price of lead in London rose to the highest point in thirty years, and averaged nearly a cent a pound higher than in 1911, the average New York price was the same as in the preceding year. As a result, the total production of primary refined lead slightly decreased, although the domestic production more than held its own. The chief producer among the States in 1912 was Missouri. In that State were mined 162,610 short tons, compared with 182,203 short tons in 1911. Idaho ranks second with 126,670 short tons in 1912, compared with 117,335 in 1911. Next in order of rank are Utah and Colorado, which produced respectively about 60,000 and 37,000 short tons in 1912. No other State produced over 6000 tons in 1912.

The production of lead in the United States in 1913 is given by the *Engineering and Mining Journal* as 433,476 tons. Of this, desilverized lead comprised 261,216 tons; antimonial lead, 16,345; lead from S. E. Missouri, 133,203; lead from S. W. Missouri, 22,312. The lead from foreign countries in 1913 amounted to 57,074 tons. The world's production of lead, according to the same authority, was, in 1912, 1,189,100 metric tons, of which there was produced in Europe 542,000 metric tons; in Mexico, 120,000; and in Canada, 16,300. The largest production in Europe came from Spain, 187,700; from Germany, 165,000; from France, 33,000; from Great Britain, 29,000; from Belgium, 57,000. Other countries producing lead in considerable quantities are Austria-Hungary, Greece, and Turkey. Australia contributed also a large amount in 1912—107,400 tons. For notes on the metallurgy of lead, see METALLURGY.

LEAGUE OF LIBRARY COMMISSIONERS. See LIBRARY ASSOCIATION, AMERICAN.

LEAKE, JOSEPH BLOOMINGDALE. An American soldier and lawyer, died June 2, 1913. He was born in Deerfield, N. J., in 1828. When he was eight years of age his parents moved to Cincinnati. He graduated from Miami University in 1848, was admitted to the bar in 1850, went into politics, and in 1861 was a member of the Iowa House of Representatives. In the following year he was elected United States senator, but resigned to become captain of the 20th Iowa Volunteers. He became lieutenant-colonel and in 1865 was made colonel and brigadier-general. At the close of the war he was again elected United States senator. He held several important offices in Iowa until 1871, when he removed to Chicago. In 1879 he was made United States attorney for the Northern District of Illinois and served five years. In 1887 he was appointed a member of the Chicago board of education.

LEATHER. The leather industry during

the year 1913 continued to reflect a condition that had been developing for several years. A shortage of cattle all over the world naturally led to a scarcity of hides and leather products so that prices were forced higher and for the greater part of the year leather was in active demand. This was not so marked in the first part of the year, but the demand developed later, and at the end of the year a shortage of 250,000 country hides, and over 100,000 calf and kip hides, was claimed, a condition that never had threatened until a few years pre-

vously. The increased cost of hides naturally led to increased prices for leather and was reflected in the boot and shoe (q.v.) and other industries. The margin of profit in tanning was fairly close during the year, and with a growing demand for hides in the United States, it was thought that this would be increased so as to afford greater profit to the tanners. In Europe the demand for hides, which had been active for much of the year, began to slacken towards the end as there were large imports from South America and Asia.

AVERAGE PRICES OF HIDES IN THE UNITED STATES

PACKER HIDES											
	Heavy native steers	Butts	Heavy Texas steers	Light Texas steers	Colorado steers	Heavy native cows	Light native cows	Branded cows	Native bulls	Branded bulls	Aver. price

* Omaha, St. Louis, and Wichita count calves for cattle.

LEES, JAMES CAMERON A Scotch clergyman, died June 28, 1913. He was born in London in 1834, and was educated at Glasgow and Aberdeen Universities. At the age of twenty-one, he was licensed to preach, and in 1856 was presented with a parish in Rosshire. After a few years in this parish, he was transferred to the more important charge of Paisley Abbey. During his ministry at Paisley, he became very popular as a preacher. In 1877 he was called to the most important pastorate in the church of Scotland, that of St. Giles Cathedral, Edinburgh. He retired from the ministry in 1909. From 1881 to 1901 he was chaplain-in-ordinary to Queen Victoria, and from the latter date till his death to the king. His published writings include *History of the Abbey of Paisley* (1878); *History of St. Giles', Edinburgh* (1889); *Life and Conduct* (1893); and a *History of the County of Inverness* (1897).

LEEWARD ISLANDS. The most northerly group of the Lesser Antilles, certain islands of

which unite to form a British colony, as detailed below (population, census of 1911):

	Sq. m.	Pop.	Capital
Antigua	170 1-4	32,265	St. John
Montserrat	32 1-2	12,196	Plymouth
St. Kitts & Nevis	150 1-3	43,303	Basseterre
Dominica	304 2-3	33,863	Roseau
Virgin Islands... ..	58	5,562	Road Town
Total	716	126,318	St. John

With Antigua are included Barbuda (population 871) and Redonda (population 120), having a total of 62½ square miles. With St. Kitts (population 26,283) and Nevis (population 12,945) is included Anguilla (population 4075); area, 35 square miles. St. John is the colonial capital (7910 inhabitants).

Denominational education is the rule, except in Dominica; there were (in 1911-12) 121 aided and government schools, with a total attendance of 12,237. The climate is reasonably healthful; mean temperature, about 80°. There are no railways and no internal telegraphs;

cables connect the islands with other islands and with Europe and North America. Sugar, long the staple product, is in some of the islands being replaced by cotton, etc. Comparative trade and finance statistics are given in the table below, revenue and expenditure being exclusive of government grants:

	1908-9	1909-10	1910-11	1911-12
Imports	£567,593	£485,393	£567,817	£713,414
Exports	536,312	441,728	558,165	566,764
Revenue	154,333	149,670	164,375	174,818
Expenditure..	146,216	149,906	159,263	158,924

For detailed accounts of the five presidencies, see separate articles. The governor for the colony in 1913 was Sir H. Hesketh-Bell (appointed 1912).

LEGGE, AUGUSTUS. A Church of England bishop, died March 15, 1913. Born in 1839, sixth son of the Earl of Dartmouth, he was educated at Eton College and Christ Church, Oxford, and in 1864 was ordained to the Church of England ministry. After serving as curate in several country parishes he removed in 1866 to London and in the following year was made rector of the parish of St. Bartholomew. Here he remained for twelve years, and then became chaplain to the Bishop of Rochester, and was made honorary canon in Rochester Cathedral. He was appointed vicar of Lewisham in 1879, and in 1891 was made by Lord Salisbury, Bishop of Litchfield. He was twice president of the Church Congress.

LEGISLATION IN THE UNITED STATES—1913. The principal laws passed by Congress in 1913 are noted in the article CONGRESS. The following is a résumé of the more important laws passed by the State legislatures in 1913. Where the legislation is treated more fully under other articles, it is so indicated.

In the article **ELECTORAL REFORM**, will be found a summary of the many important measures passed by State legislatures in 1913 affecting this subject. These include laws relating to the initiative and referendum, the recall, primary election laws, corrupt practices act, and laws against lobbying.

WOMAN SUFFRAGE. Constitutional amendments providing for woman suffrage were adopted at the November election of 1912 by Arizona, Kansas, and Oregon, making a total of nine States in which women are now granted the right of suffrage. The legislatures of these States in 1913, passed measures making these amendments effective. Proposed constitutional amendments providing for woman suffrage were submitted to the vote of the people by the legislature of 1913, by Iowa, Montana, Nevada, North Dakota, and Pennsylvania. The Illinois legislature passed an act giving women the right to vote for presidential electors, university trustees and various county, township, and municipal officers. (See **ILLINOIS**; **WOMAN SUFFRAGE**.)

MUNICIPAL GOVERNMENT. Laws providing for a commission form of government for municipalities were enacted in Arkansas, Idaho, Kansas, New Mexico, Ohio, and Texas. These were either in the way of original legislation or by extending or supplementing existing laws. (See **MUNICIPAL GOVERNMENT**.)

PUBLIC UTILITIES. Laws providing for the regulation of public utilities by commissions

established for that purpose, became effective in 1913 in Colorado, District of Columbia, Hawaii, Idaho, Illinois, Indiana, Maine, Montana, Missouri, Ohio, Oregon, Pennsylvania, and West Virginia. In New Hampshire the powers of the existing public service commissions were extended to the regulation of railroad rates. Legislation on this subject was introduced in a number of States, but failed of enactment. At its regular session the legislature of Minnesota passed a law providing for a commission to investigate the subject.

RAILROAD LEGISLATION. For notes on legislation on this subject, see the article **RAILWAYS**.

LABOR LEGISLATION. Legislation on this subject, which includes laws for employers' liability or workmen's compensation laws, laws regulating the hours of labor for women and minors, uniform child labor laws, eight-hour laws for public works, laws providing for one day's rest out of seven, measures providing for minimum wage laws relating to injunctions and labor disputes and to the arbitration of labor disputes, will be found treated fully in the article **LABOR LEGISLATION**. See also the articles entitled **CHILD LABOR**, **FACTORY INVESTIGATION COMMISSION**, **MINIMUM WAGE**, and **WORKMEN'S COMPENSATION**.

PUBLIC HEALTH AND MORALS. In California, Minnesota, Oregon, Pennsylvania, Washington, and Wisconsin, the legislatures enacted laws providing for the abatement of disorderly houses. These were in the main, patterned after the Iowa law on the subject.

Statutes relating to white slavery were enacted in Arkansas, Kansas, Missouri, New Mexico, and Idaho, patterned generally after the Mann act. The legislatures of Ohio and Pennsylvania created State boards of censorship for motion pictures. The legislatures of Indiana, Kansas, and Minnesota provided tuberculosis hospitals, and those of California, New Hampshire, Oregon, Porto Rico, Texas, and Washington passed laws of various sorts aimed at the suppression of tuberculosis. Laws pressing restrictions upon tenement houses were passed in California, Indiana, Massachusetts, and New York. In New York, the existing laws relating to employments which may be carried on in tenement houses, were extended and supplemented. Laws dealing with pure food in some phase were passed in Arizona, California, Minnesota, Massachusetts, Nevada, and Pennsylvania.

Laws providing for the sterilization of criminals, degenerates, defectives, etc., were passed by the legislatures of North Dakota and Oregon. The legislatures of North Dakota and Oregon passed laws requiring a presentation of a physician's certificate of health, as a prerequisite for obtaining a license to marry. The legislature of Massachusetts enacted a uniform marriage law. (For laws relating to mothers' pensions, see **MOTHERS' PENSIONS**; for those relating to prison reform, see **PENOLOGY**; for legislation affecting the sale of liquor, see **LIQUOR REGULATION**; and for measures relating to juvenile courts, see the article **JUVENILE COURTS**.)

EDUCATION. The legislatures of Indiana, New York, and Pennsylvania passed laws providing for vocational training in public schools. In New Hampshire and New York, provision

was made for the medical inspection of pupils in public schools, and in Massachusetts, North Dakota, Vermont, and Washington, teachers' insurance for retirement funds was provided.

MISCELLANEOUS LEGISLATION. In New Hampshire, Ohio, and Washington, State departments of agriculture were established. A State civil service law was passed in California, and legislatures of Colorado and Kansas provided a civic service for certain cities.

The subject of good roads for State highway systems was legislated upon in Idaho, Iowa, Minnesota, Nevada, New Jersey, Washington, and West Virginia.

Laws regulating the conservation of natural resources were enacted in California, Massachusetts, and New York.

Laws relating to weights and measures were passed by the legislatures of California, Massachusetts, Minnesota, and New Mexico. The legislative reference bureaus for the purpose of advising and assisting legislation were established in California, New Hampshire, and Ohio.

Laws relating to the simplification of legal practices were passed by the legislatures of Colorado, Indiana, Massachusetts, North Carolina, New York, North Dakota, Minnesota, and Oregon. In Minnesota it was provided that a jury may render a verdict in civil cases on a five-sixths vote after twelve hours' deliberation. In Ohio it was provided that a jury in civil cases may return a verdict on a three-quarters' vote of the jury.

The legislatures of California, Ohio, and Oregon sent delegates to Europe to study rural credits in cooperation with the Southern Commercial Congress. The legislature of Idaho, by concurrent resolution, asked for federal legislation on the subject, and the legislature of Kansas requested the Federal government to loan the national funds to resident landowners at a low rate of interest. The legislatures of Indiana and Texas passed statutes providing for the incorporation of rural credit unions or associations.

The legislatures of New Hampshire and Porto Rico passed a statute providing for the registration of foreign corporations. The New Jersey legislature enacted a measure prohibiting corporations from acquiring the stock or other securities of other corporations.

For laws relating to trusts, competition, and discrimination, etc., see article TRUSTS.

In the legislatures of Arkansas, Indiana, Minnesota, and Vermont, laws were passed providing for uniform negotiable instruments, and in Minnesota, Nevada, Oregon, Vermont, and Washington, uniform warehouse receipts acts were passed.

Laws regulating the practices of loan sharks were passed in Colorado, the District of Columbia, Indiana, Minnesota, Montana, Missouri, New York, and Pennsylvania.

The legislatures of Arkansas, Pennsylvania, and Vermont, changed the form of capital punishment from hanging to electrocution. In Washington, the death penalty was abolished.

So-called "blue sky" laws were passed in Arkansas, California, Florida, Idaho, Iowa, Kansas, Maine, Michigan, Missouri, Montana, Nebraska, North Carolina, North Dakota, Ohio, Oregon, South Dakota, Vermont, and West Virginia. In general, these follow the Kansas statute. (See FINANCIAL REVIEW.)

The legislature of Minnesota also passed a

blue sky act, which applies only to the stock or securities of an insurance corporation or association. The New York legislature passed laws regulating the dealing in securities by brokers and others, and prescribed penalties for various methods for deceiving the public in the matter of the value of stocks or other securities.

The legislatures of Ohio and California passed laws providing for the use of school houses and grounds and other public buildings for the entertainment and education of the citizens. This movement has aroused interest throughout the country. In some cities the plan has been put into operation without much legislation, except by way of municipal ordinance. The idea is to utilize school buildings and grounds during the hours and periods when they are not used for school purposes, for the education and entertainment of citizens generally.

The legislatures of Arizona, Indiana, Nevada, North Dakota, and West Virginia, enacted inheritance tax laws, while the Kansas legislature repealed the existing law.

The loan land laws passed by the legislatures of California and Arizona are discussed under those States. In Idaho and New York existing restrictions against the holding of property by aliens were repealed, and in Washington a provision was made for the submission of a constitutional amendment providing for the removal of certain such restrictions as to lands and municipalities.

The legislature of Massachusetts passed an act for the licensing of aviators, the inspection of aeroplanes, and the "law of the road" in flight, etc.

LEHIGH UNIVERSITY. An institution of higher learning at South Bethlehem, Pa., founded in 1866. The college includes departments of arts and science, civil engineering, mechanical engineering, chemistry, etc. The enrollment in all departments in the autumn of 1913 was 675. The faculty numbered 72. There were no noteworthy changes in the faculty during the year. The university received a gift of \$100,000 for a gymnasium and swimming-pool from Charles L. Taylor of Pittsburgh. In the autumn of 1913 a course in physical education was added to the curriculum. Every student in college is obliged to take three hours of exercise each week, receiving one unit of scholastic credit therefore. The new stadium and a separate athletic field for non-varsity men was under construction in 1913 and will be completed in 1914. The productive funds of the university amount to about \$1,200,000. The total income in 1912-13 was \$260,638. The library contains about 130,000 volumes. The president is Henry Sturgis Brinker, E.M., LL.D.

LELAND STANFORD JUNIOR UNIVERSITY. An institution for higher education at Stanford University, Cal., founded in 1891. The enrollment in all the departments in the autumn of 1913 was 1755. The faculty numbered 184. The most notable event in the history of the university during the year was the retirement of David Starr Jordan, LL.D., as president, and the appointment of John Casper Branner to succeed him. Dr. Jordan was made chancellor of the university. The library contains about 217,000 volumes.

LEMON-CURING. See HORTICULTURE, under section so entitled.

LEPROSY. According to an investigation made by Dr. Rupert Blue, surgeon-general of the United States public health service, there were up to January 1, 1913, 146 lepers in the United States, 41 of whom had been discovered during the preceding year. Dr. Blue did not believe these represented the entire number of cases, as in many States the disease was not notifiable, and in others a requirement of notification was not enforced. There were also shown to be 696 cases in Hawaii, 28 in Porto Rico, and 2754 in the Philippine Islands, making a grand total of 3624 officially reported in the United States and its possessions. The previous census taken in 1909 showed that there were then 139 cases of leprosy in 18 States and the District of Columbia, 764 in Hawaii, 17 in Porto Rico, 2330 in the Philippine Islands, and 7 in the Canal Zone. Another Father Damien has developed in the person of Dr. George Turner, who was recently knighted by the King of England. Sir George Turner is one of the greatest authorities on the subject of leprosy, having given up a great part of his life to service in the leper hospital at Pretoria, in South Africa, finally contracting the disease himself. On his retirement through reaching the age limit, Dr. Turner pursued his investigations in England, continuing his work in spite of ever-increasing pain, disfigurement, and constant seclusion.

LEUKEMIA. See BENZOL.

LEWIS, JAMES HAMILTON. An American public official, elected in 1913 United States senator (Democratic) from Illinois. (See ILLINOIS.) He was born in Danville, Virginia, in 1866, but later removed to Augusta, Ga. Educated at Houghton College and the University of Virginia, he studied law in Savannah, and in 1884 was admitted to the bar. Soon after he removed to Seattle, Wash., where he was elected to the Territorial Senate. In 1890 he declined the nomination for Congress, and in 1892 was unsuccessful candidate for governor. He was the unsuccessful nominee for United States senator in 1894, and in the Democratic national convention in 1896 was the candidate of the Washington delegates for the vice-presidency. In 1897 he was elected to the Fifty-fifth Congress, and during his services was author of the resolution for the recognition of Cuban independence. In the Democratic national convention in 1900 he was candidate for the vice-presidency. During the Spanish-American War he served on the staff of General F. D. Grant. He removed to Chicago in 1903 and two years later became corporation counsel of the city. In 1908 he was the Democratic candidate for governor of the State.

LIBERIA. An independent negro republic on the west coast of Africa, founded in 1822 by American philanthropists for the settlement of freed slaves. The area is variously estimated at from 35,000 to 41,000 square miles and having a population between one and two millions, including about 10,000 Americo-Liberians. The indigenous negroes, with the exception of the Mandingo tribe (Mohammedan), are mainly pagans, and there are said to be cannibals in the interior. The development of the country is hindered by lack of roads, impassable forests, and by laws preventing the acquisition of land by any but Liberians or (until 1909) trading by foreign-

ers in any part of the country excepting at official ports of entry. A concession obtained by Lever Bros. Ltd., embracing 12,000 square miles and intended to open up the country, was rejected by the senate. The mineral wealth is unexploited except for the operations of a native company. The products for export are palm oil, coffee, rubber, and ivory. Cotton is indigenous but little cultivated. Imports, 1909, \$1,065,200 (1911 estimate, \$1,025,000); export, \$970,500 (\$975,000)—palm oil, \$289,075; piassava, \$184,937; palm kernels, \$201,201; coffee, \$134,238; rubber, \$40,698; ivory, \$21,346.

Seventy per cent. of the trade is with Germany. In 1911 vessels entered to the number of 1056, of 2,077,000 tons. Monrovia (6000 inhabitants) is (since 1910) a cable station on the route from Germany to Brazil. The government of French west Africa obtained permission to establish a wireless station there. The revenue was estimated for 1913 at \$450,841. The debt stood in 1912 at \$1,627,418, of which foreign debt, \$1,040,378; internal, \$587,040. A president (1912-16, Daniel Edward Howard) elected for four years is the executive. The international financial controller in 1913 was an American, R. P. Clark; with Germany represented by G. Lange, the United Kingdom by R. Sharpe, and France by F. Wolff.

HISTORY. In November, 1912, the Liberian government found itself involved in difficulties with the German government by reason of insults offered by natives to German merchants and officers. The arrival of the German gunboat *Panther*, reinforced later by another gunboat and a cruiser, secured apologies from the Liberian government, but in March, 1913, the little state retaliated by offering to an English firm a concession to exploit about 12,000 square miles of the most valuable land in the republic.

LIBRARY ASSOCIATION, AMERICAN. A society organized in 1876 and incorporated in 1879 to develop the public library in its bearing on American education and by coöperation to increase the efficiency of library administration. The present membership is about 2700. The association holds annual meetings. The thirty-fifth annual conference was held at Kaaterskill, in the Catskill Mountains, New York, June 23 to 28, 1913, at which there was an attendance of 892. The general theme was specialization in library work, the various papers and addresses emphasizing the services libraries are performing in various specialized fields. The president, Henry E. Legler, librarian of the Chicago public library, in the presidential address discussed "The World of Print and the World's Work." Other topics developing the general theme were: Work with foreigners and colored races; library influences at home, in the shop and on the farm; the education of children and the conservation of their interests; the enlarging scope of library work in the high and normal schools; the library's service to business and legislation. Among subjects considered at section meetings were: Bibliographic instruction in colleges and universities; the librarian's opportunity in vocational guidance; the care of archives material; art in the college library; and the cost of library administration. The committee, which for the past two years has been studying the relations between the public library and the municipality, rendered its final

report, which embodied a statement of the things that a library law or charter section should aim to do and suggested a form for the library sections of a city charter. Committees are now engaged in studying the cost and methods of cataloging libraries; ventilating and lighting of library buildings; drawing up a code for library classifiers; and investigating insurance rates for libraries. The constitution was amended to permit State library associations to affiliate with the American Library Association upon certain specified conditions, and twelve associations have thus far affiliated.

The headquarters of the association are in Chicago, in the public library building. This is the distributing centre for all the association's publications, of which there are now about seventy in print. The office serves as a bureau of information concerning library work in the United States and Canada. The official organ is the *Bulletin of the American Library Association*, published bi-monthly and distributed free to members. One number consists of the proceedings of the annual conference and one constitutes the handbook. The association publishes a monthly magazine, the *Booklist*, an annotated guide for the selection and purchase of new books. The association has been instrumental in establishing library organizations in forty States, besides many local clubs in cities and districts. Affiliated with it are four national organizations of kindred purpose: National Association of State Libraries (president, James I. Wyer, Jr., New York State Library, Albany, N. Y.; secretary, C. B. Lester, Wisconsin Legislative Reference Bureau, Madison, Wis.); League of Library Commissions (president, Elizabeth B. Wales, Missouri Library Commission, Jefferson City, Mo.; secretary, Mrs. M. C. Budlong, North Dakota Public Library Commission, Bismarck, N. D.); American Association of Law Libraries (president, F. O. Poole, Association of the Bar Library, New York; secretary, Gertrude E. Woodard, University of Michigan Law Library, Ann Arbor, Mich.); and Special Libraries Association (president, D. N. Handy, Insurance Association of Boston, Boston, Mass.; secretary, Guy E. Marion, 93 Broad Street, Boston, Mass.). The National Education Association has a library section (president, W. H. Kerr, Kansas State Normal School Library, Emporia, Kan.; secretary, Harriet A. Wood, Library Association, Portland, Ore.) which, although not officially affiliated, is in close coöperation with the American Library Association.

An important activity of the association is a publishing board, which operates under a gift to the association of \$100,000 made in 1902 by Andrew Carnegie. The income from this fund is used in the compilation of indexes, bibliographies, reference helps, and literature for the promotion of library extension and the selection of books. Among its publications are an important bibliography of American history, a portrait index containing 120,000 references, the A. L. A. catalogue of 8000 volumes and the supplement to the above of 3000 volumes, a guide to reference books and a list of subject headings for a dictionary catalogue. A manual of library economy is being prepared, twenty chapters of which, each forming a separate pamphlet, have already been printed. The officers for the year 1913-14 are as follows:

President, E. H. Anderson, director New York Public Library; first vice-president, H. C. Wellman, librarian Springfield (Mass.) City Library; second vice-president, Gratia A. Countryman, librarian Minneapolis Public Library; treasurer, Carl B. Roden, assistant librarian Chicago Public Library; secretary and executive officer, George B. Utley, 78 East Washington Street, Chicago. The thirty-sixth annual meeting of the association will be held at Washington, D. C., May 25 to 29, 1914.

See also LIBRARY PROGRESS.

LIBRARY BUILDINGS. See heading so entitled under ARCHITECTURE and LIBRARY PROGRESS.

LIBRARY OF CONGRESS. At the end of the fiscal year 1913, there were in the library of Congress 2,128,255 books, 135,223 copies of charts, 630,799 volumes and pieces of music, and 360,494 prints. The net accession during the year included 115,862 books, 39,167 volumes and pieces of music, 10,749 prints. The library also contains a large number of manuscripts, but an accurate statement of the number is not possible. During the year there were acquired by purchase and transfer, the Hoe collection, and the libraries of the national monetary commission gathered by the tariff board. While no large groups of printed books were presented during the year, there was an aggregate of 11,256 pieces received by private gift.

Many important accessions were made in the division of manuscripts. These include the diary of John Fell, which adds to the value of the papers of the Continental Congress; the logs and journals of Admiral Sir George Cockburn, which throw much light on his movements in American waters and supplement the large collection of his papers acquired in 1911; the papers of James Murray Mason, which make valuable additions to the diplomatic history of the Confederacy; the papers of Nicholas Biddle, which complete the story of the contest between Jackson and the second bank of the United States; and the records of the American Colonization Society, already developed in part by the Thornton papers. During the year, three volumes of the journal of the Continental Congress were issued. These bring the records up to 1782. The copy for that year and for 1783 was well on the course of editorial preparation. The library lost two important members of its staff during the year: Louis C. Solymon and Steingrinnur Stefansson, who were both expert linguists. The librarian is Herbert Putnam, and the chief of the division of manuscripts is Gaillard Hunt.

LIBRARY PROGRESS. The year 1913 in American libraries was one of steady growth marked by no extraordinary events. The usual meeting of the American Library Association was held in June at Kaaterskill, N. Y. The proceedings have been published in the *Bulletin of the Association*. The various sections of the association (catalogue, college and reference, children's work, library training, agricultural libraries, etc.) and the affiliated bodies (Special Libraries Association, League of Library Commissions, Association of Law Libraries, Bibliographical Society of America, American Library Institute) absorbed the greater portion of the programme, showing that specialization in the numerous forms of library work has become a permanent feature both of these meetings and

of the work itself. The association maintains headquarters at 78 East Washington Street, Chicago. It has a permanent secretary and a publishing board. During the year the latter issued (among other books): K. T. Moody, *Index to Library Reports*; J. Kudlicka, *List of Polish Books*; F. K. Walters, *Periodicals for the Small Library*. The board also issues monthly the *A. L. A. Booklist*, a selected and annotated list of current books suitable for a public library of moderate size.

LIBRARY LEGISLATION. Thirty-seven States now have library commissions or bodies with similar duties acting under slightly different names. South Dakota and Arkansas created new commissions during the year, the latter by direct action of the governor without any legislative sanction. Ten of the States gave their commissions larger appropriations than in previous years, while Kansas and New York decreased the allotment, the latter by \$15,000. South Dakota passed a general library law, permitting a vote, on petition of 5 per cent. of the voters of any town, on the proposition to establish a library. A tax limit of two mills on the dollar is set, but below that sum the library trustees may levy for the support of the institution without reference to any other local body. A new law in Iowa fixes the tax limit at five mills for maintenance and at five mills also for a building and site, without regard to the size of the town or city. Kansas, by a new law, sets the tax limit at four-tenths of a mill, and in cities of 40,000 it may not exceed one-quarter of a mill. Minnesota raised the limit from two to three mills, and made provision for the support of libraries from country districts as well as cities. Attempts to secure a new library law failed in several States.

Iowa, Minnesota, Washington, and Texas made legal provision for the extension of the service of city libraries to the rural districts surrounding them, the first two by contract between public libraries and neighboring communities, the two latter by establishing a system of county libraries.

California passed a new law organizing its State library on a liberal basis of State support, and Indiana one changing the general scheme and adding a department of history and archives.

Legislative reference libraries have been created in Illinois, Ohio, and New Hampshire; and in Indiana an independent "bureau of legislative and administrative information" has been established to take the place of a former department of the State library.

Nebraska authorized the establishment on a cooperative basis of a retirement fund for librarians who have served thirty years or more.

LIBRARY APPOINTMENTS. Edwin H. Anderson was made director of the New York Public Library on the death of John Shaw Billings in April; W. Dawson Johnston became librarian of the St. Paul (Minn.) Public Library (in December); J. Adam Strohm succeeded Henry M. Utley (retired) as head of the Detroit Public Library (April); Prof. Henry Preserved Smith was appointed librarian of Union Theological Seminary, New York City (July); Alice S. Tyler became director of the Western Reserve University Library School (September).

LIBRARY LITERATURE. *Industrial Art Index*,

a new bi-monthly periodical, issued by the H. W. Wilson Co., of Minneapolis on the line of their *Reader's Guide and Cumulative Book Index*; Melvil Dewey, *Decimal Classification* (8th ed., Lake Placid, N. Y., 1913, but slightly altered from the 7th ed., 1912); Library of Congress, *Early books on music* (before 1800); *Check list of American eighteenth century newspapers*; *Bibliography of international law and continental law*. In addition numerous select lists of books on topics of current interest were issued by this library: Frederick C. Hicks, *Aids to the study and use of law books* (N. Y., 1913); Samuel Swett Green, *Public Library movement in the United States 1855-1893* (Boston, 1913); Wisconsin Free Library Commission, *New types of small library buildings* (Madison, 1913); Martha Thorne Wheeler, *Indexing: principles, rules and examples* (2d ed., Albany, N. Y., State Library School).

LIBRARY BUILDINGS. No large new buildings were completed during the year, but moderate sized ones of peculiar merit were opened at Portland, Ore., and Somerville, Mass. Several new branch libraries were finished in Denver, which show originality both in the arrangement and in architectural treatment.

LIBRARY TRAINING SCHOOLS. The New York Public Library School added a second year to its course of study. The University of California was added to the list of institutions holding summer courses in library methods, while Repon College (Wisconsin) inaugurated courses in library economy. The Training School for Children's Librarians conducted by the Carnegie Library of Pittsburgh has now established a course of two years' length. The California State Library opened a new library school on January 1, 1914.

LARGE AMERICAN LIBRARIES. The United States has four libraries each owning over a million volumes (Library of Congress, 2,120,000; Harvard University, 1,665,000; New York Public Library, 1,600,000; Boston Public Library, 1,050,000), while two others (Yale University, 900,000, and Brooklyn Public Library, 735,000) approach a million books. There are over sixty libraries which possess more than 100,000 volumes each. The total number of volumes in regularly established libraries is estimated as over 75,000,000.

LIBRARY TRAINING SCHOOLS. See LIBRARY PROGRESS under heading so entitled.

LIBYA. A French possession on the Mediterranean coast of Africa, comprising Tripoli and Cyrenaica. See ITALY, *History*; and TRIPOLI.

LIFE EXPECTANCY. See VITAL STATISTICS.

LIFE INSURANCE. See INSURANCE.

LIFE-TABLE. See VITAL STATISTICS.

LIGHT. See ELECTRIC LIGHTING AND PHOTOGRAPHY.

LIGHTHOUSES. The reorganization of the U. S. lighthouse service under the provision of the act of Congress approved June 17, 1910, and in progress during 1912 was entirely completed by 1913. All of the lighthouse districts, with the exception of the three river districts, had been placed in charge of civilian inspectors, the army officers detailed as engineers and the navy officers serving as inspectors being replaced by civilian employees of the Bureau of Lighthouses.

The general organization of the lighthouse service under the new system was as follows:

The executive office in Washington was under the commissioner of lighthouses and the deputy commissioner and here were maintained an engineering construction division, under the chief constructing engineer; a naval construction division, under the superintendent of naval construction; a hydrographic division, under an assistant engineer; and the general office force, under the chief clerk.

Outside of Washington the service was divided into nineteen lighthouse districts, each of which was under the charge of a lighthouse inspector. In each district there was a central office, and also one or more lighthouse depots for storing and distributing supplies and apparatus. Each district was provided with one or more lighthouse tenders for the purpose of distributing supplies to the various stations and light vessels and for transportation of materials for construction or repair, for the placing and care of the buoyage system in the district, and for transporting the officers of the service on official inspection and on other official duty.

In addition to the several district depots, there was maintained in the third lighthouse district, on Staten Island, New York Harbor, a general lighthouse depot, where many of the supplies for the whole service were purchased and stored previous to distribution, where special apparatus was manufactured or repaired, and where also there was carried on various technical work in the way of testing apparatus and supplies and designing or improving apparatus.

The accompanying table gives a summary of the aids to navigation in the United States, established and discontinued during the fiscal year by the Bureau of Lighthouses, and also the net increase, and the number in commission at the end of the fiscal years 1912 and 1913:

	1913 Dis- cussed	1912 Dis- cussed	In- crease	Total number June 30— 1912 & 1913	
Lighted aids:					
Lights (other than minor lights).....	75	19	56	1,475	1,531
Minor lights.....	331	217	114	2,552	2,666
Light-vessel stations.....	3	1	2	51	53
Gas buoys.....	75	33	42	346	388
Float lights.....	14	5	9	92	101
Total.....	498	375	223	4,516	4,739
Unlighted aids:					
Fog signals.....	10	0	10	510	520
Submarine signals.....	3	0	3	43	46
Whistling buoys, unlighted.....	3	3	0	84	84
Bell buoys, unl't'd.....	19	8	11	205	216
Other buoys.....	505	332	173	6,001	6,174
Day beacons.....	345	174	171	1,484	1,655
Total.....	885	517	368	8,327	8,695
Grand total.....	1,383	792	591	12,843	13,434

a Differences from statistics published in 1912 report are due to minor discrepancies in previous count.

Other steps were being taken to increase safety of navigation on the coast waters of Alaska by increasing the number of aids to navigation. The total number of lights, buoys, and daymarks, in commission at the close of the fiscal year ended June 30, 1913, was 279, in-

cluding 93 lights, representing an increase of 56 lights since June 30, 1910, or 150 per cent. The accompanying table, which gives the total number of aids to navigation on June 30 of each year named, illustrates the progress in establishing aids in the Territory:

Aids	1910	1911	1912	1913
Lights	87	71	85	93
Fog signals	9	10	10	10
Buoys	84	105	132	136
Daymarks	30	29	38	40
Total	160	215	265	279

LIME. The total production of lime in the United States in 1912 was 3,539,462 short tons, valued at \$13,970,114; compared with 3,392,915 short tons, valued at \$13,689,054 in 1911, an increase of 136,537 short tons in quantity and \$281,060 in value. The average price per ton in 1912 was \$3.96, compared with \$4.03 in 1911. The decline in price is apparently due to the concentration of the industry into larger units, with the consequent lowering of cost of manufacture. The total number of lime-manufacturing plants operating in 1912 was 1017, as compared with 1139 in 1911. The five leading States in 1912 in order of production were Pennsylvania, Ohio, Wisconsin, West Virginia, and Maine. Maine supplanted Missouri which, in 1911, occupied first place. In value of production, however, Maine ranked seventh while Missouri ranked sixth. Pennsylvania has long held first rank in both quantity and value of lime produced. In 1912, the total production in that State was 189,159 tons, valued at \$2,679,420. This was an increase of 7436 short tons in quantity and a decrease of \$8954 in value.

The imports of lime into the United States in 1912 were 4268 short tons, valued at \$48,153. The exports were 260,669 barrels, valued at \$199,515.

LIND, JOHN. See MEXICO, History.

LINDQUIST BILL. See BOOTS AND SHOES.

LINDSAY, SIR COURTS. An English artist, and patron of art, died May 7, 1913. He was born in 1824 and in 1837 succeeded his maternal grandfather in the baronetcy. His early years were spent as a soldier but his love of art led him to the practice of that profession, and between 1862 and 1875 he exhibited ten pictures at the Royal Academy. These were mainly portraits. For the founding of the Grosvenor gallery he was chiefly responsible. It was designed, in the first place, not as rival to the Royal Academy, but as a supplement to it, and, secondly, for schools of painting which were out of sympathy with the aims and organization of the Academy. For ten years he carried on this enterprise with the assistance of others. He then attempted to enlarge his operations and he made uses of the gallery which were incompatible with the dignity of art, and as a result artists who had hitherto supported the gallery severed their connection with it and founded a new gallery. To this some of the most important and characteristic exhibitors of the Grosvenor gallery went over. It continued in existence for a time, but its important days were over.

LIPTON, SIR THOMAS. See YACHTING.

LIQUOR REGULATION. The legislatures of most of the States were in session during 1913, and the greater number of them passed measures of some character for the regulation of liquor traffic.

In Arkansas a prohibition law passed by the legislature, known as the "Going bill," had the practical effect of placing the entire State under prohibition on January 1, 1914. This act makes it unlawful for any county, town, or city council to issue a license to sell intoxicating liquors, except in cases where such a license is asked for by a petition signed by a majority of white adult population within the incorporated limits of the town or city where the license is to be used. The law further provides that in order to secure a license in this manner the county must have voted for license in the last general election on that question. There were 12 cities in the State with a population of 5000 or more under no-license in 1913. These included Little Rock, Fort Smith, Pine Bluff, Argenta, and Hot Springs.

The only important measure passed by the California legislature in 1913 was a State law which requires saloons to close from two to six o'clock A.M. In northern and central California, consisting of 48 counties, 110 supervisorial districts were "dry" in 1913, and 17 were "wet," the "dry" territory being equal to about 22 whole counties. In this section of the State there were 43 "dry" incorporated cities and towns and 103 "wet" incorporated cities and towns. Of the cities and towns in the 10 counties of southern California, 183 were "dry" in 1913 and only 28 "wet."

In Colorado many important events connected with liquor regulation occurred in 1913. A series of decisions handed down by the State Supreme Court will result in the abolition in the city of Denver of about 150 saloons and drinking places. A campaign for State-wide prohibition will take place in 1914. This will be carried on by the Anti-Saloon League. The cities of Colorado Springs, Pagosa Springs, and Gunnison voted for no-license in 1913. About 54 per cent. of the population of the State was under no-license.

The General Assembly of 1913 in Connecticut added a number of anti-liquor provisions to the present laws of the State. Among these was one prohibiting the sale of liquor by druggists, except on prescription during the hours or days when saloons are closed. Another prohibits the employment of women in places where liquors are sold. There were in 1913, 87 towns which had no-license, and 81 which had license. One city of the 19 in the State was under no-license. A bill for a State farm for drunkards was passed by both houses of the legislature, but was vetoed by the governor.

In Georgia, the prohibition forces succeeded in electing a dry legislature in 1913. Twenty-four cities in the State, with a population of 5000 or more, were under no-license in 1913. These included Atlanta, Savannah, Augusta, Columbus, and Macon.

In Idaho, 21 of the 33 counties were dry in 1913. It was estimated at the end of the year that there were only about 195 saloons remaining in the State. The legislature of 1913 passed several stringent measures relating to the sale of liquor by drug stores. A campaign is under way to bring about State-wide prohibition in 1915. Four cities with a population of 5000 or more, were under no-license. These are Lewiston, Pacatello, Twin Falls, and Idaho Falls.

Attempts were made to repeal the present local option law in the Illinois legislature of 1913, but this failed by 22 votes. A four-mile dry zone bill was passed, making it impossible

for saloons to be located within four miles of the State University at Champaign and Urbana. In the autumn elections 22 out of 28 places voting, abolished saloons. There were eight cities with a population of 5000 or over which in 1913, were under no-license. These included Evanston, Rockford, Champaign, Jacksonville, Oak Park, Paris, Urbana, and Zion City.

The legislature in Indiana passed no measures of importance affecting liquor regulation. Of the 94 cities in the State, 30 were dry in 1913, and of the 360 incorporated towns, at least 300 were without saloons.

There were no important changes made in the liquor laws of Iowa, but as a result of the decision of the Supreme Court, the city of Des Moines became "dry." A rehearing of the case was asked for, and a stay of execution was granted. In 1911 10 towns with a population of 5000 or more were under no-license. These included Ottumwa, Waterloo, Muscatine, and Mason City.

In Kentucky there were five local option elections during the year. In each of these, no-license was successful. At the close of the year there were 99 dry counties and 21 wet counties in the State. Four cities with a population of 5000 or more were under no-license. These were Danville, Mayfield, Richmond, and Bowling Green.

In Maine, as a result of complaints made to Governor Haines that the liquor laws were being nullified, sheriffs were removed in several counties. There was no effort to repeal the prohibition law in the legislature of 1913.

Maryland has no general local option law, but a number of counties have been permitted to vote on the liquor question by special acts passed by the legislature. As a result of these special elections, 10 of the 23 counties of the State were without saloons in 1913. About two-thirds of the State's area is "dry," and about one-third of the population of the State lives in "dry" territory. The city of Baltimore has a number of "dry" residence districts which have been made so by special legislation.

In Massachusetts, of the 33 cities, 19 were under license and 14 were under no-license in 1913. Of the 320 towns, 73 were under license and 247 were under no-license. During the year 13 towns changed to license and 11 changed to no-license. The legislature of 1913 passed no important measures relating to the liquor traffic. Several measures made at liberalizing the law were defeated.

The legislature of Michigan in 1913, enacted several important measures. Among these was the Lee law, prohibiting drinking on trains other than on dining cars, and prohibiting drunken men from riding on trains. The most important measure enacted was known as the Pray law. This prohibited the shipment of liquor designed for illegal purposes into "dry" territory. It makes it illegal for any public carrier or any other person to consign, carry or ship liquor to anyone—other than a druggist—or any "dry" community in the State. As a result of this law 71 clubs closed their doors in one month. Fifteen cities in the State with a population of 5000 or more were under no-license in 1913. These included Flint, Adrian, Holland, Owosso, and Cadillac.

In 1913 in Minnesota, there was local option for villages and for about 14 per cent. of the cities. There were three dry counties in the

State and three counties with only one saloon in each.

Mississippi is one of the most radical of the States in regulating the liquor traffic. Important laws passed by the legislatures of 1912 resulted in practically prohibiting the sale of liquor in the State. The legislature of 1914 will be asked to pass two more laws, one of which will give to the governor power to remove derelict officials. The other will make the Webb law enforceable by prohibiting the shipment of liquors into the State. There were 15 cities with a population of 5000 or more, which were under no-license in 1913. These included Jackson, Vicksburg, Natchez, Meridian and Hattiesburg.

In Missouri there were no measures of importance passed by the legislature of 1913 which affected liquor regulation. There were five cities in the State with a population of 5000 or over which are under no-license. These are Carthage, Columbia, Kirksville, Webb City, and Webster Grove. Several local option elections were held during the year. Most of these voted for no-license.

Under the local option law, Nebraska was in 1913 practically without saloons. There were in the State 41 cities and towns, ranging in population from 1000 to 5000, which were "dry." The city of York with a population of 8235 was also "dry." All territory in the State within two miles of an incorporated town or village is under absolute prohibition.

In New Jersey eight cities with a population of 5000 or more were under no-license in 1913. These included Asbury Park, Millville, Bridgeton, Collingswood, Rutherford, Haddonfield, Ocean Grove, and Vineland. There were 81 municipalities and ten townships without license, chiefly owing to remonstrances made by citizens to the licensing authority. The State has no local option law. There are, however, strong laws for regulating liquor traffic.

In New Mexico, under the present law, no saloons are allowed to be licensed "except within the limits of the city, town, or village containing at least 100 inhabitants." Strong effort was made to secure through the legislature of 1913 submission of a constitutional prohibition amendment. This passed the lower house by 30 to 6, and failed in the Senate by only 2 votes. The county unit prohibition bill also passed the House by about the same vote, but did not pass the Senate.

In New York only one county, Yates, was under no-license in 1913. There were in the State 933 townships which under the Raines law were entitled to local option. Several bills were introduced in the legislature which were designed to liberalize liquor laws of the State, but all failed passage.

The general assembly of North Carolina in 1913 passed a strong search and seizure law, making over one gallon of liquor in anyone's possession evidence of guilt. The act makes it unlawful for anyone "to engage in the business of selling, exchanging, bartering, or giving away for the purpose of drug or indirect gain, or otherwise handling vinous or malt liquors." Nineteen cities in the State with a population of 5000 or over, were under no-license in 1913. The largest of these were Charlotte, Durham, Asheville, Greensboro, Wilmington, and Raleigh.

The legislature of Ohio in 1913 enacted a law carrying into effect the principles of the license

amendment adopted in 1912. This amendment limits the number of saloons in "wet" townships and municipalities to one to each five hundred of population, and also provides that on second conviction for violation of the law, a saloon's license shall be revoked. Further restrictions were placed on liquor selling by the legislature. After August 1, 1915, a saloon cannot be located within 300 feet of a school house. In the local option elections held in the State during the year, no-license was in every case successful. Of the 88 counties of the State, 45 were without saloons in 1913. About 30 cities with a population of 5000 or over were under no-license.

In Oregon, in the election of November 4, 1913, 12 cities heretofore "wet," voted no-license, and three small cities heretofore "dry" voted for license. The legislature of 1913 passed a law prohibiting the licensing of saloons outside of municipalities. In Salem on November 4, no-license won by 488 majority, and on December 1 a prohibition plank was written into the city charter by a majority of 964. There were cities in the State with a population of 5000 or over under no-license. Of these the largest was Salem.

Measures were introduced in the Pennsylvania legislature of 1913, giving municipalities of over 10,000 population and all counties the right to vote separately on question of license or no-license. These measures failed to pass. There were 11 cities with a population of 5000 or more under no-license. The largest of these were New Castle, Butler, Washington, and Wilkinsburg.

In South Carolina in 1913 nine counties held local option elections. Of these five voted "wet" and four "dry." There were at the end of the year 11 cities with a population of 5000 or over under no-license. The largest of these were Greenville and Spartanburg.

In South Dakota a law which went into effect July 1, 1913, limits the number of saloons in the State to one for each 600. This eliminated about 125 saloons, leaving about 375 still in the State. There were approximately 1404 townships, and 135 incorporated cities and towns in the State without saloons in 1913. About 68 per cent. of the population of the State was under no-license at the end of the year 1913.

In Tennessee there were very important measures taken toward regulating the selling of liquor. Governor Hooper was committed to the enactment of law for the enforcement of liquor legislation. The Anti-Saloon League and other forces organized against the liquor traffic carried on an aggressive campaign in the State. There were three meetings of the legislature, one regular and two extra. No legislation relating to liquor traffic was enacted in the regular session, and an attempt was made to keep this in continuous session in order to prevent the governor from calling extra sessions for the passage of law-enforcement measures. The regular session failed and Governor Hooper called the first extra session on September 7. The opponents of liquor legislation were able to prevent the passage of any measure in this session before the expiration of the twenty days in which it could be held. On October 13, Governor Hooper convened the legislature in an extraordinary session. In this session three important measures were passed. The most notable of these was a so-called nuisance bill, effective on March 1, 1914. This has for its purpose the closing of every saloon.

gambling house, and disreputable resort in the State. Measures taken toward enforcing the prohibition law resulted in the practical elimination of saloons in the larger cities of the State. In 1913 there were 11 cities with a population of 5000 or over under no-license. These included Memphis, Nashville, Chattanooga, Knoxville, and Jackson, the largest cities in the State.

The legislature of 1913 in Texas enacted several laws for liquor regulation. These included a measure requiring the saloons to close at 9:30 P.M. until 6 A.M., and on Saturday from 9:30 P.M. until 6 A.M. Monday, and another measure made effective the Webb Federal statute throughout the "dry" territory of the State. This law also prohibits the shipment of liquor from saloon territory into prohibition territory within the State limits. The campaign for a State-wide prohibition law was carried on throughout the State during the year. Of the 249 counties, 177 had eliminated saloons by direct vote in 1913. Fifty-two counties were without saloons except in one or two places each. Twenty counties were entirely open to saloons. There were 18 cities with populations of 5000 and over under no-license. Of these the largest were Denison, Cleburne, Paris, Marshall, and Tyler.

As a result of elections held under the local option laws of Utah in 1913 there were only about 235 saloons remaining. Of this number, about 140 were in Salt Lake City. About 33 per cent. of the population of the State was under no-license in 1913.

The Vermont legislature in its session in 1913 passed a number of important measures. These were all designed to keep the liquor traffic within stricter limits. One of these measures prohibited holders of public office from operating licenses or working in licensed places. As a result of elections held under the local option law since its adoption in 1913, five cities with a population of 5000 or over were under no-license in 1913. About 77 per cent. of the population lived in communities where no-license prevailed. In 1913, 24 towns voted for license. Of these 18 already were under license laws.

Virginia is under a local option law. In 1912 a bill providing for State-wide prohibition was passed by the House delegates but was defeated in the Senate. The prohibition forces will renew the attempt in the legislative session of 1913. Of the 100 counties in the State, 85 had no-license in 1913, and 66 had no form of liquor license whatever. Six cities having a population of 5000 and over were under no-license in 1913. These were Charlottesville, Clifton Forge, Fredericksburg, Radford, Suffolk, and Winchester.

The local option law of Washington provides for a vote on the liquor question in towns, cities, and unincorporated portions of counties, as separate units. This law has been in operation since 1909. Under it, to the end of 1913, 220 elections had been held. Of these, 140 had resulted in "dry" victories, while 80 resulted in license. About 87 per cent. of the area of the State was "dry" at the end of the year.

In West Virginia at the November election of 1912 the electors by a majority of 92,342, voted to ratify the constitutional amendment providing for State-wide prohibition, and the legislature of 1913 enacted a measure putting this amendment into effect. This bill, known as the Yost bill, is perhaps the most stringent law enforcement measure on the statute books of any

State. Under its provisions, it is unlawful to manufacture, sell, or give away intoxicating liquors anywhere within the State. It is also unlawful to ship intoxicating liquors to violators of the law. Druggists or club houses are prohibited from selling intoxicating liquors, and it is unlawful to advertise liquors by bill posts, circulars, newspapers, or otherwise in the State. Any violation of this law is punishable by fine or imprisonment in the county jail for the first offense, and by fine and imprisonment in the State penitentiary for the second offense. The law provides for a State superintendent of prohibition who shall have general supervision of the State and power to see that the prohibition laws are enforced.

The liquor laws of Wisconsin provide for local option for towns, villages, and cities. At the legislative sessions of 1913, county option was defeated. About 75 per cent. of the population of the State was under no-license at the end of 1913.

In Wyoming, the liquor laws of the State prohibit the existence of saloons outside of incorporated towns and cities, and five of the incorporated cities have excluded saloons by action of the city councils. There is a stringent Sunday-closing law which was upheld by the State Supreme Court in 1913. About 34 per cent. of the population of the State was under no-license laws at the end of 1913.

At the beginning of 1913, there were nine States which had passed prohibition laws, and steps had been taken to carry on aggressive campaigns for the enactment of such laws in 1914 in Virginia, Idaho, Iowa, and California. Votes will be taken in these States during the year. The nine States in which prohibition laws were effective were Georgia, Kansas, Maine, Mississippi, North Dakota, Tennessee, and West Virginia.

LIQUORS. The term "Liquor" includes all alcoholic beverages, which are ordinarily divided into four classes: Wines, malt liquors, distilled liquors, and cordials.

Recently in Germany there has appeared a product called "malt wine," which is made from malt, but prepared in such a manner as to have a very low extract, a very high content of alcohol, and a decided acidity, which makes it resemble more nearly a wine than a beer.

WINE. *Le Moniteur Vinicole* published the following table of the wine production of the world for the years 1911 and 1912:

	1911 Gallons	1912 Gallons
France	987,482,100	1,306,451,782
Corsica	3,441,900	2,139,192
Algeria	194,340,894	146,765,982
Tunis	3,300,000	5,600,000
Italy	930,600,000	995,702,400
Spain	368,594,400	312,400,000
Portugal	61,600,000	79,750,000
Azores, Canary Islands, and Madeira	770,000	836,000
Austria	63,800,000	55,000,000
Hungary	83,600,000	58,740,000
Germany	57,200,000	52,800,000
Russia	94,600,000	83,600,000
Switzerland	20,900,000	19,866,000
Turkey and Cyprus	26,400,000	22,000,000
Luxemburg	1,980,000	990,000
Greece	50,600,000	46,200,000
Bulgaria	28,600,000	26,400,000
Servia	11,000,000	9,900,000
Rumania	41,800,000	19,800,000
United States	28,600,000	35,200,000
Mexico	550,000	440,000
Argentine Republic	79,200,000	90,200,000

	1911 Gallons	1912 Gallons
Chile	63,800,000	55,000,000
Peru	4,280,000	4,400,000
Brazil	7,700,000	9,300,000
Uruguay	4,400,000	4,620,000
Bolivia	1,540,000	1,760,000
Australia	4,400,000	4,400,000
Cape of Good Hope.....	2,640,000	3,300,000

This table shows for France a very much higher yield in 1912 than in either 1911 or 1910. The best data for the year 1913 indicated that the production for France would be about two-thirds of the 1912 year's yield. Especially was this true of the champagne production, where it was estimated there would be about 2,200,000 gallons in 1913, as compared with 5,600,000 for 1912. Also the indications for the Cognac region were that there would be a very small production, and probably a very high price for brandy.

The best report for the German vintage indicated that the 1913 yield would be exceedingly low, in all probability not more than half the normal amount. As this followed a previous year of very low yield, the price of German wines would undoubtedly very materially increase.

Portugal and Spain both showed a slightly less than normal yield. Italy, however, from all appearances, was to have a most exceptional yield, and the best estimates indicated about 1,280,000,000 gallons of wine produced in 1913. Austria-Hungary and Algeria both show about normal conditions, indicating that the production of this year would be about the same as that of 1912.

The figures given in the previous table (35,200,000 gallons), for the 1912 production of the United States are undoubtedly too low. The probable production of wine in the United States for the year was about 50,000,000 gallons. The only exact data which is available regarding the production of American wines is that given in the report of the commissioner of internal revenue, for fortified wines, the production of which is directly under the supervision of the Treasury Department. The production of this class of wines in 1912 and 1913 is reported as follows:

	Tax gals. brandy used		Wine gals. fortified	
	1912	1913	1912	1913
Calif. 6,153,132.5	4,671,415.7	23,467,441	17,927,812.60	
Hawaii 16,598	7,776.3	70,884	34,406.83	
N York 143,422	154,151.8	595,009	637,789.64	
N. C'lina 7,820	16,936.6	54,102	92,031.06	
Virginia	88,208.4	581,672.84	
Misc. 1,331.4	977.9	11,190	8,045.15	
Total				
for U.S. 6,322,303.9	4,939,464.7	24,198,626	19,281,758.12	

From this table it will be seen that there was a very material decrease in the production of sweet wines during 1913.

FERMENTED LIQUORS. The production of fermented liquors in 1913 in the United States was

65,324,876 barrels, an increase of 3,148,182 barrels, or 94,446,460 gallons, practically an increase of one gallon *per capita* over the previous year. There was, however, a decrease in the number of breweries in operation in 1913, there being 1446 as against 1461 in 1912. This decrease in the number of breweries was along the line of the same general tendency observed in previous years, there being 212 less breweries in operation during 1913 than in 1910. This had undoubtedly been brought about, to a certain extent, by the passage of prohibition laws in various States, which required the breweries to cease operations. This, however, had not apparently affected the production of beer.

In comparison with the 1446 breweries in the United States for its population, we find that Belgium for its 7,432,784 inhabitants has 3309 breweries. A recent consular report shows an interesting condition in Norway. From 1890 to 1899 the consumption of beer increased to 158,000,000 gallons; from 1899 to 1909 it fell off to 95,000,000 gallons, owing largely to the restrictions placed upon its sale. From 1909 to 1912, however, it gradually increased again up to 132,000,000 gallons, and recently a new law has gone into effect providing for the taxation of beer in proportion to its alcoholic content, with the intent that this may materially reduce the amount of alcohol in the beer, and its intoxicating effect.

In Bavaria the consumption of beer *per capita* increased from 60.15 gallons in 1910 to 64.98 gallons in 1911. The enormous production of beer in Bavaria will be more readily understood when compared with the *per capita* consumption of Germany as a whole, which was 24.85 gallons in 1910 and 28.10 gallons in 1911. The total production of beer for Bavaria in 1911 was 498,893,202 gallons.

DISTILLED SPIRITS. During the year 1913 there were in operation in the United States in the production of distilled spirits 870 distilleries, an increase of 49 over the number of the previous year. This, however, is very much below previous conditions. Five years previously, the Commissioner of Internal Revenue reported 1587 registered distilleries. This great decrease, however, was due largely to the fact of the extension of the prohibition laws, especially in the Southern States, where a very large number of small distilleries were in operation a number of years ago. The total production of distilled spirits, exclusive of fruit brandy, during the year 1912, was 185,353,383 taxable gallons, an increase of 7,103,398 taxable gallons over the production of 1912. In the following table, taken from the report of the commissioner of internal revenue, is stated the production of the various kinds of distilled spirits for the past four years, and a study of this table will show that there is practically very little change in the kind of distilled spirits produced in the last two years.

	Production of			Distilled Spirits		
	Rum	High Wines	Gin	Whiskey	Alcohol	Commercial Alcohol
1910.....	1,730,551	206,534	2,985,435	82,463,894	50,703,845	15,841,370
1911.....	2,077,904	165,017	3,345,370	100,647,155	44,205,329	21,780,391
1912.....	2,266,063	131,001	3,577,861	98,209,574	45,869,685	24,482,304
1913.....	2,750,846	90,293	4,014,600	99,615,828	48,560,920	30,320,894

Regarding the whiskey bottled in bond, 1913 showed a decided increase over 1912, being 10,618,812 gallons, as against 9,752,486 gallons in

1912. There still continued, however, a very large amount of illicit distilling in the United States, 1447 distilleries of this class being seized

and destroyed during the year 1913. As usual, practically all of these were in the Southern States.

During the year the Department of Agriculture issued an important ruling regarding brandy, holding that brandy is "the alcoholic distillate obtained solely from the fermented juice of fruit, distilled under such conditions that the characteristic bouquet, or volatile flavoring and aromatic principles, is retained in the distillate." Further, that grape brandy is "the distillate obtained from grape wine under these conditions." "Apple, peach, and other fruit brandies are similarly prepared from the fermented juices of the respective fruits." It was further held that the "so-called brandy prepared from grain, potato, or other form of industrial alcohol, or from alcohol obtained from the by-products of wine manufacture, mixed with more or less true brandy or other flavoring material, is adulterated and misbranded unless labeled to indicate its true composition." This ruling appeared to be a much more satisfactory one than those of a number of other countries regarding this product.

Since June 6, 1894, vodka has been under the absolute control of the Russian government, both as to its production and sale. Only the most highly rectified purified alcohol is permitted to be used. Permission is granted for the sale of vodka in bottles only, and no drinking is allowed either on the premises or the streets. Further, the sale of vodka is entirely separated from the sale of beer, the government allowing beer saloons to be specially licensed for the sale of beer, but not permitting the sale of either wine or other liquors on the same premises. In 1911 the revenue received by the Russian government from the sale of vodka amounted to \$403,019,945, and the consumption *per capita* was two gallons.

Australia has recently enacted laws regarding the sale of brandy and other spirits, requiring that no product shall be sold as brandy unless wholly distilled from grape wine; and also that other spirits, with the exception of gin, Holland, geneva, and liqueurs, shall not be sold for human consumption unless matured two years in wood.

CORDIALS. As a result of the ruling prohibiting the importation of absinthe into the United States, which was effective October 3, 1912, some very interesting information was found in the records of exportation of absinthe from France to the United States. In 1911, the value of the absinthe exported to the United States was \$55,228. In 1912, it amounted to \$120,362, which large increase was undoubtedly due to the fact that the importers were trying to obtain a large reserve supply before the regulation of October 3, 1912, went into effect.

LITERATURE. See LITERATURE, ENGLISH AND AMERICAN; FRENCH LITERATURE; GERMAN LITERATURE; ITALIAN LITERATURE; RUSSIAN LITERATURE; SCANDINAVIAN LITERATURE; and SPANISH LITERATURE.

LITERATURE, ENGLISH AND AMERICAN. The large increase in the number of books produced in the United States in 1913 made the American output almost equal to that of Great Britain in the same year. For the three years 1909-11, the United States was ahead of Great Britain in the number of titles reported, but there was a falling off in this country of 2567 from 1910 to 1912, while in England there was

no set-back but a slow and steady increase. Of the 12,230 books produced in 1913 in the United States, 3145 were by English or other foreign authors. Of this 12,230, 10,607 were new books and 1623 new editions of works previously published.

FICTION. More and more, poetry and fiction respond to the sociological and moral drift of the age. Discussion of divorce, of predatory finance, of civic selfishness seeks a wider expression in popular literature. Sometimes the poem or novel breaks down with the added propaganda, but its dignity and worth are often enhanced by the ethical content. Among English novels dealing with the need of new divorce laws in England perhaps the most artistic is *The Dark Flower*, by John Galsworthy, which gives "the love life of a man" as a sub-title, and in its episodes—"Spring," "Summer," and "Autumn"—depicts the inner life of passion, a surfeit of emotion, unrelieved by any other interest. *The Passionate Friends*, by Herbert G. Wells, is also painfully limited to a single aspect of life. In each case, as in the minor characters of *The Croyston Family*, by Mrs. Humphrey Ward, the freer divorce laws of America would have averted the tragedy of death, although not the pain of a broken marriage. Mrs. Ward's novel is also the story of a masterful woman, whose ruling passion for politics destroys her happiness and the peace of her home. *The Woman Thou Gavest Me*, by Hall Caine, is another attack upon the divorce laws of England which discriminate against women. *The Joy of Youth*, by Eden Phillpotts, is in a new vein, almost Meredithian in its depiction of a self-satisfied English squire, an unconventional artist and a heroine with brains, and in its clever conversations, and contrasts of England and Italy. In Mr. Phillpotts's older manner we find *Widecomb Fair*, portraying a world in a village. His *From the Angle of Seventeen* is a delightful portrayal of an English lad entering manhood and the business world of London. Maurice Hewlett takes Lord Byron as his hero in *Bendish; a Study in Prodigality*. *The Judgment House*, by Sir Gilbert Parker, passes from London to South Africa, and, in addition to the interplay of character, contains vivid pictures of the Boer War. Another novel of the same war is *Divided; a Story of the Veldt*, by Francis Bancroft, where two brothers although bound by deep love for each other fight on opposite sides. *Where the Strange Roads Go Down*, by Gertrude Page, treats of the life of an overstrained woman in a new country—Rhodesia. *The Breath of the Karroo*, by L. H. Brinkman, expresses the essence of life in South Africa. *The Regent*, by Arnold Bennett (published in America under the title of *The Old Adam*), is a further history of the ever delightful Denry the Audacious, the "Card" who undertakes a theatrical venture with brilliant success. *The Devil's Garden*, by W. B. Maxwell, which gives the development of a murderer, and *Sinister Street*, by Compton Mackenzie, were banned by the library censors because of their frank discussion of sex questions. *The Morning's War*, by C. E. Montague, a story of England and Ireland, and of a manly hero, is written with artistic restraint. The three Benson brothers bring out novels this year: *Watersprings*, by Arthur C. Benson, the restrained romance of a college Don; *Thorley Weir*, by E. F. Benson, one of the most pleasing books by that vivacious author; *An Average*

Man, by Robert Hugh Benson, an unattractive portrait of an unchivalrous young man. *An Affair of State*, by the versatile J. C. Snaith, is a clever political satire of present day England. *The Debit Account*, by Oliver Onions, is an interesting sequel to his powerful *In Accordance with the Evidence*, the painful story of a man whose guilty past hangs upon his consciousness like an invisible ball-and-chain. *The Way of Ambition*, by Robert Hichens, shows how a great genius may fail in the attempt to commercialize his art at the behest of an imperious and ambitious wife. *Stella Maris*, by William J. Locke, is the story of a pure soul sheltered by illness from all knowledge of evil, suddenly awakening to some of its most hideous aspects, and struggling back to peace. *After All*, by Mary Cholmondeley, pictures the life in an old English village with most delightful art, and keeps interest in the plot alert to the very end. *The Ffolliots of Redmarly*, by Mrs. Lizzie Allen Harker, adds another friendly group to the list her genius for getting at the heart of young people has given us, and the contrasted types are full of joyous vitality. *Wilsam*, by S. C. Nethersole, is a very human story of the hop fields of Kent. Another tiny town is depicted in *Gracechurch*, by John Ayscough. H. de Vere Stapole, in *The Children of the Sea*, writes a romance of Iceland. *Shallows*, by Frederick Watson, is a realistic, historical novel of France and Scotland in Jacobite days. We meet again with pleasure Professor Challenger of *The Lost World* in Sir Arthur Conan Doyle's *The Poison Belt*. *Valentine*, by Grant Richards, is a diverting tale of an airy young architect in London, and a remarkable flight across the Channel after missing an important train. Mrs. Belloc Lowndes tells a good mystery story of Paris in *The End of Her Honeymoon*. In *A Prisoner in Fairyland*, Algernon Blackwood writes of a London financier who enters the Ivory Gate and passes on to a world of fantastic but exquisite imagination, the long-lost fairyland of childhood. *Lu of the Ranges*, by Elenor Mordaunt, is a powerful story of the Australian mountains, Melbourne life, and the development of a girl's character under most adverse conditions. A few other English novels should be mentioned: *Fortitude*, by Hugh Walpole; *The Garden Without Walls*, by Coningsby Dawson, the story of a revolt against convention; *Concert Pitch*, by Frank Danby (Mrs. Julia Frankau), a study of an artistic temperament; *The Catfish*, by Charles Marriott; *The Amateur Gentleman*, by Jeffrey Farnol; *The Happy Warrior*, by A. S. M. Hutchinson; *The Flying Inn*, by Gilbert Keith Chesterton.

The leading American novels are characterized by earnestness of purpose and sincerity of style. *The Inside of the Cup*, by Winston Churchill, dealing with the relation of the Church to modern life, aroused wide discussion and has had a perceptible effect on religious activities. *The Custom of the Country*, by Edith Wharton, discloses the devastating influence of a social climber, and finely contrasts French and American morals and manners. *O Pioneers!* by Willa Sibert Cather, tells the story of the land conquered by Nebraska farmers, the epic greatness of their struggle, and the types of womanhood it evoked. Other American novels are: *New Leaf Mills: a Chronicle*, by William Dean Howells, the Dean of American fiction, which pictures the pioneer life of the Middle West,

about the time of the Mexican War; *Westways, a Village Chronicle*, by the late S. Weir Mitchell, makes a Pennsylvania village during 1855-1866 live again its stormy life, by his careful art; *The Story of Waitstill Baster*, by Kate Douglas Wiggin, faithfully reproduces the life of an old New England village before the Civil War and the railroads had broken in upon its peace; Henry Sydnor Harrison followed his great success, *Queed*, with *V. V.'s Eyes*, a story of Richmond and of the potent influence of a strong character upon the spiritual development of a selfish, ambitious girl; *The Way Home*, by Basil King, is the old story of the man who sells his soul to gain the world and finds himself cheated in the bargain; *Virginia*, by Ellen Glasgow, is the common tragedy of the woman, reared to reverence the ideals of a former generation, and unable to change them in order to cope with present day life; *Laddie*, by Gene Stratton-Porter, describes farm life in Indiana forty years ago, and is a book of the open fields, wholesome and serene; *Hagar*, by Mary Johnston, is an impassioned plea for greater freedom for women; *Van Cleve*, by Mary S. Watts, is a tale of Cincinnati, of the Spanish-American War, and of a thrifty hero who supports several worthless relatives; *T. Tembarom*, by Frances Hodgson Burnett, contrasts New York streets and English country life by means of a delightful hero, who starts as a newsboy and becomes heir to a great English estate. *Mothering on Perilous*, by Lucy Furman, is the diary of a missionary teacher in the Kentucky mountains, and *The Ordeal*, by Charles Egbert Craddock (Miss Murfree) pictures life in the Tennessee mountains. *Robin Hood's Barn*, by Alice Brown, is a New England story of simple charm in the telling. *My Little Sister*, by Elizabeth Robins (Mrs. C. R. Parkes) is a painful story of the white slave traffic. *The Taste of Apples*, by Jeanette Lee, is wholesome and spicy. It is noteworthy that so many American novels are by women. And of men's novels many are about women, particularly of the noxious, parasitic type, like the heroine of Robert Herrick's *One Woman's Life*, who represents a happily passing phase in the development of woman. The newer woman is sympathetically treated in *The Business of Life*, by Robert W. Chambers; *The Penalty*, by Gouverneur Morris, and *The Iron Trail*, a story of the development of Alaska, by Rex Beach. Essentially masculine in mood and method are: *John Barleycorn*, by Jack London, a singular autobiography of the man who drinks; *The Valley of the Moon* and *The Abysmal Brute* by the same author; *The Heart of the Hills*, by John Fox, Jr., a chronicle of half-savage life in the Cumberland Mountains; *The Southerner* (Abraham Lincoln), by Thomas Dixon; *Sylvia*, by Upton Sinclair; *The Flirt*, by Booth Tarkington; *His Great Adventure*, by Robert Herrick; *The Desired Woman*, by Will N. Harben, another tale of the Georgia mountains the author knows and loves; *Down Among Men*, by Will Levington Comfort; *Elkan Lubliner, American*, by Montague Glass (Marsden); *Gold*, by Stewart Edward White; *If You Touch Them They Vanish*, a Canadian tale, by Gouverneur Morris; and *Otherwise Phyllis*, by Meredith Nicholson.

Among the many volumes of short stories, *A Changed Man*, by Thomas Hardy, stands easily first. *Twixt Land and Sea*, by Joseph Conrad, breathes the very essence of the tropics. *All Men Are Ghosts*, by L. P. Jacks, is a volume of

FOUR AUTHORS PROMINENT IN 1913

original short stories. *Here Are Ladies*, by James Stephens, is a collection of misunderstandings. *Mixed Grill*, by Pett Ridge, is a pleasing mixture. Other notable volumes of short stories are: *Shadows Out of the Crowd*, by Richard Curle; *The Headquarter Recruit*, by Richard Dehan; *News from the Duchy*, by Sir Arthur Quiller-Couch; *The Lore of Proserpine*, by Maurice Hewlett; *Women of the Country*, by Gertrude Bone; *Studies in War*, by F. Britten Austin; *The Old Time Before Them*, by Eden Phillpotts; *The Eternal Masculine*, by Mary Raymond Shipman Andrews; and *The Escape of Mr. Trimm*, by Irvin Cobb.

ESSAYS AND LITERARY CRITICISM. Essays, the product and the resource of leisure, show no increase on either side the Atlantic, although a gratifying number of meritorious collections of prose sketches are brought out each year. *Joyous Gard*, by Arthur Christopher Benson, adds another volume to the long list of his serene and gently contemplative essays. As a contrast we have *Essays in Rebellion*, by Henry W. Nevison, full of fiery denunciation and intense enthusiasm on all sorts of public themes. *The Pathos of Distance*; a *Book of a Thousand and One Moments*, by James Huneker, is written with his usual charm, touched with delicate melancholy. *Old Standards*, by John Halsham, also possesses the wistful backward look and a suspicion of patient pessimism in viewing the present. *From the Porch*, by Lady Ritchie, is a charming miscellany. *The American Spirit*, wholesome lectures and addresses by Oscar S. Straus; *History as Literature and Other Essays*, by Theodore Roosevelt; *The Different West*, by Arthur E. Bostwick; and *Youth and Life*, by Randolph S. Bourne, are all notable as voicing the spirit of hope and manly courage in facing life. *Crowds*, by Gerald Stanley Lee, is buoyant and optimistic in its survey of city life. *Out of the Dark*, by Helen Kellar, contains intensely personal essays, remarkable for their triumph over limitations. *The Summit of the Years*, by John Burroughs, is the fruit of ripe wisdom and serene confidence in the goodness of the world. Another lover of nature, the artist Edward Martin Taber, writes of northern Vermont in his *Stowe Notes, Letters and Verses*. *Loiterer's Harvest*, by E. V. Lucas, is a book of charming essays on London past and present. *The Larger Values Make for the Well Rounded Life*, by Humphrey J. Desmond, consists of aphoristic essays. *Monologues*, by Richard Middleton, are modestly described as "journalistic" by the author. Among the critical books of the year there are several of more than usual importance. *The English Novel*, by George Saintsbury comes nearer to a complete study of the subject than any that has yet been made, although Professors Raleigh, Cross, and Stoddard have written notable books concerned with it. *The Victorian Age in Literature*, by Gilbert Keith Chesterton, is a vital and witty discussion of the topic. A second edition of *The Quintessence of Ibsenism*, by Bernard Shaw, is notable because of a new preface, criticism, and notes, provoking discussion. *The Drift of Romanticism* forms the eighth volume of Paul Elmer More's fine and scholarly *Shelburne Essays*, which series, in range, literary quality, and authoritativeness, ranks with the very best contemporary work in English literary criticism. *The Enjoyment of Poetry*, by Max Eastman, is a fresh and frank plea for a greater freedom in teaching literature. *The Spirit of American*

Literature, by John Albert Macy, defends the thesis that American literature, like American life, is unfinished. *English Epic and Heroic Poetry*, by W. MacNeile Dixon, is a careful treatise. Three books on Browning are critical rather than biographical: *Browning's Heroines*, by Ethel Colburn Mayne; *Browning and His Century*, by Helen A. Clarke; *Two Masters—Browning and Turgenev*, by Phillips Moxon. *Swinburne: an Estimate*, by Professor Drinkwater, is an attempt to present a definitive and unprejudiced view of the poet. *The Tarn and the Lake: thoughts on Life in the Italian Renaissance* is a very graceful essay by C. J. Holmes. *The Renaissance and its Makers*, by J. D. Symon and S. L. Bensuan; *Italy in the Thirteenth Century*, by Henry Dwight Sedgwick; *Dante and Aquinas*, by Phillips H. Wicksteed; *Dante, Goethe's Faust and Other Lectures*, by Herbert Baring Garod and Lucy F. Garod; *The Greek Genius*, by R. W. Livingston; *The Verse of Greek Comedy*, by John W. White—all these are in various ways noteworthy. *What Can Literature Do For Me?* by C. Alphonse Smith, are direct, forceful and sensible lectures. *The Invisible Alliance*, by Francis Grierson, contains pleasing sketches. *Political and Literary Essays: 1908-1913*, by the Earl of Cromer, is engaging and interesting. The following works, also, should be mentioned: *Voices of To-morrow*, critical studies of the new spirit in literature, by Edwin Bjorkman; *Clio, a Muse and Other Essays*, by George Macaulay Trevelyan; *Milton's Astronomy*, by Thomas N. Orchard, a curious work of textual criticism; *The Influence of Baudelaire*, by G. Turquet-Milnes; *Censorship in England*, by Frank Fowell and Frank Palmer; *The Elizabethan Playhouse*, by W. J. Lawrence; *Walter Pater*, a critical study by Edward Thomas; *The Street of Adventure*, by Phillip Gibbs, which tells the story of Fleet Street; and *The Adventure of a Newspaper Man*, by Frank Dillnot. More purely technical are such books as: *The Writing of English*, by W. T. Brewster; *Newspaper Writing and Editing*, by Willard Grosvenor Bleyer of the University of Wisconsin; *The Story of a Page*, by John L. Heaton; *A Tract on the Present State of English Pronunciation*, by the Poet Laureate Robert Bridges; *The Book of Public Speaking*, by Arthur Fox Davis; and *The Press and its Story*, by James D. Symon.

DRAMA. The renewed interest in the Drama is evidenced by the issuing of many plays in library editions. One of the most interesting volumes of collected plays is found in *Plays of Old Japan*. The "No," by Marie C. Stopes, translated by M. C. Stopes and Joji Sakurai, with a preface by Baron Kato. These plays were all composed before the sixteenth century and yet are acted in Japan to-day without the slightest change, and form a music drama not unlike the Wagnerian operas. Henry Arthur Jones publishes two plays: *The Divine Gift*, a play in three acts, and *Mary Goes First*, a comedy in three acts and an epilogue, both good examples of his cleverness in stage-craft and dialogue. *The Necessary Evil*, by Charles Rann Kennedy, is a tragedy in one act and a discussion of the same subject as Brioux's *Damaged Goods*, but in a more imaginative way. *Esther Waters*, by George Moore, has been dramatized by the author into a five-act play. *This Generation*, by S. M. Fox, belongs to the series called by its publisher *Plays of To-day and To-morrow*. In

Book Ever Written (a title taken from Renan in speaking of the gospel according to Luke), by D. A. Hayea. In the historical development of religion we should mention: *Studies in the History of Religions*, edited by David Gordon Lyon and George Foot Moore; *The New Testament Documents*, by George Milligan; *Coptic Apocrypha in the Dialect of Upper Egypt*, edited with English translation by E. A. Wallis Budge; *A Critical Introduction to the Old Testament*, by George Buchanan Gray; *The Literature of the Old Testament*, by George Foot Moore; and *The Epistle of Priesthood* (Hebrews), by Alexander Nairne. Religious essays abound. Some of the most impressive are: *The Preacher, His Life and Work*, by J. H. Jowett; *Religion and Life*, by Henry Churchill King; *Rudolf Eucken's Message to Our Age*, by Henry C. Sheldon; *Sociological Study of the Bible*, by Louis Wallis; *French Prophets of Yesterday*, a study of religious thought under the Second Empire, by Albert Leon Guerard; *Mysticism in Christianity*, by W. K. Fleming; *The Evolution of the Monastic Ideal*, by Herbert B. Workman.

HISTORY. When the recent great shift in the centre of the historian's interest from the political—or rather dynastic and military—affairs of nations to the daily life of the people is considered, it is surprising to see how completely political history still dominates the book mart. There is a steadily growing literature of purely economic and industrial history, but it still bulks small in the total yearly output of history, whether text-book, general history, or scholarly monograph. The solution of this apparent paradox is to be found in the fact that political history has been largely revolutionized from within and has incorporated with itself so much of economic and social material that the distinction between the two types of work is becoming less significant with every year.

Perhaps this tendency is most clearly shown in the field of American history. The year's great contribution to American history is John Bach McMaster's *History of the People of the United States from the Revolution to the Civil War*, vol. viii., a work as broad in scope as it is original in treatment. Professor C. A. Beard clothes an economic thesis in a political wrapper in his book, *An Economic Interpretation of the Constitution of the United States*, showing that the Constitution was not the work of revolutionary theorists but of conservative and wealthy men aiming above all to make property rights secure. Distinctly in the newer fields are such books as Professor Albert Bushnell Hart's *Social and Economic Forces in American History*; *Causes and Effects in American History*, by E. W. Morse; *An Industrial History of the American People*, by J. R. H. Moore; *Economic Beginnings of the Far West*, by Katherine Coman. As in previous years the Civil War period continues to furnish the material for very many books, perhaps a majority, of American political history. We note particularly James Ford Rhodes's *Lectures on the American Civil War*; *The American Civil War*, by J. K. Hosmer; and *The History of the Reconstruction Period*, by James Schouler. Military studies of interest are: *War Time in Manila*, by Rear-Admiral B. A. Fiske; *Major Operations of the Navies in the War of American Independence*, by Captain Mahan; and *A Naval History of the American Revolution*, by Gardner W. Allen. More general surveys of American history are:

A Short History of the United States, by John Spencer Bassett; *From Jefferson to Lincoln*, by William MacDonald; *One Hundred Years of Peace*, by Henry Cabot Lodge, a study of a century's pacific relations between England and the United States; and *Transatlantic Historical Solidarity*, by Charles Francis Adams, consisting of the author's Oxford lectures on American history. In British history there are several general surveys: *The Making of England*, by Gilbert Slater; *A History of England from the Earliest Times to the Present Day*, by A. D. Innes; *England since Waterloo*, by J. A. R. Marriott, the seventh volume of a series edited by Charles Oman; *A History of England from the Accession of James the Second*, vol. i., by Charles H. Firth. French history always calls forth a number of studies, especially the revolutionary and Napoleonic epochs, but this year such works are not as numerous as usual. *The New France*, by William S. Lilly, is a pessimistic study of French democracy since 1879; *England and the Orleans Monarchy*, by Major John Hall, relates the story of a previous entente between France and England. *Symbol and Satire in the French Revolution*, by E. F. Henderson, is richly illustrated with contemporary caricature. Of military studies there are *The Franco-Prussian War and Its Secret Causes*, by Émile Ollivier, translated by G. B. Ives; and Hilaire Belloc's monograph on *Poitiers*. Historical works in other fields which must be listed are: *The Fall of the Dutch Republic*, by H. W. van Loon, a work at once of great scholarship and popular interest; *Italy in the Thirteenth Century*, by K. D. Sedgwick; *Jena to Eylau*, a history of the Prussian army by General von der Goltz, translated by Captain C. F. Atkinson; *An Outline History of China*, by H. H. Gowen; *The Queens of Aragon*, by E. L. Miron; *The Influence of Monarchs*, by Frederick A. Woods, studies of European royalty; *The Evolution of States*, by J. M. Robertson; and *The Story of the King's Highway*, by Sidney and Beatrice Webb.

TRAVEL AND CONTEMPORARY HISTORY. One book of modern travel stands out from the others of the year as much perhaps because of the vivid dramatic interest of the narrative as because of the unforgettable tragedy which closed it. *Scott's Last Expedition*, by Robert F. Scott, edited by Leonard Huxley and Dr. E. A. Wilson, is the epic of the Antarctic pole. *Lost in the Arctic*, by Ejnar Mikkelsen, is another tale of heroism from the other end of the earth. *My Life with the Eskimo*, by Vilhjalmur Stefansson, enlarges our knowledge of this people in no small degree. The Far East is as attractive to explorer and author as either pole. *Trans-Himalaya*, an account of discoveries and adventures in Tibet, by Sven Hedin, introduces the reader to vast regions which nature and the policy of the Tibetans have hitherto barred to white men. J. O. P. Bland's study, *Recent Events and Present Politics in China*, contains a rather pessimistic account of that country's condition and prospects.

The two Balkan wars have produced not only accounts of the struggle but many studies of the chief nations engaged, of which may be cited: *With the Bulgarian Staff*, by Noel Buxton, M.P.; *The Balkan War*, by Philip Gibbs and Bernard Grant; *The Ottoman Empire*, by Henry W. Stead; *The Hapsburg Monarchy*, by Henry W. Stead; *Czar Ferdinand and His*

DOCTOR S. WEIR MITCHELL
THE PORTRAIT BAS-RELIEF BY AUGUSTUS ST. GAUDENS

People, by J. MacDonald; *The Near East*, by Robert Hichens; and *Rambles and Studies in Greece*, by J. P. Mahaffy. No European nation is at present the subject of closer scrutiny than Germany. A number of attempts have been made during the year to account for the remarkable prosperity and efficiency of that country and its place in world diplomacy. *Monarchical Socialism in Germany*, by Elmer Roberts, gives a general account of the progressive paternalism of the kaiser and his ministers, and *Principles of Prussian Administration*, by H. G. James, describes in detail the official machinery used to that end. *Germany and Its Evolution in Modern Times*, by Henry Lichtenberger, a French view; *Germany to the Present Day*, by A. W. Holland; *Pan-Germanism*, by Roland G. Usher; *German Sea-Power*, by Archibald Hurd and Henry Castle; *Problems of Power*, by W. M. Fullerton; and the late Price Collier's frank and informing first-hand study, *Germany and the Germans*, are all books that demand notice.

The whole British empire is in constant process of change and development but nowhere so much as in England itself. *British Social Politics*, by Carlton H. Hayes, is an admirably compact and complete account of the many changes which the present Liberal government has made in British law since it was returned to power. The civilizing work of Great Britain in Egypt is told in Clayton S. Cooper's *The Man of Egypt*. A similar story of imperial development at the other extremity of the continent is the subject of *The Reconstruction of the New Colonies Under Lord Milner*, by W. B. Worsfold; *The Real South Africa*, by Ambrose Pratt; *The South African Scene*, by Violet R. Markham. On the war in Tripoli we have *Italy in North Africa*, by W. K. McClure, and *A War for a Desert*, by Francis McCullagh.

Of books concerned with the Western Continent, and falling properly under the present section, are: *The Coming Canada*, by J. K. Goodrich; *Alaska: An Empire in the Making*, by J. J. Underwood, a book of information as well as of narrative; ex-Ambassador James Bryce's *University and Historical Addresses* on American history; and Dr. Diomedes Carito's *In the Land of Washington*, a study of the United States by an Italian. Our outlying dependencies also receive attention: *Hawaii, Past and Present: The Philippine Problem*, by Frederick Chamberlain; *The American Occupation of the Philippines*, by J. J. Blount, a plea for the abandonment of the islands; and *The Odyssey of the Philippine Commission*, by Daniel R. Williams. And the Panama Canal zone is a centre of liveliest interest, witness: Philippe Bunau-Varilla's *Panama: The Creation, Destruction and Resurrection*; *The Panama Gateway*, by Joseph B. Bishop, a very thorough and authoritative book; and *Panama: Past and Present*, by Farnam Bishop. Latin America is treated in: *The Coming Mexico*, by Joseph K. Goodrich; *Mexico the Land of Unrest*, by Henry Baerlein; *The Republics of Central and South America*, by C. R. Enock; *Guatemala*, by C. W. Domville-Fife; *Across Unknown South America*, by A. H. Savage-Landor; *An Unknown People in an Unknown Land*, a study of the Gran Chaco region in central South America by W. B. Grubb; *To the River Platte and Back*, by W. J. Holland; *A Tour Through South America*, by A. S. Forrest; *Modern*

Chile, an optimistic sketch, by W. H. Koebel.

POLITICS AND SOCIOLOGY. During the past year attention seems to have been especially concentrated in two or three fields of political and economic inquiry. One of these foci of interest is certainly the labor union, especially the newer type of labor union which is revolutionary in purpose and is organized by complete industries rather than by crafts. *The Spirit of Association*, by M. Fothergill Robinson, is a general plea for voluntary coöperation rather than legal enactment as a remedy for industrial evils; *Trade Unions*, by H. H. Schloesser, and *Trade Unions*, by Joseph Clayton, also aim at a broad survey of the whole situation. André Tridon's *The New Unionism* is an ardent defence of the syndicalist movement, which is as vigorously attacked by another Socialist, John Spargo, in *Syndicalism, Industrialism, Unionism, and Socialism*. The movement is treated in several other books of the year, including *Industrial Warfare*, by C. Watney and J. A. Little; *The Minimum Wage and Syndicalism*, by the Hon. James Boyle; *Syndicalism: a Critical Examination*, by J. Ramsay McDonald. An admirable exposition of the Socialist party and its position is contained in *Socialism Summed Up*, by Morris Hillquit. In *The Larger Aspects of Socialism*, W. E. Walling discusses many theories of sociology and ethics as they seem to relate to his subject. *Marxism versus Socialism*, by Professor Simkhovitch, shows how far modern Socialism has departed from the original doctrines of Karl Marx and expresses the opinion that changing economic conditions will force further reconstruction. The Socialist party is not the only one to find elucidation. The National Progressive party is championed in a volume of addresses by Theodore Roosevelt, collected under the title *Progressive Principles*, and S. J. Duncan Clark contributes a volume on *The Progressive Movement: Its Principles and Programme*. *The New Freedom*, by President Woodrow Wilson, is the text-book of progressivism within the Democratic party. Of American political essays, *Experiments in Government and the Essentials of the Constitution*, by Senator Elihu Root, is certainly one of the most important. It is a discussion of the needed legislative reconstruction necessitated by the growth of modern industry. Similar problems are faced by the veteran British scientist, the late Alfred Russell Wallace, in *Social Environment and Modern Progress*, although the remedies proposed are far more drastic. In the same connection should be considered *The Future of the Working Classes*, by R. W. Babson; *The Worker and His Country*, by Fabian Ware; *Wages and Welfare*, by Professor A. C. Pigou of Cambridge; and *Constructive Rural Sociology*, by John M. Gillette.

The flood of books on feminism that pour from the press—many of them remarkable for knowledge, intelligence, and skillful presentation of material—makes the output of works on other questions of modern sociology appear insignificant. Any brief selection will seem arbitrary, but we name the following: The anonymous study *The Woman with Empty Hands*; *The Old-Fashioned Woman*, by Elsie Clews Parsons; *The Unrest of Women*, by E. S. Martin; *Sex Antagonism*, by Walter Heape, and *The Truth About Woman*, by C. Gasquoine Hartley (Mrs. Walter Gallichan), two violently contrasting works on biological psychology; *The Man and the*

Woman, by Arthur L. Salmon; *The Nature of Woman*, by J. L. Taylor; *Way Stations*, a study of the English feminist movement by Elizabeth Robins; *Woman in Science*, by H. J. Mozans; a frenzied and violent work, *The Unexpurgated Case Against Woman Suffrage*, by Sir Almoth E. Wright; and a remarkable book by Frau von Mayreder, translated from the German, and entitled, *A Survey of the Woman Problem*.

LITTLE, JOSEPH JAMES. An American printer and publicist, died February 11, 1913. He was born in Bristol, England, in 1841, and moved to the United States with his parents when he was four years of age. Educated in the public schools, in 1855 he became a printer's apprentice at Morris, N. Y. Four years later he was employed as a compositor in New York City. He served throughout the Civil War, rising to the rank of first lieutenant in the 37th New York Volunteers. In 1867 he established the firm of J. J. Little and Company. Mr. Little took great interest in public affairs and was for many years a school commissioner of New York City. He was elected to the Fifty-second Congress, serving from 1891-93. In the same year he was a member of the World's Fair Commission.

LIVESTOCK. See STOCK-RAISING.

LLANDAFF, HENRY MATTHEWS, First Viscount. An English nobleman and public official, died March 27, 1913. In 1883 he was appointed home secretary in the cabinet of Lord Salisbury. Although he did not become prominent in this position he discharged the duties of his office with firmness and efficiency. When the Unionists came into power in 1895, he did not return to office, but was raised to the position of Viscount Llandaff.

LOCKROY, ETIENNE AUGUSTE EDOUARD (SIMON). A French journalist and statesman, died November 22, 1913. He was born in 1838. His father, an actor named Joseph Philippe Simon, took the name of Lockroy. From his earliest manhood he was engaged in the service of the state; he was also a soldier, and in 1860 joined Garibaldi's band of Italian volunteers which made a famous expedition into Sicily. In 1871 he was one of the electors of the Seine, who were sent to the National Assembly in February of that year. He was one of the founders of a daily paper called *La Municipalité*, which had for its object the regulation of the municipal councils of France. His most important rôle as a journalist, however, was played during the second Reign of Terror, when the empire was falling after the Franco-Prussian War. His vigorous style made him the chief propagandist of that period. M. Lockroy held portfolios in the cabinets of all the presidents from the founding of the republic.

LONGFELLOW, WILLIAM PITT PREBLE. An American architect, died August 3, 1913. He was born in Portland, Me., in 1836, and was the son of Stephen Longfellow, and brother of Henry W. Longfellow. Graduated from Harvard College in 1885, he afterward took post-graduate studies at that college. From 1869-72 he was assistant architect in the Treasury Department of the United States. He was adjunct professor of architectural design at the Massachusetts Institute of Technology in 1881-82. In 1893 he was chairman of the architectural section board of judges at the Chicago Exposition. He was the first editor of the *American Architect*. His published writings on architectural subjects include: *Abstract of Lectures on Perspective* (1889); *Cyclopaedia of Architecture in Italy, Greece and the Levant* (1895); *The Column and the Arch, Architectural Essays* (1889); *Applied Perspective* (1901). He also contributed to magazines and reviews on architectural subjects.

LOUISIANA. POPULATION. The population of the State in 1910 was 1,656,388. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 1,745,858.

AGRICULTURE. The area, production, and value of the principal crops in 1912-1913 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1913 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1913	1,900,000	41,800,000	\$32,188,000
	1912	1,805,000	32,490,000	22,490,000
Oats	1913	45,000	990,000	564,000
	1912	34,000	707,000	361,000
Rice	1913	405,500,000	11,760,000	9,878,000
	1912	352,600,000	11,812,000	10,985,000
Potatoes....	1913	25,000	1,750,000	1,680,000
	1912	20,000	1,460,000	1,212,000
Hay	1913	160,000	a 240,000	3,000,000
	1912	142,000	234,000	2,972,000
Tobacco....	1913	600	b 270,000	68,000
	1912	500	150,000	45,000
Cotton	1913	1,126,000	c 400,000	22,389,000
	1912	929,000	361,123	20,678,000

MINERAL PRODUCTION. The total value of the mineral products of the State in 1912 was \$15,357,841, compared with \$12,710,958 in 1911.

The Louisiana fields, with those of Texas, form the Gulf oil field. There were produced in the State in 1912 9,263,439 barrels of petroleum, compared with 10,720,420 barrels in 1911. There are three important fields in the State—the Jennings, Caddo, and the Vinton fields. Of these, the Caddo field is by far the largest producer. Its production of 1912 was 7,177,949 barrels. From the Jennings field were taken 1,105,711 barrels, and from the Vinton field 932,639 barrels. The total number of wells completed in the State in 1912 was 437.

TRANSPORTATION. The total railway mileage of the State on June 30, 1912, was 6860, of which 3873 was main line, 1282 branches and spurs, 188 second track, 1414 yard track and sidings. The longest mileage is that of the St. Louis, Iron Mountain, and Southern Railway, 460. The Texas and Pacific Railway Company has 339, the Louisiana Railway and Navi-

gation Company 312, the New Orleans, Texas, and Mexico Railroad Company 276, and the Kansas City, Southern Railway Company 245. These figures are for main track only. The total gross earnings for the lines in the State for the fiscal year ending June 30, 1912, amounted to \$181,599,393.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions under the control of the State, include the following: Louisiana Institute for the Blind, Louisiana State School for the Deaf, State Penitentiary—all at Baton Rouge; the Louisiana Industrial Institute at Ruston; the State Reform School at Monroe; the Louisiana Hospital for the Insane at Pineville; and the Asylum for the Insane at Jackson.

POLITICS AND GOVERNMENT. A special session of the legislature convened on September 8 and adjourned on September 12, having called a special election for October 28 at which the people should vote upon a proposition to call a limited constitutional convention for November 10. The chief purpose of the convention was to permit the sale of bonds to refund the State bonded debt of \$11,108,300, due January 1, 1914. The election was held on the date mentioned above, the convention proposition being overwhelmingly adopted and delegates to the convention being elected. The convention met November 10 and adjourned November 22, having rewritten and reenacted the constitution of the State. The chief changes were the bond section and amendments to the acts governing the sewerage and water board of New Orleans.

On December 8 an issue amounting to \$10,567,470 of four and one-half per cent. fifty-year serial bonds, authorized by the new constitution, were sold by the State board of liquidation at 96.142. There were no other legislative sessions; and no other State-wide elections.

STATE GOVERNMENT. Governor, L. E. Hall; Lieutenant-Governor, T. C. Barrett; Secretary of State, Alvin E. Hebert; Auditor, Paul Capdeville; Treasurer, L. E. Smith; Attorney-General, R. G. Pleasant; Superintendent of Education, T. H. Harris; Commissioner of Agriculture, E. O. Bruner; Commissioner of Insurance, A. E. Hebert; Commissioner of Public Lands, Fred J. Grace—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, J. A. Breaux; Associate Justices, A. D. Laud, Walter B. Somerville, Frank A. Monroe, O. O. Provosty; Clerk, Paul E. Mortimer—all Democrats.

STATE LEGISLATURE, 1913. Both houses Democratic. The State representatives in Congress will be found in the section *Congress*, article UNITED STATES.

LOVE, ALFRED HENRY. An American merchant and peace advocate, died June 29, 1913. Born in Philadelphia in 1830, and educated in the schools of that city, he established very successfully a wool commission house in Philadelphia, but was best known as a peace advocate. For over fifty years he was president of the Universal Peace Union. During the Civil War he did much to support the "underground railway" used in bringing the slaves from the South, and with Mrs. Stowe and other prominent abolitionists, carried on the work and devoted much of his means to the abolitionist cause. After the war he continued his labors for the cause of peace, and worked sufficiently to support President Grant in his policies toward the Indians. In the Mason and Slidell controversy

he took a leading part and worked for the settlement of the Alabama claims. With Belva Lockwood and the Baroness von Suttner he was an editor of the *Peace Maker*. He was a familiar figure at the Geneva and Hague peace conferences, and wrote and spoke much on peace and philanthropic subjects.

LOVEBURN, LORD. See GREAT BRITAIN, *War or Conference*.

LOWE, THADDEUS S. C. An American aeronaut, died January 16, 1913. He was born in Jefferson, N. H., in 1832. When still a young man, his attention was attracted to the subject of balloons. He began to experiment in aeronautics; constructed several balloons while in the employ of the government, chiefly as an aid to the study of atmospheric conditions; invented several instruments for the determination of longitude and latitude without a horizon; and in 1858 he built the largest aerostat made up to that time. One of his earliest balloon flights was to a height of 23,000 feet, which far surpassed the previous record of those days. Soon after he announced his intention of crossing the Atlantic in a balloon and built one with a capacity of 725,000 cubic feet of gas. After several unsuccessful attempts to inflate the bag he gave up the plan. Soon after the beginning of the Civil War Dr. Lowe made several flights. One of these flights was from Cincinnati to the South Carolina coast, a distance of 900 miles, which he covered in nine hours. He was appointed chief aeronautic engineer of the United States army, and organized an aeronautic corps which gave valuable aid by observing the movements of the Confederate troops. In 1865 he invented a machine which made the first artificial ice in the United States. From 1891-94 he built the Mount Lowe Railway in the Sierra Madre Mountains.

LUDWIG III. OF BAVARIA. See GERMANY, *End of the Bavarian Regency*.

LUMINAL is a new hypnotic substance, phenyl-ethyl-barbituric acid, offered as a substitute for veronal, from which it differs in the substitution of one ethyl group (C_2H_5) for one phenyl molecule (C_6H_5). Luminal is a white, odorless, slightly bitter powder, almost insoluble in cold water, slightly soluble in hot water and readily soluble in alcohol, ether, and chloroform, and in alkaline solutions. It is claimed that the introduction of the phenyl group increases the hypnotic power of luminal over that of veronal. The drug has a sedative action on respiration, lessening the frequency of breathing, although the volume of each respiration is increased. It kills by respiratory paralysis. It is eliminated by the kidneys, a certain portion being probably decomposed in the organism. No injury to the kidneys or gastric disturbances have been observed. Luminal is claimed to be a useful hypnotic in nervous insomnia and conditions of excitement of the nervous system.

LUMINAL SODIUM is a white crystalline, hygroscopic powder, readily soluble in water, and used for hypodermic injection.

LUNACY. See INSANITY.

LUTHERANS. The Lutheran Church is the third largest Protestant denomination in the United States. In 1913 the confirmed or adult members numbered 2,376,579. There were 9162 ordained ministers and 15,739 congregations. For administrative purposes there were 65 district synods. The church property was valued at \$92,747,509. For local expenses there were

raised during the year \$12,185,250, and for missions and benevolence \$3,082,706. The bible and parochial schools which numbered 3514 had 1,041,304 pupils and 80,005 officers and teachers. The church is divided into four general bodies, and a number of independent synods. Details in regard to these are given below.

THE GENERAL COUNCIL, organized in 1867, has 13 district synods; 1665 ordained ministers; 2535 congregations; 493,279 confirmed members; church property valued at \$31,232,746; local expenses were \$3,661,209, and for benevolence and missions \$667,745.40. This branch of the church has a complete graded system for its bible schools which number 1803, with an enrollment of 298,834. In the 593 parochial schools the enrollment is 26,067.

THE GENERAL SYNOD, organized in 1820, has 24 district synods; 1344 ordained ministers; 1790 congregations; 320,246 confirmed members. The church property is valued at \$22,793,914. The income for local expenses was \$2,794,810, and for missions and benevolence \$546,532.10. In the 1732 Sunday schools there is an enrollment of 300,321.

THE SYNODICAL CONFERENCE, which is mainly German, was organized in 1872: 6 district synods; 2965 ordained ministers; 4722 congregations; 831,120 confirmed members. The estimated value of the church property is \$17,890,000. The income for local expenses was \$3,676,632, and for missions and benevolence \$932,893.21. This branch has many strong parochial schools. The total number of such schools is 2800 with an enrollment of 152,090 pupils. In the 688 Sunday schools, the total registration is 155,889.

THE UNITED SYNOD OF THE SOUTH, which is organized on a basis very similar to that of the General Council dates from 1886: 8 district synods; 249 ordained ministers; 485 congregations; 50,819 confirmed members. The church property is valued at \$2,345,181. The receipts for local expenses were \$250,450, and for missions and benevolence \$139,938.19. In the 408 Sunday schools, the majority of which are graded, there is a registration of 39,037.

THE INDEPENDENT SYNODS, to the number of 14, together with a few independent ministers and congregations, report 2935 ordained ministers; 6208 congregations; 672,150 confirmed members. Their church property is valued at \$18,533,543. For local expenses but six of these synods have reported. These gave \$1,813,987. The gifts for missions and benevolence were \$798,440.01. In 1426 parochial schools there are 78,981 pupils, and in 2088 Sunday schools the registration is 327,860.

In anticipation of the 400th anniversary of the beginning of the Reformation by Martin Luther, October 31, 1517, the General Council resolved to raise a \$2,000,000 jubilee fund and invited all Lutherans to cooperate and for their own missionary and institutional interests to raise from \$5,000,000 to \$10,000,000 as a "Quadricentennial Memorial of the Birth of Protestantism."

The year was notable for the planning and the raising of funds. Norwegians raised nearly \$500,000 for their educational institutions; the Swedes raised \$250,000 for Gustavus Adolphus College; the Iowa synod is raising \$300,000 for theological and collegiate education; the Pittsburgh synod completed a \$100,000 fund for Thiel College; and the Ministerium of Pennsyl-

vania has quietly pushed its fund of \$500,000 for educational work toward completion, meanwhile receiving two new endowments for professorships amounting to \$90,000 for its Philadelphia Theological Seminary. The Synodical Conference is planning the erection of a national Lutheran university as a "Quadricentennial Memorial." Important actions looking toward cooperation and the arbitration of differences between the various Lutheran bodies were taken during the year. The General World's Conference met at Nuremberg in Germany in September. The General Council continues its membership in this General Conference and insists on a positive declaration of principles which will insure a world's conference of Lutherans on a true and historic confessional basis. (See also RELIGIOUS DENOMINATIONS AND MOVEMENTS.)

LUXEMBURG. An independent, neutral grand duchy, bordering Belgium, Germany, and France. The area is 2586 square kilometers (998 square miles). Population (December 1, 1910), 259,891 (134,101 males, 125,790 females). Roman Catholics numbered 250,543, Protestants, 4007, and Jews 1270. Natives of the grand duchy numbered 220,168; there were 21,762 Germans, 10,138 Italians, 3964 Belgians, and 2103 French. Luxemburg, the capital, had 20,848 inhabitants. Iron mining is an important industry. The grand duchy is included in the German customs union. Railway (1911), 525 kilometers; telegraphs (1912), 329 offices, with 701 kilometers of line and 2078 of wire; post offices (1912), 134. Revenue and expenditure in 1910, 17,700,805 and 16,977,796 francs respectively. The budget for 1913 (law of March 1 of that year) showed estimated revenue of 20,001,733 francs and estimated expenditure of 22,958,609 francs. Customs and direct taxes each supply about one-fourth of the revenue. The debt amounts to 12,000,000 francs; annuities, 493,150 francs. The Chamber of Deputies consists of 53 members, elected for six years by direct vote. The grand duke, William, died February 25, 1912, and was succeeded by his daughter, Marie Adelaide (born June 14, 1894), who was enthroned on attaining her majority, June 14, 1912. Her sister, Princess Charlotte (born 1896), is heiress-presumptive.

A concession ratified in 1913 enabled a Belgian and three German syndicates to exploit 582 hectares of mining land for a period of fifty years. In return the government was to receive an annual rent of from 2025 to 2725 francs per hectare, a total annual payment of over 1,000,000 francs.

LYNCH, HENRY FINNIS BLOSSE. An English traveler and writer on Middle East subjects, died November, 1913. He was born in London in 1862, and was educated at the University of Heidelberg and at Trinity College, Cambridge. After a brief experience in business life, he began his extensive travels in the Middle East, for the purposes of scientific, political, and commercial research. In 1888 he made the journey from Alexandretta, through the Aleppo and Diarbekir on horseback, and then down the Tigris on a raft to Bagdad. He subsequently inaugurated a new river service under the British flag on the Karun River, Persia. He made surveys for a new trade route into Persia, which was afterward known as the "Lynch Road." His next notable journey made about 1900, embraced the Caucasus and Armenia, and in a later journey in 1908 he made himself more

thoroughly familiar with Armenia, surveying the great crater of Nimrud, and mapping the country. He took a great interest in social questions, and was associated with the work of Toynbee Hall. From 1908 to 1910 he sat in the House of Commons as a Liberal. He was a severe critic of the British foreign policy in Persia, and was a strong supporter of W. Morgan Shuster, the American treasurer-general of Persia, who was compelled to resign his office in 1911 on account of influence brought to bear by the Russian government. His published writings include, *Armenia: Travels and Studies* (2 volumes, 1901), and various articles in reviews and in proceedings of learned societies.

LYNE, SIR WILLIAM. A Tasmanian public official, died August 1, 1913. He was born at Apslown, Tasmania, 1843, and at the age of twenty removed to Queensland, where he became a pioneer settler. In the following year he returned to Tasmania, and engaged in agriculture. He entered the Tasmania Parliament in 1880, and held various government posts after 1885. He was a member of the convention which framed the commonwealth constitution, and as premier at New South Wales it fell to him to superintend the arrangements for its inauguration. He was commissioned to form the first ministry of the new commonwealth. In 1903 he was created a K. C. M. G.

LYTTLETON, ALFRED. An English statesman, died July 5, 1913. The eighth son of the fourth Lord Lytton, born in 1857. He was educated at Eton and at Trinity College, Cambridge. At the university he was notable as an athlete. After his graduation, he studied law, and from 1882-86 was legal private secretary to the attorney-general. In politics a Liberal he was a supporter of Mr. Gladstone, until the latter advocated home rule for Ireland. In 1900 he was chairman of the commission appointed to investigate the concessions granted in the Transvaal, during the rule of President Kruger. His work in this connection was very successful, and it led to his appointment in 1903 to the position of colonial secretary in Mr. Balfour's cabinet. In the defeat of January, 1906, he was one of the Unionist ministers who lost their seats, but who returned to Parliament a few months later from a precinct in London. He spoke often in Parliament, usually in opposition to the course of the government in South Africa, and on colonial questions and social problems in which he took a great interest. He was a member of many important government commissions.

McADOO, WILLIAM GIBBS. An American lawyer and public official, Secretary of the Treasury in the cabinet of President Wilson. He was born in Marietta, Ga., in 1863; was educated at the University of Tennessee; and was admitted to the bar in 1885. For several years he practiced at Chattanooga and was for a time counsel for several railways and banking companies. In 1903 he removed to New York City and practiced there. He became interested in the problem of tunneling the Hudson River between the New Jersey and New York shores, and although several attempts had been made to accomplish this, which had resulted in failure, he persisted in his efforts until he succeeded in enlisting sufficient capital for the building and equipment of these tunnels. The project was finished in March, 1904, and Mr. McAdoo became president and director of the Hudson & Manhattan Railroad Company,

which operated cars through these tunnels, in 1908. A company under Mr. McAdoo's directions afterwards built a fourth tunnel under the Hudson which was completed in March, 1909. Mr. McAdoo, although not strongly affiliated with any political party, was an ardent advocate of the nomination of President Wilson, and was one of the most efficient workers in the campaign which resulted in the election of the latter in November, 1912. He was a member of the Democratic national committee and for a time had general charge of the work of that committee in the campaign of 1912.

MACALISTER, JAMES. An American educator, died December 11, 1913. He was born in Glasgow, Scotland, in 1840, and removed to the United States in 1850. He graduated from Brown University in 1856, and from the Albany Law School in 1864; engaged in teaching; and in a few years gained a wide recognition for his educational work. From 1874 to 1881 he was superintendent of the public schools in Milwaukee, and was regent of the Normal School of Wisconsin from 1878 to 1883. In the latter year he became the first superintendent of schools in Philadelphia, serving until 1891, when he was chosen president of Drexel Institute. He held this post until the spring of 1911, when he resigned. He lectured at Johns Hopkins University in 1893, and at the College of the City of New York in 1894. From 1885-87 he was a trustee of the University of Pennsylvania. He was made an *officier d'académie*, Paris, in 1890. He was the author of many books on educational subjects, among them: *Manual of Primary Instruction* (1884); *Manual of Instruction in United States History and Civil Government* (1887); *Art Education in the Public Schools* (1893). He also contributed to periodicals on educational subjects. He received the degree of LL.D. from Brown University in 1890.

McBURNLEY, CHARLES. An American surgeon, died November 7, 1913. He was born in Roxbury, Mass., in 1845. He graduated from Harvard University in 1866. He studied at the College of Physicians and Surgeons (Columbia), and took the degree of M. D. in 1870. From 1872 to 1889 he was assistant and demonstrator in anatomy at the College of Physicians and Surgeons. He was also lecturer on anatomy of nerves and surgery in the same institution. He was appointed professor of surgery in 1889, and professor of clinical surgery in 1892, serving until 1907. In the latter year he was emeritus professor of surgery. He was also visiting and consulting surgeon in several of the largest hospitals in New York City. Dr. McBurnley was one of the best-known surgeons in the United States, and it is claimed for him that he was the first surgeon to cause a general recognition of appendicitis, and to establish the means of diagnosis and the character of treatment. He first called attention in 1889 to the localized tenderness since that time known as McBurnley's point. This discovery brought a ready means of diagnosis, and is credited in having resulted in saving many thousands of lives. When President McKinley was shot, Dr. McBurnley was called to attend him, and his efforts to save the life of the president were so great that his own health was impaired. In 1907, although he did not abandon his practice, he went to live in his country estate in the Berkshire Hills. He was a corresponding mem-

ber of many foreign medical societies, and was a member also of many American societies connected with medical subjects. His contributions to surgical literature were many and important. The most notable were in connection with the subject of appendicitis.

McFARLAND, JOHN THOMAS. An American Methodist-Episcopal clergyman, died December 22, 1913. Born in Mt. Vernon, Ind., in 1851, he graduated from Simpson College in 1873; studied at Boston University, receiving the degree of D.D.; was ordained to the Methodist ministry in 1873; and filled pastorates in cities in Illinois, Iowa, Kansas and New York. His published writings include *Preservation vs. the Rescue of the Child*; *The Book of the Child*; *Etchings of the Master*.

MACGREGOR, JAMES GORDON. A Scotch scientist and educator, died May 21, 1913. He was born in Nova Scotia in 1852 and was educated at the Free Church Academy at Halifax and at Dalhousie College, Halifax. He also studied at Edinburgh University, at the University of Leipzig and at London University. In 1876 he was made lecturer on physics at Dalhousie College. From 1877-79 he was lecturer on physics at Clifton College, Clifton, England, and from 1879-91 was Munro professor of physics at Dalhousie College. In the latter year he was professor of natural philosophy at the University of Edinburgh. Among his published writings were *Kinematics and Dynamics*; *Physical Laws and Observations*; and many scientific papers.

McGILL UNIVERSITY. An institution for higher education, founded at Montreal, Canada, in 1821. The students enrolled in all departments in the autumn of 1913 numbered 1893, of whom 510 were in the School of Arts. The faculty numbered 250. In 1913 Sinclair Laird was appointed head of the School of Teachers at Macdonald College, and associate professor of education. A. Campbell Geddes was appointed Robert Reford professor of anatomy. There were several other important additions to the faculty. During the year Sir William Macdonald donated \$182,462 for the purchase of land adjoining Macdonald College, and for construction and equipment of additional buildings in the college. The productive funds amount to \$6,839,000, and the income for the year 1912-13 was \$711,838. The library contains 140,000 volumes. The principal is W. Peterson.

McLEAN, GEORGE PAYNE. United States senator (Republican) from Connecticut. He was born in Simsbury, Conn., in 1857; received his education in the public schools; in 1881 was admitted to the bar and practiced in Hartford; was a member of the State House of Representatives in 1883-84, and in 1885 he was a member of the commission to revise the Connecticut statutes. Elected a member of the State Senate in 1886, from 1892-96 he was United States district attorney for Connecticut. He became governor of the State in 1901. He was nominated for the Senate in the Republican party caucus by a vote of 113 to 64 for opposing candidates, and was elected by the General Assembly by a vote of 158 to 96. His term of service expires March 3, 1917.

McLELLAN, PETER BAILLIE. An American jurist, died May 8, 1913. He was born in Lindon, N. Y., in 1850; studied at Alfred University, from which he received the degree of

Ph.B. in 1873, and Ph.D. in 1886; and in 1876 he was admitted to the bar. He became well known as a lawyer, and in 1892 was elected justice of the Supreme Court of New York for the term ending 1906. In 1907 he was reelected for the term ending 1920. From 1898-1903 he was judge of the Appellate Division of the fourth department, and from 1904 to the time of his death was presiding justice of the Appellate Division.

McMURTRIE, WILLIAM. An American chemist, died May 24, 1913. He was born in Belvidere, N. J., in 1851; studied at Lafayette College, from which he received the degree of E.M. in 1871, M.S. 1874, and Ph.D. 1875. From 1872 to 1879 he was assistant and chief chemist in the United States Department of Agriculture; from 1879-82 special agent in agriculture technology in that department. In the last named year he was appointed professor of chemistry at the University of Illinois. After serving in this position for six years, he resigned to become chemist of several corporations of New York City. From 1884 to 1888 he was chemist for the Illinois State board of agriculture, and from 1888-88 for the Illinois agricultural experiment stations. His published writings include: *Culture of the Beet and Manufacture of Sugar Therefrom* (1880); *The Culture of Sumac* (1880); *Grape Culture in the United States* (1883); *Wools and Other Animal Fibres* (1886-1901).

MACNAGHTEN, SIR EDWARD. First Baron Macnaghten. An English jurist, died February 17, 1913. He was born in 1830 in County Antrim, Ireland, and was educated at Trinity College, Cambridge. He studied for the bar and became a barrister and Queen's Counsel. In 1887 he was appointed lord of appeal-in-ordinary. Lord Macnaghten was at the time of his death probably the most prominent figure of the English bar. In the combination of literary gifts and legal learning he had few rivals.

McREYNOLDS, JAMES CLARK. An American lawyer and public official. Attorney-General in the cabinet of President Wilson. He was born in Elkton, Ky., in 1862; graduated from Vanderbilt University in 1882, and from the Law School of the University of Virginia in 1884. For many years engaged in private practice in Nashville, Tenn., he served at the same time as professor in the Law School of Vanderbilt University until 1893. He was appointed Assistant Attorney-General of the United States, and held that office until 1907, when he removed to New York City, and was many times specially retained by the United States government in matters relating to enforcement of the anti-trust laws, especially in proceedings against the tobacco trust and the combination of the anthracite coal railroads and others. At the time of his entering the cabinet of President Wilson he was in private practice in New York City.

MADAGASCAR. A great island in the Indian Ocean, off the east coast of Africa; a French colony, covering 585,300 square kilometers (225,984 square miles) and having a population (1913) of 13,198,889 (with dependencies, 3,293,552). Antananarivo (Tananarive) is the capital, with 72,000 inhabitants; Fianarantsoa has about 7000, Tamatave, 7026; Majunza, 4600. Madagascar is divided for administrative purposes into 19 provinces, 3 circles, and one autonomous district. The Hova

is the dominant tribe. Agriculture is the leading industry and rice the staple native crop. Cattle-raising is important. The Europeans resident in the colony cultivate coffee, tobacco, sugar-cane, hemp, cotton, vanilla, tea, etc. The forest products are valuable. Sericulture is carried on. The mines yield gold, silver, iron, copper, lead, and zinc. Native manufactures include silk and cotton goods and raffia fabrics. Trade and finance statistics are given below in francs:

	1909	1910	1911
Imports	34,140,000	34,595,000	46,057,000
Exports	33,378,000	47,883,000	52,378,000
Budget	30,780,000	30,750,000	31,153,000

Tonnage entered in the 1911 trade, 427,000. Debt January 1, 1912, 98,220,000 francs. Of railways there are 368 kilometers. A railway connects Brickaville with the capital, with an extension from Brickaville to Tamatave. The Antananarivo-Tamatave line was completed early in 1913. Telegraph lines 7192 kms., wires 12,297; telephone lines, 1381 kms.; post offices, 171. The colony is administered by a governor-general—M. Picqu  in 1913.

MADERO, FRANCISCO I. See **MEXICO, History.**

MAGN SSON, EIRIKR. An Icelandic scholar, died January 24, 1913. He was born in 1833 at Beruffjord, in Iceland, and was educated at the Latin School at Reykjavik. He edited an edition of the Icelandic Bible from 1862 to 1866, and thus became connected with English scholars. For the rest of his life he lived in Cambridge, where he held the position of under-librarian at the university from 1871 to 1910. For many years he lectured on Iceland at the university. He was in the first rank of Icelandic scholars, and many of his writings, especially his contributions to the elucidation of early poems, are of permanent value. Few, if any scholars, have done so much to advance the study of Old Norse literature.

MAINE. POPULATION. The population of the State in 1910 was 742,371. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 757,936.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

	Acreage	Prod. Bu.	Value
Corn	1913 16,000	608,000	\$ 529,000
	1912 16,000	640,000	480,000
Wheat	1913 3,000	76,000	77,000
	1912 3,000	70,000	72,000
Oats	1913 140,000	5,600,000	3,080,000
	1912 133,000	4,602,000	2,347,000
Potatoes	1913 128,000	28,160,000	14,925,000
	1912 117,000	23,166,000	12,741,000
Hay	1913 1,194,000	1,194,000	16,597,000
	1912 1,231,000	1,428,000	19,564,000

  Tons.

MINERAL PRODUCTION. The mineral products of the State are relatively unimportant. The principal product is granite, in which it ranks third among the States, being exceeded by Vermont and Massachusetts. More than half of the granite is used for building and monumental purposes. The State also produces some limestone, most of which is used by paper manu-

facturers. Slate is produced in considerable quantities. Other commercial minerals produced are clay, gem materials, mineral waters, and sand and gravel. The total value of the mineral products in 1912 was \$3,925,526, compared with \$4,645,630 in 1911.

EDUCATION. The total enrollment in the public schools of the State in 1913 was for elementary schools 127,045, and for secondary schools 12,199. The average daily attendance in elementary schools was 98,152, and secondary schools 11,211. The male teachers in elementary schools numbered 503, and in the secondary 250. Female teachers in the elementary schools numbered 6435, and in the secondary schools 420. The average yearly salary for male teachers was \$704.24, and for female teachers \$353.69. The legislature of 1913 passed several measures of importance relating to education. One of these was an act to provide for the State certification of all teachers of public schools, and another provided for the retirement of teachers of long service with pensions. Other amendments to existing laws made provision for improved methods of keeping and reporting school accounts and attendance statistics; for uniformity in the dates beginning and ending school years; and for the better enforcement of child labor laws.

TRANSPORTATION. The total mileage of steam roads in the State in 1913 was 2301. The most important lines of mileage are the Main Central Railroad Company, 992; the Bangor and Aroostook Valley Railroad Company, 630; the Canadian Pacific Railway, 178; the Boston and Maine Railroad, 139; and the Sandy River and Rangeley Lake Railroad, 105. During the year there were constructed for the Aroostook Valley Railway 17 miles of track. The mileage of street railways in the State in 1913 was 492.

FINANCE. There was a balance in the treasury on January 1, 1912, of \$502,202. The receipts for the fiscal year ending January 1, 1913, were \$5,321,711, and the expenditures were \$5,366,785, leaving cash on hand on December 31, 1912, \$457,128. The chief receipts are from taxation, and the chief expenditures are for State institutions, education, and State officers. The bonded indebtedness of the State on January 1, 1913, was \$269,000.

POLITICS AND GOVERNMENT. The legislature met in 1913; the measures passed are noted in the section *Legislation*, below. There was no election for State officers during the year, as the term of Governor Haines and the other State officers does not expire until January, 1915. The next State election will be held on September 7, 1914. On January 15 the legislature elected Edwin C. Burleigh United States Republican senator, to succeed Obadiah Gardner, Democrat, whose term expired March 4. Senator Burleigh was elected by a coalition of Republican and Progressive members of the legislature. Municipal elections were held on March 3 and on March 10. In those held on the first date, the Democrats were in the main successful, while in those held on March 10, Republicans and Democrats were about equally successful. On September 8 an election was held for a representative to Congress, to fill the vacancy caused by the death of Forest Goodwin (q.v.). There were three candidates—John A. Peters, Republican; Willard R. Pattangall, Democrat; and Edward L. Lawrence, Progressive. The election was of more than local interest, as it presented an opportunity to com-

pare the relative strength of the Progressive party in 1912-13. That local interest was strong was shown by the fact that more voters participated in this election than in the presidential election of November, 1912. The Republican candidate was elected by a plurality of 500 over the other two candidates. The vote was: Peters, 15,068; Pattangall, 14,580; Lawrence, 6515. This represented a decrease of 50 per cent. in the Progressive vote, and an increase of nearly 108 per cent. in the Republican vote, while the Democratic vote remained practically the same as in the previous election. The Democratic candidate attributed his defeat to Democratic treachery. He declared that, "because certain men failed of success in the primaries, they deliberately sacrificed the party in this election." The Progressives attributed their defeat to a lack of campaign funds.

LEGISLATION. Two important measures passed by the legislature in 1913 were an anti-trust act and a public utilities act, patterned after the Wisconsin statute. Other measures passed by this session were chiefly of local interest and importance. See also **LIQUOR REGULATION.**

STATE GOVERNMENT. Governor William T. Haines; Secretary of State, J. E. Alexander; Treasurer, Joseph W. Simpson; Adjutant-General, Albert Greenlaw; Auditor, T. F. Callahan; Attorney-General, Scott Wilson; Superintendent of Public Schools, Payson Smith; Insurance Commissioner, J. Wallace Blunt; Commissioner of Agriculture, John A. Roberts; Land Agent and Forest Commissioner, Blaine S. Viles; Bank Commissioner, H. M. Smith; Chairman Highway Commission, L. H. Nelson;—all Republicans; Chairman Board of Assessors, B. G. McIntire, Dem.; J. S. P. H. Wilson, Chairman Fish and Game Commission, Dem.

JUDICIARY. Supreme Judicial Court: Chief Justice, Albert R. Savage, Republican; Associate Justices: L. C. Cornish, Rep.; Albert M. Spear, Rep.; G. E. Bird, Dem.; A. W. King, Rep.; George F. Haley, Dem.; George M. Hanson, Dem.; and Warren C. Philbrook, Rep. Reporter of Decisions, W. P. Thompson.

MAINE, UNIVERSITY OF. A State institution of higher learning at Orono, Me., founded in 1865. The university includes agricultural, engineering, and academic departments. The enrollment in all departments in 1913 was 1056. The faculty numbered 126. The university received about \$20,000 in benefactions during the year. The income is about \$225,000 yearly. The library contains about 50,000 volumes, and 10,000 pamphlets. The president is R. J. Alely, LL.D.

MAJOR, CHARLES. An American author, died February 13, 1913. He was born in Indianapolis in 1856, and was educated in the common schools of Shelbyville and Indianapolis. He studied law, and after his admission to the bar engaged in the practice of law at Shelbyville. His first novel, *When Knighthood Was in Flower*, published in 1898, was one of the chief literary successes of that and the following year. It was also dramatized and successfully played by Julia Marlowe. This was followed by *The Bears of Blue River* (1900); *Dorothy Vernon of Haddon Hall* (1903); *Yolanda, Maid of Burgundy* (1905); *A Gentle Knight of Old Brandenburg* (1909); *A Little King* (1910).

MALACCA. See **STRAITS SETTLEMENTS.**

MALAY STATES. See **FEDERATED MALAY STATES.**

MALTA. A British crown colony, composed of the islands of Malta (91½ square miles), Gozo (25½), Comino (1), Filfla and Cominotto (mere islets). Total population, exclusive of military (census 1911), 211,564. Valletta (44,143 inhabitants with suburbs) is the capital; it is a coaling station and trade centre. The climate is agreeable, especially in winter; mean temperature, 64.6°; mean annual rainfall, 20 inches. The soil is intensively cultivated, but the products are insufficient for the support of the increasing population. The people are extremely industrious and thrifty. There are 7¾ miles of railway. Total imports for home consumption in 1911-12, £2,615,519; exports, £987,844. Total weight of transshipped goods, 14,662 tons. Total value of dutiable imports, £1,145,264 (£1,026,567 in 1910-11). Revenue (1911-12), £448,114 (£441,444 in 1910-11); expenditure, £467,783 (£467,373); shipping entered and cleared, 8,240,820 tons (8,667,037), of which 4,443,492 tons British (4,796,133). Gen. Sir H. M. L. Rundle (appointed 1909) was governor in 1913.

HISTORY. When Mr. Asquith, the British premier, visited Malta in May, 1913, he received a deputation of leading citizens and heard their request for a constitutional revision which would give Malta a greater measure of autonomy. Early in October Mr. Harcourt replied that after careful consideration, the British government had failed to discover sufficient grounds to justify a change in the constitution, but would be willing to approve the experimental adoption of recommendations made by Lieutenant-Governor Sir John Clauson.

MAMMALS. See **ZOOLOGY.**

MANCHURIA. A Chinese dependency, lying east of Mongolia and Chihli and between Korea and the Amur River, which separates it on the north from Siberia. The capital is Mukden.

The area of Manchuria is estimated at 362,483 square miles. Various estimates of the population have been made; the figure derived from the enumeration of households made in 1910 is 12,742,360. This number, however, is exclusive of children under six years of age; including these children, the estimated population becomes about 13,104,000. Manchuria consists of three provinces; their area and their population are stated as follows (the population figures are derived from the 1910 enumeration, and in parentheses are given the totals including the estimated number of children under six): Heilungkiang, 202,703 square miles, 1,562,254 inhabitants (1,807,000); Kirin 105,019 square miles, 5,349,287 inhabitants (5,501,000); Shangking, 54,761 square miles, 5,830,819 inhabitants (5,996,000). The capital of Heilungkiang province is Tsitsihar, with an estimated population of 30,000; the capital of Kirin province is Kirin, with a population variously stated, some estimates being as high as 100,000; capital of Shengking province, Mukden, with an estimated population of 158,000. Other important towns are: Kwangchengtze (Changchun), 80,000; Antung, 161,000; Newchwang (Yingtze), at the mouth of the Liao River, 61,000; Newchwang City (30 miles up the Liao), 50,000; Liaoyang, 67,000; Sinminfu, 42,000; Harbin, 35,000; Tiehling, 28,500; Fenghwangcheng, 25,000; Fakumen, 19,500.

In the southern part of Shengking, occupying the end of the Liaotung Peninsula and contain-

ing Dairen and Ryojun (Port Arthur) is Kwantung (1221 square miles) held by Japan under a lease transferred from Russia at the close of the Russo-Japanese War. (See KWANTUNG.) Outside of Kwantung, Manchuria is virtually divided into Russian and Japanese "spheres of influence." The Russian sphere is much the larger, extending south to the Japanese sphere at Kwangchengtzte, the southern limit of the Russian railway from Harbin, which connects with the Japanese railway from Ryojun and Dairen. Another Japanese railway runs from Mukden to Antung, on the Yalu River, connecting there with the Korean railways. At the beginning of 1912 the total length of railway in operation in Manchuria was about 2182 miles.

Much of Manchuria is a fertile agricultural country, the chief products being soy beans, Kafr corn, millet, corn, barley, and tobacco. China's large bean export is derived chiefly from Manchuria. There is some mining of iron and coal. Figures for the foreign trade include that of Kwantung, and the whole is included in the foreign trade of China. In the direct foreign trade, imports and exports at the Manchurian open ports in 1911 were valued at 54,052,669 and 67,954,165 haikwan taels, respectively. Financial statistics of Manchuria are not available. Governors of the three provinces in 1913: Heilungkiang, Pi Kuei-fang (*ad int.*); Kirin, Ch'i Yao-lin (*ad int.*); Sheng-king, Chang Hsi-luan.

MANITOBA. A province of the Dominion of Canada. Area, 73,732 square miles; population (census of June 1, 1911), 455,614 (255,211 in 1901). Including that portion of the northwest territories annexed to Manitoba in 1912, the area is 251,832 square miles and the population, 461,630. Winnipeg is the provincial capital, with 136,035 inhabitants in 1911. A lieutenant-governor administers the province—Douglas Colin Cameron in 1913 (appointed August 1, 1911). Premier in 1913, Sir Rodman P. Roblin. See section so entitled under CANADA, DOMINION OF.

MANN, TOM. See SOCIALISM, *Great Britain*.

MANOUBA. See ARBITRATION, INTERNATIONAL.

MANUFACTURES. See UNITED STATES, the various States of the United States, and other countries, under section so entitled.

MARATHONS. See CROSS-COUNTRY RUNNING, *Marathons*.

MARBLE, JOHN HOBART. An American publicist and public official, died November 21, 1913. He was born in Ashland, Neb., in 1869, and was educated in the public schools and at the University of Nebraska. He studied law, and in 1903 was admitted to the bar. For three years following he practiced in Philadelphia. He was attorney in charge of the division of inquiry of the Interstate Commerce Commission from 1906 to 1912, and secretary of the commission from 1912 until his appointment in 1913 as a member of the commission to succeed Franklin K. Lane (q.v.), who was attorney to the commission of the United States Senate which investigated the election of William Lorimer as senator from Illinois.

MARITAL CONDITION AND MORTALITY. See VITAL STATISTICS, and MARRIAGE AND DIVORCE.

MARKETING. See AGRICULTURE.

MARRIAGE AND DIVORCE. UNITED STATES. Those results of the Thirteenth Census comprising the data regarding population were published in 1913. They showed that, contrary to the popular understanding marriage is becoming more, rather than less, general, and that, when the whole population is considered, there is no general tendency for marriage either to be avoided or to be postponed. A comparison of the conjugal condition of the total population in 1890 and in 1910 showed that the proportion of single persons had diminished from 59.3 per cent. to 55.4 per cent. during that twenty years; at the same time the proportion of married had increased from 35.7 per cent. to 38.9 per cent. The proportion of widowed increased slightly in these two decades. When attention is focused upon persons fifteen years of age and over similar results are found. Thus the proportion of males of these ages who were single decreased from 41.7 per cent. in 1890 to 40.2 per cent. in 1900, and 38.7 per cent in 1910. The proportion of females of these same ages who were single diminished from 31.8 per cent. in 1890 to 29.7 per cent. in 1910. The proportion of males of these ages who were married increased from 53.9 per cent. in 1890 to 55.8 per cent. in 1910; and the like change for females was 56.8 per cent. to 58.9 per cent. That these tendencies are not localized but general throughout the nation is shown by the fact that they manifest themselves in each of the nine divisions of States and in nearly every State.

Two probable causes for these unexpected changes have been advanced. In the first place the decline in the birth rate, being accompanied by smaller proportion of children, has increased the percentage of the population of marriageable age. In the second place the great volume of immigration, bringing in a population with lower standards of living and a consequent tendency to marry early, has more than offset the tendency among the professional classes to marry at later ages. Moreover the increase in the proportion of urban population, which would ordinarily result in a decrease in the proportion of married, may have been likewise offset by the increase in immigration. It is possible, moreover, that these are only partial explanations and that even when account is taken of them an increased tendency to marry would be found, for it is a well-known statistical fact that in France where the birth rate scarcely balances the death rate marriages are contracted at earlier ages and a larger proportion of the population is married than in some neighboring nations where the population is increasing. Marriage, therefore, is not so clearly, as formerly, correlated with the birth rate.

The Federal census of 1910 also showed that instead of a tendency to postpone marriage there is an opposite tendency. Thus the percentage of males of ages 20-24 who were married was 18.9 in 1890, 21.3 in 1900, and 24.1 in 1910. Even in the age group 15-19 the percentage of married had increased from 0.5 in 1890 to 1.1 in 1910. Among females the percentage in the age group 15-19 married was 9.5 in 1890, 10.9 in 1900, and 11.3 in 1910; in the age group 20-24 the figures for the three censuses were respectively 46.7, 46.5, and 49.7. In the age groups above 35 years there have been only slight changes, but these were in the direction

of a smaller proportion of married among both sexes. While, therefore, early marriages are more common among both sexes than they were twenty years ago, the increase in the proportion of those married is almost entirely confined to ages under 35 for men and under 25 for women.

Marriage and Longevity. Much attention was given to a new statement of the long-established fact that married persons have a lower death rate than single, widowed, or divorced persons of the same ages. Prof. Walter F. Wilcox, from New York State and Federal census data, showed this rule to hold for men of all ages from 20 to 80 and over, except the very highest, and for women of all ages except the age group 20 to 30. Thus for ages 20 to 30 the death rate for single men is 6.6 per 1000, and for married men, 4.2; in the age group 30 to 40 the respective rates are 13 and slightly less than 6; for ages 40 to 50 they are 19.5 and 9.5 respectively. Even larger differences were found in the age groups 50-60 and 60-70. The cessation of marriage by the death of the mate or by divorce affects the death rates very adversely, as the rates of widows and divorced persons are even higher than those of single persons.

The Commission on Uniform State Laws, which is composed of representatives from 48 States and Territories has drawn up a uniform marriage evasion act whose adoption is being urged upon State legislatures. It was passed by Massachusetts in 1913 and approved by the American Bar Association. In recent years the great diversity of State laws has given rise to much confusion of conjugal conditions, mainly through the fact that a marriage legal in one State may not be upheld by the judicial authority in another. The proposed law would prevent fraud upon the courts committed by persons who go to a State other than that in which they reside, contract a marriage and then return to their own State. It would also serve as a protection for innocent parties who have presumed themselves legally married, but on account of divergencies in divorce procedures have found their supposed marriage illegal.

The triennial general convention of the Protestant Episcopal Church meeting at New York in October gave considerable attention to the marriage-divorce problem. A joint commission was appointed to inquire into the *Næ Temere* decree of the Catholic Church. In addition a committee of nine was appointed to co-operate with the international commission on marriage and divorce. The latter plans to hold an international congress in the United States in May, 1915. One of the prime purposes will be to secure the enactment of a uniform divorce law.

Eugenic marriage laws have followed the recent awakening of popular interest in the subject of race preservation. At the opening of 1913 thirty-four States had laws forbidding marriage of insane, lunatic, and those incapable of consent; fifteen forbade marriage of idiotic; nine of epileptic; eight of imbecile and feeble-minded; two of habitual drunkards; and four had laws relating to persons suffering from venereal infection. Besides various minor enactments three States, Oregon, Pennsylvania, and Wisconsin, passed laws of a summary character. The Oregon law required that ten days previous to the issue of a marriage license the prospective husband must file a physician's certificate stating under oath that the former was

free from contagious, venereal diseases. The law fixed the physician's fee at \$2.50 and punished him with loss of his own license in case of false certification. The Wisconsin act was much more stringent in that it required laboratory tests of a highly scientific character in order to determine freedom of the blood from venereal germs. Severe penalty for falsification was provided for the physicians and public officers having the execution of the law in charge. Persons leaving the State to marry and returning within one year were required to submit to the usual examination. The Pennsylvania law required the answering of numerous questions, including a score of very personal ones. It forbade the issuance of marriage licenses to persons with communicable diseases, imbeciles, epileptics, degenerates, persons under guardianship, those of unsound mind, those under the influence of liquor or narcotics, and first cousins. Moreover, a man was required to show that he could support a family. These laws excited much comment, favorable and adverse; while they may be largely nullified for various reasons, they doubtless serve as forerunners of more extensive efforts to prevent racial degeneration through the unchecked multiplication of defective stocks.

GREAT BRITAIN. Since the submission of the report of the Royal Commission on divorce and matrimonial causes, in November, 1912, the whole subject has been discussed from every possible angle throughout the British Isles. The majority of that commission had favored a considerable extension of the grounds for divorce and an increase in the judicial facilities for securing divorce. The minority, on the other hand, favored divorce only on the Biblical ground, contending that marriage is a sacrament and therefore essentially indissoluble. In the discussion through the year the extreme viewpoints were represented by those who held the narrowest churchly position and those who, on the other hand, advocated divorce by mutual consent of both parties. Those less extremely liberal advocated divorce by mutual consent subject to provision for delay and for proper financial safeguards. While some held that an extension of the grounds of divorce would increase immorality, others held that failure to facilitate divorce would increase immorality, since the only alternative would then be for one or other party to commit such an offense as would secure a divorce on statutory grounds.

Among the measures advocated to strengthen marriage and check divorce were laws to prevent the formation of improvident and reckless marriages. Laws were advocated to give the wife and children an inalienable right to some proportion of the husband's estate at his death, and the husband and children a similar claim in case of the wife's death. Moreover it was contended that divorce should be treated as having the same effect as death in this regard. In this manner it was contended effective financial responsibility would be enforced upon both parties.

MARSHALL, HUGH. A Scotch chemist and educator, died September 6, 1913. He was born in Edinburgh in 1868 and was educated at the Universities of Edinburgh, Munich, and Ghent. In 1887 he was appointed assistant in chemistry at the University of Edinburgh; in 1894 lecturer on mineralogy and crystallography; and in 1902 lecturer on chemistry. He wrote

many papers on chemical and crystallographical subjects.

MARTIN, BRADLEY. An American banker, died February 5, 1913. He was born at Albany, N. Y., in 1841, and graduated from Union College in 1863. After graduation he saw service for a time in the Civil War, becoming first-lieutenant of the ninety-third regiment of the national guard. At the close of the war, he was admitted to the bar, but never practiced law, devoting himself to the management of a rapidly-accumulating fortune, resulting from his banking interests, and his interest in trust companies and industrial corporations. He took a prominent part in social life in New York, and in that connection attained a pinnacle of conspicuity through his famous costume ball, which was one of the most elaborate functions in the history of New York City. In 1893 he removed to England, where he remained during the remainder of his life.

MARTIN, LEWIS J. Representative in Congress from New Jersey, died May 5, 1913. He was born in Deckertown, N. J., in 1844, educated in the common schools, and admitted to the bar, practicing his profession until he was appointed chief clerk in the office of the county clerk of Sussex County. He was a member of the New Jersey House of Assembly from 1878 to 1881 and from 1881 to 1896 was law judge of Sussex County. In 1911 he was appointed county judge by Governor Wilson. In 1897 he was elected to the State Senate and was reelected in 1900. He served as minority leader during the sessions of 1899-1902. He was elected to the Sixty-third Congress in 1912.

MARTINIQUE. An island of the lesser Antilles, a French colony. Area, 987 square kilometers (381 square miles). Population (1911), 184,084. The capital is Fort-de-France, with about 27,000 inhabitants. The imports in 1911 were valued at 19,855,000 francs and the exports at 22,583,000 (France, 10,707,000 francs imports and 20,914,000 exports). Vessels entered 88, of 156,000 tons. The 1911 budget balanced at 7,054,000 francs, and the debt amounted, January 1, 1912, to 4,511,000 francs. The governor in 1913 was M. Gajan.

MARYLAND. POPULATION. The population of the State in 1910 was 1,295,346. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 1,330,209.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1913	670,000	22,110,000	\$14,372,000
	1912	670,000	24,455,000	13,450,000
Wheat	1913	610,000	8,113,000	7,221,000
	1912	599,000	8,985,000	8,538,000
Oats	1913	45,000	1,260,000	605,000
	1912	45,000	1,350,000	608,000
Rye	1913	27,000	339,000	296,000
	1912	27,000	418,000	334,000
Potatoes	1913	43,000	3,741,000	2,506,000
	1912	37,000	4,144,000	2,404,000
Hay	1913	390,000	4,491,000	7,463,000
	1912	381,000	575,000	8,280,000
Tobacco	1913	25,000	218,500,000	1,720,000
	1912	26,000	17,160,000	1,373,000

a Tons. b Pounds.

MINERAL PRODUCTION. The total value of the mineral products of the State in 1912 was \$10,916,671, compared with \$9,386,515 in 1911. The total production of coal in the State in 1912 was 4,964,038 short tons, valued at \$5,839,079. Compared with the production of 1911, this was a gain of 278,243 short tons. The coal production in 1913 was estimated by the United States Geological Survey as approximately the same as in 1912. In 1912 there were 6162 men employed in the coal mines, compared with 5381 in 1911. According to United States Bureau of Mines, there were 13 men killed in the coal mines during 1912, compared with 11 in 1911. Nine of the fatalities in 1912 were due to falls of roof. The clay products of the State in 1912 were valued at \$1,865,753, an increase of \$93,319 over 1911. The principal clay product is common brick. The State produces a small amount of copper. In 1912 this amounted to 53,043 pounds of blister copper, compared with 23,559 pounds in 1911. The production was from the New London district of Frederick County.

EDUCATION. The school population of the State between the ages of five and twenty years, in 1913, was 415,908. The total enrollment in public schools was 237,125, and the average daily attendance 155,007. The total number of teachers was 5805. Nine hundred and six were males, and 4899 females. The average yearly salary for teachers both male and female was \$537.59. The total expenditures for education during the school year was \$75,326,876.

FINANCE. The report of the comptroller of the treasury shows receipts for the fiscal year 1913, \$10,720,082. There was a balance at the beginning of the year of \$1,826,229. The disbursements for the same period amounted to \$11,070,356, leaving a balance in the treasury on September 30, 1913, of \$1,475,956. The chief expenditures are for State institutions, education, and State officers, and the chief receipts are from taxation. The net funded debt of the State at the end of the fiscal year was \$8,390,942.

COMMUNICATIONS. The total railway mileage in the State on June 31, 1912, was 1377.14. The longest mileage is that of the Baltimore and Ohio, 336. Philadelphia, Baltimore, and Washington had 324; the Western Maryland, 221; the Baltimore, Chesapeake, and Atlantic, 87. This mileage given is for single track only. The mileage of single track electric railways in the State on December 31, 1912, was 721.

CHARITIES AND CORRECTIONS. The State institutions are the Maryland Hospital for the Insane, the Springfield State Hospital, the Maryland Asylum and Training School for Feeble-minded, the Maryland School for the Deaf and Dumb, and the Maryland Tuberculosis Sanatorium. There are, in addition, many hospitals and asylums, carried on under local and private auspices. The State institutions are under the direct control of the board of State aid and charities, and this board has a supervisory control over many other institutions.

POLITICS AND GOVERNMENT. There was no session of the legislature in 1913, the sessions being biennial and beginning the first Wednesday in January of the even years. There was a general election in November at which members of the House of Delegates and half the Senate were elected for the session of January, 1914. In addition to these, State officers, with

the exception of governor and attorney-general, were also elected. The terms of the present governor, P. L. Goldsborough, Republican, and of Atty.-Gen. Edgar Allen Poe, Democrat, end, the former in January, 1916, and the latter in November, 1915. This election of November, 1913, was of exceptional interest because the first election in the State of a Federal senator under the new amendment to the constitution took place. Upon the death of Senator Rayner in 1912, the governor appointed William P. Jackson to fill the place until an election by the legislature which would have taken place in the session of 1914. In the meantime the amendment for the election of senators by the people had been ratified by the States. Governor Goldsborough issued a warrant for the election of a senator by the people at the November election, although the legislature had passed no special law providing the machinery and method for nomination and election of senators. The governor, acting under the advice of the attorney-general, decided this could be done under existing general laws. Under this warrant the Democrats nominated Blair Lee, the Republicans Thomas Parran, and the Progressives George L. Wellington. Lee was elected by a large majority, as were other Democratic candidates, due in part to the division of the Republican party by the Progressive movement. In behalf of Senator Jackson, the points above alluded to were raised later on, against the seating of Mr. Lee in the Senate but were overruled, and Mr. Lee was seated in January, 1914. Mr. Lee is a Democrat of the Progressive type, and his election was favored, it was understood, by President Wilson, and Secretary W. J. Bryan, a personal friend of Mr. Lee, who came into the State and made two speeches in his behalf. For this he was criticised by the Anti-Saloon League, which was opposing Mr. Lee. In the November election, the Democrats elected a two-fifths majority in both houses of the General Assembly, sufficient to override the executive veto. Six amendments to the State constitution were ratified, the most interesting being one to empower the legislature to put the penalty for bribery at elections upon the buyer of votes as well as seller.

In material progress, the year 1913 was notable in Maryland. The State government, through a special commission, progressed rapidly in the construction of a system of State roads, many million dollars having already been spent.

STATE GOVERNMENT. Governor, Phillips L. Goldsborough, Rep.; Secretary of State, R. P. Graham, Rep.; Treasurer, Murray Vandiver, Dem.; Adjutant-General, C. E. Macklin, Rep.; Attorney-General, Edgar Allan Poe, Dem.; Superintendent of Education, M. B. Stephens, Dem.

JUDICIARY. Court of Appeals: Chief Judge, Andrew H. Boyd; Associate Judges, N. Charles Burke, William H. Thomas, John R. Pattison, Hammond Urner, John P. Briscoe, Henry Stockbridge, and Albert Constable; Clerk, Caleb C. Magruder, all Democrats except Stockbridge and Urner, Republicans.

STATE LEGISLATURE, 1913. Democrats: Senate, 18; House, 80; joint ballot, 98. Republicans: Senate, 9; House, 22; joint ballot, 31. Democratic majority: Senate, 9; House, 58; joint ballot, 67.

The State representation in Congress will be

found in the section *Congress*, article UNITED STATES.

MASSACHUSETTS. POPULATION. The population of the State in 1910 was 3,366,416. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 3,548,705.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1913	48,000	1,944,000	\$1,652,000
	1912	47,000	2,115,000	1,629,000
Oats	1913	9,000	315,000	170,000
	1912	8,000	272,000	128,000
Rye	1913	3,000	56,000	55,000
	1911	3,000	48,000	46,000
Potatoes	1913	27,000	2,835,000	2,410,000
	1912	26,000	3,380,000	2,535,000
Hay	1913	475,000	a 575,000	12,132,000
	1912	477,000	596,000	12,814,000
Tobacco	1913	6,100	b9,455,000	1,986,000
	1912	5,800	9,860,000	2,357,000

a Tons. b Pounds.

MINERAL PRODUCTION. The value of the clay products in 1912 was \$1,766,166, an increase of \$66,879 over 1911. The chief clay product is common brick.

EDUCATION. The total number of pupils of all ages in the public schools in the school year 1913 was 557,211. The average membership in all the schools was 501,983. The average attendance was 466,689. The male teachers numbered 1687 and the female 15,292, or a total of 16,979. The legislature of 1913 enacted many important measures relating to education. One of these provided for the establishment and maintenance of continuation schools and a course of instruction for working children. The board of education made investigation into the needs of the part-time school, vocational or otherwise, for working children, and presented a report to the legislature for the needs and possibilities for part-time schooling, for which the above act makes provision. Other measures provided for regulating the school attendance of minors, and provided for a retirement system for teachers.

CHARITIES AND CORRECTIONS. The institutions under the supervision of the State board of charity are the State Infirmary at Tewksbury, the State Farm at Bridgewater, the Norfolk State Hospital, the Lyman School for Boys at Westborough, the Industrial School for Boys at Shirley, the State Industrial school for Girls at Lancaster, the Massachusetts Hospital School at Canton, the North Reading State Sanatorium, the Rutland State Sanatorium, the Lakeville State Sanatorium, and the Westfield State Sanatorium. The total number of persons under care of these institutions in 1913 was about 20,000, and the cost of maintenance is about \$1,500,000 yearly. The board of prison commissioners has charge of State prisons. These include the State Prison in Boston, the Massachusetts Reformatory at Concord, the Reformatory for Women at Sherborn, Prison Camp and Hospital at Rutland, and the State Farm at Bridgewater. The prison population at the end of 1913 was about 6000.

TRANSPORTATION. The total railway mileage in the State in January, 1913, was 4892. Of this, 2110 was of main lines; 1075 second, third,

and fourth track; and 1707 side tracks. There was practically no construction of railways during the year.

POLITICS AND GOVERNMENT. The legislature met in 1913 and passed a number of important measures which are noted in the section *Legislation* below. The decision of Senator Crane, whose term expired on March 4, 1913, not to be a candidate for reelection, made it necessary for the legislature to choose his successor. The two principal candidates were Congressman Samuel W. McCall and Congressman John W. Weeks. McCall was, during his term in Congress, one of the strongest members of the House, though his conservative tendencies lessened his chances of election. Mr. Weeks was also an important member of the House of Representatives, by no means radical, and less outspoken in his denunciations of principles of the more radical Progressives than was Mr. McCall. On January 14, the legislature elected Mr. Weeks senator. His election made a vacancy in the thirteenth district, and on April 15 an election was held to fill this vacancy. The district had hitherto been a Republican stronghold, but in this election the Republicans showed very little interest, and did not go to the polls in large numbers. Many of those who did, cast their votes for John J. Mitchell, a Democratic candidate, who was elected. In this election the Democrats and Progressives polled about five per cent. less votes than were polled in the presidential election in 1912. The Republicans, however, lost 45 per cent. of the votes of 1912. On March 25 the House defeated the proposed woman suffrage amendment to the constitution. On June 18 Governor Foss vetoed the nine-hour bill. On May 14 Governor Foss appointed a commission to investigate the vice conditions in the State.

Massachusetts is one of the three States in which elections for governor and other State officers were held in 1913. On August 11 Congressman A. P. Gardner announced his candidacy for the Republican nomination. Lieutenant-Governor Walsh was a candidate for the Democratic nomination, and Charles S. Bird a candidate on the Progressive ticket. Governor Foss was also an active candidate for reelection, but, as he was unable to obtain the proper number of names for the primaries, he was obliged to run independently. At a primary election held on September 23, Mr. Gardner was nominated by the Republicans, Lieutenant-Governor Walsh by the Democrats, and Mr. Bird by the Progressives. The campaign between the nominating primaries and the election on November 4 was aggressively conducted by all candidates. Governor Foss, running independently, declared his confidence in his reelection, and shortly before election, had called upon the other candidates to withdraw as there would be no doubt of his election. As the result of the voting on November 4, David I. Walsh was elected governor, receiving 180,460 votes. Charles S. Bird, Progressive, received 126,700; Augustus P. Gardner, Republican, 116,300. Mr. Foss received only 20,900 votes. As a result of the election, the Republicans lost their majority in the lower House, in which the Progressives held the balance, and also lost control of the governor's council which reviews all executive appointments. Calvin D. Paige was elected to fill an unexpired term in Congress.

LEGISLATION. In the year 1913 a num-

ber of pure food laws were enacted. A measure was passed regulating the attendance at school and the employment of minors. The existing law relating to the maximum hours of women and minors was extended. A law was passed providing for mothers' pensions. The workmen's compensation law was amended, and a uniform labor law was passed. Measures were enacted regulating the construction and alteration of tenement houses. A retirement system of public school teachers was created, and an advisory board of pardons. The powers of the attorney-general in the prosecution of trusts, etc., were extended. Measures were enacted providing for the simplification of legal procedure, and the laws relating to weights and measures were amended. A law licensing aviators, providing for the inspection of aeroplanes, and regulating the "laws of the road" in flight was enacted. The legislature passed various conservation laws. The laws relating to elections were so amended that on application signed by 1200 voters in any senatorial district, or by 200 voters in any representative district, asking for the submission to the voters of any question of instructions to senators or representatives, the secretary of the commonwealth shall determine if such question is one of public policy, and, if he so determines, he shall place such question on the official ballot to be used at the next State election. The legislature provided for the submission to the people of a proposed amendment providing for the referendum. A uniform marriage law was passed. A measure was enacted providing for one day's rest in seven in certain manufacturing and mercantile employments. The granting of preliminary injunctions and restraining orders was restricted. See also *LIQUOR REGULATION*.

STATE GOVERNMENT. Governor, David I. Walsh; Lieutenant-Governor, E. P. Barry; Secretary of State, F. J. Donahue; Treasurer, F. W. Mansfield; Comptroller, F. L. Dean; Auditor, F. H. Pope; Adjutant-General, G. W. Pearson; Attorney-General, T. J. Boynton; Secretary of the Board of Agriculture, Wilfrid Wheeler; Commissioner of Insurance, Frank H. Hardison; Commissioner of Education, David Shedden—all Democrats.

JUDICIARY. Supreme Judicial Court for the Commonwealth: Chief Justice, Arthur Prentice Rugg; Justices, James M. Morton, John W. Hammond, Henry Newton Sheldon, William C. Loring, Henry K. Braley, and Charles Ambrose De Courcy; Clerk of the Court, C. H. Cooper—all Republicans.

STATE LEGISLATURE, 1913. Republicans: Senate, 18; House, 101; joint ballot, 119. Democrats: Senate, 17; House, 98; joint ballot, 115. Progressives: Senate, 2; House, 18; joint ballot, 18. Various parties and combinations of parties: Senate, 3; House, 25; joint ballot, 28.

The State representation in Congress will be found in the section *Congress*, article UNITED STATES.

MASSACHUSETTS INSTITUTE OF TECHNOLOGY. An institution for technical education, founded in Boston in 1861. The number of students in November, 1913, was 1685. The total teaching staff numbered 251, of whom 57 were professors, 23 associate professors, 33 assistant professors, 74 instructors, 54 assistants, and 10 research workers. During the year Earle B. Phelps, assistant professor of

research in chemical biology, S. Homer Woodbridge, associate professor of heating and ventilation, and Thomas E. Pope, professor of inorganic chemistry, retired from the faculty. Edgar Irving Williams was appointed assistant professor of architecture, and Robert Spurr Weston was appointed assistant professor of public health engineering. The endowment institute at the end of the year 1912-13 amounted to \$2,874,867, and the income for the year 1912-13 to \$120,747. The library contains 98,700 volumes and 28,400 pamphlets and maps. The president is Richard C. Macclaurin.

MAURITANIA. A civil territory of the government-general of French West Africa (q.v. for area, population, etc.). Considered from the ethnical point of view as the country inhabited by the descendants of the mixed Arab and Berber races known under the name of Moors, Mauritania is that region included within the south and west frontiers of the Sahara, the Atlantic coast, and the Senegal and Niger rivers. A part of the population is of the same races as those to be found in Senegal—Oulofs, Peuhls, Toucouleurs, etc.; but the majority are Moors, invariably of Islam strongly tintured with Sufism. With the exception of palm-tending groups, they are nomads, exclusively occupied in grazing. The negroes gather forest products, cultivate grains, etc., and catch and dry fish. Little information concerning the commerce of the country is available; in the oases the primitive method of barter obtains. Travel is by caravans. The chief towns are: Port-Etienne, Boutilimit, Aleg, Altar, etc. Lieutenant-Colonel Patey, appointed commissioner January 1, 1910, repressed numerous uprisings on the part of pillaging bands. Lieutenant-Colonel Mouret assumed the commissioner'ship March 11, 1912.

MAURITIUS. A British crown colony; an island in the Indian Ocean. Area, 720 sq. miles; population (1911): 108,844 descendants of Europeans, Africans, or mixed races; 222,361 Indo-Mauritians; 35,526 other Indians; 3662 Chinese. Among the descendants of Europeans (mostly French creoles) intellectual development is of a high order. Capital, Port Louis, with 50,060 inhabitants. The primary schools enrolled 21,010 pupils in 1911 (63.52 per cent. Roman Catholic, 23.42 Hindu, 9.77 Mohammedan, 2.35 Church of England, 0.94 other Christian). The picturesque beauty of the island scenery is far-famed. Game abounds. From April to December the climate is agreeable; but during the rest of the year the island is visited by hurricanes and cyclones, with torrid heat in the lowlands and coast districts. Sugar is the chief product and export—237,050,048 kilos. in 1911, valued at Rs. 38,639,158 (estimate). Rum export, Rs. 39,671; molasses, Rs. 292,971; aloë-fibre, Rs. 605,552; cocoanut-oil, Rs. 161,064; vanilla, Rs. 44,182. Trade (calendar years) and finance (fiscal years) statistics are given below:

	1908-9	1909-10	1910-11	1911-12
Imps.	£30,550,160	£29,294,140	£37,545,260	£37,805,993
Exps.	33,803,560	32,802,140	37,109,170†	41,204,854†
Rev.	8,824,464	10,799,723	11,129,988	10,435,648
Expd.	9,621,454	9,449,260	9,578,243	9,843,980
Shipping*	755,150	986,267	877,691

* Tonnage entered and cleared. † Including shipping charges on home products, previously excluded.

Customs revenue (1911-12), Rs. 3,841,091. Public debt, June 30, 1912, £1,290,691 (exclusive of £127,314, December 31, 1911, foreign debt, of the municipal corporation of Port Louis, plus loans amounting, December 31, 1911, to Rs. 74,334). Governor (1913), Maj. J. R. Challoner (appointed 1911).

Dependencies of Mauritius are Rodrigues (4829 inhabitants), Diego Garcia (517 inhabitants), and a number of scattered islands.

MAWSON'S EXPEDITION. See **POLAR EXPLORATION, Antarctic.**

MAYBRICK, MICHAEL. An English composer, died August 26, 1913. He was born in Liverpool, in 1845, and educated in that city, in Milan, and Leipzig. He wrote many popular songs, including *The Holy City*; *The Star of Bethlehem*; *The Blue Alsatian Mountains*. These were written under the pen name of Stephen Adams. Mr. Maybrick was the younger brother of James Maybrick, whose wife Florence Maybrick, served sixteen years in prison, after conviction of a charge of poisoning her husband. He was at one time vice-president of Trinity College, in London.

MAYNARD, WASHBURN. An admiral of the United States navy, died October 24, 1913. Born in 1844, and graduated from the United States Naval Academy in 1866, he was made ensign in 1868, lieutenant in 1870, commander in 1893, captain in 1900, and rear-admiral (retired) in 1902. He served on many vessels, and during the Spanish-American War commanded the *Nashville*.

MAYOTTE AND THE COMORO ISLANDS. A group of islands, administratively attached to Madagascar, belonging to France. Area, 2168 sq. kilometers (837 sq. miles); population (1911), 97,750. The trade amounted in 1909 to 1,133,429 francs imports and 2,700,652 francs exports. For Mayotte the 1909 budget balanced at 221,341 francs; for Grand-Comore at 176,200. Administrator in 1913, M. Cartron, residing at D'zoudzi.

MEAT PRODUCTION. See **STOCK-RAISING AND MEAT PRODUCTION.**

MECKLENBERG-STRELITZ. See **GERMANY.**

MEDICAL PROGRESS IN 1913. Several important and new discoveries as to the therapeutic properties of the X-ray and of radium were announced (see **RADIOTHERAPY** and **RADIIUM**). Distinct advances were made in the control of several epidemic diseases and in preventive medicine (see **DIPHTHERIA**, **HOOKWORM DISEASE**, **OCCUPATIONAL DISEASES**, **POLIOMYELITIS** (infantile spinal paralysis), **PELLAGRA**, **TETANUS**, **TYPHOID FEVER**, **SMALL-POX**, and **VACCINATION**). More information was gained regarding certain imperfectly understood tropical diseases (see **BERIBERI**, **PLAGUE**, **SLEEPING SICKNESS**, and **TROPICAL DISEASES**). Many new drugs were introduced, among which the following may be enumerated: **BENZOL**, **EMETINE HYDROCHLORIDE**, **HEDIOSIT**, **ISATOPHAN**, **LUMINAL**, and **NEOSALVARSAN**. Encouraging results were reported in the diminution of tuberculosis and steps were taken to educate the public in the proper methods of controlling cancer (see **CANCER**, **TUBERCULOSIS**). The investment of New York State of a million dollars, in order to acquire the water and mineral rights of the springs at Saratoga, together with 250 acres for a park, and the steps taken preliminary to the erection of the American Spa at Saratoga, are

chronicled under the caption SARATOGA SPRINGS. Other medical items and statistics will be found under their respective captions.

MEDICAL SCHOOLS. See UNIVERSITIES AND COLLEGES.

MELLEN, CHARLES SANGER. An American railway official, born in Lowell, Mass., in 1851. In 1869 he began his railway service as a clerk in the office of the cashier of the Northern New Hampshire Railroad. He served on various railroads in New England, until 1880, when he was appointed assistant to the manager of the Boston and Lowell Railroad, of which he eventually became general superintendent. In 1889 he became assistant general manager of the Union Pacific system, and for three years following was general traffic manager of the system. In 1892 he received the appointment of general manager of the New York and New England Railroad. He was second vice-president of the New York, New Haven, and Hartford Railroad from 1892 to 1896, and from 1896 to 1903 was president of the Northern Railway Company. In the latter year he returned to New England as president of the New York, New Haven, and Hartford road. His conduct in the New Haven system was marked by radical departures from the hitherto conservative policy of this railroad. Gradually, chiefly through his efforts, the New Haven road obtained a practical monopoly of transportation in New England, both by land and water. In addition to acquiring many steam railroads and steamship lines, he obtained for the New Haven road control of the chief traffic systems in Connecticut and many in Maine. A control of the Boston and Maine Railroad, which he finally acquired, was brought about only after efforts on the part of the Massachusetts State government had failed to prevent it. As a result of the policy carried out by Mr. Mellen and supported by the directors of the road, it gradually became burdened with an enormous debt and suffered a shortage of money necessary to carry out needed improvements in its lines and rolling stock. A succession of terrible accidents, in which many people were killed, added to popular disfavor of Mr. Mellen's management, and in addition he was indicted for manslaughter as a result of an accident near Westport, Conn. In July he resigned as president of the New Haven road and was succeeded by Howard Elliott (q.v.). For a further discussion of the New Haven road and of Mr. Mellen's connection with it, see RAILWAYS.

MEMORIAL ART GALLERY, ROCHESTER. See PAINTING AND SCULPTURE.

MENELIK II. Negus, or emperor, of Abyssinia, died December 15, 1913. He was born in 1844, the son of King Heili Meleket. His official title was King of Kings of Ethiopia, and he claimed direct descent from the Queen of Sheba and King Solomon. When Menelik ascended the throne in succession to his father in 1866, his country was riven by conflicts between petty chiefs. He established order with a strong hand, and peace reigned in Abyssinia until the attempt of Italy in 1890 to establish a protectorate over a considerable portion of Menelik's dominions bordering on the coast of the Red Sea. In 1890 Menelik declared war against Italy. The conflict dragged on, until in 1896 Menelik defeated a large Italian force at Adowa. The Italian government made no further effort to obtain a foothold in Abyssinia.

Menelik was perhaps the most remarkable man ever produced by the Negroid race. He ruled his kingdom as an absolute monarch, and called to his aid the sciences and arts of Europe. He brought about many reforms and abolished slavery. He encouraged commerce and established agriculture. He also aided in the construction of railroads, and maintained friendly relations with foreign powers. The heir to the throne is his son, Lidj Jeassu, born in 1897. He was proclaimed heir in 1908. See also ABYSSINIA.

METAL-KETYS. See CHEMISTRY.

METALLURGY. Metallurgical progress during the year 1913 was concerned more with the improvements of processes in detail in the interest of greater economy and efficiency and in investigation and research, than with inventions and discoveries of extraordinary importance. The following paragraphs summarizing the progress in the metallurgy of the various metals are based in large part on authoritative reviews of progress published in the annual statistical and progress number of the *Engineering and Mining Journal* (New York):

GOLD AND SILVER. The principal improvements in the metallurgy of gold were designed to increase the efficiency in handling slimes and recovering gold from the concentrates at the mills in order to save freight and charges for treatment. Low grade ores were also being treated successfully where once such material would hardly have been considered worth attention. The cyanide process was improved during the year, rather than radically changed, and in a new mill of the Nipissing Mining Company, at Cobalt, aluminum dust was used as a precipitant to precipitate gold and silver from the cyanide solution. Aluminum forms no compound with cyanide, so when the metals are removed from the solution the cyanide used in dissolving can be returned to the solution for further use. In the plant mentioned it was found that the arsenic carried by the ore interfered with the process, and this was avoided entirely by the use of aluminum instead of a zinc precipitant. It was thought that this discovery might lead to a practical process for the treatment of ores containing soluble base metals by the cyanide process. Hitherto ores containing copper, or other metals, to a large extent could not be economically treated by cyanide on account of the great chemical consumption. This was a development indicated, rather than demonstrated, during the year. Stamp mills for crushing ore were in many cases being replaced by rolls, ball mills, or chilean mills.

LEAD. At Herculaneum, Mo., and Midvale, Utah, a two-hearth form of MacDougall type of furnace was devised by U. Wedge, for the preliminary partial oxidizing roast to which ore and matte are subjected previous to blast roasting. Previously this had been done in a single-hearth reverberatory furnace, but when matte was used in a mechanically raked furnace, the caking of the charge surely acted to give trouble. In the new furnace the temperature and air were controlled and regulated carefully so that an effective roast could be secured with material which is readily fusible. The Dwight-Lloyd straight-line sintering machine, which found considerable application in the United States, was

used for blast roasting at Cerro de Pasco, Peru, a plant at an elevation of 14,000 feet, and with certain modifications worked as well as at lower levels, being able to handle charges with a higher percentage of sulphur. The accidents due to the ignition of sulphur and flue dust, which had been experienced at lower altitudes, but were avoided by watching the temperature of the flue, were not experienced at the higher altitudes. New processes have been worked for desilverizing lead bullion, and a new process has been developed whereby the antimony formerly wasted is saved.

COPPER. No radical departures from standard practice was recorded in the smelting of copper ores during the year 1913, but existing methods were developed and improved and the use of particular processes was better understood. New construction, or rebuilding, at Great Falls, Mont., Douglas and Jerome, Ariz., were in progress, and the modernizing of these great plants was based on results secured by previous large-scale experiments, especially at Anaconda and Great Falls. Improvements were being made in roasting devices, and Dwight-Lloyd sintering machines found increased use in the copper field. Progress was made in the standardization of reverberatory furnaces so that the type capable of most successful operation was well understood and generally adopted. The Great Falls plant showed various types of blasting furnaces for smelting, and comparative studies of the different systems were published during the year in the *Transactions of the American Institute of Mining Engineers*. The question of fume condensation and smelter smoke were important during the year, and several refineries had under investigation various methods for recovering valuable metals in the smoke, preventing damage to agriculture, and the question of damage suits. American copper companies were also working on the question of extracting copper from low-grade ore by leaching and electrolytic and other methods, especially those by means of precipitation with metallic iron. In fact, almost all the large copper companies had under test, or in operation, some method for treating the wastes or low-grade ores.

ZINC. Wide interest was manifested during the year in the electric smelting of zinc ores. The experimental plant at Butte, Mont., was abandoned, as the results were not considered commercially promising, though most instructive. A small one-ton furnace was in operation at Hartford, Conn., at intervals, while an experimental installation was begun at Nelson, British Columbia, by the Canadian Department of Mines. In Europe a 400-kilowatt furnace using the Côte-Pierron process, was installed at Ugine, Savoy, while several thousand tons of electrically smelted spelter were produced at Sparsborg, in Norway, and at Trollhattan, in Sweden. At the latter place a new plant with seventeen furnaces of 1000 horse power and eight furnaces of 500 horse power, was being completed. Smelting operations at these Scandinavian works had not been demonstrated as profitable, but in August the results were better than in any previous month, and hopes for a better outcome were held. Among the chief hydrometallurgical processes attracting attention in 1913 was the so-called bisulphite and the Bretherton ammonia process, which had not been put into commercial operation, but which, on a

theoretical basis, promised good results. To precipitate the zinc by electrolysis after it has been obtained in solution was the object of another class of hydrometallurgical processes in which there was considerable experimentation, but without any publication of results.

IRON AND STEEL. The large supplies of iron ore in the State of Texas promised to receive some attention by the building of a smelting plant in that State, while the treatment of various foreign ores in which American interests were more or less represented, attracted increased attention. The increase in the use of dry blast and also blast-furnace blast and bessemer blast enriched in oxygen continued, and liquid air was being employed in a basic bessemer steel converter, with the result that the temperature was raised from a normal of less than 1700° C. to about 2000° C. The use of blast-furnace gas with gas engines continued and improved methods for cleaning the gases were developed. Some nineteen electric furnaces for the manufacture of iron and steel were in operation in the United States during the year, but of these it was stated that hardly more than one or two were running continuously. About 150 active electric steel furnaces had been constructed in different parts of the world, though the tendency was to employ the electric furnaces for annealing, hardening, and other operations requiring exact control rather than for melting, smelting, and refining.

The failure of railway rails, leading in some cases to serious accidents, attracted much attention, and processes for making sound steel ingots so as to eliminate pipes, were being actively worked. In England the Hadfield process, which consisted in placing a charcoal fire on top of the melted steel after interposing a layer of insulating slag and then using the combustion of this charcoal for heating the steel and drawing the shrinkage cavity to a higher point. The ingot mold was provided with a fire clay top to decrease the radiation from this part. In the Talbot process the ingot is passed through a pair of rolls before the interior has solidified, and by thus reducing its size the shrinkage cavity was closed. This principle was used by P. H. Dudley, the well-known American rail metallurgist, and Emil Gathmann, who cast his ingot with the large end up, and hastened the cooling of the lower part by increasing the metal of the ingot mold at that point. There was involved also an ingenious process for stripping the ingots without turning them over. The increase in the price of petroleum has caused a decrease in the use of this fuel, and in the increased attention in the application of pulverized coal, which is said to give the highest temperature next to the electric furnace, together with good control of combustion. The critical points of steel have attracted attention from leading metallurgists and investigators in Europe and America, and the work involved some recasting of theories and newer developments. Alloy steels, including those where cobalt (see **CHEMISTRY, INDUSTRIAL**) and manganese were added, attracted more than usual attention, while copper steels were still further investigated on account of their rust resisting properties and greater durability in rails and steel sheets. Copper-steel, containing up to 4 per cent. of copper, can be forged, and with .8 per cent. of copper can be welded successfully. The effect of the copper is to lower the Al critical

point, to increase the elastic limit and the hardness of the steel. The effects of nitrogen and oxygen on steel were further discussed during 1913. The injurious effect of nitrogen remaining dissolved in steel was confirmed in a long research published during the year, and methods for determination were discussed in regard to oxygen. So much attention was being paid to the subject that important developments in the near future were looked for. (See IRON AND STEEL.)

Important events of the year in connection with the electrometallurgy of steel were the putting in operation of several new plants. The Crucible Steel Company of America at its Harrison works put in operation a Heroult furnace, and about the same time a foundry in southern California started operations with the first American steel furnace of the pure Stassano. Two large Frick furnaces, each of twenty tons capacity, were ordered by a Pennsylvania steel company, and these furnaces were reported as unusually large for induction furnaces. Several Girod steel furnaces were also in operation, while Dr. Carl Hering continued his experimental work with the Pinch-effect furnace, which was designed for steel refining, as well as for brass and copper melting.

During the year the well-known Stora Kopparbergs Bergslags Company, in Dalecarlia, Sweden, prepared plans for an increase of the production of iron and steel from 100,000 to 300,000 tons per annum, of which 200,000 tons were to be manufactured electrically. This would amount to an increase in the annual output of iron for all Sweden of some 25 per cent., and would require a greater horse power than the company's own water could supply, as well as an increased output of some 500,000 tons of ore from the company's mines. The plan involved the export of finished rolling-mill products only and the supply of home manufacturers with cheap raw materials and with structural iron and steel. It was proposed to use the Helfenstein, which works on a large scale and stands a very large current, as it seemed able to work with as much as 10,000 to 12,000 horse power. Other branches of this Swedish plant were also being extended. (See also CHEMISTRY, INDUSTRIAL.)

METAPHYSICS. See PHILOSOPHY.

METEOROLOGY. Meteorological science suffered a distinct loss early in 1913 in the death of Teisserenc de Bort (q.v.). His pioneer work in the investigation of the upper air, and his discovery of the "stratosphere," or layer of the atmosphere in which the vertical temperature gradient is zero, was the cause of a complete revolution in our knowledge of the upper regions of the atmosphere.

AURORAL RESEARCH. Störmer, whose researches on the aurora were noticed in the YEAR BOOK for 1911, undertook another expedition to Bossekop, N. Sweden, for the purpose of obtaining a further series of photographs of the aurora. To secure more reliable parallaxes, a base of $27\frac{1}{2}$ kilometers was used; in 1910 the base employed was only $4\frac{1}{2}$ kilometers. Störmer himself superintended the work of observation at Bossekop, while his associate, Birkeland, made the necessary observations at Store Korones, where the other extremity of the base was situated. A large number of simultaneous pairs of photographs of the aurora were obtained, from which important conclusions as to the

height and position in space of the aurora were expected. Attempts to secure a kinematographic record of the aurora failed altogether on account of the faintness of the auroral light.

VOLCANIC DUST AND CLIMATIC CHANGES. Humphreys, in the *Bulletin of the Mount Weather Observatory*, directed attention to the various theories which had been advanced to account for the origin of the ice ages, and particularly to that propounded by P. and F. Sarasin in 1901, and suggested, vaguely perhaps, by Franklin so long ago as 1784. This theory states that the low temperature essential to the glaciation of the ice ages was caused by the absorption of solar radiation by volcanic dust clouds in the upper atmosphere. Humphreys examined the records of exceptionally cold years since 1750, and found that practically all the great volcanic eruptions were followed by cold periods extending, in many cases, to three years, and in one case to five years. The most notable eruptions were those of Asama, in Japan, which occurred in 1783, and was followed by the cold years of 1784-6; Tomboro, near Java, in 1815, which came during a period of exceptional volcanic activity, and was followed by 1815, the famous "year without a summer," thus extending a period of three cold years to five; and Krakatoa, in 1884, which was succeeded by the three-year cold period of 1884-6. The cold years, 1912 and 1913, were attributed to the eruption of Katmai, in Alaska, in June, 1912. Not all eruptions are followed by cold years, but only those in which an enormous quantity of volcanic dust is projected into the upper layers of the atmosphere. The conclusion reached is that volcanic dust in the upper atmosphere, by decreasing the intensity of solar radiation in the lower atmosphere, and therefore the average temperature of the earth "must have been a factor, possibly a very important one, in the production of many, perhaps all, past climatic changes, and that through it, at least in part, the world is yet to know many another climatic change in an irregular but well-nigh endless series—usually slight though always important, but occasionally it may be, as in the past, both profound and disastrous."

THE INFLUENCE OF FORESTS UPON CLIMATE. Professor Ward, in the *Popular Science Monthly*, discussed the widespread belief that forests are influential in affecting the rainfall and temperature. As might be expected, equatorial forests, by supplying much water vapor through transpiration and evaporation, and possibly also by cutting off sunshine through the tendency to form fog and clouds, have more marked effects in lowering the temperature than temperate forests, but, as Supan asserts, it is not probable that the system of isotherms would be radically altered if Europe and Asia were one great forest from ocean to ocean. The same thing is probably true about the United States. With regard to the rainfall, Ward concluded that we have as yet no satisfactory evidence that forests, at least in temperate latitudes, have any important effect upon the amount of the rain fall as distinct from the rain catch. In the tropics, the conditions are different. From the hot and damp tropical forests there must come a large amount of moisture which will increase the vapor content of the ascending air and tend to increase condensation and rainfall; but the amount of rainfall in the tropics is so large under any circumstances that whether there is more or less is

of no significance, and certainly of no economic importance.

POLARIZATION OF SKYLIGHT. Kimball reported that the polarization of skylight underwent a decided change during the summer. The increase in polarization after sunset at a distance of 90° from the sun and in the sun's vertical, which was so pronounced in 1902-3 and again early in 1913, was found to be quite insignificant, while with the sun at 60° from the zenith, there was a marked increase in the polarization at the point indicated. This polarization, which in August, 1912, amounted to 32 per cent., increased to 44 per cent. in July, 1913, and to 49 per cent. in August. It was thought probable that these changes were connected with the gradual precipitation from the atmosphere of the volcanic dust which had been present in the upper layer since the great eruption of Mount Katmai, which occurred on June 6, 1912.

METHODIST EPISCOPAL CHURCH. Is the largest in point of number of communicants among the Protestant denominations in the United States, and it also shows the largest percentage of growth in recent years. The total number of communicants in 1913 was 3,415,768, churches 28,291, and the preachers 18,783. This represents a gain of 182,242 communicants over the figures for 1912. The church is divided into conferences. Of these there are in the United States and Territories 105, and in foreign countries 24, making a total of 129. There are also in the United States 16 missions and mission conferences, and in foreign countries 12, making a total number of conferences of all kinds of 157. The foreign conferences are divided into three main classes—European Central Conference, Eastern Asia Central Conference, and Southern Asia Conference. In the Sunday schools of the denomination in 1913 were 1,165,015 officers and teachers. The estimated value of the church property was \$89,385,857. Missions are carried on in nearly all countries of Europe, Asia, and Africa. There are also missions in South America, Hawaii, and Mexico. Missions are conducted through the board of foreign missions. The total receipts for the support of foreign missions in 1913 was \$1,157,469, and the disbursements amounted to \$1,108,961. Domestic missions are carried on through the board of home missions and church extension. The receipts for the support of this work in 1913 amounted to \$1,055,057, and the disbursements to \$1,000,715. Work among colored people in the South is carried on by the Freedman's Aid Society, and educational work is in the hands of the board of education. Among the notable achievements of this board during the year was the raising of \$1,000,000 for the Goucher College, Baltimore, \$500,000 for the University of Chattanooga, and a total of approximately \$1,500,000 for other institutions. The denomination supports many universities and colleges through the country, and there are ten theological schools for white students and five for colored. Perhaps the most notable event in the history of Methodism during the year was the Methodist men's convention held in Indianapolis on October 28-31, 1913. Over 3300 men were present. A committee on policy was appointed, which consisted of 62 members. The convention adopted a programme which includes personal evangelism at home and abroad; the principle of social redemption in all lines, and the application of the spirit and teachings of

Christ to the total relations of men; the bringing of Methodist youth everywhere into real Christian life and their training for effective Christian service; the adoption of the practice of the principle of stewardship by every member of the church as defined by its principles. The last general conference of the denomination was held in Minneapolis on May 1, 1912. See also **RELIGIOUS DENOMINATIONS AND MOVEMENTS.**

METHODIST EPISCOPAL CHURCH, SOUTH. This body, which includes the greater number of Methodists in the Southern States, had in 1913, according to statistics gathered by the Federal Council of the Churches of Christ in America, 1,996,877 communicants, 15,991 churches, and 7007 preachers. Of the total membership about 30,000 are outside of the United States. Churches and colleges of the denomination are valued at about \$13,000,000, and the endowment to nearly \$4,000,000. The annual expense for foreign missions amounted to about \$450,000, and for home missions about \$415,000. For educational purposes it expended over \$250,000 annually. See also **RELIGIOUS DENOMINATIONS AND MOVEMENTS.**

METHODIST PROTESTANT CHURCH. This denomination had in 1913 180,382 communicants, 2348 churches, and 1371 preachers. The denomination is found in various parts of the country, but is strongest in the South. Efforts have been made in recent years to bring about union between the Congregational Church, the United Brethren (q.v.), and the Methodist Protestant Church, but these have been in abeyance for several years as the result of the action of the national council for the Congregational churches in voting to defer action. The denomination carries on foreign and domestic missions, and maintains publishing houses in Baltimore and Pittsburgh. See also **RELIGIOUS DENOMINATIONS AND MOVEMENTS.**

METHODISTS, COLORED. The colored branches of the Methodist Episcopal Church include the Colored Methodist Episcopal Church of 276,077 communicants, 2997 churches, 2993 preachers; the African Methodist Church, with 620,000 communicants, 6000 churches, and 5000 preachers; the African Methodist Episcopal Zion Church, with 568,608 communicants, 3180 churches, and 3552 preachers; the Zion Union Apostolic Church, with 3059 communicants, 45 churches, and 33 preachers; the Union American Methodist Episcopal Church, with 18,500 communicants, 200 churches, and 160 preachers; and the Reform Methodist Union Episcopal Church, with 4000 communicants, 58 churches, and 40 preachers. The largest of these denominations have their chief strength in the Southern States. See also **RELIGIOUS DENOMINATIONS AND MOVEMENTS.**

METROPOLITAN OPERA COMPANY, **NEW YORK.** See **MUSIC, Opera.**

MEXICO. A federal republic between the United States and Central America; called in its official publications, *Estados Unidos Mexicanos* and *República Mexicana*. The capital city is Mexico.

AREA AND POPULATION. The area is officially stated at 1,987,201 square kilometers (767,258

square miles). The census of 1895 returned a population of 12,632,427; census of 1900, 13,607,259; census of October 27, 1910, 15,160,369. The estimated population in 1911 was 15,329,831, and in 1912 15,501,684. Only a small proportion of the population is of pure white race. In 1900, the number of pure whites, and nearly pure, constituted about 19 per cent. of the total population; mestizos, about 43 per cent.; Indians, about 38 per cent. The following table shows the area, the population according to the corrected returns of the 1910 census, and the density per square kilometer for the Federal District and for each of the states and territories:

	Sq. kms.	Pop.	Dens.
Distrito Federal.....	1,499	720,753	480.82
Aguascalientes	7,692	120,511	15.67
Campeche	46,865	86,661	1.85
Coahuila	165,219	362,092	2.19
Colima	5,887	77,704	13.20
Chiapas	71,302	438,843	6.15
Chihuahua	233,214	405,707	1.74
Durango	109,495	483,175	4.41
Guanajuato	28,363	1,081,651	38.14
Guerrero	65,480	594,278	9.08
Hidalgo	22,373	656,551	28.90
Jalisco	86,752	1,208,855	13.93
México	23,909	989,510	41.39
Michoacán	58,594	991,880	16.93
Morelos	4,911	179,694	36.57
Nuevo León	64,838	365,150	5.63
Oaxaca	92,443	1,040,398	11.25
Puebla	33,663	1,101,600	32.73
Querétaro	11,638	244,663	21.02
San Luis Potosí.....	62,177	627,800	10.10
Sinaloa	71,380	323,642	4.53
Sonora	198,496	266,383	1.34
Tabasco	26,871	187,574	6.98
Tamaulipas	79,861	249,641	3.13
Tlaxcala	3,974	184,171	46.34
Veracruz	72,216	1,132,859	15.69
Yucatán	41,287	339,613	8.23
Zacatecas	63,886	477,556	7.53
*Baja California.....	151,109	52,272	0.35
*Quintana Roo.....	49,914	9,109	0.18
*Tepic	28,371	171,173	6.03
Islands	4,042
Total	1,987,201	15,160,369	7.63

* Territory.

The following figures (from a total return of 15,115,612 and therefore subject to slight revision) show the principal nationalities according to the 1910 census: Mexicans, 15,010,068; Spaniards, 24,212; Guatemalans, 21,302; Americans, 19,568; Chinese, 12,769; British, 4771; French, 3971; Germans, 3645; Turks, etc., 2563; Cubans, 2394; Italians, 2068; Japanese, 1922.

Population of the larger cities, according to the 1910 census, with percentage of increase since 1900: Mexico, 471,066 (36.65); Guadalajara, 119,468 (18.04); Puebla, 96,121 (2.78); Monterrey, 78,528 (26.12); San Luis Potosí, 68,022 (11.48); Mérida, 62,447 (43.13); Aguascalientes, 45,198 (29.20); Morelia, 40,042 (7.41); Chihuahua, 39,706 (30.59); Pachuca, 39,009 (4.06); Oaxaca, 38,011 (8.45); Guanajuato, 35,682 (—13.99); Saltillo, 35,414 (47.58); Querétaro, 33,062 (—0.27); Durango, 31,763 (2.16); Toluca, 31,023 (19.51); Zacatecas, 25,900 (21.19); Colima, 25,148 (21.50); Xalapa, 23,640 (15.95); Tepic, 16,778 (8.33); Campeche, 16,775 (1.95); Hermosillo, 14,578 (37.36); Culiacán, 13,527 (30.32); Cuernavaca, 12,776 (33.30); San Juan Bautista, 12,327 (16.92); Ciudad Victoria, 12,103 (20.00); Tuxtla Gutiérrez, 10,239 (8.98). The foregoing are capitals. Other large cities and towns are:

León, 57,722; Veracruz, 48,633; Tacubaya, 35,830; Orizaba, 35,263; Torreón, 34,271; Tacuba, 29,596; Celaya, 23,062; Irapuato, 21,469; Mazatlán, 21,219; Ciudad Guzmán, 17,085; Campeche, 16,775; Tampico, 16,528; Matahuila, 16,476; Gómez, Palacio, 15,997; Acayucán, 14,295; Silao, 14,059; Juchitán, 13,891; San Cristóbal Las Casas, 13,745; Salamanca, 13,497; San Pedro de las Colonias, 13,066; Atzapotzalco, 12,818; Valle de Santiago, 12,737; Guadalupe Hidalgo, 12,350; Guaymas, 12,333; Lagos de Moreno, 12,243; Teziutlán, 11,813; San Francisco del Rincón, 11,359; Acámbaro, 11,080; Ciudad Juárez, 10,621; Autlán, 10,308; Córdoba, 10,295; San Andrés Tuxtla, 10,132; Progreso, 5509.

The 1910 census showed only about 58,000 Protestants, the bulk of the population being Roman Catholic; a large number of inhabitants are without specific confession. Illiteracy is prevalent, and, on account of incessant revolutionary disturbances, no recent trustworthy statistics of schools are available. In 1906 public elementary schools (primary) numbered 8451, with 542,539 pupils; public elementary schools (superior), 354, with 51,789 pupils.

INDUSTRIES. Industrial and commercial conditions in Mexico since 1911 have been greatly disturbed by the various revolutionary outbreaks. The country is a large producer of silver and gold, while the mining of copper, lead, antimony, zinc, etc., is also carried on. In proportion to the country's capabilities, agricultural production is small. The leading crops include corn, cotton, henequen, wheat, sugar-cane, coffee, beans, and tobacco. The largest output of gold was attained in the fiscal year 1910-11, amounting to 37,111.56 kilogrammes, worth 49,481.956 pesos. Notwithstanding political conditions, the silver output, as officially reported, reached its maximum in the year 1911-12, amounting to 2,493,730.73 kilogrammes, valued at 138,182,067 pesos. The development of gold and silver production is reported as follows for fiscal years:

	Gold		Silver	
	Kilos	Pesos	Kilos	Pesos

1911-12....	36,415.3	48,553,632	2,493,730.7	89,628,435

In the thirty-five years from 1877-78 to 1911-12, the gold output amounted to 395,904.7 kilos, worth 527,871,760 pesos; silver, 49,600,726.5 kilos, 1,973,394,124 pesos; total value gold and silver, 2,501,265,884 pesos.

The principal manufactures are cotton and other textiles, tobacco, sugar, and spirits. In the year 1910-11, the mill consumption of raw cotton was 34,568,212 kilos; in 1911-12, 33,153,636 kilos. The output of cotton goods and prints was 15,090,669 bolts in 1910-11, and 14,128,366 in 1911-12; yarn, 2,766,973 and 3,020,569 kilos. In 1910-11 and 1911-12, tobacco manufacturing consumed 8,874,118 and 10,137,790 kilos.

COMMERCE. In fiscal years ended June 30, imports, exports of merchandise, exports of silver and gold and their ores, and total exports have been valued as follows in pesos:

	Total Imports	Exports Sil. & gold	Other	Total Exports
1900...	128,796,606	79,216,597	79,031,336	158,247,933
1905...	178,204,963	93,885,527	114,634,924	208,520,451
1907...	232,229,579	123,735,504	124,282,506	248,018,010
1910...	194,865,781	118,985,524	141,060,746	260,046,270
1911...	205,874,273	142,958,367	150,795,273	293,753,640
1912...	182,662,311	139,473,469	158,515,660	297,989,129
1913...	195,772,000	130,885,000	169,521,000	300,406,000

Principal exports in the year 1912-13 were valued as follows, in thousands of pesos: Silver, 91,294; gold, 39,591; copper, 36,522; henequen, 30,150; coffee, 11,264; hides and skins, 11,172; rubber, 8376; live animals, 7552; guayule, 7235; chicle, 4930; lead, 4907; chick peas, 4342; ixtle, 3646; woods, 3365; vanilla, 3315; zacatón root, 1960; antimony, 1575; tobacco, 1323; beans, 1160; fresh fruit, 1019.

Exports of gold and silver respectively, in thousands of pesos: In 1904-05, 28,362 and 65,524; in 1906-07, 42,636 and 76,349; in 1910-11, 62,091 and 80,868; in 1911-12, 49,905 and 89,568. Classified exports in 1910-11 and 1911-12: Mineral products other than silver and gold, 37,048 and 46,733; total mineral products, 180,006 and 186,207; vegetable products, 91,267 and 83,587; animal products, 16,802 and 19,861; manufactured products, 3610 and 6604; various, 2069 and 1731; total, including gold and silver, 293,754 and 297,989.

Classified imports in 1910-11 and 1911-12, in thousands of pesos: Animal substances, 17,433 and 16,466; vegetable substances, 38,600 and 31,286; mineral substances, 52,031 and 46,712; textiles and their manufactures, 24,640 and 21,282; chemicals and drugs, 12,090 and 12,074; beverages, 6813 and 6744; paper and its manufactures, 5609 and 5121; machinery and apparatus, 25,811 and 23,384; vehicles, 9095 and 4601; arms and explosives, 3213 and 5388; miscellaneous, 9638 and 9605; total, 205,874 and 182,662.

Trade by countries in fiscal years, in thousands of pesos:

	Imports		Exports	
	1911-12	1912-13	1911-12	1912-13
United States...	98,426	97,288	224,103	232,036
United Kingdom	21,506	25,900	40,199	31,147

France	15,618	18,338	8,330	7,151
Spain	5,900	10,531	2,361	2,183
Belgium	3,279	2,803	6,355	5,121
Italy	1,949	1,884	157	94
Austria-Hungary	2,091	1,901	208	7
Total, including other...	182,662	195,772	297,989	300,406

During the first four months of the fiscal year 1913-14, imports were valued at 60,272,471 pesos, as compared with 60,835,283 pesos in the corresponding months of 1912-13; the decline being only 0.95 per cent. The exports for the same periods were valued at 84,807,557 and 114,296,030 pesos respectively; the decline being 25.80 per cent.

SHIPPING. In direct international navigation, there entered in 1910-11 1908 vessels, of 3,727,519 tons (steam 1342, of 3,609,823), and cleared 1964 vessels, of 3,852,234 tons (steam 1361, of 3,746,605); in 1911-12, entered 2090 vessels, of 3,604,527 tons (steam 1407, of 3,434,293), and cleared 2059 vessels, of 3,714,742 tons (steam 1418, of 3,531,544). Merchant marine (1911), 32 steamers, of 16,648 tons net, and 50 sail, of 8712 tons net.

COMMUNICATIONS. The length of railway re-

ported as in operation in September, 1913, was 25,398 kilometers (15,782 miles), of which 19,877 kilometers were controlled by federal or state government; as compared with 25,287 kilometers (15,713 miles) in operation in September, 1912; 24,717 kilometers (15,358 miles) in 1911; 24,559 kilometers in 1910, and 24,161 in 1909. Wireless telegraphy stations, 9. Post offices (1913), 2911.

FINANCE. Mexico has the gold exchange standard; the monetary unit is the peso, whose par value is 49.846 cents. In the fiscal year 1910-11, revenue amounted to 111,142,482 pesos, and ordinary expenditure to 100,913,924 pesos. The budget of 1912-13 showed estimated revenue and expenditure of 103,657,000 and 103,602,400 pesos respectively; budget of 1913-14, 122,000,000 and 141,155,437. The latter budget showed estimated receipts as follows: Customs, 52,600,000; direct taxes, 11,150,000; posts and telegraphs, 4,218,000; internal revenue and stamps, 32,100,000; taxes on mines, 1,700,000; lottery, 1,200,000; various, 2,300,000; treasury reserves, 6,732,000; total, 122,000,000. Estimated departmental disbursements: War and marine, 43,724,839; finance and public debt, 37,261,878; interior, 19,418,212; communications, 15,013,517; public instruction, 13,926,600; fomento, 4,317,838; legislative, 2,274,376; foreign affairs, 2,230,205; justice, 1,988,055; supreme court, 772,170; executive, 227,749; total, 141,155,437.

Public debt June 30, 1912: External, 315,360,585 pesos; internal, 134,763,710; floating, 482,574; total, 450,606,869. Charges on external debt, 29,701,647 pesos; on internal, 14,389,655; total, 44,091,302.

NAVY. The navy in 1913 included: One gunboat (*Veracruz*, built in 1903), of 1000 tons; 2 gunboats (*Bravo* and *Morelos*, 1904), of 1200 tons each; one small cruiser (*General Guerrero*, 1909), of 1630 tons; one transport (*Progress*); 2 corvettes (*Yucatán* and *Zaragoza*); 3 dispatch boats, and several small vessels of little value.

GOVERNMENT. Under the constitution of February 5, 1857, last modified April 25, 1912, the Mexican republic is a federation of states which retain their autonomy in local affairs. The legislative powers rest with a congress of two houses: The Senate (fifty-six members, elected by direct vote for four years, two for each state and the Federal District); and the Chamber of Deputies (233 members, elected by direct vote for two years). The constitution provides that the president and vice-president be elected indirectly for six years. The president is assisted by a cabinet of eight members. Gen. Porfirio Díaz was president during 1877-80 and from 1884 until his resignation May 25, 1911, which was forced by the revolution under Francisco I. Madero. Díaz was succeeded by the secretary for foreign affairs, Francisco León de la Barra, as acting president. In October, 1911, Madero was elected president and on November 6 was inaugurated for the term ending November 30, 1916 (the unexpired term of Díaz). The vice-president was José Marino Pino Suárez. On February 23, 1913, Madero and Pino Suárez were murdered, after General Victoriano Huerta had proclaimed himself (February 18) acting president. See *History*.

ARMY. Conditions in Mexico during the year 1913 naturally did not conduce to a permanent organization and development of the federal army. One of the first measures taken by President Huerta was to reorganize the federal forces. Instead of the military zones previously existing ten military territorial districts, or divisions, under the orders of a commander-in-chief were established. These were as follows: Division of the Peninsula, headquarters at Mérida; Division of the Orient, headquarters at Puebla; Division of the Federal District, headquarters at Mexico; Division of the South, headquarters at Iguala; Division of the Centre, headquarters at Leon; Division of the West, headquarters at Guadalupe; Division of the Yaqui, headquarters at Torin; Division of the North, headquarters at Chihuahua; Division of the Nazas, headquarters at Torreón; Division of the Bravo, headquarters at Monterey.

Previously, in normal times, an army of 28,000 was held as the approximate strength of the Mexican national army and it was thought that prior to the fall of President Díaz a well-disciplined force with a fighting strength of about 40,000 was available, yet in the Madero revolution hardly more than 12,000 men were put into the field by General Díaz, and these were badly clothed and maintained. It was obvious that further disorganization of the national forces had taken place and, notwithstanding the modern weapons, some of which were indeed excellent, the army was to be considered more as a guerrilla force than as a well-organized and compact aggregation of fighting units. This, of course, did not diminish their effectiveness for certain kinds of warfare, especially in defensive fighting in the mountainous districts over which they were called to operate either in conflict with insurrectionary bands or any possible invader. For the former organization of the Mexican army, as it existed prior to the insurrections, see YEAB BOOK for 1911.

RAILWAYS. The political troubles in Mexico during the year had their effects on railway construction. The projects in hand involved the Vera Cruz-Tampico line of the National Railways and the Vera Cruz-Tabasco and Campeche, and the Santa Lucrécia extension on the Vera Cruz and Ishim Railway. There was railway construction near Acalpulco on the Pacific Coast.

HISTORY

THE FEBRUARY REVOLUTION. Swept into the presidential office by a revolutionary movement, Francisco I. Madero proved neither strong enough to crush out insurrection nor determined enough to give to the tax-burdened peasantry and the land-hungry peons the constitutional liberties and the little plots of freehold land they demanded. He failed moreover to command the respect or to buy the loyalty of the army, and popular generals more powerful than he had only contempt for his weakness and scorn for his talk of reform. Unkind critics hinted that the Madero family with its vast estates was interested in the spoils of office, but not in the lot of the peon. With his support thus weakening, Madero might well have taken heed, when in October of 1912, General Felix Díaz, nephew of the famous Porfirio Díaz, raised the standard of revolt at Vera Cruz. The Díaz insurrection was all too

easily suppressed. Filled with a false sense of security, and inclining rather to clemency than to harshness, President Madero allowed the death sentence on General Felix Díaz to be suspended. The confidence of the government was rudely shocked when, on February 9, 1913, the military cadets in Mexico City mutinied and liberated from prison both General Díaz and General Bernardo Reyes, an old-time enemy of Madero. In the street fighting that followed, General Reyes was killed and many civilians, including two American women, were killed or injured. The rebels under General Díaz secured a strong position in the arsenal, which they defended against four attacks of the loyal, federal troops on February 11. It then became the turn of the federals to defend themselves, in the National Palace, against the artillery and machine-guns of Díaz's soldiers. As the street-fighting showed no signs of cessation, the ambassadors insisted that foreign residents be allowed to escape, and a twenty-four-hour truce was arranged on the 16th. Fighting was resumed before the truce had expired. On the 17th General Blanquet arrived in the city with 1200 federal troops, but instead of coming to the assistance of the president he joined with General Victoriano Huerta, President Madero's commander-in-chief, in overthrowing the government. President Francisco Madero, Vice-president José Pino Suárez, and Finance-Minister Gustavo Madero were arrested, and, on February 23, the president and vice-president were "shot while attempting to escape." On February 19 General Huerta, assuming the title of provisional president, called a session of Congress for April and, two days later, formed a cabinet with Señor de la Barra as minister of foreign affairs; Señor García Granados, interior; Señor Rodolfo Reyes (son of General Reyes), justice; Señor V. Estanol, education; Señor T. Obregon, finance; and Señor de la Fuente, public works. In the troubled weeks that followed many prominent Maderistas, as the friends of Madero were called, escaped, or were executed, or met an "accidental" death.

THE HUERTA GOVERNMENT. The provisional government was practically an army government with General Huerta as recognized head and Blanquet and Díaz as silent partners. General Díaz, the instigator of the revolt, modestly, or shrewdly, effaced himself before General Huerta, possibly thinking to let the latter bear the responsibility, risk, and not inconceivable odium of the provisional régime, and hoping himself to be regularly elected as the next constitutional president. In the meantime he supported the provisional president, and if the report be true, appointed half the cabinet.* It was believed that the submission of the troublesome rebels Orozco, Salazar, and Emilio Gómez was a fruit of the Díaz-Huerta alliance. General Díaz grew less friendly as General Huerta gained power. The presidential elections, in which General Díaz hoped to be victor, were at first planned for July 27, then deferred till October 26, and their farcical consummation at once defeated Díaz's hopes and completed his breach with Huerta. Díaz's friends had resigned from the cabinet, he himself had resigned

* Some time after the February revolution, General Díaz was sent as special envoy to Japan, but, failing to obtain a reception at Tokyo, returned to Mexico.

from the army, and late in the year he sought refuge on an American warship at Vera Cruz. Subsequently in Havana, Cuba, he was wounded in a violent encounter with supposed agents of Huerta. In order that General Díaz might be disposed of, the story has been somewhat interrupted. Returning to the newly established provisional government, it is interesting to observe that General Huerta justified his seizure of power by accusing Madero of corruption, and promised to correct the flagrant abuses of the Madero administration, to promote real reform, and to welcome and protect foreign capital. This last engagement is worthy of particular notice, in the light of later allegations that the February revolution was favored, if not engineered, by foreign financiers seeking concessions in Mexico. More specifically it was charged that a British syndicate interested in the exploitation of the rich Mexican oil-fields looked for new and important concessions from Huerta. Oil and similar economic interests were asserted to underlie the gracious attitude of Great Britain and the unsympathetic bearing of President Wilson toward General Huerta. The refusal of the United States to recognize the provisional government will be discussed later; it will suffice to remark here that it rendered almost impossible the negotiation of a foreign loan and greatly impeded the "pacification" of the rebellious northern states of Mexico. Money was needed to pay the soldiers, to buy ammunition and arms, to pay indemnities, to support the administration. Señor de la Barra found it impossible to place the loan of \$100,000,000 authorized by Congress, and although loans were frequently mentioned in later unreliable reports, the financial situation of the government was decidedly grave.

THE COUNTER-REVOLUTION. The revolt against Huerta assumed threatening proportions during the spring and summer. From the very first the Huerta government had been repudiated as unconstitutional by the northern states, where the party of Madero, the party that had consistently agitated for agrarian reform, was in power. Calling themselves Constitutionalists, the adherents of this party rose in arms against the federal government, and in a platform adopted on March 26 the Constitutionalist leaders repudiated the provisional government, and named Don Venustiano Carranza, governor of the state of Coahuila, as commander-in-chief of the Constitutionalist armies. The Constitutionalist stood in general for the interests of the small farmer and the peon, demanding the division of large estates, with compensation to the owners, the alleviation of the tax-burden which at present bears with crushing weight on the poorer agriculturists, the establishment of a rural system, and the promotion of education for the poor. If these things could not be done by peaceful methods—as had been expected under the Madero régime—the Constitutionalist armies would not hesitate at violent methods. Where they could, they did seize and divide the properties of absentee landlords. The Constitutionalist movement was strongest in the northern states of Coahuila, Chihuahua, Sonora, and Sinaloa. Everywhere the rebellion against Huerta had an agrarian aspect, and it was naturally so, for, as Mr. J. K. Turner pointed out in an article in the *Metropolitan Magazine* (May, 1913), "Seven thousand families hold practically all the arable land. . . . In Chi-

huahua . . . the Terrazas family holds nearly twenty million acres. . . . The greater portion of the state of Yucatan is held by thirty men. . . . The Madero holdings in Coahuila run into millions of acres." In Sonora, the Constitutionalist defeated small federal forces at Nacozari and at Nogales in March, and at Naco in April, and then invested Guaymas, on the coast, practically the only federal stronghold left in the state. In Chihuahua, Juarez at the north and Chihuahua city in the centre were the objective points of the Constitutionalist campaigns. In Coahuila, the town of Torreon was the scene of a protracted battle early in August. In Nuevo Leon, General Aubert with several hundred Federals surrendered to the insurgents in May. Meanwhile in Tamaulipas, the Constitutionalist captured Matamoros. Durango joined the rebellion. Matehuala and the capital of San Luis Potosi were lost to the Federals. Zapata continued to terrorize Morelos. Insurrections were also reported in Zacatecas, Tepec, Michoacan, Guerrero, and Campeche. During the hot summer months few engagements of note were fought; October, however, witnessed renewed activity in the struggle. General Pancho Villa defeated the federal forces under General Alvarez and captured Torreon early in that month. Another Constitutionalist, General Jesus Carranza, attacked Monterey, the capital of Nuevo Leon, and after a week of fighting captured the city on October 25. It was reported also that Mazatlan, in Sinaloa, had succumbed to rebel attacks. A few days later a federal troop train was dynamited in Zacatecas.

RELATIONS WITH THE UNITED STATES. The unsettled condition of Mexico could not be regarded with equanimity in the United States. The "Mexican situation" was the topic of countless editorials and more conversations. It was held by some that since Great Britain and France had already recognized Huerta, United States should not give moral support to the rebels by withholding recognition. At the other extreme were those who believed it the moral duty of the United States to oust General Huerta by force, or else to establish a protectorate over northern Mexico. Others advocated armed intervention in a different cause: they would have had United States soldiers assist Huerta to maintain order and to protect the property and lives of Americans in Mexico. As an argument in favor of this course it was urged that if Germany or Great Britain should intervene to protect their property in Mexico, the Monroe Doctrine would be infringed. Many laid stress on this last point especially; and insisted that the United States should at least make sure of being the first to send troops to Mexico; after the troops were there they might be used to assure a peaceful election. There was no lack of ably expounded opinions on the Mexican question, at any rate.

President Taft during his last few weeks in office maintained a policy of non-intervention and non-recognition. On March 4 he bequeathed the Mexican problem to his successor, President Woodrow Wilson. There were three questions to be decided: (1) Should the United States go to war because Mexican bullets happened to stray over the Arizona boundary (at Naco, April 8), or because American investors in Mexican mines and oil wells were uneasy, or because the lives of the Americans already in Mexico

JOHN LIND
Personal Representative of President Wilson in Mexico

FOUR IMPORTANT FIGURES IN MEXICO, 1913

were endangered? President Wilson, estimating the cost of war in lives and money, answered this first question in the negative. Governor Colquitt of Texas, who had ordered out the Texan militia, was induced to assume a less belligerent attitude. Nevertheless, Senator Fall introduced a resolution on July 22, calling for adequate protection of American citizens resident abroad; and, as a precaution, warships were sent to Vera Cruz on the east coast and to Guaymas on the west; and an extra military force was held in readiness at Galveston, Tex. (2). If not for her own citizens, should the United States intervene on behalf of the lives and property of German or British citizens? This question very naturally led to two others: Does the Monroe Doctrine bind the United States to police America, and is the Monroe Doctrine sacred? President Wilson did not immediately answer. (3). Should the authorities in Washington recognize Huerta in Mexico, or simply recognize disorder in Mexico? In addition to being insecure and provisional, the Huerta government was now accused of being "blood-stained." Cartoons depicted General Huerta with hands dripping gore. The charge had been frequently repeated, and was now widely believed, that Francisco Madero and José Suarez were not shot "while attempting to escape," but murdered at the order of General Huerta, and that he had not made due efforts to punish the alleged murderers. This circumstance carried great weight with the press in the United States. Speaking at Swarthmore, President Wilson said: "Nowhere can any government long endure which is stained by blood or supported by anything but the consent of the governed." Obviously President Wilson was not inclined to recognize Huerta, and it soon became evident that only an elected president could secure recognition at Washington.

Hon. Henry Lane Wilson, ambassador to Mexico, strongly favoring the provisional president, could not work in harmony with the administration, and on August 4 Secretary of State Bryan announced that the ambassador's resignation had been accepted, to take effect October 14. President Wilson now determined to utilize other than ordinary diplomatic means. Somewhat earlier he had sent Dr. William Bayard Hale unofficially to investigate the situation at Mexico City. He now sent a "personal representative," without diplomatic rank, as mediator to Mexico. The gentleman selected for this rather delicate mission was ex-Governor Lind of Minnesota. Mr. Lind arrived in Mexico City August 10, instructed* to inform Huerta that since, "It became daily more and more evident that no real progress is being made toward the establishment of a government at the city of Mexico which the country will obey and respect . . ."; and since "the present situation in Mexico is incompatible with the civilized development of Mexico herself, and with the maintenance of tolerable political and economic conditions in Central America"; all parties should assent to a settlement upon the following terms: (1) An immediate cessation of fighting throughout Mexico, and a definite armistice solemnly entered into and scrupulously observed; (2) security given for an early and free election in which all will agree to take part; (3) the

promise of General Huerta not to be a candidate in the presidential election; and (4) the agreement of all parties to abide by the results of the election and cooperate in the most loyal way in organizing and supporting the new administration. The United States would recognize and assist a government thus established.

In declining so well-intentioned an offer of mediation, Huerta's foreign secretary, Señor Gamboa, took pains to explain on August 16, in a document of extraordinary length, that President Wilson misconceived the situation, that it was impossible to arrange an armistice with the rebels; that the United States ought not to allow the rebels to obtain aid and arms across the American border, and that President Wilson's discrimination against General Huerta could not be considered, "because, aside from its strange and unwarranted character, there is a risk that the same might be interpreted as a matter of personal dislike: this point can be decided only by Mexican public opinion when it is expressed at the polls." The provisional government was legal, Señor Gamboa concluded, and demanded recognition.

In the face of this rebuff, Mr. Lind persisted in his pacific endeavor. His second note to the provisional government asked merely for an assurance that a constitutional election would be held in which General Huerta would not be a candidate. As an inducement to the acceptance of these terms, a virtual promise of a loan was made. In reply, Señor Gamboa explained that under the Mexican constitution the *ad interim* president could not be a candidate in the presidential election. The reference to a possible loan was stigmatized as an attempt to bribe the government.

Mediation had failed, but President Wilson continued to play a waiting game; and in the meantime American citizens resident in Mexico were supplied with third-class passage out of the country, Congress appropriating \$100,000 for that purpose. On August 27 President Wilson summed up the situation to date in a special message which he read before Congress.

THE COUP D'ÉTAT OF OCTOBER 10. General Victoriano Huerta was not minded to efface himself at the invitation of President Woodrow Wilson. And had he been so minded, as once it was rumored, there were many of his adherents and many foreigners as well, ready to persuade him that only a strong man could uphold the honor of unhappy Mexico. This was the great, the only excuse for Huerta. He was to be the strong and practical man, as contrasted with the weak and theorizing Madero. Yet the strong man was not proving very successful: he was feared in one-half of Mexico, disregarded in the other; the country was in worse turmoil than ever before. The reason was not far to seek. Madero, with his proposals for agrarian and democratic reforms, had been disliked because he was weak; Huerta, the enemy of reform and of constitutionalism, could rely only on the army and the aristocracy—and the army would remain faithful only as long as it was paid. The situation was becoming untenable; nevertheless, General Huerta was prepared with a message of confidence when the Mexican Congress assembled on September 16 for its regular autumnal session. "Though there have been difficulties with the government of the United States," he said, "there have not, fortunately, been any with the American peo-

* These instructions were not made public until President Wilson referred to them in his special message to Congress on August 27.

ple." The work of pacifying Mexico was to go on rapidly, and the army was to be raised from 80,000 to 100,000 men. A great many members of Congress, however, were stubbornly opposed to the administration and felt genuine alarm at the course of recent events. The changes in the personnel of the cabinet were openly criticised. The friends of General Díaz had been replaced by personal adherents of the provisional president. The chief alterations were as follows: Minister of the interior, García Granados, followed by Aureliano Urrutia, followed by Manuel Garza Aldape (resigned November 16); foreign affairs, Señor de la Barra (resigned July 8), Frederico Gamboa, Querido Moheno (appointed October 6); justice, Rudolfo Reyes (resigned September 12), Enrique Gerosi-teta; education, V. Estanol, García Navanio; finance, T. Obregon, Adolfo de la Lama (sent to Europe, December 4); public works, Señor de la Fuente, José M. Lozano; war, General Mondragon, General Aureliano Blanquet; *fomento*, Señor Le Bollar.

To the dissatisfaction caused by the cabinet changes was added considerable anxiety about the approaching presidential election, which, by a decree of May 31, had been set for October 26. Despite the unsettled conditions throughout the country, the protests of the Constitutionalists, and the warnings of the United States, General Huerta was determined to hold the election on that date; and it was suspected that, regardless of the constitution, the provisional president would enter the electoral campaign and use the army to secure his own election. The opposition in the Congress grew daily more bitter and outspoken. Belizario Dominguez, senator from Chiapas, boldly denounced Huerta as "a blood-thirsty and ferocious military tyrant." After making his speech, Senator Dominguez mysteriously disappeared, and the Chamber of Deputies, fearing that he had met a fate similar to Madero's, decided to investigate the case. Claiming that this decision constituted an invasion of the powers of the judiciary, General Huerta dispatched Señor Aldape with a body of soldiers to dissolve the unruly assembly and to arrest the members of the Liberal and *Renovador* parties. The *coup d'état* of October 10 was successful. One hundred and ten of the 233 deputies were imprisoned. On the following day a proclamation was published in which General Huerta justified his action: instead of supporting the administration, the Congress had caused disorder by invading the rights of the executive to name his cabinet and of the judiciary to investigate Dominguez's disappearance; instead of working to secure peace and honor for Mexico, many of the congressmen were actually fomenting and plotting rebellion; it was the duty of the president to put an end to the "anti-patriotic labor of the legislature." General Huerta accordingly called elections for a new congress to take place simultaneously with the presidential election on October 26, and meanwhile invested himself with dictatorial powers.

If the *coup d'état* strengthened Huerta's position in Mexico City, it certainly failed to improve his relations with the United States. On October 13 he was warned that any violence or injury done to the imprisoned deputies would "have a painful effect in the United States." And on the following day he was informed that President Wilson was "shocked at the lawless

methods employed by General Huerta," and could not recognize as constitutional an election held under the present anarchic conditions. No inconsiderable alarm and ill-feeling was caused by the fact that Sir Lionel Carden, British minister to Mexico, chose this very inauspicious moment to present his credentials to the Huerta government, and by the rumor that he had openly censured President Wilson's non-recognition policy. The situation was exploited by alarmist press agencies, according to whose reports the powers of Europe were about to intervene in disregard of the Monroe Doctrine. Somewhat later a similar panic was caused by the presence of the British cruisers *Suffolk* and *Berwick*, the German *Hertha*, the French *Condé*, and the Japanese *Idzuma* in Mexican waters. According to official statements, however, President Wilson possessed the sympathy and support of the powers in his attempt to reach a pacific solution of the Mexican question. As the British prime minister (Mr. Asquith) said at the Guildhall in London, November 9, "There never has been and cannot be any question of political intervention on the part of Great Britain in the domestic concerns of Mexico or of any Central or South American state. . . . The utmost we can expect to do is to give whatever protection is possible on the coasts to English lives and property in times of urgent danger."

THE ELECTIONS. In defiance of President Wilson's declaration that such an election would not be recognized, and in spite of Carranza's threat that the Revolutionists would kill the man elected, General Huerta persisted in holding a general election on October 26. A new Senate, a new House of Representatives, a president, and a vice-president were to be chosen. Four presidential candidates were in the field. The National Democratic party had nominated General Felix Díaz for president and General José Luis Requena for vice-president. The Catholic candidate, Señor Frederico Gamboa, former foreign minister, with Eugenio Rascon as running-mate, promised measures for social betterment, savings-banks, and a rural credit system. Manuel Calero, a lawyer and a former ambassador to the United States, and Jesus Florez Magón, a member of Madero's cabinet, represented the Liberals. The Liberal-Republican faction supported David de la Fuente, who had been minister of public works under Huerta. Up to the last moment it had been declared that General Huerta would not run; then it was reported that "his friends" had prepared a ballot bearing his name as a candidate for the presidency, with Gen. Blanquet for the vice-presidency, and that the army would be ordered to vote this ticket. It was well-nigh impossible to obtain reliable information about the elections. Early reports indicated that the Constitutionalists had not taken part in the balloting, and, that in districts controlled by the Federals, soldiers had been practically the only voters. The New York *Sun* reproduced in facsimile what purported to be Huerta's instructions to the local authorities, ordering them so to manipulate the ballot that no returns would be made from at least two-thirds of the polling-booths in each district, and of the vote reported Huerta and Blanquet should receive an absolute majority. Later returns showed that a larger vote was cast than had been anticipated, and that General Huerta had received a majority.

Once more President Wilson protested. The

American *chargé d'affaires* at Mexico City, Nelson O'Shaughnessy, demanded the provisional president's resignation, it was believed, and, early in November Mr. Lind, who had been staying at Vera Cruz, returned to Mexico City to demand the invalidation of both presidential and congressional elections. On the 11th Mr. Lind returned unsatisfied to Vera Cruz. As far as the presidential elections were concerned, the Mexican government was compliant, and Foreign Minister Querido Moheno was credited with a statement denying General Huerta's intention of accepting the election. As a matter of fact the presidential election was declared invalid by Congress on December 9, on the ground that less than the required half of the electoral districts had sent in legal returns. The congressional elections, however, were obstinately held to be valid.

The newly elected Congress held a preliminary meeting on November 15, and met on November 20, to pass on the validity of the elections and to review the conduct of the government since October 11. As has been noted, the Congress held itself to be duly elected, and the presidential election to be void. General Huerta's term as constitutional president *ad interim* was extended by a resolution of December 9 to July 5, 1914. The review of the administration since October 11 was brief and favorable. Among the financial decrees issued by Huerta and approved by Congress were a 50 per cent. increase in the customs duties, an increased stamp tax, a tax on petroleum, a cotton tax, and a banking law (decreed November 5). This latter made the acceptance of the silver peso obligatory for any amount; the paper issued by the National Bank of Mexico and the Bank of London and Mexico was declared legal tender for all amounts, and the said banks were instructed not to redeem their paper. The object was of course to enable the banks to keep their specie reserve. The most important work of the Congress was in connection with proposed loans and concessions. A loan of \$3,500,000 had been contracted by General Huerta with the Bank of London and Mexico in order to meet the obligations of the national railways. In addition to this, a loan of 100,000,000 pesos was authorized on December 10 by the House of Representatives. Two important concessions, one an oil concession, the other a railway project, were considered. The latter, approved by the House on December 6 authorized Belgian *Compagnie de Chemins de Fer Secondaires* to construct 3000 or more miles of railways in Mexico. It was frequently asserted that President Wilson's protests against the meeting of the recently "elected" Congress were inspired by his anxiety to prevent the ratification of such concessions. The assertion is quite in accord with President Wilson's Mobile speech (October 27) in which it was asserted that "the United States will never again seek one additional foot of territory by conquest," but rather act as the friend and champion of the Latin American countries, to "emancipate them from the control of foreign financial interests." Ambassador Page at London reiterated the doctrine on December 6. Referring to the Monroe Doctrine and American republics, he said: "We have now developed subtler ways than taking their lands. There is the taking of their bonds, for instance. Therefore, the important proposition is that no sort of financial control can with the consent of the

United States be obtained over these weaker nations which would in effect control their government." This is the newest interpretation of the Monroe Doctrine.

Meanwhile General Huerta's position at Mexico City was weakening. A serious split in his cabinet had been caused by Home Minister Señor Aldape's inclination to placate the United States, and Señor Aldape had been forced out of the ministry on November 16. Popular sentiment demanded the release of the 83 former deputies still in prison. In spite of the new banking laws, the financial situation was serious and a legal holiday had to be declared in order to stop a run on the banks. There were many and contradictory rumors of loan negotiations, but late in December it was reported on good authority that Huerta had no funds to pay his army. To be ready for emergencies he transferred his residence from the National Palace to the more defensible Castle of Chapultepec.

On December 2 President Wilson made an important statement to Congress. "There can be no certain prospect of peace in America," he said, "until General Huerta has surrendered his usurped authority, until it is understood on all hands that such pretended governments will not be countenanced or dealt with by the government of the United States. . . . We are friends of constitutional government in America . . . because in no other way can our neighbors, to whom we would wish in every way to make proof of our friendship, work out their own development in peace and liberty. Mexico has no government. The attempt to maintain one at the city of Mexico has broken down, and a mere military despotism has been set up which has hardly more than a semblance of national authority." As for Huerta, "he has not succeeded . . . the collapse is not far away. We shall not, I believe, be obliged to alter our policy of watchful waiting, and then, when the end comes, we shall hope to see constitutional order restored in distressed Mexico by the concert and energy of such of her leaders as prefer the liberty of the people to their own ambitions." Who might such high-minded leaders be? The answer would seem plainly to be the Constitutionalists, with whom, by the way, President Wilson's agent, William Bayard Hale, had conferred at Nogales on November 12. At the close of the year, then, Washington was waiting for the Huerta régime to collapse.

THE CONSTITUTIONALIST VICTORIES. In the northern states the Huerta régime had already collapsed, and Venustiano Carranza's rival government, with its seat at Hermosillo in the state of Sonora, was issuing paper money and controlling most of the states of Sonora, Chihuahua, Coahuila, Sinaloa, Durango, Tepic (territory), Zacatecas, and San Luis Potosi; while near Mexico City the Zapatistas were terrorizing Guerrero, Puebla, and Morelos; and in Campeche ex-Governor Brito led 2000 rebels. Active campaigns were directed by the Constitutionalist General Obregon in Sinaloa, Pancho Villa in Chihuahua, Blanco in Tamaulipas, Aguilar in Vera Cruz, and Sanchez in Michoacan. General Obregon, with a force estimated at 8000, captured Culiacan in Sinaloa early in November. Mazatlan, the remaining federal stronghold in that state, was captured November 27. At the very close of the year Tepic was sacked by the rebels; but Guaymas on the coast of Sonora still held out. The

greatest attention was attracted by the campaign of Pancho Villa, without doubt the foremost military leader of the Constitutionalists. About November 1 he moved against the city of Chihuahua with some 9000 men. His assaults on the 6th, 7th, and 8th were beaten off, but instead of despairing, he suddenly advanced northward and captured the important border town of Ciudad Juarez, taking 125 prisoners, and a quantity of ammunition. The federal army from Chihuahua, attempting to retake Juarez, was repulsed on November 24-25 in a battle about 12 miles south of that town. A few days later the Federals evacuated Chihuahua and Pancho Villa entered the city in triumph on December 8. It was expected that the federal force, having fled to Ojinaga, would be once again defeated by Villa, and that the victorious rebel would then march south in somewhat tardy fulfillment of his boast that he would eat Christmas dinner in Mexico City. The constitutionalist armies in the east were busy. Lucio Blanco and Pablo Gonzales captured Ciudad Victoria, the capital of Tamaulipas, on November 18. They then proceeded against Monterrey, which had again fallen into federal hands, and in December occupied Linares, and Montemorelos, on the road to Monterrey. Somewhat further south, in the state of Vera Cruz, the revolutionists attacked Tantoyuca on November 11, and on November 13 General Candido Aguilar with 1500 men captured the port of Tuxpan. Lord Cowdray, a British financier whose firm goes by the name of Pearson and Son, Ltd., appealed to the United States to protect his valuable oil interests at Tuxpan; no damage was reported. On December 10 the important Gulf port of Tampico was attacked by Constitutionalists. Admiral Fletcher, whose flagship, the *Rhode Island*, lay in Tampico harbor, feared damage to the business property in Tampico and ordered cessation of fighting on December 12. On the following day the siege was raised.

MEYER, PROF. ADOLF, M. D. See INSANITY.

MIAMI UNIVERSITY. An institution of higher education at Oxford, Ohio, founded in 1809. The enrollment in the university in 1913 was 808. Of these 382 were in the College of Liberal Arts and 226 in the Normal College. The faculty numbered 50. A. H. Upham was appointed professor of English in place of G. B. Woods, resigned. The productive funds of the university amount to about \$210,000. The library consists of 35,000 volumes. The president is Raymond M. Hughes.

MICHIGAN. POPULATION. The population of the State in 1910 was 2,810,173. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 2,936,618.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1913 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1913	1,675,000	56,112,000	\$37,595,000
	1912	1,625,000	55,250,000	31,492,000
Wheat	1913	835,000	12,776,000	11,371,000
	1912	700,000	7,000,000	6,720,000
Oats	1913	1,500,000	45,000,000	17,550,000
	1912	1,485,000	51,826,000	17,103,000
Rye	1913	375,000	5,362,000	3,324,000
	1912	370,000	4,921,000	3,199,000
Potatoes	1913	350,000	33,600,000	17,808,000

		Acreage	Prod. Bu.	Value
Hay	1912	350,000	36,750,000	15,068,000
	1913	2,400,000	22,520,000	33,012,000
	1912	2,395,000	2,185,000	40,450,000

c Tons.

MINERAL PRODUCTION. The total value of the mineral products of the State in 1912 was \$80,062,486, compared with \$65,275,324 in 1911.

The production of refined copper in Michigan in 1912 was 231,112,228 pounds, compared with 218,185,235 pounds in 1911. The production of the mines during 1912 was 218,138,408 pounds of copper. The excess of the smelter production over that of the mines was due to the smelting of "mineral" produced prior to 1912. Michigan ranks third in the yearly production of copper, and second in the total production. At the close of 1912, 5,205,717,206 pounds of copper, or 29.53 of the total output of the United States, had been produced. The entire output is from the Keweenaw or Lake Superior district. Also the district has been an active producer for 65 years. Most of the older mines still had large reserves of ore, and new mines were being opened while much territory remained to be prospected. The most important new developments during the previous few years were made in the southern part of the district, and active development was continued in this section during 1912. (See COPPER.) The copper mines of the State produced 528,453 fine ounces of silver in 1912, compared with 497,281 ounces in 1911. The silver output is mainly from the electrolytic refining of the copper produced. Of the total output, Houghton County produced 475,543 ounces in 1912, compared with 459,715 ounces in 1911.

The State is one of the most important in the production of iron ore. It is surpassed only by Minnesota. There were mined in 1912 11,191,430 long tons, compared with 10,329,039 long tons in 1911.

The total coal production of the State in 1912 was 1,206,230 short tons, valued at \$2,339,451. This is smaller than the production of 1911, which was 1,476,074 tons. The decrease was due chiefly to the suspension of mining from April 1 to May 31, pending the renewal of the wage agreements. The coal production of the State has decreased each year since 1907, due partly to the competition of West Virginia coal, and the small demand for lump coal in the State. There were 3113 men employed in mines of the State in 1912, compared with 3323 in 1911. Eight men were killed in the coal mines in 1912, compared with seven in 1911.

The value of the clay products of the State in 1912 was \$2,545,498, an increase of \$461,566 over 1911. The leading clay product is common brick.

EDUCATION. The total school population in 1912 was 795,423. The total enrollment was 555,137, and the average daily attendance was 164,556. The male teachers numbered 2708, and the female teachers 16,116. The average salary of men teachers was \$82.33 a month, and of women teachers \$54.97. The laws passed by the legislature of 1913 included provisions for changing the boundaries of or consolidating districts, a provision amending the compulsory school law, and several measures relating to raising funds for schools.

CHARITIES AND CORRECTIONS. The institutions under control of the State board of correc-

tions and charities, with their populations on June 30, 1912, were as follows: Kalamazoo State Hospital, 2015; Pontiac State Hospital, 1391; Traverse City State Hospital, 1398; Newberry State Hospital, 836; Ionia State Hospital, 439; State Psychopathic Hospital, 47; Home for Feeble-minded and Epileptic, 981; Michigan State Prison, 762; Michigan Reformatory, 578; Branch Prison, 311; Industrial School for Boys, 779; Industrial School for Girls, 341; State Public School, 179; School for the Blind, 144; Employment Institute for the Blind, 81; School for the Deaf, 309; Michigan Soldiers' Home, 872; State Sanatorium, 66. The total disbursements for the current expenditures for these institutions for the fiscal year ending June 30, 1912, was \$2,480,179. The legislature of 1913 passed many important measures and amendments relating to the administration of charities and corrections. The juvenile court law, passed in 1907, was amended. Provision was made for sending dependent and neglected children to the State Public School and to institutions approved by the State board of charities and corrections. Provision was also made for the medical treatment of children of indigent parents.

TRANSPORTATION. The total mileage of steam railways within the State on June 30, 1912, was 9015.41. The lines having the longest mileage are the Péré Marquette, 1828; Michigan Central, 1216; Grand Trunk System, 861; Lake Shore and Michigan Southern, 606; Chicago and Northwestern, 519; Duluth, South Shore, and Atlantic, 505. The mileage of electric railways in the State on June 30, 1913, was 1223.28.

POLITICS AND GOVERNMENT. The Michigan legislature met in biennial session on January 1, 1913, and went through the form of reëlecting United States Senator William Alden Smith. Senator Smith was reëlected by the unanimous vote of all the Republican legislature. The legislature subsequently ratified the amendment to the Federal Constitution providing that hereafter United States senators shall be elected by direct vote of the electors.

Under Michigan's county local option system, 12 counties, some "wet" and some "dry," voted again on the question of continuing to be "wet" or "dry" at the April, 1913, election. The result was a net gain by the "wets" of two counties. At the present time, 33 of the counties of Michigan are "dry" and 50 are "wet." See also **LIQUOR REGULATION.**

At the April election of 1913, Joseph B. Moore and Joseph H. Steers were elected justices of the Supreme Court by pluralities of 28,039 and 29,424 respectively. Both are Republicans. Other State officers elected on the Republican State ticket at the same time were university regents, Walter H. Sawyer and Victor M. Gore; superintendent of public instruction, Luther L. Wright; member of State board of education, Frank Cody; members of the State agricultural college board, Alfred J. Doherty and Robert D. Graham; State highway commissioner, Frank F. Rogers. The pluralities of each of these was about 30,000. Congressman H. Olin Young, Republican, of the 12th Michigan district, relinquished his seat in the national House to William J. MacDonald, national Progressive, while MacDonald was contesting it. Young, on the face of the returns, was declared elected by 458, and the contest in

the national House was based on the fact that several hundred and more votes intended for MacDonald had not been counted for him because of a minor misspelling of his name on these ballots.

LEGISLATION. The legislative session of 1913 passed four amendments to the State constitution, namely:

(1) Providing that hereafter the State constitution can be amended by the initiative and referendum without recourse to the legislature.

(2) Providing that statute laws may be enacted by the initiative and referendum.

(3) Providing ways for the recall of all elective public officers, excepting judges of courts.

(4) Providing for woman suffrage.

The first amendment was ratified at the State election in April, 1913, by a majority of 42,377. The second amendment was ratified at the same election by a majority of 92,331. The third amendment was ratified at the same election by a majority of 62,669. The woman suffrage amendment was rejected at the same election by a majority of 96,144, the vote on this amendment being 168,738 for; 264,882 against. Woman suffrage had been submitted to the electors of the State only five months previous, namely, November, 1912. It then came within 760 votes of carrying, the vote being 247,375 for; 248,135 against.

STATE GOVERNMENT. Governor, Woodbridge N. Ferris, Dem.; Lieutenant Governor, John Q. Ross; Secretary of State, Frederick C. Martinale; Treasurer, John C. Haarer; Auditor, O. B. Fuller; Attorney-General, Grant Fellows; Adjutant-General, R. C. Vandercook; Superintendent of Public Instruction, F. L. Keeler; Commissioner of Insurance, Calvin A. Palmer—all Republicans, except Ferris and Vandercook.

JUDICIARY. Supreme Court: Chief Justice, Aaron V. McAlvay; Justices, John E. Bird, Joseph B. Moore, Joseph H. Steers, Flavius L. Brooke, John W. Stone, Russell C. Ostrander, F. C. Kuhn; Clerk, Charles C. Hopkins—all Republicans.

STATE LEGISLATURE, 1913. Republicans: Senate, 21; House, 54; joint ballot, 75. Democrats: Senate, 5; House, 35; joint ballot, 40. Progressives: Senate, 6; House, 11; joint ballot, 17. Republican majority: Senate, 10; House, 8; joint ballot, 18.

The representation in Congress will be found in the article **UNITED STATES**, section *Congress*.

MICHIGAN, UNIVERSITY OF. A State institution for higher education at Ann Arbor, Mich., founded in 1837. The enrollment of November 1, 1913, was 6008, in addition to 235 extension students pursuing work for credit. The faculty in 1912-13 numbered 362. There were in addition 116 graduate assistants and about 65 administrative officials. No new departments were created in 1913, but the work in architecture which has been carried on as a sub-department in the department of engineering, was separated for administrative purposes, and the engineering school is now denominated the department of engineering and architecture. The university is extending its work for the service of the people of the State not in attendance in the university, particularly in the way of extension lectures and scientific and technical tests, and through the constantly-enlarging work of the hospitals under the control of the medical de-

partments, in which there are ordinarily about 500 patients at all times. There has been also a bureau of municipal research, which will co-operate with the Michigan municipalities in the solving of municipal problems. During the year, donors gave notice of their willingness to present to the university dormitories for women. One of these is given by the Newberry family of Detroit as a memorial to their mother, and the other anonymously by a resident of New York. These buildings will cost several hundred thousand dollars. The trust funds of the university amount to about \$365,000, in addition to about \$545,000, the present amount of the proceeds of the Federal land grant. The total income of the university for all purposes during 1912-13 was \$1,844,952. The library contains about 325,000 volumes. The president is Harry B. Hutchins.

MILITARISM. See **SOCIALISM.**

MILITARY AERONAUTICS. See **AERONAUTICS.**

MILITARY PROGRESS. GENERAL. The military feature of 1913 was the increased effort made by the powers of the world in preparation for war. Nor was this effort limited to the powers. Smaller countries as well, as it were, set their houses in order, so as to be ready for a struggle that all appeared to regard as imminent. Not satisfied with the increase of 1912, Germany passed a new military law, the effect of which was to bring its peace army to a total of 870,000 officers and men. France balanced this German expansion by a radical change in its military system, the adoption of the so-called three-year law. Among smaller countries, Belgium, by a law passed in the spring, raised its war effective to 340,000; 150,000 for a field army, 130,000 for the fortifications of Antwerp, Liège, and Namur; 60,000 as reserve and auxiliary troops. This action on the part of Belgium was significant, and sprang from her determination to protect her neutrality should Germany, at war with France, decide to turn the fortifications of the immensely strong eastern French frontier by crossing Belgian territory. Holland reorganized its army in order to enable it to pass instantly from a peace to a war footing. Turkey, notwithstanding the defeat of its German-drilled army, again turned to Germany for the reconstruction of its forces. This step was strongly opposed by Russia. The German mission in charge of the reformation of the Turkish army, was declared to have no political bearing, but as its powers were almost supreme, and as Germany had almost exclusive control of the Bagdad Railway, it was clear that Turkey would become, or might become, a ward of the German Empire. Russia and Austria were occupied rather with the internal development of their respective armies than with any material increase of strength. It was to be noted that Austria mobilized two corps in the Slav provinces, the real purpose of which was to prevent the Slav subjects from taking a hand in the Balkan troubles.

If we except the civil war in Mexico, the war between the Balkan allies, following the termination of their struggle with Turkey, and the never-ending warfare between Spain and Morocco, it may be asserted that the peace of the civilized world remained unbroken. But as may be inferred from what has already been

said, signs of tension existed. There could be no doubt that ill feeling was increasing between France and Germany. The execution by the French of a supposed German subject, serving in the Foreign Legion, and the Saverne (or Zabern) incident further excited the two nations concerned. That war between the two countries was inevitable was regarded as a commonplace in France. All Frenchmen, civilian as well as military, looked forward with calm to a struggle which they felt would involve national existence itself.

In the United States intervention in Mexico stared the American people daily in the face, and intervention, however pacific and altruistic the intention, spells war, and war of a particularly disagreeable type. Moreover, although the matter was not susceptible of proof, war between Mexico and the United States would not impossibly bring up certain Oriental issues as yet unsettled. Although no material increase of the British army was to be recorded, yet the effort made to improve this army was so successful that the French general staff reported it as being now one of the best armies in existence. A new rifle, giving a flatter trajectory, was in process of issue, and hereafter all battalions will be of four companies, instead of eight as heretofore.

The chief lesson derived from the experience gained in the Balkan War has been the importance of long-range artillery fire. Hence the assertion that hereafter armies in the field must be accompanied by guns intended for this sort of fire, and using a high explosive shell.

UNITED STATES. A great step forward was taken in the organization, so far largely on paper, of the mobile army into divisions and brigades. The territory of the United States is itself divided into four departments: Eastern department, headquarters, Governor's Island, N. Y.; central, headquarters, Chicago; western, headquarters, San Francisco; southern, headquarters, San Antonio. Each of these has one division of troops. Hawaii and the Philippines constitute separate departments. As small and now useless posts were abandoned, it was hoped that Congress would authorize, by suitable appropriations, the concentration of troops into real units of higher rank than had been the case heretofore. The coasts of the United States were divided into three districts for the better organization of the sea-coast defense against a naval enemy. A provisional organization was provided by general orders of December 4, 1913, for an aero squadron of the signal corps. This squadron was to consist of twenty officers and ninety men, to operate a material of eight aeroplanes, sixteen tractors, and six motor-cycles. The real development of this adjunct of modern warfare was waiting, however, for congressional action. The same remark might be made of the cavalry arm of the army. Recognized as obsolete of organization, an attempt to illustrate by comparison the defects of the present system was made in mid-summer by the assembling of eight squadrons into an experimental brigade of cavalry at Winchester, Va. This brigade was intended to furnish an object lesson not only to officers and men but also to Congress.

At the close of the year the fortifications of Subig Bay were completed, those of Pearl Harbor nine-tenths, and those of Manila Bay three-fourths completed. The serious defense by high-power guns of Guantánamo Bay was under

project. The plan for the protection of the Panama Canal contemplated the works at each end (actually under construction), submarine mines, field works along the coast to arrest possible landing parties, a system of roads and of sanitation. On the material side, we record the adoption of a 45-calibre automatic pistol, under manufacture at the Springfield arsenal. This pistol is loaded by a clip holding seven cartridges and slipped up through the end of the stock into position where it is held by a spring. The recoil of the pistol is used to eject the empty case and to load and cock the piece for the next shot. The model 1912 sea-coast mortar was adopted for the works at Panama. This piece is 15 calibres long as against 10 for the old models, is wire wrapped, and permits fire to be opened at nearly 25,000 yards.

GERMANY. The great event of the year, not only in Germany, but in the military world at large, was the passage, June 30, by the Reichstag, of a new military law, inspired possibly by fear of Russia. This law marks an epoch in the history of the German army. Briefly, it adds to that army 4000 officers, 15,000 non-commissioned officers, 117,000 men, and 27,000 horses. If we add various other elements, such as one-year volunteers, the peace strength rises to 835,000, and by the further inclusion of certain military employees, to 870,000. This law was, after the third reading, passed as a whole without debate, all the deputies voting for it except the Alsatians, the Poles, and the Socialists. The new law calls for an expenditure of \$332,600,000, spread over the years 1913, 1914, 1915, and regularly thereafter adds nearly \$50,000,000 to the war budget of the nation. The bill proposed trebling the war fund from \$30,000,000 in gold to \$60,000,000 in gold and \$30,000,000 in silver. See **GERMANY**.

FRANCE. To meet this increase of the German army, following upon that of 1912, France returned to the three-year enlistment system, under which she will keep three classes with the colors instead of two. The effect of this law is to increase the peace strength of the French army by one-half. Great as is the sacrifice involved, it is nevertheless cheerfully made by the French people, in the face, however, of bitter opposition by the Socialists. A fresh attempt was made by executive order to adjust the long-standing differences between the war and navy departments as to who should have charge of the coast defense of France. The great trouble in the past was the division of responsibility; the new order did not remove it. After the fall manœuvres, held near Toulouse, a great number of officers of high rank were summarily placed on the retired list, owing to the inefficiency displayed by them. This energetic proceeding testifies to the determination of the French to be ready at all times for action.

AERONAUTICS. Interest in this subject shows no abatement. The German minister of war declared during the debate on the new military law, that aeronautics had passed the experimental stage, that its engines were really fitted for service in war and could be expected to give invaluable results. In England aviation regulations were incorporated in the new field service regulations quite as a matter of course. Even the East Indian budget appropriated \$75,000 for aviation. The modest step taken by the War Department of the United States has already been mentioned. Germany, under

the terms of the law of 1913, was to have seven-teen balloon, and fourteen aviation companies. In addition, a corps of volunteer aviators was to be formed to serve as a reserve of aviation under the war ministry on the outbreak of hostilities. Belgium created an aviation company, an aviation school, and established an advisory committee to assist the minister of war. Brazil founded an aviation school at Rio de Janeiro for the training of army pilots. Holland for the first time appropriated money for aviation; Russia increased the pay of its aeronautic service; Spain created an aeronautic service of thirty-three officers, twenty-one technical experts, and three hundred and sixty-seven enlisted men.

Although it thus appears that all armies recognize the value of aviation, yet opinions differ as to the precise way in which this value will manifest itself. On account of the vulnerability of the present aeroplane at low speeds and altitudes, an armored aeroplane was contemplated, operated by powerful motors (400 h.p. and higher). When this type shall have become successful its machine gunfire will be dangerous. In the meantime the incendiary shell or grenade will be found useful against extended targets, and against dirigibles. It was reported, however, that Spanish aviators successfully used bombs against the Moors in Morocco. On the whole, it may be asserted that aviation fire under present conditions will prove ineffectual; and that as regards reconnaissance, much remains to be done in developing the type, and differentiating the functions of the military aeroplane before the high hopes of its partisans can be realized. Whether we consider the dirigible or the flying machine, only experience on a serious scale in a serious war will reveal the full possibilities of military aeronautics either in offense or in reconnaissance.

For additional information regarding military progress, see various countries, under section *Army*; and see also **MILITIA**.

MILITARY TERRITORY OF THE NIGER. A territory belonging to the government-general of French West Africa (q.v.). A commandant (1913, Lieutenant-Colonel Mouret) administers the government under control of the lieutenant-governor for Upper Senegal and Niger. In compliance with an order of June 22, 1910, Zinder was made the capital January 1, 1911; and the military territory was reorganized. See **UPPER SENEGAL AND NIGER** and **FRENCH WEST AFRICA**.

MILITIA. As will be seen in the accompanying table, there was a small decrease in the number of officers and enlisted men in the organized militia during the fiscal year 1913. This decrease was due to a large extent to the elimination of organizations which were found hopelessly inefficient and is made up for by the increase in general efficiency. In a number of States the systematic and progressive course of theoretical construction formulated and supervised by regular army officers produced good results. In many States also officers' camps were held during the year, and the results obtained indicated that these camps are a valuable means of supplementing the theoretical instruction previously imparted.

Necessity for a greater number of inspection-instructors for the organized militia had become so pressing that the Secretary of War

believed that legislation should be secured providing for an increase of officers of the regular army sufficient to fill the demands of the States for these officers. Such a law contemplated the detail of an inspector-instructor for each regiment or separate battalion of infantry, and the equivalent for the other branches of the service. This would require a total of 187 officers, an excess of 109 over the present number of such detail.

The Secretary of War also pointed out in his annual report the importance of a reserve system for the organized militia. He declared that the minimum strength at which militia organizations were maintained in times of peace would render necessary a great and immediate increase in a national emergency, and this fact demanded the presence of a system of reserves from which trained men might be secured for this increase. The cooperation of the governors

of the States had been secured for the organization of the entire organized militia under military divisions.

The national militia board held its annual meeting in January, 1913. The most important work of the board consisted in defining what constituted field or camp service, and in formulating rules to determine the eligibility of officers and enlisted men to attend such service and to receive pay, transportation, etc.

A bill to provide pay for the militia, introduced in Congress in 1912, failed of action. A new bill to accomplish the same purpose was introduced in the 63d Congress, but no action had been taken at the end of the year.

The strength of the organized militia on May 31, 1913, as shown in the table below, was 111,672 enlisted men, and 9130 officers, a net increase of 12 officers and 1038 enlisted men as compared with 1912.

State, Territory, or District	1912		1913		Gain (+); loss (-)

* No organized militia (mustered out May 20, 1906).

MILK. An epidemic of septic sore throat, due to contamination of milk, occurred in Canton, Mass., in May; nearly 400 out of the 3000 inhabitants were afflicted and ten died. The constant recurrence of such epidemics led to attempts to discover the precise origin of septic sore throat and whether the infection was of bovine or of human derivation. Some interesting data came to light during the past year.

Certain of the English epidemics were attributed to milk taken from cows with diseased udders, but it was known that streptococci are present in milk even when obtained from healthy animals and protected from contamination. The harmless milk streptococci, *S. lactious*, is normally present in the lacteal ducts and skin of the cow, but there seems to be little doubt that pyogenic streptococci are also present.

Furthermore it has been shown experimentally that bovine streptococci may acquire under certain conditions extremely virulent characteristics. Davis isolated a streptococcus from the milk of cows with mastitis, which, after being passed through three guinea pigs, acquired a capsule and produced watery growths, becoming similar in many respects to streptococcus cultures from patients with septic sore throat. Rosenow found that cultures from the slime of milk separators were non-virulent to animals, but that if the slime itself were injected into animals these usually died of streptococcus poisoning, the blood yielding pure cultures of streptococci, which, being inoculated into animals, became encapsulated and acquired cultural qualities similar to the strains from epidemic septic sore throat. These again being artificially cultivated acquired the characters typical of *S. pyogenes*. Rosenow also found that in typical strains of streptococcus pyogenes from various sources, both human and bovine, growth was delayed on inoculation into milk at low temperature, and would assume characteristics peculiar to the strains isolated from cases of epidemic sore throat; and that there resulted some increase in virulence toward animals. This observation is important since it indicates that milk under certain conditions may encourage the development of a pathogenic quality in the streptococci that may get into it. (See also DAIRYING.)

MILLER, JOAQUIN. An American poet, died February 17, 1913. He was born in the Wabash district of Indiana, in 1841, and was christened Cincinnati Heine. In 1850 he went with his parents to Oregon. In his early manhood he labored in the California gold mines, and in 1855 volunteered for the filibustering expedition into Nicaragua led by Walker. For several years he lived among the Indians on the Pacific coast. Returning to Oregon in 1860, he studied law, but soon left the practice of his profession to spend two years as an express messenger in Idaho. He then became editor of a paper called the *Democratic Register*, in Eugene, Ore. This was suppressed on account of its disunion sentiments, and Miller removed to Canon City, Ore., where he practiced law, and in 1870 was appointed county judge of Grant County. During these years he had written many poems, and with a collection of these he went to London, and there published his first book, which met with a favorable reception. This was entitled *Songs of the Sierras*. In London he affected the costume of the West, including flannel shirt and sombrero, and received marked attention as a literary lion. Returning to the United States, he went to Washington, and spent some time there in newspaper work, but in 1887 he returned to California, establishing a home at Oakland. He visited Alaska in the early days of the discovery of gold in the Klondike. His home in Oakland was one of the notable features of that city, and in it he entertained many celebrities. His principal poetical works in addition to his *Songs of the Sierras* mentioned above, are: *Songs of the Sunland*; *The Ship of the Desert*; *Shadows of Shasta*; *Songs of Far Away Lands*; *The Building of the City Beautiful*; *Chants for the Boer*. He also wrote a novel, *The Danites in the Sierras*, from which he made a play, *The Danites*, which enjoyed a long run in New York City. He also wrote several other plays, in-

cluding *The Silent Man* and *Tally-Ho*. The name "Joaquin," under which his writings appeared, he is supposed to have borrowed from a Mexican bandit, Joaquin Murieta, a man widely known and dreaded among the California miners, but admired and defended by Miller.

MILLER, ROSWELL. An American financier and railway official, died January 3, 1913. He was born in Harford, Pa., in 1843; received a public school and academic education; when still a youth, entered the railway service on the Cairo and Vincennes Railway; and rose to be secretary and later superintendent of this road. In 1882 he became second vice-president and treasurer of the Chicago and Indiana Railway; in the following year assistant to the general manager of the Chicago, Milwaukee, and St. Paul Railway Company; in succession assistant general manager, general manager, and president of this road. From 1889 until the time of his death, he was chairman of the board of directors. He was one of the best-known American railway officials.

MILNE, JOHN. An English seismologist, died August 5, 1913. He was born in 1851 and was educated at King's College, London, and the School of Mines. After a wide experience as a mining engineer in Cornwall and Lancashire, and in various parts of Europe and America, he was appointed in 1875 to the chair of geology and mining in the Imperial College of Engineering at Tokyo. Although he continued to lecture on geology for nearly twenty years, he became absorbed in the study of earthquakes, and in 1880 founded the seismological society of Japan. He constructed instruments of many types to aid in his observations, the cost of which was in part defrayed by the British association. Professor Milne collected a large number of books and pamphlets relating to earthquakes, and had equipped with instruments the finest seismological observatory in the world. These instruments he hoped to bring with him on his return to England after nearly twenty years' absence, but they were unfortunately burned before his departure. In 1895 he returned to England, and at Shide, he began the construction of an observatory. His work soon became known throughout the world, and proposals were made for the establishment of a network of seismological stations all over the world. This plan he took up with great energy, and his horizontal pendulum, known as the Milne seismograph, was improved and became the standard instrument. Within a dozen years nearly fifty pendulums were established in all parts of the world, chiefly in Great Britain and the colony. Each year Professor Milne analyzed the records obtained from these instruments, and he had determined approximately the position of the origin of fifty-seven world-shaking earthquakes a year. His published writings include *Earthquakes* (1883); *Seismology* (1898); *The Miner's Hand Book*; and many articles and pamphlets on seismology, geology, mineralogy, and mining.

MINERALOGY. The application of the methods of physical-chemistry to the study of minerals has been one of the more significant developments in the recent progress of this science. As a leading example may be cited the work of Day and Allen of the geo-physical laboratory of the Carnegie Institution with reference to the feldspar minerals, an investigation that received quite as much attention from the

geologist as from the mineralogist. In their determination of the thermal constants it was not found practicable at the time to establish the magnitude of the melting interval for the plagioclase group, but information on that point was given by N. L. Bowen in a published research. In brief the experiments indicated that the melting temperatures lie between 1550°C for the pure calcium variety anorthite, and 1100°C for the sodium feldspar albite. Mixtures of the two species show an interval between the beginning and completion of melting which varies with the composition, amounting to 63° for a plagioclase made up of equal parts of the albite and anorthite molecules. Such a mixture, if cooled quickly, solidifies in homogenous crystals; on slow cooling, however, solidification begins at 1450°, when crystals with a predominant amount of the anorthite molecule separate; from that point by progressive cooling the composition moves continuously toward the proportion of one to one and at the temperature of 1287° the remainder crystallizes.

The theory of solid solutions, as developed principally from investigations of metallic alloys, has been considered by some mineralogists to afford a possible explanation for the chemical anomalies exhibited by certain species. According to H. W. Foote and W. M. Allen, chrysocolla shows no close agreement with the commonly-accepted formula of one part copper oxide, one of silica and two molecules of water, even when the purest material obtainable is used for analysis. As a consequence they were inclined to the opinion that this mineral, in company probably with many other amorphous minerals, is chemically similar to gelatinous precipitates as made in the laboratory. Such substances are of the nature of solid solutions of water in the oxide or some lower hydrate; they have no fixed composition, but a variable one depending on the conditions of their formation.

From the number of text-books issued it would appear that mineralogy was becoming a rather popular subject of study in schools and colleges. A work that makes a more limited appeal, though of the greatest importance to the advanced student and specialist, was a treatise by Victor Goldschmidt on the crystal forms of minerals. This work was designed to cover the whole field of previous research, inclusive of all material relating to the growth, habit, and other problems connected with crystals, and will consist of five or six volumes of figures and as many of text. The first installment was issued in 1913.

NEW MINERALS. The list of species described for the first time during the year under review follows: *Custerite*, a hydrous fluosilicate of calcium, occurs as a contact metamorphic product in a copper mine at Mackay, Idaho. It is pale greenish gray, crystallizes in the monoclinic system, and has a formula like that of cuspidine with an added molecule of water. A series of new minerals from some remarkable pegmatite occurrences in Madagascar include *betafite* and *samiresite*, which contain radium in considerable quantity. The former is an oxide of niobium and titanium, and the latter contains tantalum oxide as well. Both are isometric and radioactive. *Ampangabeite* is made up of a number of the rarer earths, inclusive of uranium, yttrium, and erbium, besides those previously mentioned, and iron. *Manandonite* is a hydrous silicate of aluminum, beryllium, and

lithium. *Plumbdoniobite* from the mica mines of Morogoro, German East Africa, contains uranium, yttrium, lead, and other bases. *Uhlegite* is a mineral allied to keilhauite and zirkelite, and occurs in black octahedra near Magad Lake, East Africa. *Urbaite*, a sulphide of tantalum, arsenic, and antimony, is from Allchar, Macedonia. A complex basic phosphate of lead and copper from Tsumeb in German Southwest Africa has been described by two mineralogists under the names of *Prestitite* and *Tsumebite*. *Hutchite* from Binnenthal, Switzerland, is a lead-gray, monoclinic mineral of undetermined composition. *Palaitite*, *stewartite*, *salmonsite*, and *sicklerite* are new manganese phosphates from the tourmaline locality at Pala, Cal. *Arsenoferrite* is an isometric form of iron diarsenide, isomorphous with pyrite. It comes from Binnenthal, Switzerland. *Hokutolite* is a radio-active compound of lead and barium sulphides chiefly, found as an incrustation from the hot waters of the Hokut River, Formosa. A variety of triclinic pyroxene that contains about 20 per cent. of manganous oxide has the name *pyroxmangite*; it comes from Iva, Anderson County, South Carolina. *Skemmatite* is an associated hydrous oxide of manganese and iron. *Hodgkinsonite*, a hydrous silicate of zinc and manganese, comes from the famous mineral locality at Franklin Furnace, New Jersey.

MINERAL PRODUCTION OF THE UNITED STATES. The details of the mineral production of 1912 are contained in the accompanying table. The following is a general summary of the production, based on the data by the United States Geological Survey.

With pig iron, the basis of iron values, and the refined metals (smelter production), the basis of values for gold, silver, copper, lead, zinc, etc., the total value of the mineral production of the United States was \$2,243,630,326, compared with \$1,927,532,128 in 1911. The four leading States are Pennsylvania, Ohio, Illinois, and West Virginia. With iron ores as the basis of iron production, and with the recoverable metallic contents of ores as the basis of other metal output, the total value of the mineral production in 1912 was \$1,917,818,084, compared with \$1,681,281,031 in 1911. The same four States remain at the head but in different order, and hold their prominence because of their leading position in the production of coal. Pennsylvania outranks all others, and West Virginia, Illinois, and Ohio follow in the order given. These four States are credited with about 42 per cent. of the total value of the mineral output of the United States. California, which produces no pig iron or coal, is fifth in rank, owing to its importance as a producer of petroleum and gold. Michigan and Minnesota, as the most important producers of iron ore, rank sixth and ninth respectively in the value of their total production. Colorado, with gold, coal, and zinc as its principal products, is eleventh in rank. Montana, with copper, the leading product, stands seventh, and Missouri, with zinc and lead as its chief products, ranks tenth. In the accompanying table, the States are arranged in the order of their rank, as shown by the value of their mineral products in 1912.

It will be noted from this table that in the 48 States including Alaska and the District of Columbia, there were 44 in which the value of the mineral production in 1912 exceeded that of

MINERAL PRODUCTS OF THE UNITED STATES, CALENDAR YEARS 1911 AND 1912

Product	1911		1912

^a Marketed production of iron ore. 1911: 41,092,447 long tons; value at mines, \$86,716,575. 1912: 57,017,614 long tons; value at mines, \$107,050,153. Statistics for iron ore and, since 1910, inclusive, for marketed production of pig iron are collected by the Survey; statistics for pig iron output were furnished by the American Iron and Steel Association prior to 1910.

^b By "spot" value is meant value at the point of production.

^c Ferro-alloys include ferromanganese and spiegeleisen, ferrosilicon and ferrophosphorus, ferromolybdenum, ferrotitanium, ferrotungsten, and ferrovanadium. The ferro-alloys are made chiefly of foreign ores. Pig iron in 1910 included ferro-alloys valued at \$7,423,502.

^d Average price per troy ounce in 1911, 53 cents; in 1912, 61.5 cents.

^e Prior to 1905, coining value, \$20.6718 per troy ounce; in 1905, coining value, \$20.671834; since 1905, coining value, \$20.671834625323.

^f The product from domestic ores only.

^g Of 76½ avoirdupois pounds net; of 75 avoirdupois pounds net since June, 1904.

^h Includes antimony smelted from imported ores, and also antimony contained in hard lead.

ⁱ Includes nickel in copper-nickel alloy, and in exported ore and matte.

^j In 1911, from Alaska and Texas. In 1912, from Alaska.

^k Including brown coal and lignite, and anthracite mined elsewhere than in Pennsylvania. Coke, 1911: 35,551,489 short tons; value at ovens, \$84,130,849. 1912: 43,983,599 short tons; value at ovens, \$111,736,696.

^l Value of clay mined and sold as unmanufactured clay. 1911: \$3,480,763. 1912: \$3,946,020.

^m Includes limestone for iron flux, but not grindstones.

ⁿ Included under feldspar and quartz.

^o Includes metallic paint, mortar colors, ocher, umber, sienna, shale, ground slate; also sublimed blue lead, sublimed white lead, zinc-lead, and leaded zinc oxide; also whitening; also zinc oxide.

^q Includes nitrate of soda, carbonate of soda, sulphate of soda, and alum clays used by paper manufacturers; and cadmium, rutile, selenium, and uranium and vanadium minerals, estimated together at \$500,000 in 1912.

TOTAL VALUE OF THE MINERAL PRODUCTS IN 1911 AND 1912

	1911	1912
Metals.....	\$ 680,531,782	\$ 867,103,085
Non-metals.....	1,246,750,346	1,376,027,241

Total.....	\$1,927,532,128	\$2,243,630,326

1911, and only six showed decrease. Five of the six States in which decreases were shown, were relatively unimportant as mining States. The first seven States maintain the same relative position in both years, with the exception of West Virginia and Illinois, whose positions were reversed in 1912. Arizona is another exception, advancing from eleventh place in 1911 to eighth place in 1912. This was due to the increased production of copper and a decided advance in the price of that metal. New Mexico shows the highest percentage of increase, a gain of over 76 per cent., due also to the increased production of copper. The combined production of all the States east of the Mississippi River, which aggregate less than 30 per cent. of the total area of the country, exclusive of Alaska, is nearly two-thirds of the total, whereas the States west of the river, which aggregate about 70 per cent. of the total area, contribute slightly more than one-third of the total value of the output. The States ranking first in the production of coal, iron ores, stone, clay products, natural gas, and most of the important non-metallic substances, except petroleum and silver, are east of the Mississippi River, while those holding first place in the production of gold, silver, copper, lead, zinc, and petroleum, and producing all of the quicksilver, platinum, and sulphur, lie west of the river.

The mineral products group themselves naturally into three special classes—metals, fuels, and structural materials. The group of metal shows a notable increase in 1912 over 1911. One item only shows a decrease, the value of gold produced in 1912 being less by nearly \$3,500,000 than the output of 1911. The largest proportionate increase in value was shown in the pro-

duction of copper, which, although gaining only about 13 per cent. in quantity, had a value in 1912 nearly 50 per cent. larger than in 1911. Zinc had the second largest percentage of increase in value. Silver increased about 20 per cent., and lead showed the smallest gain. The average percentage of increase for the six metals was 27, and the combined increase in value was \$174,764,293.

The three fuels—coal, petroleum, and natural gas—had a combined increase of \$108,740,865, or 13 per cent., in 1912 over 1911. Coal contributed the largest part of the increase, but the largest percentage of increase was in petroleum. Natural gas increased about 13 per cent.

Of the five substances grouped in structural minerals, sand and gravel showed the largest percentage of increase, with cement second, and clay products third. See articles on the separate minerals, as ALUMINUM, COPPER, GOLD, IRON, etc. See also section *Mineral Production* or *Mining* under various countries, and under various States of the United States.

MINES, BUREAU OF. See UNITED STATES, *Bureau of Mines.*

MINIMUM WAGE. One of the most discussed reforms of the last few years has been the proposal to establish minimum-wage standards for women and children in a few or all industries of a State. This movement is based primarily on the doctrine that any industry worthy of continued existence should be able to pay a

living wage to all the workers which it requires. Investigation has shown that beyond all question large numbers of the workers in the sweated trades have been exploited primarily because of their ignorance of American conditions and their lack of organization. Grasping employers have been able to take advantage of their poverty and ignorance, with the result that they and their families have contributed to social vice, crime, and other forms of degeneracy, and at the same time have increased the burdens of poor relief. Some material relating to this subject will be found under PROSTITUTION. In 1912 a law was enacted in Massachusetts. This was followed in 1913 by laws in California, Colorado, Minnesota, Nebraska, Oregon, Utah, Washington, and Wisconsin, and the Massachusetts act was extended and modified. The Colorado law applies to mercantile and manufacturing establishments, laundries, hotels, restaurants, telephone and telegraph offices; those of other States apply to all industries. These laws apply to women and minors under eighteen, except that the Minnesota law applies to women and minors under twenty-one, the Utah law to females, and the Wisconsin law simply to women and minors. As a rule they specify that the "necessary cost of proper living" or "necessary cost of living" shall be the principle on which wages are determined. The Utah law, however, fixes \$1.25 a day as the minimum wages of experienced adults. Special license for defective women is granted in all cases except by Utah; and Wisconsin provides special licenses also for minors. By these a person partially incapacitated may be employed at less than the prescribed minimum wage. The administration of these laws is entrusted to a minimum wage commission or some other labor authority serving the same function. As a rule the law requires that that body must include a woman. On account of the great similarity of these laws, only two of them are described in detail.

OREGON. One of the most notable laws of the year was the Oregon minimum wage law enacted "to protect the lives and health and morals of women and minor workers, and to establish an industrial welfare commission and define its powers and duties, and to provide for the fixing of the minimum wage and maximum hours and standard conditions of labor for such workers." The law prohibits the employment of women or minors under conditions detrimental to health or morals, or for wages inadequate to meet the necessary cost of living. A commission of three is established to determine what conditions are inimical to health and morals, what are reasonable forms and standard conditions of employment and wages for women and minors. This commission, composed of a representative of employers, employees, and the public, has full power to make investigations and subpoena witnesses. If investigation shows that a substantial number of women are employed under detrimental conditions, the commission must call a conference composed of not more than three representatives of employers in the occupation, an equal number of employees, and an equal number of disinterested persons. This conference makes a report of findings and recommendations covering hours, conditions, and wages. It may recommend rates for piece work, a minimum wage for apprentices and learners, and the period of apprenticeship. If this report is not approved

by the commission, it is recommitted to the same or another conference. When approved, the commission issues orders based thereon, which become effective after sixty days. Violation by an employer is then punishable by fine, or imprisonment, or both. Exceptions to the general minimum-wage order are permitted for a person physically defective or aged. This law represents an advance over preceding American legislation in that, unlike the Massachusetts law, it is not enforceable by public opinion, but by executive and judicial authority.

MINNESOTA. The Minnesota law provided for a commission to be composed of the commissioner of labor, an employer of women, and a woman, who is to be the salaried executive officer of the commission. A living wage is defined as sufficient to maintain the worker in health and supply the necessary comforts and conditions of a reasonable standard of living. The commissioners were authorized to investigate occupations employing women and minors. Exact registers are required of employers. Whenever the commission is satisfied that one-sixth of the women or minors in an occupation receive less than living wages, it may establish a legal minimum for that occupation. Such a wage may be made to apply to the whole or a part of the State. By special license physically defective women may secure employment at special rates, but not more than one-tenth of the workers in any establishment may be of this class. Discrimination against employees testifying in public hearing is prohibited. By legal suit any employee may recover the difference between the legal minimum wage and wages actually received. An advisory board is authorized in every occupation; they will be composed of three to ten persons representing employers, employees, and the public. At least one-fifth of the members of such boards must be women, and at least one representative of the public must be a woman.

CONSTITUTIONALITY. The first test of the constitutionality of a minimum-wage law took place in Oregon. The last legislature created the industrial welfare commission with liberal powers. The commission issued an order in September prescribing conditions of employment of women, whereby hours were limited to 9 per day and 54 per week, and the minimum wage of experienced adult workers was put at \$8.64 per week. A box manufacturer attacked the wage provision of the act on the grounds that it deprived him of property without due process of law; that it deprived him of the right of judicial review of the reasonableness of the order; and that it delegated legislative powers to a commission. The Circuit Court of Multnomah County declared laws fixing the maximum hours for women and those fixing, or providing authority for fixing, minimum wages to be complementary. The former being within the police powers, the latter must be also. But that section of the law abolishing the right of judicial review the court held invalid. The case was taken to the Supreme Court.

MINING. See section so entitled under various countries.

MINING INDUSTRY. See MINERAL PRODUCTION OF THE UNITED STATES.

MINNESOTA. POPULATION. The population of the State in 1910 was 2,075,708. According to the estimates of the Bureau of the

Census, made in 1913, the population in that year was 2,181,077.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1913	2,400,000	96,000,000	\$50,880,000
	1912	2,266,000	78,177,000	28,925,000
Wheat	1913	4,200,000	68,040,000	51,711,000
	1912	4,325,000	67,038,000	48,046,000
Oats	1913	2,980,000	112,644,000	36,046,000
	1912	2,948,000	122,932,000	31,962,000
Rye	1913	300,000	5,700,000	2,736,000
	1912	262,000	6,026,000	3,013,000
Potatoes.....	1913	275,000	30,250,000	15,730,000
	1912	245,000	33,075,000	9,261,000
Hay	1913	1,600,000	22,490,000	16,434,000
	1912	1,661,000	2,541,000	16,262,000

c Tons.

MINERAL PRODUCTION. The total value of the mineral products of the State in 1912 was \$66,672,729, compared with \$53,395,381 in 1911.

Minnesota is the most important State in the production of iron ore, and the Minnesota iron ranges produce considerably more iron ore than is produced in all the rest of the States together. There were produced in 1912 34,431,768 long tons, and 24,645,105 long tons in 1911.

The value of clay products exclusive of pottery in 1912 was \$1,641,040, a decrease of \$82,438 over 1911. The principal clay product was common brick.

TRANSPORTATION. The total mileage of all railways within the State of Minnesota in 1913 was 9058.49. The total mileage of all the railroads which are within or pass through the State was 64,277.11 miles.

FINANCE. The total receipts from all sources for the fiscal year ending July 31, 1913, amounted to \$17,809,401. The disbursements of the same period were \$18,959,752. At the beginning of the fiscal year there was a balance in the treasury of \$2,992,728, and at the end of the fiscal year a balance of \$1,842,367. The chief sources of revenue are railroad taxes, general taxes, the twine plant, the State prison, and permanent trust funds. The chief expenditures are for school apportionment, general school aid, the twine plant, and State institutions. The State has no bonded debt.

EDUCATION. The total enrollment in the public schools in 1913 was 448,891. The average daily attendance (estimated) was 326,000. There were 6098 teachers. The average salary of male teachers in high and graded schools was \$110 per month, and for women \$59 per month. In semi-graded and rural schools the average salary for men was \$55 monthly, and for women \$46. The legislature of 1913 authorized the appointment of an education commission of seven members to revise and codify school laws, and to make a complete study of the education situation in the State. This commission is to render a report to the legislature in 1914, and recommend such changes in the administration, supervision, and maintenance of the schools, as seem necessary for efficiency and progressive school work.

CHARITIES AND CORRECTIONS. The institutions under the control of the State with their populations on July 31, 1913, are as follows: The Anoka Asylum, 681; the Hastings Asylum, 718; Fergus Falls Hospital, 1500; Rochester

Hospital, 1167; St. Peter Hospital, 1126. These are all asylums for the insane, and the total number of inmates on the date mentioned above was 5212. In the Asylum for the Blind at Faribault, there are 86 inmates; in the Asylum for the Deaf at Faribault, 257; in the Home for the Feeble Minded and Epileptics, 1327; in the State School at Owatonna, 283; in the Training School for Boys at Red Wing, 153; in the Training School for Girls at Sauk Centre, 157; in the State Reformatory at St. Cloud, 451; in the Penitentiary at Stillwater, 1069; in the State Tuberculosis Sanitarium at Walker, 108; in the Inebriate Hospital at Willmar, 24; and in the Home for Crippled Children, 50. The total number of inmates in all institutions of the State was 9212. During 1913, four additional cottages were opened at the Hastings and Anoka asylums, for the chronic insane, giving an increased capacity for 250 patients. A successful department in scientific research is in operation at the Institution for Feeble Minded and Epileptics at Faribault, and valuable contributions to the literature of degeneracy and feeble-mindedness have been made. A new State prison at Stillwater was practically completed in 1913, and about half the convicts were transferred from the old prison. The twine industry is now carried on at the new prison. The product of this industry in 1913 was 18,000,000 pounds, and the profit for the year, \$372,364. The manufacture of farm machinery in the prison has been successful. Up to August, 1913, there had been manufactured and sold 7000 machines of different kinds, and the profit of the State was nearly \$50,000. The State hospital for the care of inebriates and persons addicted to the drug habit was in successful operation in 1913. Since its opening in December, 1912, 123 patients had been committed, of whom 19 have been discharged and 37 released on parole.

POLITICS AND GOVERNMENT. There was no election for State officers during the year, as the term of Governor Eberhart and the other State officials does not expire until January 1, 1916. The next State election will be held on November 3, 1914. On January 21 the legislature re-elected Knute Nelson United States senator. On June 2 the United States Supreme Court, in deciding the Minnesota rate case, unanimously upheld the rights of the State, under existing laws, to regulate railroad rates within its borders. On July 21 the courts restored a two-cent passenger rate and commodities law. (For a discussion of these matters, see article RAILWAYS.) The legislature of 1913 passed measures reapportioning the congressional and legislative districts of the State.

LEGISLATION. The legislature met in 1913 and enacted an unusual number of important measures. Among them were the following: A law was passed providing that five-sixths of a jury may return a verdict in civil cases after twelve hours' deliberation. A measure was passed providing for the abatement of disorderly houses. Among the laws relating to conduct of business were those providing for uniform negotiable instruments, uniform warehouse receipts, and a blue-sky law relating to insurance companies only. Measures were enacted providing for county tuberculosis sanatoria. The State labor department was reorganized to include a bureau of women and children, with a woman superintendent. A workmen's compensation act was passed, and a minimum wage

commission to regulate the wages of women and minors was passed. Another measure limited the maximum for employment of women in certain occupations to 10 hours per day and 58 hours per week, and in other occupations to 9 hours a day and 54 hours a week. A measure was enacted providing for presidential preference primaries, and the non-partisan primary was extended to members of the legislature. The powers of the juvenile courts were extended. A loan-shark law limiting the rate of interest to 1 per cent. a month on loans of \$200 or less was passed. A distance tariff law was enacted, and an act providing for good roads. Measures were passed providing for mothers' pensions in the State. Provision was made for a constitutional amendment to be submitted to the people providing for the increase of Supreme Court justices from five to seven, and providing further that no statute shall be declared unconstitutional unless five members concur. Provision was also made for another constitutional amendment providing for the initiative and referendum, and the recall of public officials. See also LIQUOR REGULATION.

STATE GOVERNMENT. Governor, Adolph O. Eberhart; Lieutenant-Governor, J. A. Burnquist; Secretary of State, Julius A. Schmahli; Auditor, S. G. Iverson; Treasurer, Walter J. Smith; Attorney-General, L. A. Smith; Adjutant-General, Fred B. Wood; Superintendent of Education, C. G. Schultz; Commissioner of Insurance, J. A. Preus; Commissioner of Agriculture, J. F. Maxfield—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, Calvin L. Brown; Associate Justices, Andrew Holt, G. L. Brunn, P. E. Brown, Oscar Hallam—all non-partisan; Clerk, L. A. Caswell, Republican.

STATE LEGISLATURE, 1913. Republicans: Senate, 42; House, 90; joint ballot, 132. Democrats: Senate, 20; House 26; joint ballot, 46. Republican majority: Senate 22; House, 64; joint ballot, 86.

The names of senators and representatives to Congress will be found in the article UNITED STATES, section *Congress*.

MINNESOTA, UNIVERSITY OF. A State institution for higher learning, founded at Minneapolis in 1869. The enrollment in all departments in 1912-13 was 4008. The faculty numbered 450. During 1913 a medical school was reorganized and a number of strong men were added to the general university staff. There were no noteworthy benefactions received during the year. The productive funds in 1912-13 amounted to \$1,506,136, the total income to about \$2,355,362, of which \$1,643,752 was for the support of the university and \$711,610 for the increase of plant. The library contains about 175,000 volumes. The president is George E. Vincent, LL. D.

MISSISSIPPI. POPULATION. The population of the State in 1910 was 1,797,114. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 1,876,987.

AGRICULTURE. The area, production, and value of the principal crops in 1912-1913 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1913 are estimates only.

	Acreage	Prod. Bu.	Value
Corn 1913	3,150,000	63,000,000	\$48,510,000
1912	3,106,000	56,840,000	40,356,000

	Acreage	Prod. Bu.	Value
Wheat 1913	1,000	14,000	13,000
1912	8,000	96,000	93,000
Oats 1913	140,000	2,800,000	1,764,000
1912	113,000	1,966,000	1,180,000
Rice 1913	1,500,000	42,000	29,000
1912	2,200,000	77,000	69,000
Potatoes 1913	12,000	960,000	960,000
1912	10,000	890,000	801,000
Hay 1913	220,000	a 293,000	3,956,000

MINERAL PRODUCTION. The utilization of some of its clay resources and the digging of sand and gravel, with the sale of some commercial mineral waters, constitutes the State's only title to consideration as a mining State. A small quantity of iron ore is produced, and some sand-lime brick is made, but both of these are unimportant. The total value of the mineral output in 1912 was \$1,242,528, compared with \$1,052,848 in 1911.

FINANCE. The total receipts from all sources for the fiscal year 1913 amounted to \$4,501,447, and the disbursements to \$4,426,591. There was a balance at the beginning of the fiscal year of \$250,999, and at the end of \$325,855. The chief sources of revenue are State taxes, and the chief expenditures are for education and State institutions. The bonded debt of the State at the end of the fiscal year 1913 amounted to \$3,923,752.

POLITICS AND GOVERNMENT. The legislature did not meet in 1913, as the sessions are biennial, and the last was held in 1912. There was no election for State officers during the year, as the terms of Governor Brewer and the other State officials do not expire until January 18, 1916. The next State election will be held on November 3, 1914. The State suffered severely from floods in the spring and early summer months of the year. (See FLOODS.)

STATE GOVERNMENT. Governor, Earl Brewer; Lieutenant-Governor, Theo. G. Bilbo; Secretary of State, J. W. Power; Treasurer, P. S. Stovall; Auditor, D. L. Thompson; Superintendent of Education, J. N. Powers; Attorney-General, Ross A. Collins; Adjutant-General, Arthur Fridge; Land Commissioner, J. H. Brown; Commissioner of Agriculture, H. E. Blakeslee; Commissioner of Insurance, T. M. Henry—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, S. Smith; Associate Justices, S. C. Cook and R. F. Reed; Clerk, George C. Myers—all Democrats.

STATE LEGISLATURE. The State legislature is wholly Democratic.

The names of senators and representatives to Congress will be found in the article UNITED STATES, section *Congress*.

MISSOURI. POPULATION. The population of the State in 1910 was 3,293,325. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 3,353,983.

AGRICULTURE. The area, production, and value of the principal crops in 1912-1913 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1913 are estimates only.

	Acreage	Prod. Bu.	Value
Corn 1913	7,376,000	129,060,000	\$95,506,000
1912	7,622,000	243,904,000	112,196,000

		Acreage	Prod. Bu.	Value
Wheat	1913	2,315,000	39,586,000	\$33,252,000
	1912	1,900,000	23,750,000	21,375,000
Oats	1913	1,250,000	26,500,000	11,925,000
	1912	1,125,000	37,125,000	12,994,000
Rye	1913	16,000	240,000	180,000
	1912	15,000	222,000	178,000
Potatoes.....	1913	85,000	3,230,000	3,004,000
	1912	95,000	7,980,000	5,506,000
Hay	1913	3,000,000	61,800,000	26,100,000
	1912	3,187,000	4,143,000	40,601,000
Tobacco.....	1913	5,100	23,315,000	421,000
	1912	6,000	6,000,000	720,000

a Tons. b Pounds.

MINERAL PRODUCTION. The total value of the mineral products of the State in 1912 was \$58,332,550, compared with \$51,932,906 in 1911. The State produces a small amount of iron ore. This, in 1912, amounted to 43,480 long tons, compared with 65,325 long tons in 1911. Some copper is produced in the State. In 1912 this amounted to 440,725 pounds, compared with 640,411 pounds in 1911. The output is mainly recovered as a by-product in the dressing of lead ores.

The total coal production in 1912 was 4,339,856 short tons, valued at \$7,633,864. This was the highest production in the coal-mining history of the State, and surpassed the production of 1911 by 503,749 tons. There were employed 9704 men in the coal mines of the State during 1912, compared with 10,259 in 1911. The average time per man in 1912 was 206 days, compared with 182 days in 1911. In 1912 there were 20 men killed in the coal mines of the State, compared with 8 in 1911. Of the 20 fatalities, 16 occurred underground, 1 in the shaft and 3 on the surface. Missouri is one of the most important clay-working States of the country, and is the leading Southern State in this respect. The total value of the clay products in 1912 was \$6,412,861, an increase of \$138,508 over 1911. Fire brick is the product of chief value.

EDUCATION. The total school population of the State in 1913 was 954,699. The total enrollment was 690,484, and the average daily attendance, 494,309. The male teachers numbered 4706, and the female teachers 14,148. The average annual salary of male teachers was \$497.60, and of female teachers, \$485.44.

FINANCE. The reports of the treasury are for the biennial period 1911-12. There was a balance in the State treasury on January 1, 1911, of \$1,829,491. The total receipts from all sources during the two-year period was \$9,998,292, and the disbursements were \$6,518,122, leaving the balance in the treasury on January 1, 1913, of \$537,829. The State debt on January 1, 1913, amounted to \$4,398,839. The chief receipts are from taxation, and the chief expenditures are for State institutions, State officers, and education.

TRANSPORTATION. The total miles of steam railroad in the State in 1913 was 8147. There were 847 miles of electric railroad. There was practically no construction of new mileage during the year.

CHARITIES AND CORRECTIONS. The institutions under control of the State, with their populations in 1913, are as follows: Hospital No. 1, Fulton, 1038; Hospital No. 2, St. Joseph, 1509; Hospital No. 3, Nevada, 1249; Hospital No. 4, Farmington, 586; Industrial Home for Girls, Chillicothe, 226; Training School for

Boys, Boonville, 518; Colony for Feeble Minded and Epileptic, Marshall, 471; Missouri School for the Deaf, Fulton, 280; Missouri School for the Blind, St. Louis, 108; Federal Soldiers' Home, St. James, 295; Confederate Soldiers' Home, Higginsville, 306; State Sanatorium, Mount Vernon, 78; State Penitentiary, Jefferson City, 2484. These institutions are under the administration of the State board of charities and corrections, which has wide powers. This board meets quarterly for the purpose of discussing the work and for the discussion of the social welfare question.

POLITICS AND GOVERNMENT. There was no election for State officers during the year, as the terms of Governor Major and the other State officials do not expire until January, 1917. The next State election will be held on November 7, 1916. Governor Major was inaugurated on January 14. Both houses of the legislature adopted the amendment providing for the direct election of senators. As a result of stringent legislation passed to regulate them, many fire insurance companies withdrew from the State in 1913. (See FIRE INSURANCE.) The election laws of the State were greatly changed by the legislature of 1913. The most important of these is a so-called non-fusion provision and the "blanket ballot" instead of the "ribbon blanket." The date for holding State conventions was changed from the second Tuesday in September to the fourth Tuesday in August, and the conventions may be at any point in the State selected by the State committee of each party. On July 8 Governor Major issued a proclamation asking for volunteers to give aid in improving the highways. As a result of this call, many of the citizens of this State, including the governor himself, did manual labor on the roads for several days. On August 23 the governor released 22 convicts to work on the roads, and several days later released more convicts for the same purpose. Suits brought by the State against certain railroad for overcharges were decided in favor of the State on December 20. (See RAILROADS.) On December 26 the San Francisco Railroad was sued for recovery of excess rates.

LEGISLATION. The legislature met in 1913 and passed many important measures. Among them may be noted the following: A blue-act law patterned after the Kansas statute was enacted. The mothers' pension law, already in force, was extended. A measure was passed prohibiting any railroad, street railway, terminal, transfer, or electric railway corporation from operating any intra-State business unless incorporated under the laws of Missouri. A white slave act patterned after the Mann act was passed. The legislature enacted a number of laws relating to safety and the hours of labor of employes in various occupations. A public service commission with broad powers over all public utility corporations and persons was created. Provision was made for a non-partisan convention for the nomination of Circuit Court judges, delegates to which are selected at general primary elections. The primary election system was extended to include the nomination of all elective city officers in cities having more than 400,000 inhabitants. A "county unit law," which is regarded as practically assuring prohibition of the State outside of the large

cities, was passed. A stringent loan-shark law was enacted. A drastic statute on the subject of pools, trusts, conspiracies, and discriminations was passed. One provision of this is that in any proceeding against an insurance company, it will be *prima facie* evidence that the company is a member of a conspiracy if it be shown that it or any agent in writing insurance has used any rate or made use of any schedule of rates prepared or furnished by any person or concern acting in behalf of any insurance company or association in the making and publishing of insurance rates. This act is said to have caused more than 150 life insurance companies to suspend writing insurance in Kansas City. A provision was made for constitutional amendments allowing pensions to the deserving blind, to be submitted to the people.

STATE GOVERNMENT. Governor, Elliott W. Major; Lieutenant-Governor, W. R. Painter; Secretary of State, Cornelius Roach; Auditor, John P. Gordon; Treasurer, E. P. Deal; Attorney-General, John T. Barker; Superintendent of Education, Wm. P. Evans—all Democrats except Evans.

JUDICIARY. Supreme Court: Chief Justice, Henry Lamm, Republican; Associate Justices, Walter W. Graves, Democrat; A. M. Woodson, Democrat; H. W. Bond, Democrat; C. B. Faris, Democrat; R. F. Walker, Democrat; John C. Brown, Republican; Clerk, J. D. Allen, Democrat.

STATE LEGISLATURE, 1913. Democrats: Senate, 25; House, 113; joint ballot, 138. Republicans: Senate, 9; House, 28; joint ballot, 37. Progressives: House, 1; joint ballot, 1. Democratic majority: Senate, 16; House, 84; joint ballot, 100.

The names of senators and representatives to Congress will be found in the article UNITED STATES, section Congress.

MISSOURI, UNIVERSITY OF. A State university of higher education at Columbia, Mo., founded in 1839. The students enrolled in all departments in 1913-14 were 3349. The faculty numbered 245. There were no noteworthy changes in the faculty during the year, and no notable benefactions were received. The productive funds amount to \$1,280,000, and the income to approximately \$1,000,000. The library contains 155,000 volumes. The president is Albert R. Hill, LL.D.

MOALE, EDWARD. Brigadier-general of the United States army, died September 27, 1913. He was born in Maryland in 1840. In 1861 he was appointed first lieutenant of the 19th Infantry and was promoted to be captain in 1864. In the following year he became lieutenant-colonel and assistant adjutant general of volunteers. He took part in the battle of Spottsylvania and in the campaign before Richmond, receiving brevets of major, lieutenant-colonel, and colonel for gallantry in the field. After serving in various regiments, following the Civil War he was appointed major of the 1st Infantry in 1887, lieutenant of the 3d Infantry 1891, and colonel of the 15th infantry in 1897. In 1902 he was retired at his own request after forty years' service. He was advanced to the rank of brigadier-general, retired, by the act of April 23, 1904.

MOMBERT, JACOB ISIDOR. An American Protestant Episcopal clergyman and author, died October 7, 1913. He was born at Cassel, Ger-

many, in 1829, and received an academic education in Germany and England. After studying theology in the United States, he was ordained priest in the Protestant Episcopal Church in 1857. From 1857-1859 he was assistant to Trinity Church in Quebec, Canada; from 1859-1870 rector of St. James Church at Lancaster, Pa.; from 1870-1876 rector at St. John's parish, Dresden, Germany; and from 1877-1882 of Christ Church at Jersey City, N. J. In the last named year he gave up pastoral work and devoted himself entirely to literature. He was the author of *Authentic History of Lancaster County, Pa.; Faith Victorious* (1882); *Great Lives* (1886); *Charles the Great* (1888); *Handbook of English Versions of the Bible* (1890, 1907); *Short History of the Crusades* (1894); and *Raphael's Sistine Madonna* (1895). He received the degree of D.D. from the University of Pennsylvania in 1866.

MONACO. A constitutional European monarchy, occupying 1.5 sq. kilometers; population, 19,121. The city of Monaco has 2410 inhabitants, La Condamine 6218, Monte Carlo 3794. No creed but Roman Catholicism is tolerated. There is no cultivation. The revenue is chiefly derived from the gaming concession at Monte Carlo. The constitution dates from January 5, 1911. The reigning prince (house of Goyon-de-Matignon-Grimaldi) is Albert, born 1848, came to the throne 1889. He married in 1869 Lady Mary Douglas-Hamilton (mother of the heir-apparent, Louis, born 1870). This marriage being dissolved in 1880 he married Alice, dowager duchess of Richlieu (née Heine); this union was also dissolved (1902).

MONROE DOCTRINE, NEW. See MEXICO, History.

MONTANA. POPULATION. The population of the State in 1910 was 376,053. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 419,174.

AGRICULTURE. The area, production, and value of the principal crops in 1912-1913 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1913 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1913	28,000	882,000	\$ 679,000
	1912	24,000	612,000	428,000
Wheat	1913	870,000	20,673,000	13,644,000
	1912	803,000	19,346,000	12,381,000
Oats	1913	500,000	21,750,000	6,960,000
	1912	476,000	22,848,000	7,997,000
Rye	1913	10,000	210,000	116,000
	1912	10,000	235,000	141,000
Potatoes	1913	36,000	5,040,000	3,377,000
	1912	37,000	6,105,000	2,442,000
Hay	1913	660,000	61,188,000	11,405,000
	1912	640,000	1,216,000	10,093,000

a Tons.

MINERAL PRODUCTION. The total value of the gold, silver, copper, lead, and zinc produced by the deep and placer mines in the State in 1913 was estimated by the United States Geological Survey as somewhat over \$59,000,000, a decrease of about 8 per cent. from the production of 1912. There was a large decrease in the copper yield, and consequently in the gold. The gold decreased nearly 12 per cent., the figures being \$3,194,000 in 1913 as against \$3,625,225 in 1912. An increase of nearly 4 per cent. was made in

MORAVIAN CHURCH. See **MORAVIANS.**
MORAVIANS, also called **UNITED BRETHREN** (*Unitas Fratrum*) and the **MORAVIAN CHURCH**. The denomination maintains missions in Africa, Alaska, Asia, Australia, Labrador, Nicaragua, South America, West Indies, and Bohemia. The educational institutions which have high reputation for efficiency include the Moravian College and Theological Seminary, the Moravian Parochial School for Boys and Girls, and the Moravian Seminary for Girls at Bethlehem, Pa., Linden Hall Seminary for Girls at Lititz, Nazareth Hall for Boys at Nazareth, Pa., and an academy for girls at Salem, N. C. The denomination had in 1913 19,463 communicants, 122 churches, and 142 ministers. There is a smaller body called the United Bohemian and Moravian Church, which in 1913 had 1000 communicants, 31 churches, and 4 ministers. The Moravians are strongest in Pennsylvania. See also **RELIGIOUS DENOMINATIONS AND MOVEMENTS**.

MORET Y PRENDERGAST, SIGISMOND. A Spanish public official, died January 28, 1913. He was born in Cadiz in 1838 of a family of good position, and he received as excellent an education as could be obtained at that time in Spain. Almost immediately after taking his university degree he was appointed professor of political economy and financial institutions. His chief interests, however, were in journalism and politics, and he soon rose to distinction in both of these branches of effort. The most important part of his first parliamentary career began after the restoration of Alfonso XII., although he had previously held office as minister of the interior and of finance in 1870-71 and had been for a short interval ambassador in London. On the abdication of Amadeo in 1873 Moret was one of those who voted for a republic. In 1879 when he reentered the Cortes he assisted in the organization of the Democratic dynastic party. After the death of Alfonso XII. and during the regency of Maria Cristina he was the constant colleague of Señor Sagasta, as minister for foreign affairs in 1885, as chief of the home office until 1888, and again as minister for foreign affairs in 1893 and 1894. He also served as minister of public works and minister for the colonies. He occupied the latter position in 1898, at the outbreak of the Spanish-American War. He foresaw the disasters which ensued but could do nothing to prevent them. After the death of Sagasta and the arrival of Alfonso XIII. at majority, he became the nominal leader of the Liberal party and was prime minister in 1905 and 1906. His inability to control his party drove him to resign in the latter year. In October, 1909, the Conservative government of Señor Maura was compelled to resign, although it possessed a strong majority in the cabinet. A new government was rapidly constituted under Moret, but its weakness led to its downfall in February, 1910. Moret had a reputation among his countrymen for his restless activities and encyclopædic knowledge. He was, however, not a successful party leader, due largely to his tendency to speak hastily and utter truths which were damaging.

MORGAN, JOHN PIERPONT. An American financier, philanthropist, and art collector, died April 1, 1913. He was born in Hartford, Conn., April 17, 1837. His father, Junius Spencer Morgan, was a successful banker. His mother was a daughter of the Reverend John

Pierpont. John Pierpont Morgan received his early education in the East High School in Boston. Before he had finished the course, however, on the establishment of a branch of his father's banking house in London, the family moved abroad, and his education was completed at the University of Goettingen, from which he graduated in 1857. The two years following were spent in the London banking house of his father. He then settled in New York, where he entered the employ of Duncan, Sherman, and Company. In 1861 he helped to organize, and became a member of the firm of Dabney, Morgan, and Company. With this firm he remained until 1869, and there, without attracting the attention of financiers by any display of brilliancy, he laid the foundation of his successful career. He first appeared in the public eye in 1869, as the victorious opponent of J. Gould and James Fisk, then at the zenith of their power, in their designs upon the Albany and Susquehanna road, which was then in bad financial condition. Shortly after this, Mr. Morgan was taken into partnership by the Drexels in Philadelphia, and he was placed in charge of the New York house of the reorganized firm under the name of Drexel, Morgan, and Company. This firm name continued until 1895, when it was reorganized as J. P. Morgan and Company, and the Philadelphia business was left to the Drexels alone.

In his early years with the Drexel, Morgan Company, Mr. Morgan gradually extended the foreign exchange department, which was then considered by most New York bankers as a greatly inferior branch of banking. This work laid the foundation for Mr. Morgan's activity in international financing, in which field his first important venture was the successful underwriting of an issue of 300,000 shares of New York Central stock, to be sold in England. The transaction was so successful that it showed a gross profit of \$3,000,000 to bankers. It also had the result of establishing Mr. Morgan as a fiscal agent for the Vanderbilt lines, and as private banker for most of the Vanderbilt family up to the time of his death. It gave him also prestige, and attracted foreign capital to great enterprises in the United States.

Through his connection with the Vanderbilt railway interests Mr. Morgan gradually rose to a position of dominance in American railway finance. The period 1880-90 was one of destructive railway competition and great financial instability. In 1885, through the efforts of Mr. Morgan the New York Central secured control of the West Shore, its most formidable competitor, with great resulting gains to the stockholders of both companies. By similar means other railway consolidations were effected, and the support of Mr. Morgan greatly strengthened the tendency toward agreements limiting railway competition throughout the country. Still more notable was his work in effecting reorganization of roads that had become hopelessly involved, financially. Among these reorganizations the more important were the Reading (1886); the Chesapeake and Ohio (1888); the Southern (1894); the Erie (1895); the Northern Pacific (1896). The most dramatic episode in Mr. Morgan's career as railroad financier was his fight, in association with J. J. Hill, with E. H. Harriman for the control of the Northern Pacific. Mr. Hill

Copyright by Pach Bros., N. Y.

JOHN PIERPONT MORGAN

Died March 31, 1913

controlled the Great Northern, and it was advantageous to him as well as to Mr. Morgan that the two companies should have an understanding. They succeeded in obtaining possession of the Burlington road, which was designed to serve as a feeder for their lines. Mr. Morgan at this time went to Europe, and while there received a cablegram announcing that the Harriman interests had acquired control of the Northern Pacific and Union Pacific systems. Mr. Morgan at once ordered his partners to buy 150,000 shares of Northern Pacific. This resulted in the famous panic of May, 1901. The purchases under Mr. Morgan's orders began on May 6 of that year. The price of Northern Pacific rose from \$110 to \$1000 per share. The panic resulted in the failure of many large business houses which were "short" on Northern Pacific stock. As a result of these transactions, the Harriman interests had a majority of the preferred stock and a majority of all the stock, common and preferred, together. Nevertheless the Morgan-Hill party had a majority of the common stock and was in control of the road with a right to retire the preferred stock. This stock was retired, but at the same time the factions came to an agreement for a joint control of the roads. The next step in the settlement of this warfare was the organization of the Northern Securities Company, a holding company which took over the Burlington, Great Northern, and Northern Pacific railways. The government took action against this combination as being against the Sherman law, and it was dissolved. This resulted in litigation for the possession of the stocks which was financially decided in favor of the Morgan-Hill party, which thus came into control of the three great roads in the system. While railway finance remained until the end of his life one of Mr. Morgan's chief interests, industrial finance absorbed much of his attention after the opening of the present century. His most important venture in this field was the organization in 1901 of the United States Steel Corporation, the successful launching of which had much to do with the great consolidation movement of the five years following. After the panic of 1907, Mr. Morgan's firm greatly extended its power through securing control of other banks, or at least agreements for harmonious action, thus creating the so-called money trust.

In his work as financial leader Mr. Morgan performed public services of the highest importance. In 1893, when the United States Treasury was seriously embarrassed by the demands upon it for gold, Mr. Morgan formed a syndicate to supply \$85,117,500 in purchase of \$62,317,500 of 33-year bonds. In 1894 and 1902, through organization of control over foreign exchange, the Morgan firm checked the development of panic, and in 1907 Mr. Morgan assumed the leadership of the American banking world in its struggle to ward off a universal crash.

Mr. Morgan bore the reputation of the leading art collector of his generation. At the time of his death, the value of his collection was estimated at over \$50,000,000. Through loans to public museums a great part of the Morgan art collections have been put to the service of the public. Mr. Morgan was also distinguished for his munificence in contributing to public and semi-public institutions. His

largest gifts were to the New York Lying-in Hospital, the New York Trade Schools, and the Cathedral of St. John the Divine.

MOROCCO. The largest of the Barbary states; an African sultanate under French protection by virtue of the treaty of March 30, 1912 (ratified without reservation by Germany in 1913), except for the area conceded to Spain, and Tangier, which is to be internationalized. The Spanish concessions cover an area of 21,800 square kilometers carrying a population of about 404,000; Tangier, 600 square kilometers, 60,000 inhabitants. The French protectorate has an area of 416,800 square kilometers and an estimated population of 3,000,000. Jews number about 150,000; Europeans (1910), 19,243. There are three capitals—Fez, with 102,125 inhabitants; Morocco (Marakesh), 87,120, and Mequinez. Mogador, an important port, has 22,000 inhabitants, Casablanca (Spanish) 42,000, Tetuan (Spanish) 43,000, Rabat 60,200, Tangier 46,270. Berbers, Tuaregs, Bedouin, and Mued Arabs are among the chief elements of the population; roving bands wage war among themselves and with their European rulers. Agriculture is undeveloped and the abundant mineral resources remain unexploited. Carpets and slippers are manufactured. The trade was rated for 1912 at 152,497,000 francs imports and 75,047,000 francs exports (Great Britain 50,725,000 francs imports and 15,617,000 francs exports, France 49,953,000 and 15,540,000, Germany 13,209,000 and 17,839,000, Algeria 18,178,000 and 8,993,000, Spain 5,345,000 and 8,795,000, Belgium 4,073,000 and 442,000, Austria-Hungary 3,958,000 and 116,000, etc.). Chief articles of export follow with values in thousands of francs: Barley, 19,332; vegetables, 7113; wheat, 6579; eggs, 6125; flax, 5005; hides and leather, 4764; almonds, 4127; cattle, 2327; wool, 1580; corn, 1201; slippers, 1078; canary seed, 1224; wax, 872.

There are no authentic figures for Moroccan finance. The customs duties at the seven ports amounts to about 12,500,000 francs. The sultan's budget is placed at about seven millions. The sultan is an absolute spiritual and temporal despot. He and his subjects belong to the Malekite sect of the Sunnite Mohammedans. The reigning sultan is Mulai Yussuf, proclaimed at Fez August 17, 1912, in place of his deposed brother, Mulai Abd-el-Hafid, who had succeeded another brother, Mulai Abdul, deposed in 1908. All are sons of Mulai Hassan (1873-1894). French resident commissioner-general in 1913, General H. Lyautey; Spanish high commissioner (at Tetuan), Lieutenant-General J. Marina.

HISTORY

ORGANIZATION OF THE FRENCH PROTECTORATE. By the treaty of March 30, 1912, France was given a protectorate over Morocco with the right to occupy any part of Moroccan territory, to veto any loan or concession, and through diplomatic and consular agents to control the relations of natives with foreigners. Tangier, the Spanish zone in the north (including Melilla, Jebda, Ceuta, El Arish, and Alcazar), and the Spanish enclave at Ifni (the southernmost portion of the Atlantic coast) had been excepted from the protectorate by the Franco-Spanish Treaty of November 27, 1912.

Although Spain and France had agreed in a general way on the extent of the Spanish zones, the boundaries had yet to be delimited, and in 1913 a mixed commission of delimitation began work. The territory occupied by the French was divided into nine "regions," each under a military officer, as follows: Region of Rabat, Colonel Blandat; Chaouia, General d'Esperey; Mekinez, General Palbiez; Fez, General Gouraud; Doukhala-Abda (Mazagan), Lieutenant-Colonel Peltier; Marrakesh, Colonel Mangin; Oujda, General Alex Taowriat, General Girardot; Southern Region, Lieutenant-Colonel Ropert.

The civil administration was completed in January, 1913, by the creation of a general secretariat, to have charge of the relations with the Maghzen, public instruction, and questions affecting the natives. French interests were further represented by a director-general of finance, and a director-general of public works, chosen by the French resident-general and appointed by the sultan to assist the shereefian ministry. The resident-general (General Lyautey in 1913) was the highest representative of the French government in Morocco, combining civil and military powers, and owing obedience only to the Foreign Office at Paris, where a special Moroccan department was created. General Lyautey appeared to be on the best of terms with Mulai Yussuf; in August the sultan was decorated with the grand cross of the Legion of Honor; and on November 3 the monarch and the officers exchanged complimentary speeches at Rabat, General Lyautey expressing the hope that the pacification of Morocco might be carried on apace with his majesty's coöperation, and Mulai Yussuf rejoicing in the anticipated work of reform and civilization.

The pacification of the western coastland was interrupted in December, 1912, by the treason of kaïd Anflous, a native chieftain in the vicinity of Mogador. On January 24 General Brulard, in command of a punitive expedition sent out from Mogador, inflicted a decisive defeat on the kaïd and captured the Kasbah of Anflous. In this engagement the French lost 13 killed and 62 wounded. Subsequently the ex-kaïd Guellouli, a fellow-rebel with the kaïd Anflous, was captured, and most of the Ida-ou-Guelloul tribesmen solicited pardon and recognized Mulai Yussuf. In August there was fighting in the region of Taradant (near Agadir), and again in December, when the French commander at Agadir, warned in advance of the hostile intentions of the Kisma tribe, sent out a force to surprise the tribesmen. The insurrectionary propaganda of the pretender El Heiba met with but little success in the southern Atlas region, while in the north the French were making considerable progress. The establishment of a French post at Oued-Zem, south of Rabat, was resented by the Tadra tribesmen, who attacked Oued-Zem on February 22-23. Colonel Mangin led a column against the refractory Tadras, defeated them, and entered their Kasbah on April 7. On June 9-10 he defeated the rebellious Mohaou-Said and captured the Kasbah of the Kribas. This second success cost him 45 men killed and 101 wounded. Meanwhile General Henrys quelled a rebellion in the region south of Mekinez and occupied Azrou, in the neighborhood of Beni M'Tir mountain. General Gour-

aud, the commandant of Fez region, forced a large part of the Beni-Seddem tribe to make peace.

THE SPANISH ZONE. The Spanish army of occupation encountered determined resistance in northern Morocco. Although General Alfau, who entered Tetuan in February, inflicted a severe defeat on a body of Moors near Ceuta on July 11, they continued to hem in the Spaniards at Tetuan and made it dangerous, if not impossible, to go from Tetuan to Ceuta. No communication at all was possible between Tetuan and El Arish (Laraiche). In August the Spanish forces won several minor victories, and in September the situation around Tetuan was reported much improved. In October General Silvestre captured a Moorish stronghold at Zarkuntz. Fighting also occurred on the Anjera coast, which was bombarded by Spanish ships on June 18, and at Alhucemas, where the crew of a wrecked gunboat were set upon and killed by Moors. The expense and seeming futility of the Spanish operations in Morocco caused extreme dissatisfaction in Spain. The new Spanish cabinet issued the following statement in December: "Our designs (in Morocco) are pacific, our policy is a policy of conciliation and of intimate relations with the natives. . . . Meantime it is necessary for us to maintain the positions which we have occupied thanks to the efforts and heroism of our army, and the ability of our officers; and the positions whose occupation may be indispensable if we would assure our position and convince the rebels that Spain has the might to protect its rights and its interests."

MORPHINE. See COCAINE AND MORPHINE HABIT.

MORROW, PRINCE ALBERT. An American dermatologist, died March 17, 1913. He was born in Mount Vernon, Christian County, Ky., in 1843, and graduated from Princeton College, Kentucky, in 1864. He studied medicine at the University Medical College of New York, graduating in 1874. From 1884-1904 he was attending surgeon at the City Hospital, New York City. After holding important positions in other hospitals, he became in 1890 attending physician in the skin department of New York Hospital. Here he remained until 1904. He was also consulting dermatologist in other New York hospitals. For over twenty years he made a particular study of leprosy. In 1888 he spent the winter in the Sandwich Islands and visited the leper colony at Molokai. He was one of the first physicians of note to advance the theory that the nostrils are the port of entry for leprosy. He was a prolific writer of medical literature, and from its organization in 1905 was president of the American Society for Sanitary and Moral Prophylaxis. He was also the author of *Drug Eruptions* (1887); *Leprosy* (1899); *Social Diseases and Marriage* (1904).

MOUNT HOLYOKE COLLEGE. An institution for higher education of women, founded at South Hadley, Mass., in 1837. The students.

enrolled in all departments of the college in the autumn of 1913 were 772. The faculty numbered 89, and the administrative staff 43. There were no noteworthy changes in the faculty during the year. There were received for scholarships \$28,010. The productive funds of the college in 1912-13 amounted to \$1,386,119, and the income to \$55,677. There were 50,000 volumes in the library. The president is Mary E. Woolley, M.A.

MOVING PICTURES. The popularity of the moving picture as a form of entertainment constantly widened with the development of the art, and by the year 1913 had become so comprehensive as to include not only a means of public entertainment, but one of demonstration and instruction as well. Moving pictures were used to a very great extent for instructing employes of railroads, factories, and machine shops as a part of the "Safety First" movement to which so much attention in the industrial world was being directed. To illustrate the safest method of operating a certain machine, for example, or the safest method to adopt when moving heavy machinery from one portion of a shop to another, are instances in which this system had been of great value. In many schools and colleges also, moving-picture apparatus was finding a constantly widening use for the instruction of students in the elementary branches of science.

In New York City the Educational Alliance had arranged to give moving picture shows for school children, to which the price of admission was to be 3 cents. It was decided to introduce these shows after a study had been made of the entertainments given at the alliance. District superintendents of the city schools announced that the exhibitions would be confined to educational and morally uplifting topics, rather than any that might unduly develop a taste for excitement and adventure in the minds of the children. It was advocated also by the New York Kindergarten Association that moving pictures be employed in the primary grades of the schools. This matter was, at the end of the year, not decided upon. Some enterprising manufacturers of automatic machinery recently made use of the moving picture machine through their selling department for the purpose of demonstrating to prospective customers the details of operation of such machines which would not ordinarily be visible to an observer.

Processes of manufacture were shown in great detail by moving picture films, and a prominent manufacturer of steel wire fencing exhibited before farmers' institutes and at the hardware trade conventions throughout the United States films descriptive of the modern methods of mining and shipping ore, manufacturing pig iron, the subsequent process of the conversion of the material into steel and thence through the mill to the finished product, wire; the exhibitions thus combining the advantages of advertising for the manufacturer with that of a broader instruction of the people at large.

Many estimates have been attempted to determine the amount of money invested in the moving picture business in the United States and Canada. At the close of the year 1913, the number of theaters was more than 20,000 and this number did not include existing houses that had substituted moving pictures for their

regular theatrical business. The capital invested is certainly several hundred million dollars, and the difficulty of obtaining an accurate estimate of its amount was due to the fact that the manufacturing portion of the business involved an immense amount of capital which was not reported to any particular board or agency. In making up a photoplay, the time and expense involved in getting the actors together, staging, and making a satisfactory set of photographs is considerable. Add to this, the duplication of the original, so that the films may be used in many theatres simultaneously, and also the allowance for depreciation due to the short-lived popularity of the average photoplay, and it is possible to realize the large amount of money invested in this part of the industry.

There was considerable advance made in the design and construction of the projection machines used, with a view to giving clearer pictures and to diminishing the risk of fire in case of a stoppage of the film, which was the commonest cause of fires in these places of amusement.

From both a commercial and a sociological point of view, the popularity of this form of entertainment was constantly increasing. A reliable estimate stated that the average daily attendance at moving picture theatres in the city of Chicago exceeded 750,000 persons. In proportion to the 2,000,000 population of the city and its suburbs this was significant, and probably quite representative of the ratio that holds in other large cities.

This widespread popularity, and the ever-present desire of theatrical managers to secure new topics and scenes to enable them to hold it, naturally resulted in the necessity of facing many serious problems that at first were not foreseen. Among these may be mentioned the moral tone of the plays shown and the attitude of the public, the newspapers and the managers towards them; and of equal importance was the fire risk existing in the average badly planned and cheaply built hall, or theatre, in which such exhibitions were held. With regard to both these questions, the public was showing an encouraging tendency, in the light of events taking place during the year, to hold the officials of various grades concerned to a strict accountability, not only for the quality of the plays shown, but for the construction and regulation of the buildings in which they were displayed. There was a decided improvement in the design of these theatres, due to an aroused public interest and a much stricter examination by local building and fire department inspectors, accompanied often by more vigorous State statutes.

Considering the exhibition in a number of moving picture theatres of films whose purport was alleged to be to call the attention of the public to various forms of vice and arouse a general interest in the correction of these evils, it appeared as if the management running such reels had either sadly misjudged the public taste, or had overdone a matter which presented with more delicacy and discretion, might have resulted in a wholesome enlightenment of the public. As it was, there seemed to be a marked disgust expressed by the more discriminating and disinterested of the audience, and it was unlikely that such films would be run to any extent, until some modification and expurgations

should have been made by a duly appointed board of censors.

While the idea of combining a phonograph, or talking machine, with a kinoscope, known as the kinetophone, or "talking movies," was by no means new, and while several such machines were used in public for some time, they were not satisfactory, for the reason that where the connection between the two was simply mechanical, as was common, any irregularity of motion due to the wearing of bearings or inaccuracy of construction would cause one machine to run at a different rate from the other and spoil the effects produced. In order to obtain perfect synchronism between action and lines, an ingenious electrical connection was being developed and was said to give perfect results, the motor driving the projecting mechanism being controlled electrically by one of the circuits of the phonograph motor. It was said that all possible sources of irregularity and asynchronism had been eliminated, and the slightest change in the one circuit immediately affected the other, reproducing each sound with the motion accompanying it, exactly as enacted by those making the original film.

A decision was handed down in the chancery division of the High Court of Justice in England in the case of a petition for revoking a patent No. 26,671 granted to George Albert Smith for "improvement in and relating to cinematograph apparatus for the production of colored pictures." The decision was adverse and dismissed the petition in legal language. No ground was shown for the revocation of the patent and the petition was dismissed with costs. The court also granted the prayer of the respondent for a certificate that the validity of the patent had been brought into question. This decision, it was said, terminated finally the litigation over the invention of what is known as "kinemacolor."

MUNICIPAL EFFICIENCY. See MUNICIPAL GOVERNMENT.

MUNICIPAL GAZETTES. See MUNICIPAL GOVERNMENT under *Official Municipal Gazettes*.

MUNICIPAL GOVERNMENT. In the United States, the commission plan continued to be a country-wide movement and the commanding feature in municipal government. About a hundred cities adopted the plan in 1913; a few more than in any previous year. Next to the commission plan in general interest was the city-manager plan, which made a great stride during the year. The campaign for honesty, for greater efficiency, and for the freedom of municipal from State and Federal politics was continued on every hand, often with encouraging results.

COMMISSION PLAN. Probably no other innovation in municipal government ever spread so rapidly as did the commission plan, with its small confined legislative and municipal body elected at large by non-partisan means and its democratic control features of the initiative, the referendum, the recall, and publicity. Beginning at Galveston, Tex., in 1901 with the small all-powerful commission as the distinctive feature which had given the name to the plan, and continuing in 1905 with the adoption of a modified plan by Houston, the movement began to gain force in 1907 with the adoption of an improved plan by Des Moines,

Iowa. In and since 1910 from sixty-five to a hundred cities have adopted the commission plan each year until at the end of 1913 385 places were included in the list. Reliable figures are not easily secured because the plan varies considerably from State to State and city to city, as well as in the minds of those who attempt to say what are and what are not commission cities.

The accompanying list of 385 cities is rearranged geographically from one compiled by the National Municipal League of Philadelphia, with five cities added from the 1913 list of the National Short Ballot Organization, New York City. Of the 40 States in the list, Texas leads with 41 and Kansas is a close second with 39 cities.

† Home rule charter.

Arranged geographically by groups of States the number of commission plan cities from greatest to least is as follows:

South Central.....	110	Pacific	37
North Cen. West.....	86	Mountain	22
North Central.....	56	New England.....	8
Middle	52		
South Atlantic.....	28	Total	385

By years the growth of the commission plan was as follows:

1901.....	1	1910.....	66
1905.....	1	1911.....	96
1907.....	7	1912.....	67
1908.....	5	1913.....	112
1909.....	23	Not given.....	7
Total			385

In the early years of the commission plan nearly all the cities which adopted it were small and it was urged that it was not applicable to cities of considerable size. Gradually the size of the commission cities rose to 100,000 and then upwards until in 1912 New Orleans (population 339,030 in 1910) was included in the list. Four other of the cities had populations of more than 200,000 in 1910; eight had between 100,000 and 200,000 and nearly forty had more than 50,000 inhabitants. The total population of the cities which had adopted the commission plan up to the close of 1913 was given by the National Municipal League as 7,500,000. In addition to the cities of the United States one Canadian city, St. John,

N. B., was reported as being under the commission plan.

The large accession to the commission plan list in 1913 was in no small part due to an act of the Pennsylvania legislature which brought all 23 of the third-class cities (below 100,000 population) under the commission plan. A second act enabled any one of 42 boroughs of the State having a population of 10,000 or more to adopt the commission plan, which was done by some of the boroughs in 1913. The Pennsylvania commissions consist of a mayor, who serves four years, and four councilmen, who serve two years each. All are elected at large, as is also a controller. A city solicitor, engineer, treasurer, assessor, and clerk are appointed for two years by the commission. The commission fixes the salaries of its members within a wide stated range. It was said that this would facilitate the adoption of the city manager plan—under which it was common for the commissioners to serve for a nominal salary. The recall feature was omitted from the act. No provision was made for civil service and little was stipulated as to the qualifications of administrative officers. Unusual dignity and importance was given to the office of city engineer. That official must be a "competent civil engineer" and was to have the "direction and control of the engineering matters of the city," besides appointing his own assistants.

CITY MANAGER. The adoption of the city manager plan by 13 cities during the year 1913 led many persons to believe that it was going to sweep over the country as did the commission plan. There was at least some warrant for this belief since the manager plan made more rapid progress in this one year than did the commission plan in its first six years, and since the manager plan was being adopted by commission plan and non-commission plan cities. The forerunner of the city manager plan and in the opinion of some the first city to adopt it was Staunton, Va., in 1907 or 1908. In 1911 a proposed new charter for Lockport, N. Y. (which never went into effect), provided for a city manager. In 1912, Sumter, N. C., decided for a city manager along lines more like the proposed Lockport plan than like the plan in effect at Staunton. In 1912, also, Norwood, Mass., combined in one official position the duties of town engineer, superintendent of public works, and director of the water and lighting systems. A similar combination of offices was made at Clarinda, Ia., in 1913. Neither the Staunton, Norwood, nor Clarinda managers appeared to have so full powers nor such a relation to the legislative division of the respective municipalities as was required by the city manager plan, as promoted by the National Short Ballot Organization. In the conception of the association just named the city manager exercised all executive functions, including appointment to all other executives, but was himself subject to the control of the city commission or council, which appointed and at any time might discharge the manager. Under this definition Sumter was the first city to adopt the plan and, all told, 14 cities had adopted it at the close of 1913.

These cities, with their populations by the U. S. Census for 1910, are as follows:

Hickory, N. C....	3,716	River Forest, Ill.	
Morris, Minn.....	1,685	Morganton, N. C. 2,712	

Sumter, S. C.	8,109	Abilene, Kan.	4,118
Dayton, O.	116,577	Amarillo, Tex.	9,957
Middletown, O.	13,152	Terrill, Tex.	7,050
Springfield, O.	46,921	Phoenix, Ariz.	11,134
Cadillac, Mich.	8,675	La Grande, Ore.	4,843

If Stanton, Norwood, and Clarinda be added (see text), the list would number 17 cities and towns. Westmount, Quebec, also appointed a city manager in 1913, after public advertisement for applicants.

It will be noted that Dayton and Springfield were the only cities of any size that had adopted the city manager plan. The plan seemed to be particularly well adapted to small cities, which would not be able to hire a well-trained man to become head each of a number of city departments, but could well afford to pay a high salary to a single administrator of broad experience and high ability. The city manager plan had more generally than otherwise been adopted as an adjunct of the commission plan. It was thought that this fact, and the strong advocacy in some quarters combining the two plans was a confession of weakness in the commission plan which had been noted by important observers almost from the start: The attempt to elect executive officers and make them a combined legislative and administrative body, without a head or leader.

Under the new commission-manager charter (1913) of Dayton, Ohio, the city manager is appointed by the commission without regard to political beliefs or residence. He holds office at the will of the city council and in addition is subject to recall by popular vote. It is his duty to see that the laws are enforced; to appoint and remove all heads of departments and all subordinate officials and employees, subject to certain civil service rules, all appointments to be based on "merit and fitness alone"; to exercise control over all city departments; to attend all meetings of the commission, with the right to take part in the discussions but with no right to vote; and to keep the commission advised as to the financial condition and needs of the city. The Dayton manager has power to cause an investigation to be made of any department or of the conduct of any officer or employee of the city. His salary is fixed by the commission. Late in 1913 the Dayton commission appointed as city manager, at a salary of \$12,500 a year, H. M. Waite, at that time city engineer of Cincinnati, Ohio. For an exposition of the city manager plan, as conceived by the National Short Ballot Association of New York City, see a bulletin issued by the association late in 1913. The bulletin will also be found to contain city manager charter provisions, both for cities which have adopted and for those which have rejected the plan.

HOME RULE. It had long been an anomaly that cities of so democratic a country as the United States should have far less freedom than those of some of the most strongly monarchical countries of Europe. In America both theory and practice had been until recently, and still was in most commonwealths, that the city was merely the creature of the State. Accordingly a large proportion of American cities had to go to their State legislature for any and every minor change in their frame of government and in many cases for authority to increase the salary of a city official. For several de-

CADES freedom from legislative control over city charter had been increasing in the Western States and latterly this freedom had been granted in greater or less degree to some or all the cities of several States in the Middle West. The so-called home rule States in 1913 included California, Oregon, Washington, Idaho, Colorado, Texas, Oklahoma, Nebraska, Minnesota, Michigan, and Ohio. Some degree of home rule was granted to the cities of New York in 1913 by an act which increased the general powers of municipalities, but this act carried no authority to adopt or amend charters. The home rule principle was upheld during the year by the courts of Colorado and Ohio, the new locally-framed charter of Cleveland being at issue in the Ohio decision. Acting under an Ohio constitutional amendment of 1912 not only Cleveland but also a number of other Ohio cities framed new charters through local charter drafting commissions elected by popular vote, the charters also being approved by popular vote.

PUBLIC UTILITY COMMISSION. By 1913 Wisconsin and New York public utility commissions, which had not been established many years before, were copied more or less closely by many other States. These commissions have control of the rates, quality of service and capitalization of companies operating under municipal franchises. The Wisconsin commission and the Massachusetts gas and electric commission (established two decades or so before any of the other commissions) have control over municipally as well as privately owned utilities. The extreme home rule advocates objected strongly to the State utility commissions, urging that the regulation of street railway and lighting companies, etc., should be left entirely to the local authorities. This contention overlooked the fact that the State utility commissions were established because the municipalities were unable or unwilling to regulate the franchise companies and the further fact that the larger expert staff, financial resources, and experience of the State commissions enabled them to exercise more efficient and economical control than could local commissions.

INSTRUCTION IN MUNICIPAL GOVERNMENT. An encouraging factor in the municipal field was the attention which the universities and colleges of the United States were giving to the subject of municipal government. According to figures gathered by Prof. William B. Munro (see *National Municipal Review*, July, 1913) in behalf of a committee of the National Municipal League, no less than 64 institutions were giving "independent and distinct instruction" in municipal government in 1913, as compared with 46 five years earlier. The enrolled students in 1913 ranged from 5 to 86 per institution. The article mentioned contains a table showing what institutions had courses devoted wholly and what partly to municipal government, the number of courses offered, the amount of time given to each, and the number of undergraduate and graduate students enrolled at each institution.

OFFICIAL MUNICIPAL GAZETTES. The United States is almost the only one of the leading nations of the world which does not supply its people with information of its activities through an official gazette. What the govern-

ment has failed to do, several cities have attempted. The following is a partial list, compiled by Henry J. Harris, Library of Congress, of the cities which publish official journals for general information concerning the activities of the municipality. The name of the periodical is also given:

Atlantic City, *Commission Government*.
 Boston, Mass., *Monthly Bulletin*; issued by the statistics department.
 Baltimore, Md., *Municipal Journal*; issued semi-monthly.
 Burlington, Ia., *Proceedings of the City Council under the Commission Plan of Government*; monthly...
 Centralia, Wash., *Monthly Summary of Proceedings*, and itemized statement in detail of the receipts and expenditures of the city commission.
 Chattanooga, Tenn., *Municipal Record*; issued monthly.
 Colorado Springs, Col., *Summary of Proceedings and Department Reports*; issued monthly.
 Denver, Col., *The City of Denver*; issued semi-monthly by the city and county of Denver. Successor to *Denver Municipal Facts*.
 Houston, Tex., *Progressive Houston*; issued monthly.
 Lexington, Ky., *The City of Lexington*.
 Los Angeles, Cal., *Los Angeles Municipal News*; discontinued in 1913.
 Memphis, Tenn., *Commission Government*.
 New York, N. Y., *The City Record*; issued daily by the board of city record.
 Omaha, Neb., *Municipal Statistics*; issued monthly by the department of accounts and finance.
 Philadelphia, Pa., *Philadelphia*; issued monthly; discontinued.
 San Francisco, Cal., *Municipal Record*; issued weekly.
 San Jose, Cal., *Municipal Record*; issued monthly.
 Seattle, Wash., *Municipal News*.
 Spokane, Wash., *Official Gazette*.
 Tacoma, Wash., *Municipal Bulletin*; issued monthly.

SOCIAL CENTRES. The social centre movement, at first local in character and depending upon private initiative, had become national in extent and had a large amount of public support. In 1910 a bureau of social centre development was established as a part of the extension division of the University of Wisconsin, with Edward J. Ward, who had been active in that line of work in the city of Rochester, as adviser. In 1911 a national conference on social centre development met at Madison, Wis., and the Social Centre Association of America was formed. Its aim was to utilize public school buildings for all sorts of municipal activities, notably for voting, as well as for educational, recreational, and purely social purposes. Various features of this plan had been adopted by different American cities. In Grand Rapids the kindergarten was used as a voting place. In Los Angeles, to meet the needs of the newly-enfranchised women voters for a decent place to cast their ballot, the public school buildings were thrown open. In Chicago and New York recreational centres had been established in buildings especially devoted to recreation. New York had thirty-eight such centres. At least five States passed laws authorizing the use of public school buildings for general community gatherings. Wisconsin, the pioneer in State legislation on this subject, enacted a law in 1910, authorizing school trustees or school or other boards to grant to organizations of a civic, social, or recreational nature, the use of schools for public meetings on petition of one-half the voters in the district. Similar legislation was enacted in Ohio and Indiana in 1913. The Massachusetts law authorized the school committees of any town or

city except Boston to conduct educational and recreational activities in or upon school property and to allow private associations to do the same, under regulation and without charge to the public.

In California the law established a civic centre at every school house in the State, to be under the control of the school trustees or district boards of education. Light, heat, janitor service, and a special supervising officer were to be provided out of the school funds. Consult: Ward [Editor], *The Social Centre* (New York, 1913); Perry, *The Wider Use of the School Plant* (New York, 1910).

Statistics of Social Centres. In the Recreation Census for the year ending November 1, 1913, completed by the Playground and Recreation Society of America, the following statistics were given regarding the use of school houses as social centres in the United States: "In 79 cities, last year, school houses were used as recreation centres. Seventy-four of these cities reported 368 such centres. In three additional cities 65 schools were used for lectures." Of these 82 are included in the 342 cities whose recreation centres had paid supervision. Of the 300 other communities which had recreation centres but no paid supervisors "55 cities reported evening recreation centres in their schools. Fifty-one of these cities reported 96 such centres." Altogether the wider use of public schools was seen in 137 cities last year, of which 128 cities reported 529 school centres. In the previous year (1912) 114 cities reported the evening use of schools; in 102 of these cities there were 357 such centres.

WOMEN HOLDING OFFICE. There were few municipal offices, whether elective or appointive, that were not held by women in one or more cities at the close of 1913. The following cities had women mayors: Warrenton, Ore.; Tyro, Kan.; Hunnewell, Kan.; Dayton, Wyo.; Anadia, Ill. Thirteen cities, of which eight are in Colorado, had women city treasurers. Atlantic City, N. J., made a woman city comptroller. One Kansas city and one Colorado city had a woman auditor. There were five city clerks, seven judicial officers, one alderman, and twenty-six policemen (most of them with very special duties) on this partial list of women municipal office holders published by Jane Campbell in the *National Municipal Review* for January, 1914. In addition Miss Campbell gave a miscellaneous list of women office holders containing about thirty names. This did not include about 500 school superintendents and many other officials connected with the public school system.

GRAFT. Those who wish to enter an unpleasant part of the municipal government may consult a "Review of Graft Prosecutions and Exposures for the Past Year," by C. R. Atkinson, in *The National Municipal Review* for July, 1913. Major cases or investigations were reported for New York, Chicago, Philadelphia, Atlantic City, Detroit, Des Moines and Clinton, Iowa, West Hammond and Gary, Ind., Milwaukee, and Bloomsburg, Pa.; eleven cities in all. Minor cases are reported briefly for 13 additional cities, and mention was made of 11 more cities for which sufficient data was lacking.

BIBLIOGRAPHY. Howe, *European Cities at Work* (New York); Pollock and Morgan, *Modern Cities* (New York); McVey, *The Making of*

a Town. By far the most extensive single source of information on the various phases of municipal affairs is *The National Municipal Review*, a quarterly published by the National Municipal League of Philadelphia. Besides essays, short articles, and scores of notes classified under various heads, each number contains reviews of reports, documents, and books, and also an extensive bibliography.

See also BATHS; CITY PLANNING; GARBAGE AND REFUSE DISPOSAL; MUNICIPAL OWNERSHIP; ROADS AND PAVEMENTS; SEWAGE PURIFICATION; SMOKE ABATEMENT; WATER PURIFICATION.

MUNICIPAL LEAGUE, NATIONAL. The annual meeting of the league was held at Toronto, November 15, 1913. At this meeting the committee on franchises presented an elaborate report discussing the question of local and State regulation. The committee in general took strong ground against making State regulation on street railways, telephones, electric and gas plants, and other public utilities, exclusive. The committee on commission government reported at length, showing wherein the city manager plan was to be regarded as a logical development of the commission form of government. Several of the speakers pointed out wherein this plan represented a completer and more effective unification of the administrative work of the city, making possible the retention of prominent professional experts, and therefore opening a new career with great possibilities. Other committees which reported were on municipal budgets, municipal reference libraries, the liquor question, and on municipal courts. New committees were authorized on political methods, on the cost of living, and on experts. The following officers were elected: President, William Dudley Foulke; vice-presidents, Miss Jane Addams, John Stuart Bryan, Camillus G. Kidder, George McAneny, J. Horace McFarland, Charles Richardson, Chester H. Roell, Dudley Tibbits, A. Lawrence Lowell; secretary, Clinton Rogers Woodruff; treasurer, George Burnham, Jr.

In September, 1913, a department of civic education was established, with Arthur W. Dunn as director. This new department will have charge of the coördination and extension of the work of the public schools in the matter of civic education. Maurice Fels was made chairman of the committee in charge. The league also established during the year the National Municipal League Series. This consisted of four volumes: *City Government by Commission*, by Clinton Rogers Woodruff; *The Initiative, Referendum and Recall*, by William Bennett Monroe; *The Regulation of Municipal Utilities*, by Clyde Lyndon King; and *The Social Centre*, by Edward J. Ward. The league continues to publish the *National Municipal Review*, a quarterly discussing municipal questions.

MUNICIPAL OWNERSHIP. In 1913 San Francisco, Denver, and Indianapolis were the only cities of the United States which did not own their water-works. During the year San Francisco began condemnation proceedings to acquire the water-works of the Spring Valley Water Company, and secured Congressional authorization to build a dam and aqueduct in the Yosemite National Park for an additional water-supply (see WATER-WORKS). In Denver agitation for municipal ownership of water-works was continued. Besides the purchase of the

plant of the Denver Union Water Company the city had under consideration a joint water-supply and railway tunnel scheme. If this was carried out the city would contribute \$3,000,000 toward the building of a tunnel through the Continental Divide for the Denver and Salt Lake Railroad (the "Moffatt Road" under a new organization). The tunnel would also accommodate a water conduit from the headwaters of the Grand River, on the western slope of the Divide. A tentative agreement was made for the city purchase of the property of Des Moines Water-works Company, but ratification by popular vote had not been attempted at the close of the year.

The municipally-owned street railway lines at San Francisco were being extended during the year, and there was a movement at Toronto, Ontario, to buy the privately-owned street railways which serve that city.

A municipal milk distribution system for Jamestown, N. Y., was recommended in October by S. A. Coolson, mayor of that city. A committee of the council endorsed the recommendation. Late in December the matter was before the legal department for report. The plan was for the city to pasteurize all milk at one station and establish a single delivery system, in place of the present seventy-five private milk distributors. The estimated capital cost of the prospect was \$30,000.

Legislation authorizing municipal ownership of one kind or another in ten different States was passed in 1913. See *National Municipal Review*, October, 1913, for this legislation, and same, January, 1914, for notes on municipal markets and slaughter houses. The Georgia Supreme Court declared constitutional the issue of bonds for a municipal ice plant, and the attorney-general of Ohio ruled that under the new Ohio constitutional amendments cities cannot make and distribute ice.

MURRAY, ROBERT. An American soldier, died January 1, 1913. He was born at Elk Ridge, Maryland, in 1822, and was educated privately and at the University of Pennsylvania. Appointed assistant surgeon in the United States army in 1846, he was transferred to California and served in several posts in that State until 1850, when he returned to Fort Independence, in Boston. In 1854 he again returned to California and was promoted to be surgeon. In the following year he became medical director and purveyor of the Department of the Cumberland. In 1862 he went to Philadelphia, and remained there until 1865. He received brevets of lieutenant-colonel and colonel for services in the Civil War. From 1867-76 he was medical purveyor of the military division of the Pacific at San Francisco. He was medical director of the division of Missouri in 1882. Coming again to the East he was assigned as medical director of the division of the Atlantic and the Department of the East. In 1883 he was appointed surgeon-general of the United States army, and three years later was placed on the retired list.

MUSEUMS OF ART. See PAINTING AND SCULPTURE.

MUSIC. Following an established custom, a brief summary of the principal events of the last four years precedes the record of musical events of the past year. When Mr. Gatti-Casazza assumed the directorship of the Metropolitan Opera House, the Manhattan Opera

House under Mr. Hammerstein had come to be a formidable rival. The effect of this rivalry was noticed in a marked improvement in the chorus and stage management of the other institution (1908). The next year the Metropolitan company almost doubled its forces in all departments. The season at both houses closed with a heavy deficit. Boston opened its own opera house with a brilliant company. The New York Philharmonic Society, which for several years had been declining, was entirely reorganized under Gustav Mahler (1909). The enormous expenditures incurred through the production of many new operas and the payment of exorbitant salaries to the principal artists forced Mr. Hammerstein to withdraw and sell all his interests to his rival. The greater part of his company was formed into a new organization, the Chicago Opera Company, under Mr. Dippel. In order to prevent a recurrence of conditions leading to financial ruin, the three opera companies of New York, Boston, and Chicago apportioned the territory among themselves and adopted a plan to exchange their principal artists (1910). This understanding was strictly observed and resulted in great saving. But still more important was the effective resistance that was opposed to the so-called Opera Trust controlled by the house of Ricordi of Milan. Not only had the trust become more and more tyrannical in its demand for exorbitant royalties on the works it controlled—they included almost the entire operatic output of Italy—but it practically dictated what Italian works were to be produced, irrespective of the wishes or taste of the audience. The failure of Puccini's *Girl of the Golden West* brought matters to a climax. Mr. Dippel immediately eliminated all of Puccini's works from his repertoire (1911). The differences between the American opera houses and the trust were finally adjusted. Operas by American composers were produced, and the movement for the production of opera in the vernacular was rapidly gaining ground. The activity of musical scholars, especially in Germany, resulted in the discovery of several manuscripts of Beethoven, Bach, Liszt, and Schumann in hidden corners of old libraries (1912).

GENERAL NEWS. The year 1913 brought to light some forgotten manuscripts. In an old chapel on the estate of Count Fürstenberg near Donau Eschingen an unknown symphony of Haydn, written in the master's humorous vein, was discovered. It was performed at Baden-Baden. The Schumann Museum at Zwickau acquired the manuscript of a short treatise on counterpoint written by Schumann for his pupil, C. G. Ritter, in 1847-48. On the first page is written in the master's own hand: "Not intended for publication." In order to increase the fund for the Chopin monument to be erected in Warsaw, the family of Count Scheremetje turned over to the monument committee an "Album Leaf" written by Chopin in 1843 into an album belonging to Countess Anna Scheremetje. The existence of this composition was unknown to any but the immediate family.

If formerly young composers found it difficult to obtain a first hearing, conditions have radically changed in recent years. A cursory glance over programmes of musical organizations all over the world shows a formidable array of unknown names and an endless list of new works by composers of greater or less reputation. The

statistics of Germany for the past year show that no less than 265 new operas by composers of all nationalities were given in Germany alone. It is safe to predict that over 250 of these will never find their way to any other stage. It is not that the public has developed this craze for novelties; but the rivalry of organizations is responsible for this state. Everywhere complaints are heard that the public does not support new works, so that at last the London Symphony Society has had the courage to announce in its last prospectus that no novelties will be produced during the ensuing season (1913). It states explicitly that too much time and energy is expended in rehearsing works which no one wishes to hear a second time, while the masterpieces of the great composers are neglected.

During the year the musical world followed with intense interest the petition presented to the German Reichstag by the Wagner family for an extension of the copyright of *Parsifal*, which expired on December 31, 1913. To the sincere joy of all lovers of music the petition was denied, and opera houses throughout the civilized world at once began preparations for the earliest possible production of this masterpiece. Toward the end of the year the rivalry was so keen that several houses announced the first performance to begin on the stroke of midnight of December 31. Barcelona even announced the beginning at 11 o'clock, corresponding to midnight of Central European time. Zürich did not wait till the end of the year, but produced the work already during the summer. As a matter of record it may be stated that up to January 1, 1914, *Parsifal* had forty-three performances at the Metropolitan Opera House in New York, and a considerable number of performances of excellent quality by the Savage Opera Company, in English, during the season 1904-5.

THE UNITED STATES

ARTISTS: INSTRUMENTALISTS. The idol of Americans, Paderewski, made his ninth American tour and proved that his hold on the American public is still as strong as ever. His art was at its highest even when he first came here in 1891, but it has not declined. The only fault that must be charged against him is an occasional forcing of the tone of the instrument beyond its proper limitations. A new artist of the first rank was Max Pauer, who in Boston was acclaimed a second Paderewski and made a profound impression everywhere. An English pianiste, Ethel Leginska, proved herself an excellent artist, and scored genuine success. Eleanor Spencer, a native American, made her début in her native land after she had established a European reputation in eight successful seasons abroad. Her sterling qualities won the unstinted approval of her compatriots. Harold Henry of Chicago, proved himself a serious artist whose further career will be watched with interest. Josef Hofmann may now be regarded as having attained his full artistic height. There is no pianist living who surpasses him in any respect. He is one of those very rare cases where a child prodigy has fulfilled in the fullest measure the early expectations. After an absence of several years Teresa Carreño was heard again by large and enthusiastic audiences, whose attitude was decidedly at variance with

that of some critics who believed they detected a falling off in her former mastery of the instrument. That the year was an exceptional one for brilliant pianistic achievements becomes evident from the mere enumeration of the names of the other eminent pianists whose fame is securely established, and calls for no special comment. The gentlemen included Bachaus, Godowski, Scharwenka, Lhevinne, Ganz, Schilling; the ladies, Fannie Bloomfield-Zeisler, Tina Lerner, Katharine Goodson, Germaine Schnitzer, Yolanda Merù.

Among the violinists attention was chiefly centred upon Ysaye. He still drew enormous audiences, although it became evident that he has passed the zenith of his powers. His playing was very unequal. At times he was the incomparable master of former years, at other times he seemed listless, and even his former impeccable purity of intonation left much to be desired. The fact that as recently as 1911 Kubelik had announced his farewell American appearance did not prevent that master from coming again and playing to crowded houses. His joint concert with Mme. Melba at the Hippodrome in New York established a new record for attendance. After a few performances with the Boston Symphony Orchestra during the preceding year, Kreisler was heard again in a number of recitals, and impressed many as being the greatest living master of the violin. One of the concerts of the Philharmonic Society of New York became of special significance from the fact that Maude Powell played the Tchaikowski concerto just twenty-five years after she had first introduced that masterpiece to America in a concert with the same organization. Elman, Zimbalist, Hartmann, Persinger, and Kathleen Parlow also contributed to the artistic offerings of the year. The noble 'cello was represented by such artists as Alwin Schroeder, Leo Schulz, Paulo Gruppe. A newcomer was the English 'cellist, Beatrice Harrison. Although her tone was not large, it possessed an excellent carrying quality, and the impression made by the artist was most favorable.

VOCALISTS. The famous Dutch contralto, Julia Culp, visited America for the first time. Her wonderful voice and supreme art immediately won enthusiastic recognition. By the end of the year she had securely established herself as one of the prime favorites. Another new artist of the first rank was the great contralto of the Hamburg Opera, Otilie Metzger, who appeared only in two concerts of the Philharmonic Society, but even so left no room for doubt as to her rank among the world's great contraltos. The tour of Mme. Melba, who sang only in concerts, and chiefly in conjunction with Kubelik, was a succession of triumphs. It was remarked that time had scarcely affected her beautiful voice, and that she had shown greater intensity of feeling than ever before. After an absence of fourteen years Clara Butt, the renowned English contralto, visited America once more. While her voice sounded as full and fresh as in former years, her mere mechanical skill had grown considerably. Just before the close of the year a German baritone, Franz Egenieff, introduced himself in a recital and created a very favorable impression. That Mme. Nordica has practically abandoned the stage and is devoting herself to concert singing—not lieder recitals,—is cause for sincere regret. Unsurpassed as a dramatic singer, especially in the Wagnerian rôle, on the

concert platform she cannot satisfy the fastidious because her programmes are generally arranged with poor taste. To complete the record of the year's profusion of vocal offerings of the first order it is sufficient merely to mention the names of such recognized artists as Mmes. Schumann-Heink, Sembrich, Alda, Gluck, Gadske, Farrar, Teyte Gerhardt, and Messrs. Bonci, Hess, Griewold, Witherspoon, Hinshaw, McCormack, Clément.

ORCHESTRAS. The Boston Symphony Orchestra (Karl Muck) reports the most prosperous season since its foundation in 1883. Not less than 109 concerts were played, including two for the benefit of the pension fund. Its famous harpist, Heinrich Schneckner, who died during the year, was succeeded by Alfred Holy, of the Imperial Opera of Vienna. The great reputation which this famous American orchestra enjoys can readily be seen from the fact that for Mr. Schneckner's position not less than two hundred applications were received from all parts of the world. The third season of the New York Philharmonic Society under its new conductor, Josef Stransky, proved that the choice of the directors was a happy one when they selected Mr. Stransky to succeed the late Gustav Mahler. Mahler's policy has been faithfully and efficiently carried out, and the results of unceasing rehearsal are plain. The orchestra is now in all respects the equal of the famous Boston organization. The year witnessed several changes in the personnel of the society, the principal one being the advent of Leopold Kramer, formerly of the Theodore Thomas Orchestra and the Chicago Opera Company, as concertmaster. The Theodore Thomas Orchestra (Frederic Stock) changed its name and was officially incorporated as the Chicago Symphony Orchestra. Its season was marked by the production of an unusual number of novelties, two of its concerts having been devoted exclusively to works by American composers. The Minneapolis Symphony Orchestra (Emil Oberhoffer) played 109 concerts in 52 different cities in twelve States, performing 139 compositions. The Cincinnati Symphony Orchestra (Ernst Kunwald) was increased to 85 players, and extended its activities. Every year reports are received of the establishment of new symphony orchestras in all parts of the United States, a gratifying testimony to the growth of musical culture. Thus San Francisco reports the establishment of the Peoples' Philharmonic Orchestra of 55 performers under Herman Perlet, while the older symphony orchestra under Henry Hadley reports a satisfactory season. Denver also now boasts two symphony orchestras since Raffaele Cavallo continued his popular summer concerts as regular symphony concerts through the winter. Cleveland established a municipal orchestra of forty performers under Christian Timmner to give free concerts in the parks from June to September. During the winter months it is increased to fifty players, and gives symphony concerts at the Hippodrome. Since the dissolution of its fine orchestra in 1910, Pittsburgh has been in a rather sad plight. The concerts given by visiting orchestras under the auspices of the Pittsburgh Orchestra Association have met with so little success that the association during the past year announced its intention of abandoning all orchestral concerts. Thereupon the Pittsburgh Festival Orchestra under Carl Bern-

thaler undertook to provide a number of symphony concerts for the winter.

NOVELTIES. The number of novelties provided by the more important orchestras was unusually large, but little of real value was heard. In fact, considerable adverse criticism was directed against Dr. Muck and the Boston Symphony Orchestra for the poor quality of most of the new works brought out. The Philharmonic Society under Mr. Stransky introduced two works by Max Reger, both of which were very fine. The first was a new *Romantische Suite*, op. 125, the second a *Ballet Suite*, op. 130. In neither work does the composer employ more than a moderate orchestra, but he obtains splendid effects. The Minneapolis Orchestra under Emil Oberhoffer gave the first performance in America of Richard Strauss's latest work, *Festliches Präludium*, op. 61, a work written especially for the dedication of a new auditorium in Vienna. It contained little inspiration and much noise. Under Dr. Kunwald the Cincinnati Orchestra produced a tone-poem by Friedrich Gernsheim, *Zu einem Drama*, a really beautiful and inspired composition. Another work well worth hearing was the Second Symphony in E minor by Henri Rabaud, played by the Philadelphia Orchestra under Leopold Stokowski. For the purpose of introducing new instrumental compositions by modern Italian composers an orchestra calling itself the Italian Symphony Orchestra gave under Cesare Sodero a programme which contained Martrucci's Symphony in D, in every respect a noteworthy work. Among the many novelties produced by the Chicago Orchestra under Mr. Stock the first place belongs to a Symphony in E minor, op. 115, by Hans Huber. It is a work in the established classical form, full of noble ideas. A concerto for violin and orchestra in A minor by Heinrich Moreen, though scored rather heavily, proved very effective. Reinhold Glière's symphonic poem, *The Sirens*, made a real and deep impression. On the other hand Arnold Schönberg's *Fünf Orchesterstücke* was received with hisses and loud laughter—a reception probably unique in the history of serious concerts in America. The New York Symphony Society under Walter Damrosch likewise offered a number of novelties, of which the *Fourth Symphony*, in A minor, by Sibelius was the most important. It is very sombre and lacking in obvious charm, but withal fascinating. While not easy to grasp at a first hearing it well repays closer study. The *Tableaux symphoniques* by Ernest Fanelli, of which only two sections were played, though musically of little intrinsic value, were very interesting as exhibiting the later style of Debussy, while the latter was still a boy. A *Funeral March* by Grieg, composed in memory of Nordraak, while not important was of some interest. Sir Edward Elgar's symphonic poem *Falstaff*, this composer's latest work, was as dull, uninspired, and insignificant as his two symphonies. An orchestral suite *Le printemps* by Debussy caused some surprise, as it seemed to indicate a return to the established scales. The mystery was solved when it was discovered that this composition, published in 1913, was in reality only an expansion of an earlier work written in 1889.

CHORAL SOCIETIES. While not discarding the older oratorios and choral works many of the larger organizations were extremely active in

the production of new works. By far the most important of these was *Eine deutsche Messe*, by Otto Taubmann, presented by the New York Oratorio Society under Louis Koemmenich. This work is unquestionably one of the most notable choral works written since Brahms. The same society produced Georg Schumann's *Ruth*. Though lacking in individuality and strongly influenced by Wagner, the music is very beautiful and effective. The Cecilia Society of Boston under Arthur Mees introduced to America Florent Schmitt's *Forty-sixth Psalm*, a typical work of the ultra-modern French school. Mr. Mees had also intended to give the first American performance of Sir Edward Elgar's *Musio Makers* on April 17. The concert actually took place on that date, but the honor—if such it be—of a first production was snatched away from Mr. Mees by the Columbia University Chorus under Prof. Walter Hall, who gave the work on April 16 in New York. Neither the Boston nor the New York audience showed great interest in the work. The MacDowell Chorus of New York, under Kurt Schindler, was reorganized as the *Schola Cantorum*, and under its new name brought out Richard Strauss's *Der Abend* (written for 16 parts) and Granville Bantock's *Atalanta in Calydon* (for 20 parts). Both works showed the excellent work of the society to great advantage, but proved decided disappointments musically. A new society cultivating a so far practically unknown field was founded by N. Lindsey Norden in New York. The *Æolian Choir*, consisting of 45 trained boys' and men's voices, gave during its first season ten concerts of a cappella Russian church music. Almost all the works performed were unknown in America, as well as many of the composers. The chief reason why such remarkable compositions have not been introduced long ago seems to be the fact that all are available only with Russian text. Mr. Norden is producing these works in English, in which form he is also publishing them through G. Schirmer of New York.

CHAMBER MUSIC. To the large number of existing chamber music organizations two important additions were made. For several years the Longy Club of Boston, consisting of woodwind instruments, has had a small, but highly-appreciative and cultivated following. Four seasons of the Barrère Ensemble, a similar organization, have created a taste for that class of music also in New York. The Boston club, in addition to their home concerts, now also gives a season in New York under the name "Longy New York Modern Chamber Music Society." At the same time ten members of the New York Philharmonic Society, flute, oboe, clarinet, bassoon, horn, and string quintette, have organized the "Philharmonic Ensemble." Every one of the artists of the two organizations is a virtuoso upon his instrument. The success of the famous Flonzaley Quartette (Bette, Pochon, Ara, d'Archambeau) has been such that during the past year they have been obliged to extend their tour to the principal cities from coast to coast.

MUSIC FESTIVALS. Among the festivals of the year may be reckoned the innumerable extra concerts given by all organizations throughout the country, orchestral and choral, large and small, in honor of the centennial of the birth of Wagner and Verdi. In Cleveland the Chicago Orchestra under Mr. Stock with Fremstad,

Jörn, and Witherspoon gave three Wagner concerts of excerpts from all operas from *Rienzi* to *Parisfal*. It was regarded as the greatest musical event since the Wagner festival given by Theodore Thomas with Anaterna, Scaria, and Winkelmann in 1884. The success attending the same programme given in Milwaukee resulted in a movement toward the establishment of a symphony orchestra in that city. The works performed at the annual Bach festival in Bethlehem under J. F. Wolle were the *Passion according to St. Matthew* and the *Mass in B minor*. In order to produce both works in their entirety, without undue fatigue to the audience, Mr. Wolle gave each work in two parts with an intermission of three hours. At the fifty-sixth annual music festival at Worcester, Mass., Pierné's *St. Francis of Assisi* had its first performance in America under the direction of Arthur Mees. While the musical ideas were not compelling, the work, nevertheless, created a favorable impression because of well-arranged contrasts and excellent orchestral tone-painting. But it marks no advance over the same composer's *Children's Crusade*. The memory of Verdi was honored by a superb performance of the master's *Requiem*. Strange to say, the only number by which Wagner was represented was the Prelude to *Tristan und Isolde*. Verdi's *Requiem* was the principal work produced at the Maine festival in Portland and Bangor, under the direction of William Chapman. At the North Shore festival at Evanstown, Ill., Handel's *Messiah* and Pierné's *Children's Crusade* were sung by a chorus of 1000 voices under P. C. Lutkin. The festival concluded with a Wagner concert by the Chicago Orchestra under Mr. Stock. For the Norfolk, Conn., festival E. S. Kelley had written a symphony in B minor, entitled *New England*. Under the composer's direction the work achieved a decided and well-merited success.

PRIZES. In order to encourage native composers the National Federation of Music Clubs has offered a prize of \$10,000 for the best grand opera written by a native of the United States. A guarantee fund of \$50,000 has been raised for the purpose of producing the successful work at Los Angeles during the time of the Panama Exposition of 1915. It is expressly stated that works founded on immoral plots, such as *Thais*, *Jewels of the Madonna*, *Cavalleria Rusticana*, etc., will not be considered.—The Italian Philharmonic Society of New York offered a prize of \$10,000 for the best symphony by an Italian composer resident in the United States. The successful work is to have its first performance during the Panama Exposition. The judges are Puccini, Franchetti, Sgambati, Boito, and Perosi.

OPERA. At the Metropolitan Opera House of New York 164 performances were given from a repertoire of 43 operas by 22 composers. According to nationality these were divided as follows: German, fifteen works by six composers totaled fifty-four performances; Italian, twenty works by nine composers totaled seventy-seven performances; French, six works by five composers totaled twenty-two performances; Russian, one work totaled six performances; American, one work totaled five performances. Wagner, represented by nine works, led with thirty-four performances. Next in order came Puccini, of whom five works achieved twenty-six performances. Third ranked Verdi with six

works and twenty performances. This in spite of the fact that the year marked the centenary of the master's birth. The works most frequently given were Puccini's *Madame Butterfly* and Offenbach's *Contes d'Hoffmann*, each nine times. Next came Mozart's *Zauberflöte* and Leoncavallo's *Pagliacci*, each eight times. Wagner's *Walküre* was given seven times. Verdi's *Aida*, Puccini's *Tosca* and *Bohème*, Mascagni's *Cavalleria*, Massenet's *Manon*, and Moussorgski's *Boris Godunoff* were each given six times. Gounod's *Faust* had one single performance. Three novelties were produced. Damrosch's *Cyrano de Bergerac* (February 27) with Alda and Amato in the principal rôles, under Hertz, was given in English. Of all the American operas presented so far it is in all respects the best. It lacks originality, its style is eclectic, but the composer shows himself a man of good taste, who takes pains to avoid the commonplace. The text by William J. Henderson is effectively constructed with due regard for variety and climaxes. Aside from the question of individuality, the music is natural, expressive, and really dramatic. The orchestration throughout shows the hand of a master. There can be no doubt that the work was received with decided favor. Moussorgski's *Boris Godunoff* (March 19) with Homer, Althouse, and Didur, under Toscanini, was sung in Italian. The text itself is not good. There is no character drawing; only "Boris" stands out as a real character, the other persons are mere figures. The element of love is reduced to a minimum. An atmosphere of unbroken gloom pervades the entire work. In spite of these handicaps the composer has succeeded through sheer power of genius in producing a work of overpowering grandeur. The themes, though little developed, are characteristic and possess inherent vitality. The music is of barbaric splendor and pulsates with seething passion. Much of the overwhelming effect produced is due to the superb orchestration by Rimski-Korsakoff. It may be said that the relation between principals and chorus has been completely inverted in this opera. The work made a profound and seemingly lasting impression. At any rate, it is unquestionably one of the very few valuable novelties, and one that possesses the qualities to insure it a permanent place in the repertoire. A novelty awaited with more than ordinary interest was Richard Strauss's *Der Rosenkavalier* (December 9). It was produced on a lavish scale with Hempel, Goritz, and Weil in the principal rôles under Hertz. The composer has fortunately abandoned the style of *Salome* and *Elektra* which, at any rate, would be impossible for a comedy. The text by von Hoffmannsthal is far from ideal, the chief defect being excessive elaboration of episodes that often cause the real action to stand still. The music does not reveal any new side of Strauss's genius; it is exactly what one would expect from the composer of the great tone-poems. Like these latter, his opera contains passages of surpassing beauty magnificently sustained, but also portions where the inspiration lags perceptibly. In a general way it might be said that the composer has not been over-critical in the selection of his themes. By the side of some that show the master's inventive power at his best there are others hopelessly commonplace, yet made acceptable by an inexhaustible resourcefulness in harmonization

and orchestration. Of the latter quality it is needless to speak. Long before this Strauss has been acknowledged as the wizard of the orchestra. On the whole, the work gave genuine pleasure, and was received with unqualified approval. In the acquisition of new singers the management has been unusually successful. In no previous year have there appeared as many new artists of such superlative qualities. Freida Hempel, the great German coloratura soprano, had made her debut in the last days of 1912 and was plainly suffering from the effects of a recent illness. During the past year she gave evidence of her full and extraordinary powers. In Mme. Ober the public made the acquaintance of one of the greatest contraltos. With a powerful voice, lavish in intensity, she combines the highest qualities of the actress. Her debut as "Ortrud" in *Lohengrin* was sufficient proof that her command of facial expression and dramatic gesture are unsurpassable. The superb singing and acting of Jacques Urlus recalled the days of Jean de Reszke. Since the latter's appearance no such interpreter of the great Wagner rôles has been heard. The impersonation of Wagner's baritone heroes by Carl Braun equals the finest by artists of former seasons. The work of Carl Schlegel, another baritone, also was excellent. The admirers of modern Italian opera found a new idol in the fine new tenor Giovanni Martinelli. Ever since his arrival in America Mr. Toscanini has been looked upon as an unsurpassable operatic conductor. During the year he proved that he is equally great on the concert platform. A special concert with the opera orchestra and chorus showed him to excellent advantage. The programme consisted of Wagner's *Faust Overture*, Strauss's *Till Eulenspiegels lustige Streiche*, and Beethoven's *Ninth Symphony*. The concert had to be repeated. After many years of efficient service the concert master, Eugen Boegner, resigned. His place was filled by Gino Nastrucci of La Scala. Mr. Gatti-Casazza, the general director, reported the past year as the most successful in the history of the opera house. Among the artists were the established favorites Mmes. Fremstad, Gadske, Destinn, Farrar, Alda, Sparkes, Bori, Matzenauer, Homer, and Messrs. Caruso, Jörn, Cristalli, Martin, Althouse, Amato, Goritz, Griswold, Didur, Weil. The conductors were Toscanini, Hertz, Polacco.

The Boston Opera Company produced three novelties, none of which made a deep impression. Bizet's *Djamilek* (February 24) contained exquisite music, but lacked dramatic interest. Aubert's *Fôret Bleue* proved deficient in potent musical ideas and was entirely under the influence of Debussy. The apparent success of Février's *Monna Vanna* was due chiefly to the intense dramatic interest of the text. The music itself is insignificant; it never rises to the heights of the dramatic situation. Among the new singers Mmes. Edvina (soprano) and d'Alvarez (contralto), and Messrs. Muratore (tenor), Dangès, and Ludikar (baritones) were accepted as superb artists.

After the completion of the season of the Chicago Opera Company Andreas Dippel resigned his position as general director and was succeeded by Cleofonte Campanini, who inaugurated a new policy of giving performances in English (not necessarily English works) on Saturday

nights. Of five new works, all conducted by Mr. Campanini, not one holds out a promise of maintaining itself. Erlanger's *Noël* (January 8) is lacking in melodic charm. The book of Zandonai's *Conchita* (February 3) is vulgar and filthy, and the music is on the level of those Italian operas that are yearly produced by the dozen in Italy. Kienzl's *Kuhreigen* (February 27) is melodious, but light and without real distinction. Massenet's *Don Quichotte* (November 15) is in the familiar style of that composer. It is melodious and pleasing, but without depth. Franchetti's *Cristoforo Colombo* (November 20) contains some beautiful melodies.

Owing to a large deficit and the withdrawal of its principal supporter, Colonel Meighan, the Montreal Opera Company was disbanded at the end of the third season. Its place was immediately taken by the National Opera Company of Canada with Max Rabinoff as general director. A season of eight weeks was given with a repertoire of fourteen Italian and French operas. Practically all the artists of the former company were engaged, and an arrangement for the exchange of artists was made with the operatic institutions of New York, Boston, and Chicago. Artistically the first season was a brilliant success, financially a failure.

With the highest expectations the new Western Metropolitan Opera Company began its first season of six weeks in San Francisco. Amidst scenes of the wildest enthusiasm Leoncavallo personally conducted the American première of his *Zingari* (October 30). But the undertaking ended in disaster.

In New York the efforts of the City Club for the establishment of opera at popular prices resulted in the organization of the Century Opera Company under the direction of Milton and Sargent Aborn. All works are performed in English, and each work is given an entire week on six evenings and two afternoons. Alfred Szendrei, formerly with the Chicago company, is the principal conductor. The singers are largely native Americans and artists of real ability. The prospectus announces a season extending over thirty-five weeks and promises besides works in the standard repertoire a complete cycle of all the Wagner operas, including *Parsifal*, in English. The opening performance was *Aida*. By the end of the year it seemed that the public would support the new venture. Some very excellent performances were given, notably of *Aida*, *Louise*, and *The Jewels of the Madonna*. The only Wagner opera heard so far was *Lohengrin*, which received a rendering that could scarcely be called adequate.

EUROPE. Throughout the German Empire the centennial of the birth of Wagner was observed with impressive ceremonies. In Munich the celebration lasted almost two weeks, and concluded with the unveiling of a new statue in front of the Prinzregententheater. In Dresden court-conductor Schuch performed the master's *Liebesmahl der Apostel* in the Liebfrauenkirche, the same place where Wagner conducted the first performance in 1843. The festival spirit seems to have run riot, for in Berlin the Wagner celebration was followed by a three-day Bach-Beethoven-Brahms festival, and this immediately by a four-day Beethoven festival. The forty-eighth annual festival of the Algemeiner deutscher Musikerverband at Jena brought out

only one work of importance, Reger's *Römischer Triumphgesang*, op. 126, for male chorus and orchestra. The same composer's *Böcklin Suite*, op. 128, had its first performance at Essen, where it was received with enthusiasm. Gustav Mahler's posthumous *Ninth Symphony* was played under Fried in Berlin. The general verdict was that this symphony denoted a decided falling off against its predecessors. At Dresden D'Albert won a gratifying success with a new opera, *Liebesketten*. The first performance in Germany of Moussorgski's *Boris Godunoff* took place in Berlin, and was a marked success. Wolf-Ferrari's latest opera *L'Amore Medico* was brilliantly successful at Dresden. At its German première in Berlin, with the composer present, Puccini's *Girl of the Golden West* drew an enormous house, but succeeding performances were given before small audiences.—In the spring a new opera house, the Théâtre des Champs Elysées, was opened in Paris by Gabriel Astruc. The opening opera was Berlioz's *Benvenuto Cellini*, under the direction of Weingartner. The work had not been heard in Paris since 1838. Mr. Astruc presented an array of exceptionally fine artists, and spared no expense in the mounting of the works. The first novelty produced was De Lara's *Les Trois Masques*, which met with emphatic success. But as early as November the new house had to be closed, since opera in France without municipal subvention is an impossibility. At the Grand Opéra the friction between the two directors, Messager and Broussan, resulted in open quarrel, so that the former resigned. But he was at last persuaded to serve out his term, which ends January 1, 1915. After that time there will be only one director. *Panurge*, a posthumous opera of Massenet, was produced with great success. Charpentier's *Julien*, a sequel to *Louise*, was at last produced, and proved a severe disappointment. At the Salle Gaveau the veteran Saint-Saëns gave his last concert before retiring from all concert work. He appeared both as organist and pianist. For the first time in the history of the conservatory the much-coveted *Grand Prix de Rome* was won by a woman, with a lyric episode *Helena* and *Faust*. Lili Boulanger, a sister of Nadia Boulanger, is the daughter of a former professor at the conservatory, who won the prize in 1835.

BIBLIOGRAPHY. Among the important books published during the year are the following:

Biographical. A. Boschot, *La Crépuscule d'un romantique, H. Berlioz* (Paris), enthusiastic rather than critical, but reliable as to facts; A. Pirro, *Dietrich Buxtehude* (Paris), exhaustive and authoritative, the best biography published so far; D. Chennivière, *Claude Debussy et son œuvre* (Paris); G. Samazeuilh, *Un musicien français: P. Dukas* (Paris); H. Des-sauer, *John Field: Sein Leben und seine Werke* (Langensalza); L. Borgex, *Vincent d'Indy, sa vie et son œuvre* (Paris); C. L. Kellogg, *Memoirs of an American Prima Donna* (New York); Lilli Lehmann, *Mein Weg* (Leipzig), very comprehensive and a valuable contribution to the history of Wagner's art; L. Schmidt, *Mozart* (Berlin), brief but authoritative, uniform with the other volumes of *Berühmte Musiker*; V. Thompson, *The Life of Ethelbert Nevin* (Boston), rather personal reminiscences than a real biography; B. Litzmann, *Clara Schumann: An artist's life* (2 vols.,

Leipzig), translated and abridged from the fourth German edition by G. E. Hadow, very full, contains many letters and extracts from diaries; A. Pirro, *Schütz* (Paris), comprehensive and scholarly, the standard biography; R. Batka, *Richard Wagner* (Berlin), the latest addition to *Berühmte Musiker*, excellent, brief, appreciative; G. Schjelderup, *Richard Wagner und seine Werke* (Leipzig), one of the best and most comprehensive biographies written, embodying the results of latest researches.

History of Music. H. Botstiber, *Geschichte der Ouvertüre und der freien Orchesterformen* (Leipzig), exhaustive and scholarly treatment of all forms of overtures from the very beginnings; E. Clements, *Introduction to the Study of Indian (Hindu) Music* (London), explains the interpretation of the older music in modern times; J. Combarieu, *Histoire de la musique des origines jusqu'à la mort de Beethoven* (Paris), vol. i. goes to the end of the sixteenth century, detailed, result of original research, at end of each chapter a judiciously chosen bibliographical list having reference to the period treated; A. Friedenthal, *Musik Tans und Dichtung bei den Kreolen Amerikas* (Berlin), contains numerous illustrations in notation, treats Mexico, Central America, West Indies, Cordilleras, Chile, the La Plata states and Brazil; W. Niemann, *Die Musik seit Richard Wagner* (Berlin), characterizes in broad outlines general tendencies, treats all nations, emphasizes folk music and national elements; H. Riemann, *Handbuch der Musikgeschichte*, vol. ii., part 3 (Leipzig), treats eighteenth and nineteenth centuries; G. Schünemann, *Geschichte des Dirigierens* (Leipzig), from the earliest times, very full, scholarly and accurate; J. Wolf, *Handbuch der Notationskunde*, vol. i. (Leipzig), treats exhaustively all systems, ancient and modern Greek, mediæval, old Russian, Neumes, and beginnings of mensurable music, throws new light on disputed points of Byzantine notation.

Instruments. Theory. W. H. Clarke, *Standard Organ Building* (Boston); A. Jacquot, *La lutherie lorraine et française depuis les origines jusqu'à nos jours* (Paris); R. Lenormand, *Etude sur l'harmonie moderne* (Paris), very valuable, examines works of Debussy, Ravel, Dukas, D'Indy, Chausson, etc., gives examples, attempts to formulate laws from them, not dogmatic, rather tentative, shows that modern development does not affect validity of established fundamental laws.

Acoustics. Criticism. H. Berlioz, *A Critical Study of Beethoven's Nine Symphonies*, translated by E. Evans (London); E. J. Dent, *Mozart's Operas; a Critical Study* (New York), valuable, gives full history of each opera. E. S. Kelley, *Chopin the composer* (New York), contains not only masterly technical analyses of chief works, but also genuine appreciation; G. Révész, *Zur Grundlegung der Tonpsychologie* (Leipzig), strictly scientific, based on actual experiments.

Correspondence. J. Joachim and A. Moser, *Briefe von und an Josef Joachim*, vol. iii. (Berlin), contains the letters from 1869-1907; C. S. Benedict, *Richard Wagner in seinen Briefen* (Leipzig), a selection of important letters from 1832-1883, carefully chosen to give a complete picture of Wagner's artistic development. Letters arranged in six groups, each group pre-

ceded by a brief biographical and critical introduction.

Miscellaneous. G. Nottebohm, *Thematisches Verzeichniss der Werke Beethovens* (Leipzig), a reprint of the original very valuable catalogue, augmented by a bibliotheca Beethoveniana, a complete record of all books and articles (newspaper and periodical) written about Beethoven from 1827-1913; Th. v. Frimmel, *Beethoven Forschung*, vol. iv. (Vienna); A. Schering, *Bach Jahrbuch*, vol. ix. (Leipzig); L. Frankenstein, *Wagner Jahrbuch*, vol. v. (Berlin); R. Schwartz, *Jahrbuch der Musikbibliothek Peters*, vol. xix. (Leipzig).

MYLIUS, EDWARD T. See IMMIGRATION AND EMIGRATION.

NASH, PAUL CLEVELAND BENNETT. An American public official, died January 7, 1913. He was born in Geneva, N. Y., in 1877, and educated at Hobart College, the Massachusetts Institute of Technology, and at Paris and Rome. He entered the diplomatic service and in 1903-04 was secretary of the American legation and consul-general at Bangkok, Siam. In 1904-07 he was consul at Venice, and in 1907-08 at Vladivostok, Russia. He was appointed consul-general at Rheims, France, in 1908, serving in that position for two months, when he was appointed consul-general at Budapest. He held this position at the time of his death.

NASHVILLE, FIRST NATIONAL CONSERVATION EXPOSITION AT. See EXPOSITIONS.

NATAL. One of the four original provinces of the Union of South Africa (q.v.). Of the total population, census of 1911 (1,194,043), 49.15 per cent. were born in the colony. Pietermaritzburg, the seat of the provincial government, had (1911) 60,187 inhabitants (with suburbs, 89,998); Pietermaritzburg, 30,555; Ladysmith, 5595; Greytown, 2344. During the year three railway lines 68 miles in length were opened and important reconstruction and improvement work was in progress. This involved the boring of the Stockton tunnel, the longest in South Africa. This is 857 yards in length and is discussed elsewhere in the YEAR BOOK. (See TUNNELS.) Administrator (1913), C. J. Smythe. See SOUTH AFRICA, UNION OF, for area, population, etc.

NATIONAL ASSOCIATION OF STATE LIBRARIES. See LIBRARY ASSOCIATION, AMERICAN.

NATIONAL BANKS. The following article contains only statistics of resources, liabilities, circulation, earnings, distribution of shares, and savings deposits of national banks. An account of the banking and currency (Owen-Glass) law passed in December will be found under BANKS AND BANKING. See also FINANCIAL REVIEW; and TRUSTS, *Money Trust*.

STATISTICS. According to the report of the Comptroller of the Currency there were in the United States on August 9, 7488 national banks with total resources of \$10,876,852,000. Their loans and discounts amounted to \$6,168,555,000; United States bonds, \$790,023,000, or 80 per cent. bonded debt of the country; other bonds and securities, \$1,040,422,000; gold coin and treasury certificates, \$478,438,000; total specie, \$728,267,000; legal tender notes, \$170,902,000; and 5 per cent. redemption fund, \$35,596,000.

The principal items of liabilities were as follows: Capital stock, \$1,056,345,000; surplus, \$725,333,000; undivided profits, \$259,549,000; notes outstanding, \$724,459,000; individual deposits, \$5,761,338,000.

Of the loans and discounts 9.8% were made on demand paper having one or more firm names; 16% on demand secured by stocks and bonds; 33.1% on time paper with two or more firm names; 20.5% on single name paper; and 20.6% on time secured by stocks and bonds, mortgages, or other real estate security. New York City banks alone made 14.4% of all loans and discounts; Chicago and St. Louis made 7%; other reserve cities 26.7%; and country banks 51.9%. The income from all investments in loans, discounts, bonds and other securities was \$499,252,000, or 6.19% on the total investment. The highest percentage on such investments was made by banks in the Western Division, 8.33%, and the lowest by those in the Eastern States, 5.62%. The rate in the New England States was 5.88%. This average income is notable when the great amount of United States bonds included is considered. From the gross earnings were deducted expenses and taxes of \$284,515,000; and losses and premiums of \$53,756,000. Net earnings amounted to \$160,980,000, or 9.06% on capital and surplus. There were paid dividends amounting to \$119,906,000, or at the rate of 11.4% on capital. The dividend rate varied from 7.4% in Hawaii and 8.6% in the New England States, to 11.6% in the Eastern States, and to 15.8% in the Western States.

A table showing the number of share holders and average number of shares held by each on July 7, showed that the 7490 banks having \$1,056,229,000 capital stock on that date had 432,920 share holders, with an average of 24.4 one-hundred-dollar shares each. In New England there were 453 banks with \$101,636,700 capital, having 50,819 share holders with 20 shares each. In the Eastern States there were 158,385 share holders with 21.2 shares each; in the Southern States 80,307 share holders with 21.6 shares each; in the Middle Western States, 96,516 share holders with 29.4 shares each; in the Western States, 24,548 share holders with 29.5 shares each; and in the Pacific States, 22,238 share holders with 39.4 shares each.

Over 93% of the United States bonds held were to secure circulation. The notes outstanding amounted to about 70% of the paid-in capital stock. Not more than 2.5% of these notes were secured by lawful money. This circulation was composed almost entirely of five, ten, and twenty dollar notes. There were outstanding, however, a few one and two-dollar notes, a considerable number of fifty and one hundred-dollar notes, and a few five-hundred and one-thousand-dollar notes. There were presented for redemption for the year ending October, 1913, \$683,431,000, of which nearly one-half came from New York. The expenses of national banks in connection with their circulation amounted to \$4,377,945, of which the semi-annual tax on circulation was \$3,804,762, and the cost of note redemption \$517,842. The comptroller pointed out that the taxes paid by national banks on capital and on circulation from the organization of the system amounted to \$108,188,000, not including \$4,951,000 paid under the corporation tax. In contrast to this

the total expenses of the Currency Bureau during the same period totaled only \$14,736,000. About 45% of the national banks have established savings departments. These reported on August 9, 3,020,831 depositors, with total deposits of \$820,639,000, or \$205.50 per depositor. (See also BANKS AND BANKING, and FINANCIAL REVIEW.)

NAVAL PROGRESS. Progress in naval affairs during 1913 will be found summarized in the following paragraphs dealing with the navies of the great powers, in the accompanying official tables showing relative strength and tonnage, and in a general section dealing with aviation as practiced during the year in connection with the great war fleets.

RELATIVE ORDER OF WARSHIP TONNAGE, 1913
Compiled by Office of Naval Intelligence, U. S.
Navy Department

Tonnage Completed		As Would Be the Case If Vessels Building Were Completed	
Nation	Tonnage	Nation	Tonnage
Great Britain...	2,072,711	Great Britain...	2,611,291
Germany	943,338	Germany	1,228,208
United States..	760,002	United States..	921,844
France	645,891	France	876,155
Japan	497,199	Japan	702,099
Russia	283,681	Russia	685,373
Italy	259,136	Italy	452,089
Austria	198,351	Austria	258,740

AUSTRIA. New Construction. At the 1914 session, the delegations were to be asked to vote the first credit for the second dreadnought division to replace four obsolete vessels in the Austrian navy; cost, about \$13,600,000; displacement, 25,000 tons; principal armament, ten 14-inch guns; speed, 23 knots. The fourth dreadnought, *Szentistvan*, was to be launched in January, 1914. Of the six destroyers building at Fiume, three were launched, and three were undergoing trials. Characteristics: Displacement, 800 tons; speed, 32 knots; armament, two 102 mm., six 37 mm. guns; and two torpedo tubes.

ENGLAND. New Construction. Four capital ships, commissioned in the last two months of 1912 (*King George V.*, *Conqueror*, *Princess Royal*, and *New Zealand*), were not ready for service until early in 1913. Including the battle cruiser *Australia*, five capital ships were commissioned in 1913: *Centurion*, *Australia*, *Queen Mary*, *Audacious*, *Ajax*. Five capital ships were launched: *Queen Elizabeth*, *Benbow*, *Warspite*, *Emperor of India*, *Tiger*. The *Dublin* and the Australian cruisers *Melbourne* and *Sydney*, were the only protected cruisers completed. The *Southampton*, put down as completed in 1912, was not commissioned until February 25, 1913. The only protected cruisers launched were: *Birmingham*, *Nottingham*, and *Lowestoft*. Two light armored cruisers of a new type were launched, the *Aurora* and the *Arethusa*. The displacement of the first group

of light armored cruisers was 3600 tons; of the second, 3740; IHP of first group, 37,000; of second, 40,000; estimated speed of both groups, 30 knots; turbines; armor belt 3-inch; fuel capacity, 750 tons, oil only; four submerged 21-inch tubes; armament: two 6-inch Q.; six 4-inch Q.; four machine guns.

Twenty-six destroyers were launched in 1913; and twenty held their trials. The 16 destroyers of the 1913-14 programme had the following characteristics: Displacement, 1200 to 1350 tons; IHP, 27,000-28,500; speed, 34-35 knots; armament, four 4-inch Q., and four 21-inch torpedo tubes. Oil capacity, 210 tons. Complement, 120. The six submarines of the F class, 1913 programme, had a surface displacement of 950 tons, and a submerged displacement of 1200 tons; surface speed, 20 knots; submerged speed, 12 knots; six 21-inch torpedo tubes; two (or four) quick firing guns, and radiotelegraphy.

Supplementary Entries of Officers. It was found necessary to enter upward of 50 lieutenants and sub-lieutenants from the Royal Naval Reserve; also to have a special entry of 40 cadets of about eighteen years of age who had completed their general education in the public schools.

FRANCE. Administration and Organization. In December, M. Baudin was succeeded by Senator Monis as minister of marine. According to M. Baudin's plan, the French fleet would consist of 38 battleships, 6 armored cruisers, and 10 protected cruisers in 1918. Reforms were carried out in administration and personnel. Among these reforms were the creation of military directors, and of an admiralty council, improvements in the ordnance service from a technical point of view, an enlistment law, a systematic effort to increase enlistments by making the navy better known throughout the country, increased admissions to the Naval School, a law to increase the pay of officers and petty officers, introduced July 1, and a law organizing the corps of line officers, petty officers, and enlisted men.

New Construction. The 1914 budget provided for 50 battleships, 3 scouts, 5 torpedo boats, 24 submarines, and other small craft. Sixteen new vessels were to be commissioned in 1914: the battleships *France* and *Paris*; two 30-knot torpedo boats and 12 submarines, 8 of 410 tons and 3 of 520, and one, *Gustave Zédé* of 797 tons and a speed of 20 knots. The battleships under construction are the *Bretagne* and *Provence*, the *Lorraine*, *Flandre*, *Gascogne*, *Languedoc*, and *Normandie*. Ten ships were to be laid down in 1914, the most important being the battleship *Bearn* (25,200 tons) of the *Normandie* type. The 1912 programme provided for two battleships to be laid down in the latter half of 1914. The recent naval manœuvres having shown the imperative need of squadron scouts, three scouts were to be laid down before the second battleship of the 1912 programme, and the date of the first (the *Bearn*) was put forward from July to January. Five submarines of 833 tons and speed of 20 knots were also to be laid down. The mine layer *Pluton* was launched on March 10; her sister ship, the *Cerbère*, is nearly completed: displacement, 566 tons; IHP, 6000; speed 20 knots; armament one 3-inch gun. They are fitted to carry 120 mines.

Powder. Ships of the navy only carried new powder for the big guns. The old powder which had caused so many accidents was still used for guns of smaller calibre, and for the reserve stock on land. Only one-half of the powder required during 1914 could be made with the staff actually employed.

GERMANY. New Construction. Five capital ships were launched in 1913 (*König, Gross Kurfürst, Markgraf, Lützow, and Derfflinger*); and four were commissioned (*König Albert, Prinzreg Luitpold, Kaiserin, and Seydlitz*). The protected cruiser *Graudenz* (5530 tons) was launched; and the protected cruisers *Karlsruhe* and *Rostok* (4900 tons) completed. The 1914 budget provides for 12 more torpedo-boats. There are 27 submarines completed and several building, one of them at the Fiat San Giorgio Works, Spezia; and the 1914 budget provided 19 million marks for submarine construction. All the new protected cruisers have a four-inch armor belt; and a designed speed of not less than 27 knots. It was reported that those of the current programme had a main battery of improved 5.9-inch guns, and a coal capacity of about 1500 tons. The displacement of the latest submarines averaged about 800 tons, with a surface speed of 16 knots; but the one building in Italy was considerably smaller, with a speed of about 18 knots. The twelve destroyers of the 1912 programme (S13-S24) were completed; 12 more were building. The standard contract speed seemed to be fixed at 32.5 knots. Six torpedo tubes and two 3.4-inch guns were expected to represent the new armament.

ITALY. New Construction. Four battleships were authorized in 1913. Characteristics (Major-General Ferrati's plans): Displacement, 28,000 tons; length, 184.24 m.; speed, 24 knots; armament, eight 16-inch guns in 4 axial turrets; twenty 15 cm., and twenty 75 mm. guns, the former in casemates; 4 machine guns; armor belt, 320 mm. Turbines, with motor of 12,000 H. P., to drive the middle propeller. Fuel—oil only. Two of these are to be laid down early in 1914. The *Andrea-Doria* and *Caio-Dulio* (22,340 tons each) were launched in 1913. The protected cruisers *N* and *Mirabello* (5000 tons each) were to be commenced early in 1914. The protected cruisers *Basilicata* and *Campania* (2500 tons each), for foreign service, were commenced in the summer of 1913. The scouts *Nino Bizio* and *Marsala* (3400 tons, six 4.7-inch guns, six 3-inch guns; 3 above water torpedo tubes, Curtis turbines, designed H. P. 22,500, estimated speed 29 knots) have been commissioned. The ten 630-ton 30 knot destroyers of the *Impavido* class are all complete, or nearly so, and 15 larger and faster vessels are in hand. Four types of submarines were built or building: (1) 8 building of the *Zoea* 12,000 H. P., to drive the middle propeller. type (displacement, 250-300 tons; speed, 13-8.5 knots); (2) 2 of *Ferraris* type (displacement, 345-400 tons; speed, 15-9 knots); (3) 2 of *Nautilus* type (displacement, 225-320 tons; speed, 15-7 knots); (4) the *Atropo* (displacement, 230-320 tons; speed, 12.5 knots).

JAPAN. Building Programme. The vice-minister of marine stated that the Japanese programme was elaborated with a view to possible conflict with an enemy whose strength

consists of 21 battleships and armored cruisers. Financial reasons made it impossible to adopt this plan during the year.

Dry Dock. The new dry dock, completed at Sasebo, has a length on the blocks of 777 feet, a width of 111 feet, and a depth over the sill of 38 feet.

New Construction. The battleship *Fuso* was the only one of the four of her class launched. The battle cruiser *Kongo*, built in England, arrived in Japan. The *Haruna* and *Kirishima* were launched; both were to be finished in 1915. The *Hiyei* was to be finished at the end of 1914; but her construction had been considerably delayed. The destroyers *Sakura* and *Tachibana*, of 790 tons, were completed. Two of about 1000 tons have been ordered from Yarrow, Glasgow. Two of the 490-ton *Laubeuf* type are building at the Creusot Works, France. Guns for the new battleships were being made at the Japan Steel Foundry at Muroran; breech blocks and other secret parts at the Kure Naval Station.

RUSSIA. New Construction. The four battleships of the *Sebastopol* class (23,000 tons) were not to be completed until the end of 1914. The three battleships of the *Emperor Alexander III.* class (23,000 tons) were laid down at Nicolaïff in 1913; the *Imperatritsa* was launched on November 1. Four battle cruisers of the *Borodino* class (32,500 tons) were laid down in the Baltic. Two light cruisers of 4300 tons, and six of 7000 tons were building. Nine destroyers of 1100 tons displacement were launched in 1912-13; 36 were building, 12 of them to be delivered yearly in 1914, 1915, and 1916. Three Holland submarines were launched in 1913; also three of *Bubnov* type (460-610 tons); 1 (500 tons) *Bubnov* type, presented by public subscription. One submarine mine layer, the *Krab* (500-700 tons) was launched.

TURKEY. Turkey during 1913 bought the Brazilian battleship *Rio de Janeiro*, which was to be completed in 1914. The battleship *Resadiah* was launched on September 3, 1913. An important event was the agreement between Turkey and Armstrong-Vickers group: The agreement was for thirty years. The company was to construct and repair war and merchant vessels. Interest on \$6,534,000 was guaranteed by the government. The company was to have a monopoly for all naval construction and repairs which could be done at Ismid or in the Golden Horn; take over and reorganize the naval construction and repair plant; construct a floating dock to hold a vessel of 32,000 tons. For first fifteen years 50 per cent. of the workmen were to be Ottoman subjects. Apparently after that time all workmen will be native, the company being a training school. Foreign officials and workmen were to be British. Dock charges for naval vessels were to be a specified per cent. less than for merchant ships. Profit on naval work for the company will be 10 per cent. Plant will pass into the hands of the Turkish government after thirty years.

UNITED STATES. New Construction. The battleships *New York* and *Texas* were to be completed in the spring of 1914. Battleship No. 39 was commenced; and the battleships *Nevada*, *Oklahoma*, and *Pennsylvania* were building. The *Monocacy* and *Palos*, river gun-

boats, were building at Mare Island; also the fuel ships *Kanawha* and *Maumee*. The *Jupiter* (19,360 tons) was a collier of new type, driven by electric motors, power for which was generated by turbine driven dynamos.

Armor. The *Pennsylvania* was to carry almost 8000 tons of armor. All armor must be cemented to avoid the tendency of non-cemented armor to spall.

Dry Dock. On February 17, 1913, the huge cofferdam structure of the new graving dock at Pearl Harbor was wrecked by underground pressure. The Secretary of the Navy laid the facts before Congress for advice.

Education. On January 1, 1914, schools were to be established for the instruction of enlisted men, petty officers, and warrant officers serving on board ships.

Radio. Twenty-three stations had been established, and experiments were in progress to determine the difference in longitude between Radio, Va., and Paris (Eiffel Tower) by radiotelegraphy, and to determine the velocity of propagation of Hertzian waves.

Recommendations. The Secretary of the Navy recommended: (a) the construction of 2 dreadnoughts, 8 destroyers, 3 submarines; (b) legislation to enable the department to refine its own oil from its own wells; (c) the establishment of a government armor plant. See UNITED STATES under *Navy Department*.

BIBLIOGRAPHY. The following references may be of service to readers of the *YEAR BOOK* who desire more extended or technical information on the navies of the world:

AVIATION

By 1913 the navies of all the leading naval powers had become vitally interested in aviation and the problems of offense and defense connected with the navigation of the air. Not only questions of material but also of organization were receiving careful consideration.

FRANCE. In the French navy one of the most pressing problems was the organization of the naval air service. The aeroplane parent ship, the *Foudre*, fitted with a hangar on the upper deck, spent during the year 1913 much

time in port having changes made in her aeronautical apparatus. A sum of £1,200,000 was to be devoted to four airship and five aviation stations. Three dirigibles were to be allotted to each station, and five aeroplanes to each aviation centre.

GERMANY. Seventeen naval air stations were being established to employ 50 hydro-aeroplanes. In December a new type of hydro-aeroplane, a Rumpler biplane, driven by a 100-h.p. Mercedes motor, was tested and accepted. The navy was to have two airship squadrons, four dirigibles in each. The Germans retained faith in the dirigible balloon, notwithstanding the loss of *L. I.* and *L. II.* *L. I.* was lost at sea under what might be termed service conditions. *L. II.* was burned on October 17 while on her acceptance trials at Johannesthal. With the destruction of these two Zeppelins, almost the entire airship personnel was wiped out. (See *AERONAUTICS*.) *L. II.* differed from previous Zeppelins in two principal points: The cars were placed close under the gas bag, and the forward car containing the engines was fitted with a large hooded wind screen. It is believed that the airship, in rising, gave off a large amount of gas which, owing to the wind screen, accumulated in the forward car, forming a highly-explosive mixture which was ignited by a spark from the motor.

ENGLAND. Air craft took part in British naval manœuvres in 1913 for the first time. There was a naval aerodrome at Eastchurch (Naval Flying School) and naval air stations were located at Grain Island, Calshot, Yarmouth, Felixstowe, Cromarty, and Leven. The headquarters of the naval wing were transferred from the *Hermes* to the naval sub-depot, Sheerness.

AUSTRIA. An experimental station was established on St. Katharina Island off Pola. In 1913 the best hydro-aeroplane owned by the Austrian navy was a small one built at the Pola arsenal, and driven by a 35 h.p. Daimler motor. The Austro-Hungarian colony in Bavaria, and the Vienna Navy League presented to the navy two hydro-aeroplanes, purchased by public subscription.

JAPAN. Curtis aeroplanes were used as scouts in the autumn manœuvres of the Japanese navy.

UNITED STATES. At the end of 1913 Pensacola was about to become the principal aviation centre, with the battleship *Mississippi* as parent ship. A larger and more seaworthy type of flying boat for use on land or water was developed, using a Sperry gyroscopic automatic stabilizer. Three more Curtiss flying boats were to be delivered to the fleet. See *AERONAUTICS*; *BATTLESHIPS*.

* Published by permission.

(a) Battleships having a main battery of all big guns (11 inches or more in calibre).

(b) Battleships of (about) 10,000 tons or more displacement, and having more than one calibre in the main battery.

(c) Armored cruisers having guns of largest calibre in main battery and capable of taking their place in line of battle with the battleships. They have an increase of speed at the expense of carrying fewer guns in main battery, and a decrease in armor protection.

(d) Includes all unarmored cruising vessels above 1500 tons displacement.

(e) Includes smaller battleships and monitors. No more vessels of this class are being proposed or built by the great powers.

(f) England has no continuing shipbuilding policy, but usually lays down each year 4 or 5 armored ships with a proportional number of smaller vessels.

(g) Germany has a continuing shipbuilding programme, governed by a fleet law authorized by the Reichstag. For 1913 there were authorized 2 battleships, 1 battle cruiser, 2 cruisers, 12 destroyers. Eventual strength to consist of 41 battleships, 20 armored cruisers, 40 cruisers, 144 destroyers, 72 submarines.

(h) \$78,837,669 authorized to be expended from 1911 to 1917 for the construction of war vessels.

(i) \$4,760,000 authorized for experiments and further construction.

(k) Includes vessels of colonies.

(l) Russian shipbuilding programme provides for the completion by 1913 of 4 battle cruisers, 3 small cruisers, 36 destroyers, and 18 submarines.

Note.—Vessels undergoing trials are considered as completed.

The following vessels are not included in the tables: Ships over twenty years old from date of launch, unless they have been reconstructed and re-armed within five years; torpedo craft over fifteen years old; transports, colliers, repair ships, converted merchant vessels, or any

other auxiliaries; vessels of less than 1500 tons, except torpedo craft; torpedo craft of less than 50 tons.

Table II. includes vessels authorized but not yet laid down, as well as those actually under construction.

* Published by permission.

a Battleships having a main battery of all big guns (11 inches or more in calibre).

b Battleships of (about) 10,000 or more tons displacement, whose main batteries are of more than one calibre.

c Includes smaller battleships and monitors.

d Armored cruisers having guns of largest calibre in main battery and capable of taking their place in line of battle with the battleships. They have an increase of speed at the expense of carrying fewer guns in main battery and a decrease in armor protection.

e All unarmored warships of more than 1500 tons are classed as cruisers. Scouts are considered as cruisers in which battery and protection have been sacrificed to secure extreme speed. The word "protected" has been omitted because all cruisers except the smallest and oldest now have protective decks.

f Colonial vessels included.

g Includes 4 submarines authorized in 1913, contracts for which will not be awarded until latter part of December, 1913.

The following vessels are not included in the tables: Ships over twenty years old from date of launch, unless they have been reconstructed and re-armed within five years; torpedo craft over fifteen years old; those not actually begun or ordered, although authorized; transports, colliers, repair ships, torpedo depot ships, or other auxiliaries; vessels of less than 1500 tons, except torpedo craft; torpedo craft of less than 50 tons. Vessels undergoing trials are considered as completed.

NAVAL RESERVE. See MILITIA.

NAVY. See BATTLESHIPS, NAVAL PROGRESS, and various countries under Navy.

NEBRASKA. POPULATION. The population of the State in 1910 was 1,192,214. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 1,233,122.

AGRICULTURE. The area, production, and value of the principal crops in 1912-1913 are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

	Area	Prod. Bu.	Value
Corn1913	7,610,000	114,150,000	\$74,198,000
.....1912	7,609,000	182,618,000	67,568,000
Wheat1913	3,475,000	62,325,000	44,251,000
.....1912	3,123,000	55,052,000	37,985,000

.....1912	1,150,000	1,552,000	13,037,000

a Tons.

MINERAL PRODUCTION. Nebraska has been termed "the State without a mine," and with a strict interpretation this may be true. There are considerable clay deposits which are utilized, and sand and gravel are produced in some quantities. In the production of volcanic ash or pumice, the State ranks first, with an almost complete monopoly of the production. More than half the total output comes from clay pits. The total value of the stone pro-

duction in 1912 was \$336,889, and the output of sand and gravel was valued at \$257,597.

TRANSPORTATION. The total railway mileage in the State on June 30, 1912, was 8090. The Chicago, Burlington, and Quincy Railroad had a mileage in the State of 3565; the Union Pacific of 1958; and the Chicago and Northwestern of 1298. During 1913 the Union Pacific built a new line from Hastings to Gibbon, the total length about 27 miles. The Chicago, Burlington, and Quincy built a small amount of track between Nebraska City and Nemaha. This was largely in the nature of reconstruction of lines occasioned by the encroachment of the Missouri River on the old line. By reason of the development of oil fuels in eastern Wyoming, the Chicago and Northwestern Railway changed their locomotive fuel from coal to oil in 1913, and established a number of fuel oil storage stations along the line. One of the most important of these was at Fremont, Neb. The Chicago, Burlington, and Quincy Railroad also changed a number of their engines for use of fuel oil.

EDUCATION. The total enrollment in the public schools of the State in 1912 was 284,458. Of these 144,386 were boys and 140,072 girls. The total school population between the ages of five and twenty-one was 381,194. The teachers employed numbered 10,939, of whom 1470 were men and 9469 women. The average monthly salary of the men teachers was \$79.02, and of women teachers, \$55.31. The total expenditures for school purposes during the year was \$10,461,719. The legislature of 1913 enacted several important measures relating to education. Several of these provided for taxation. Measures were also passed regulating the length of school terms, and providing State aid for weak districts. Certain high schools were given the privilege of maintaining an agricultural and industrial department.

FINANCE. The total receipts for the fiscal year ending November 30, 1913, amounted to \$5,785,893, and the disbursements, \$5,718,803. There was a balance on December 1, 1912, of \$573,310 and on November 30, 1913, of \$640,-

401. The chief sources of income are from taxation, and the principal disbursements are for the support of education and public institutions.

POLITICS AND GOVERNMENT. There was no election for State officers during the year, as the term of Governor Morehead does not expire until January 1, 1915. The next State election will be held on November 3, 1914. The legislature on January 22 elected George W. Norris United States senator. Senator Norris was a successful candidate in the senatorial primaries held in 1912. The legislature of 1913 made several amendments to the election laws of the State. These, however, were not of particular significance.

STATE GOVERNMENT. Governor, John H. Morehead, Dem.; Lieutenant-Governor, S. R. McKelvie, Rep.; Secretary of State, Addison Wait; Treasurer, W. A. George; Auditor, W. B. Howard; Attorney-General, Grant G. Martin; Superintendent of Education, James E. Dalzell; Commissioner of Insurance, L. G. Brian; Commissioner of Public Lands, Fred Beekman—all Republicans, except Governor.

JUDICIARY. Supreme Court: Chief Justice, Manoah B. Reese; Justices, Charles B. Letton, Francis G. Hamer, Jacob Fawcett, William B. Rose, John B. Barnes, and Samuel H. Sedgwick; Clerk, H. C. Lindsey—all Republicans.

STATE LEGISLATURE, 1913. Democrats: Senate, 15; House, 55; joint ballot, 70. Republicans: Senate, 18; House, 45; joint ballot, 63. Majority: Senate, 3 Republicans; House, 10 Democrats; joint ballot, 7 Democrats.

The names of senators and representatives to Congress will be found in the article UNITED STATES, section *Congress*.

NEBRASKA, UNIVERSITY OF. A State institution for higher education, founded at Lincoln, Neb., in 1869. The enrollment in all departments in the autumn of 1913 was 3752. The faculty numbered 256. There were no important changes in the faculty during the year and no noteworthy benefactions were received. The university is supported almost entirely by the State. The amount of productive funds is about \$763,000 and the annual income about \$904,000. The library contains 105,800 volumes. The president is Samuel Avery, Ph.D.

NECROLOGY. The following list contains the names of persons who died during 1913. An asterisk prefixed to a name indicates that there is a separate biography in proper alphabetical order, in the body of the book:

Abercorn, James Hamilton, Duke of. Scotch nobleman. Died January 3; born, 1838.

Acevedo, Guillermo. Cuban soldier and revolutionist. Died February 24.

Adams, Walter Scott. American financier. Died January 18.

Akin, Louis B. American painter. Died January 2; born, 1871.

Allen, Auster Dana. American metallurgist and educator. Died April; born, 1836.

* Allen, Charles. American lawyer and public official.

* Altman, Benjamin. American merchant and art connoisseur.

* Amateis, Louis. American sculptor and designer.

* Amen, Harlan Page. American educator.

Ancone, Scydenham. Former congressman from Pennsylvania. Died June 20; born, 1824.

André, Louis Joseph Nicholas. French soldier and statesman. Died March 18; born, 1848.

* Aphorpe, William Foster. American musical critic and author.

Araujo, Manuel E. President of Salvador. Assassinated February 9; born, 1863.

* Arrol, Sir William. Scotch engineer.

* Ashbourne, Edward Gibson, first baron. British jurist.

Ashburnham, Earl of. English nobleman. Died January 15; born, 1840.

Asser, Tobias Michael (Kard). Dutch public official and member of Hague Court of Arbitration. Died July 28; born, 1838.

* Auguste, Tancrede. President of Haiti.

Aulick, William W. American journalist and playwright. Died December 25; born, 1872.

* Austin, Alfred. British poet.

* Avebury, John Lubbock, first baron. English scientist and writer.

* Bacon, John Mosby. American soldier.

Baermann, Carl. American musician. Died January 18; born, 1842.

Bailey, Lansing Chapman. American editor. Died March 29; born, 1868.

Baker, Sir Edward. An Anglo-Indian official. Died March 28; born, 1857.

* Baker, James Heaton. American soldier, editor, and writer.

Baldwin, Edwin Candee. American bacteriologist. Died October 3; born, 1865.

* Ball, Sir Robert Stawell. British astronomer.

* Barnes, William. American lawyer and insurance specialist.

* Barnett, Samuel Augustus. English clergyman and social worker.

Bartels, Hans von. German painter. Died October; born, 1856.

Bayles, James Conner. American engineer and technical journalist. Died May 8; born, 1845.

* Bayles, James Copper. American engineer and editor.

* Beaumetz, Dujardin. French public official and art curator.

* Bebel, Ferdinand August. German socialist leader and writer.

* Becke, George Louis. Australian author.

* Bedford, Sir Frederick George Denham, English admiral.

* Berry, James Henderson. Former United States senator from Arkansas.

Beville, Sir George Francis. British soldier. Died January 18; born, 1838.

* Bezjian, H. Alexan. Turkish scholar and educator.

Biene, Auguste van. Dutch cellist. Died January 23; born, 1846.

Binney, John. American theologian. Died June 12; born, 1845.

* Bisbee, Marvin Davis. American educator and librarian.

* Blake, Lillie Devareux. American lecturer and advocate of woman suffrage.

Blumenberg, Marc A. American musical critic and editor. Died March 27; born, 1851.

Boehm, George Boerg. German theologian. Died April; born, 1864.

Bonilla, Manuel. President of Honduras. Died March 21; born, 1858.

* Boucicault, Aubrey. American actor.

Bourdillon, Sir James. Anglo-Indian official. Died April; born, 1848.

Bowdoin, George Sullivan. American financier and philanthropist. Died December 16; born, 1823.

* Bowman, Edward Morris. American musician and composer.

* Brady, Anthony Nicholas. American capitalist.

Bramann, Fritz von. German physician and educator. Died April; born, 1845.

* Briggs, Charles Augustus. American theologian and educator.

* Briggs, Frank Obadiah. Former United States senator from New Jersey.

Brokaw, Isaac V. American merchant and philanthropist. Died September 29; born, 1834.

Brookfield, Charles. English censor of plays. Died October 20; born, 1857.

* Brown, Addison. American jurist.

* Brown, Henry Billings. American jurist.

* Brown, John George. American artist.

Brown, Vernon H. American steamship agent. Died August 5; born, 1832.

* Brown, William Garrot. American historian.

* Browne, Francis Fisher. American editor.

Browne, John Deane. American life insurance official. Died March 24; born, 1836.

Bryce, John. New Zealand public official. Died January.

Burden, Isaac Townsend. American financier. Died April 23; born, 1838.

- * Campos Salles, Manuel Ferraz. Former president of Brazil.
- * Carnahan, Robert H. American brigadier-general. Died June 15; born, 1831.
- * Carrier-Belleuse, Robert Louis. French painter and sculptor. Died July 15; born, 1840.
- * Carrington, Sir Frederick. English major-general.
- * Carrington, Sir John Worrell. British public official.

- *Leake, Joseph Bloomingdale. American soldier and lawyer.
- Lee, Edwin Mervin. American soldier, formerly governor of Wyoming Territory. Died January 2; born, 1836.
- Lee, George Washington Curtis. American soldier and elder son of Robert E. Lee. Died February 18; born, 1832.
- *Lees, James Cameron. Scotch clergyman.
- *Legge, Augustus. Church of England bishop.
- *Lindsay, Sir Coutts. English artist and patron of art.
- *Little, Joseph James. American printer and publicist.
- *Llandaff, Henry Matthews, first viscount. English nobleman and public official.
- *Lockroy, Etienne Auguste Edouard Simon. French journalist and statesman.
- Lomax, Lunsford Lindsay. Former general of the Confederate army. Died May 28; born, 1835.
- *Longfellow, William Pitt Preble. American architect.
- *Love, Alfred Henry. American merchant and peace advocate.
- *Lowe, Thaddeus S. C. American aeronaut.
- *Lubbock, John. See Avebury.
- Lucas-Championniere, Just. French surgeon. Died October 22; born, 1843.
- *Lynch, Henry Finnis Blossie. English traveler and writer on Middle East subjects.
- *Lyne, Sir William. Tasmanian public official.
- *Lyttleton, Alfred. English statesman.
- *Macalister, James. An American educator.
- *McBurney, Charles. American surgeon.
- *McFarland, John Thomas. American Methodist Episcopal clergyman.
- Macfarlane, Alexander. Scotch mathematician and educator. Died August 23; born, 1851.
- *Macgregor, James Gordon. Scotch scientist and educator.
- *McLellan, Peter Baillie. An American jurist.
- *McMurtrie, William. An American chemist.
- *Macnaghten, Sir Edward. First baron Macnaghten. English jurist.
- Magill, Edward H. American jurist. Died April 20; born, 1858.
- *Magnusson, Firikr. Icelandic scholar.
- *Major, Charles. American author.
- Manteuffel, Otto von. German public official. Former president of the upper House of the Prussian Diet. Died February; born, 1845.
- *Marble, John Hobart. American publicist and public official.
- *Marshall, Hugh. Scotch chemist and educator.
- *Martin, Bradley. American banker.
- Martin, Edwin Koenigsmacher. American capitalist and soldier. Died May 4; born, 1845.
- *Martin, Lewis J. Representative in Congress from New Jersey.
- Martin, William Wilsey. English poet. Died March; born, 1834.
- *Maybrick, Michael. English composer.
- *Maynard, Washburn. An admiral of the United States navy.
- Mead, Charles Henry. American temperance lecturer and editor. Died May 6; born, 1841.
- Metenier, Oscar. French dramatic author and theatrical manager. Died February; born, 1860.
- *Miller, Joaquin. American poet.
- *Miller, Roswell. American financier and railway official.
- *Milne, John. English seismologist.
- *Moale, Edward. Brigadier-general of the United States army.
- *Mombert, Jacob Isidor. American Protestant Episcopal clergyman and author.
- *Moore, John W. American rear-admiral, retired, United States navy.
- Moret, Henri. French painter. Died May; born, 1855.

- * Moret Y Prendergast, Sigismund. Spanish public official.
- * Morgan, John Pierpont. American financier, philanthropist, and collector.
- * Morot, Aime. French painter. Died August 12; born, 1850.
- * Morris, Edward Lynan. American curator. Died September 14; born, 1870.
- * Morrow, Prince Albert. American dermatologist.
- * Morse, Edward Fleet. American mechanical engineer and inventor. Died November 11; born, 1857.
- * Murray, Robert. American soldier.
- * Muthmann, Wilhelm. German chemist and educator. Died September; born, 1861.
- * Naeyer de Count de Smet. Belgium minister of state. Died September 10.
- * Nagl, Franz X. Roman Catholic archbishop of Vienna. Died February 4; born, 1863.
- * Nash, Paul Cleveland Bennett. American consul-general at Budapest.
- * Nebeker, Enos H. United States treasurer under President Harrison. Died January 6; born, 1837.
- * Nelson, William. American editor.
- * Nelson, Wolfred. American physician.
- * Nestle, Eberhard. English Biblical scholar. Died April; born, 1861.
- * Niles, Kossuth. A rear-admiral (retired) of the United States navy.
- * Nindeman, William F. C. A survivor of the Jeannette polar expedition. Died May 7; born, 1851.
- * Northern, William Jonathan. A former governor of Georgia.
- * Norwood, Thomas Manson. American jurist and former United States senator from Georgia.
- * Ober, Frederick Albion. American author and ornithologist.
- * O'Connell, Edward. American engineer, constructor of the Monitor. Died January 20; born, 1827.
- * Ogier, Jules. French toxicologist. Died September 30; born, 1850.
- * Ollivier, Emile. French statesman and historian.
- * Olmsted, Marlin Edgar. American public official, former member of Congress from Pennsylvania.
- * Oreglia di Santo Stefano, Luigi. Italian Roman Catholic cardinal.
- * Orr, James. Scotch theologian and educator.
- * Orrock, James. English artist and writer.
- * O'Sullivan, Thomas C. American jurist. Died July 29.
- * Palmer, Thomas Witherell. A former United States senator from Michigan.
- * Park, John. English metaphysician and educator. Died April.
- * Parsons, Eben Burt. American clergyman and educator.
- * Passy, Louis Charles Paulin. French public official. Died July 31; born, 1830.
- * Paulien, Joel. Roman Catholic scholar and educator. Died April 30; born, 1831.
- * Pepper, George Dana Boardman. American theologian and educator.
- * Ferrier, Louis. Federal councillor and home secretary in the Swiss government. Died May; born, 1849.
- * Perry, Alexander James. American soldier.
- * Phelps, Charles. American surgeon.
- * Picard, Alfred Maurice. French public official and member of the Academy of Sciences. Died March 8; born, 1844.
- * Pierola, Nicolas de. Peruvian statesman.
- * Pierson, Henry. English ornithologist. Died February.
- * Platt, James Perry. American jurist.
- * Poortugael, Jonkheer Jacobus C. C. den Beer. Dutch jurist and author. Died January 30; born, 1832.
- * Post, George Browne. American architect.
- * Poulson, Thomas Layman. Methodist Episcopal clergyman and temperance orator. Died June 3; born, 1831.
- * Powers, Horace. American jurist and public official.
- * Preece, Sir William Henry. English engineer and inventor.
- * Prendergast, Sir Harry North Dalrymple. British soldier.
- * Prentiss, Robert Wadsworth. American educator and mathematician. Died April 5; born, 1857.
- * Pugh, Charles Edmund. American railway official.
- * Puelleine, John James. A Church of England bishop, suffragan of Richmond. Died April 14; born, 1841.
- * Quaritch, Bernard. English publisher and bookseller.
- * Rainer, Archduke. Austrian nobleman and soldier.
- * Ralph, Elsie (Reasoner). American sculptor and journalist.
- * Rampollo Mariano. Roman Catholic cardinal.
- * Ravenstein, Ernst George. German cartographer. Died March; born, 1847.
- * Raymond, Charles Walker. American soldier.
- * Reid, Sir George. Scotch painter.
- * Reiss, Hans. American inventor. Died April 8; born, 1836.
- * Reyes, Bernardo. Mexican soldier.
- * Reynolds, George Greenwood. American lawyer and jurist.
- * Richardson, Charles Francis. American scholar and educator.
- * Roberts, Samuel Judson. American editor and political leader.
- * Robinson, Henry Douglas. American bishop of the Protestant Episcopal Church.
- * Rochefort-Lucay, Victor Henri, Marquis de. French politician, journalist, poet, and revolutionist.
- * Roddenberg, Seaborn Anderson. American public official, member of the House of Representatives from Georgia.
- * Rose, Ralph. American athlete. Died October 16; born, 1885.
- * Rose, Uriah M. American jurist and peace advocate.
- * Ross, F. W. Forbes. English surgeon. Died September 20.
- * Rumbold, Sir Horace. English diplomat.
- * Russell, Horace. American jurist. Died June 14; born, 1843.
- * Sabine, William Tufnell. American bishop of the Reformed Episcopal Church.
- * Saint Gaudens, Louis. American sculptor. Died March 8; born, 1864.
- * Sawtelle, Charles Greene. American soldier.
- * Schlieffen, Count Alfred von. German field marshal. Died January 4; born, 1830.
- * Schmidt, Erich. German scholar and educator.
- * Schniewind, Friedrich. American chemist.
- * Scott, Sir Richard. Canadian statesman. Died April 23; born, 1825.
- * Sedgwick, Adam. English zoologist.
- * Seidl, Gabriel W. German architect. Died April; born, 1848.
- * Shea, Sir Edward Dalton. A former president of the legislative council of Newfoundland. Died January; born, 1820.
- * Sheehan, Patrick Augustine. Irish Roman Catholic priest and author.
- * Shieker, George Frederick. American Lutheran theologian and educator. Died September 3.
- * Smith, Benjamin Eli. American lexicographer.
- * Solomon, Sir Richard. British administrator.
- * Sonnenschien, Adolf. English mathematician and educator. Died May; born, 1825.
- * Sophie, queen mother of Sweden.
- * Soule, Charles Carroll. American publisher and author. Died January 7; born, 1842.
- * Southerland, Cromartie Southerland-Leveson-Gower, 4th Duke of. English nobleman.
- * Spear, William Thomas. American jurist.
- * Sprigg, Sir John Gordon. A former premier of Cape Colony.
- * Stafford, John Aloysius. American Roman Catholic priest and educator.
- * Stauffer, David McNeely. American engineer, author, and soldier.
- * Stewart, Hugh Angus. American pathologist. Died March 29; born, 1882.
- * Stiness, John Henry. American jurist.
- * Stokes, Anson Phelps. American banker and philanthropist.
- * Stull, Henry. American painter. Died March 19; born, 1861.
- * Sullivan, Timothy D. American politician, congressman from New York. Died August 31.
- * Swift, Lewis. American astronomer.
- * Sykes, Sir Tatton. English sportsman. Died May 4; born, 1826.

*Faschner, Ignatius. German sculptor. Died November 27; born, 1871.
 *Teller, Charles. Discoverer of the cold storage process. Died October 19; born, 1828.
 *Terry, John Taylor. American capitalist. Died May 3; born, 1822.
 *Thornton, Thomas Henry. English public official. Died March 3; born, 1832.
 *Thureau-Dangin, Paul Marie Pierre. French historian.
 *Thwaites, Reuben Gold. American historian and educator.
 *Tinworth, George. English artist.
 *Tokugawa, Prince Keiki. Fifteenth and last of the Shoguns of Japan.
 *Torney, George Henry. American surgeon and public official.
 *Townsend, James Mulford. American lawyer and educator.
 *Trumpy, Jean Rodolphe. American horticulturist. Died May 23; born, 1830.
 *Tuke, Sir John Batt. English alienist.
 *Uhler, Philip Reese. American scientist and educator.
 *Underwood, John Cox. American soldier, former Lieutenant-Governor of Kentucky. Died October 26; born, 1840.
 *Unger, Joseph. Austrian jurist. Died May; born, 1829.
 *Vambery, Arminius. Hungarian linguist and orientalist.
 *Vander-Meulen, Frederick Samuel. British admiral. Died February; born, 1839.
 *Vives Y Tuto, José Calasancio. Spanish Roman Catholic cardinal.
 *Vivins, J. Addison. American educator. Died March 3; born, 1863.
 *Walt, Lucien Augustus. American mathematician and educator.
 *Wakeman, Thaddeus Burr. American author and advocate of free thought.
 *Wallace, Alfred Russell. English scientist.
 *Ward, Lester F. American geologist and botanist. Died April 19; born, 1841.
 *Warwick, Charles Franklin. American lawyer, public official, and writer.
 *Waterloo, Stanley. American author and journalist.
 *Watson, William Henry. American physician and scientist.
 *Weber, Heinrich. German mathematician and educator. Died May; born, 1842.
 *Weems, Capell Linn. A former congressman from Ohio.
 *Westlake, John. English jurist and writer on legal subjects.
 *Whalen, John Sibley. American public official. Died May 3; born, 1865.
 *White, Stephen Van Culen. American financier.
 *White, William Hale. English writer.
 *White, Sir William Henry. English naval officer.
 *Wilder, William Henry. American public official, member of Congress of Massachusetts.
 *Wilson, Charles Irving. American soldier.
 *Windmüller, Louis. American financier and philanthropist. Died October 1; born, 1835.
 *Windsor, Arthur Lloyd. Australian journalist. Died January.
 *Winslow, Lyttleton Stewart Forbes. English physician and psychologist.
 *Wise, John Sergeant. American lawyer and soldier.
 *Wolseley, Garnet Joseph, first Viscount. English field-marshal.
 *Wombwell, Sir George Orby. The last survivor of the officers who took part in the charge of the Light Brigade. Died October 17; born, 1832.
 *Woodford, Stewart Lyndon. American diplomat.
 *Woodruff, Carle Augustus. American soldier.
 *Wright, George. English jurist.
 *Wyndham, George. English statesman and writer.
 *Ye-Ho-Na-La. Empress Dowager of China. Died February 23; born, 1865.

NEGRI SEMBILAN, THE (NINE STATES).

A federation of states composing a state of the Federated Malay States (q.v.). The Malays (numbering about 65,000) engage chiefly in agriculture in the Kuala Pilah and Tampin districts. The tin mines are worked by Chinese. Export of tin in 1911, 8517 Straits Settle-

ments dollars; tin ore, 2,741,591; rubber, 5,039,968; gambier, 168,457; tapioca, 274,079; pepper, 21,014—total exports, 8,420,746 (7,987,071 in 1910). Total imports, 4,708,194 S.S. dollars, against 5,014,277 in 1910. Seremban is the capital. A. H. Lemon was the British resident in 1913; Tungku Mohammed, the reigning sultan.

NELSON, WILLIAM. An American editor, died October 26, 1913. He was born in Rutherglen, England, in 1839. When still a child, his parents removed to the United States, where he was educated in the common schools, and in 1852 began an apprenticeship in the newspaper business in Munroe, Wis. At the outbreak of the Civil War, he enlisted, and served throughout the war. At its close he became joint proprietor of a paper in a small town in Wisconsin, and, after editing several other papers in that State, he removed to Utah in 1876, and from 1876 to 1878 was United States marshal for that State. In 1881 he became connected with the *Salt Lake Tribune*, and after filling various positions on that paper, he became its editor-in-chief in 1907. He retained this position until his death.

NELSON, WOLFRED. An American physician, died January 16, 1913. He was born in Montreal, in 1846, and graduated from McGill University in 1872. From 1880-85 he practiced at Panama, Colombia, and from 1885-88 traveled in Central and South America, Mexico, and the West Indies, collecting data in climatology and tropical diseases. In 1890 he began the practice of medicine in New York and continued this until the time of his death. In 1904 he went to Cuba for the New York *Herald*, and for his work in the prevention of tropical diseases was given the Order of Queen Isabelle the Catholic. He was the author of *A Review of Several Difficulties to be Overcome in the Construction of the Panama Canal* (1887); and *Five Years of Panama* (1885); and he contributed many papers to the medical press.

NEON LAMPS. See ELECTRIC LIGHTING.

NEOSALVARSAN. This drug was introduced in 1912 as a substitute for salvarsan, with the expectation that it would prove relatively less toxic and would obviate the undesirable by-effects of the latter drug. It appeared that this hope was not altogether fulfilled, since a number of cases of death and of paralysis of the nerves similar to those occurring from "606" were reported in the brief time it had been on trial. Hagerty, Wechselmann, and Swift reported fatalities. A. Bayet, of Brussels, reported one case of paralysis of the legs and bladder and one of bilateral neuritis of the forearm. Bayet believed that the immediate effects of neosalvarsan were less severe than those of salvarsan, but the late effects were practically identical. See SALVARSAN.

NERADOL. See CHEMISTRY, INDUSTRIAL, under *Synthetic Products*.

NETHERLANDS, THE (or HOLLAND, KINGDOM OF). A constitutional hereditary monarchy of western Europe. Capital, The Hague.

AREA AND POPULATION. Including the rivers of Zeeland and South Holland, the Zuider Zee, the Dollart, and the Wadden (the shallows extending along the shores of Friesland and Groningen as far as the Dollart), the total area, based on a low-tide planimetric calculation, is 40,828.71 sq. kilometers (15,764 sq. miles). The following table shows the land area, the popu-

lation according to the census of December 31, 1909, and as calculated December 31, 1912, with density per sq. kilometer in 1912:

	Sq. kms.	1909	1912	D.
North Brabant...	4,972.84	623,079	649,306	127
Gelderland	5,024.40	639,802	662,260	130
South Holland...	2,931.00	1,390,744	1,471,761	489
North Holland...	2,762.01	1,107,693	1,156,162	414
Zeeland	1,831.75	232,515	236,149	132
Utrecht	1,363.21	288,514	298,367	216
Friesland	3,220.25	359,552	366,305	111
Overijssel	3,354.50	382,880	397,341	119
Groningen	2,283.52	328,045	336,741	142
Drenthe	2,662.09	173,318	181,501	68
Limborg	2,194.68	332,007	358,409	163
Total	32,600.25*	5,858,175	6,114,302	185

* 12,587 square miles.

Males in 1909 numbered 2,899,125, against 2,959,050 females. The majority of the population are Protestants. Dutch, 5,788,193; German, 37,534. There were 45,931 marriages in 1912 (43,030 in 1911), 176,909 (174,165) births, 81,287 (86,782) deaths, 6640 (6638) stillbirths, 2155 (2638) emigrants. Communal population (December 31, 1912) of Amsterdam, 587,876; Rotterdam, 446,897; The Hague, 294,693; Utrecht, 122,853; Groningen, 78,276; Haarlem, 70,491; Arnhem, 64,823; Leiden, 59,207; Nimeguen, 58,390; Tilburg, 53,498; Dordrecht, 48,295; Maastricht, 38,611; Apeldoorn, 38,476; Leeuwarden, 37,897; Bois-le-Duc, 36,029; Enschede, 35,495; Delft, 34,634; Schiedam, 33,882; Zwolle, 33,712; Hilversum, 32,938; Emmen, 31,076; Deventer, 28,627; Breda, 27,512.

EDUCATION. Primary instruction is compulsory, and free in the public schools, which are provided by local taxation where private institutions are lacking. In preference, however, to maintaining public schools, the government encourages and subsidizes private instruction. The number of public elementary schools reported in 1910-11, was 3303, with 18,373 teachers and 563,047 pupils; private, 2060, with 11,873 teachers and 353,547 pupils. Public infant schools 163, with 30,185 pupils; private 1096, with 105,470. The average attendance is 95 per cent. Secondary instruction is not free. The special schools are excellent and well attended. There are universities at Amsterdam, Groningen, Leiden, and Utrecht, as well as a small private university.

PRODUCTION. The land is flat and low, and traversed by numerous rivers and canals. Grains, flax, hemp, root crops, and tobacco are grown. Poultry, eggs, and dairy products are exported. Of the productive area, 872,171 hectares are classed as arable, 1,213,073 pasture, 78,097 gardens and orchards, 260,923 forest. The following table shows area and production of main crops in 1912 and 1913 (1913 figures subject to slight revision), with production per hectare in 1912:

	Hectares	Quintals	Qs.
	1912	1913	ha.
Wheat	57,854	56,800	1,501,007
Rye	228,044	227,562	4,026,713
Barley	26,861	26,864	728,518
Oats	137,863	138,580	2,645,038
Flax*	14,862		98,197
Beets†	64,824	60,555	21,760,860

* Fibre production. † Sugar beets.

Quantities of bulbs, shrubs, trees, vegetables, and fruits are raised for export, the total

shipments of bulbs, shrubs, and trees being valued in 1911 at 15,156,141 guilders (15,230,483 gl. in 1910), vegetables, 56,700,000 (64,800,000), fruits, 2,546,000 (3,188,000).

The coal mines belong mostly to the state; total output (1911), 1,476,580 metric tons, valued at 9,488,000 gl. There were reported (1911) 434 distilleries, 11 sugar refineries, 27 beet-sugar refineries, 34 salt works, 437 breweries, 69 vinegar factories. The output of the herring fisheries (North Sea) was valued at 11,049,693 gl.

COMMERCE. The table below shows in millions of guilders the trade (special) by great classes and the totals for three years:

	Imports		Exports	
	1911	1912	1911	1912
Foodstuffs	869.1	901.2	823.5	914.1
Raw materials...	1,312.6	1,391.3	983.5	1,038.4
Manufactures ...	592.4	695.0	517.1	584.0
Miscellaneous ...	540.1	579.9	377.3	558.3
Mdse.	3,315.2	3,567.4	2,711.4	3,094.8
Proc. metals...	18.0	45.6	20.5	18.3
Total	3,333.2	3,613.0	2,732.3	3,113.1

A comparison of some of the principal articles of trade, imports with exports, is of interest as an indication of the chief sources of the nation's wealth and the corresponding necessities not supplied by home production (values in thousands of guilders, 1911)—cereals and flour, 573,630 imports and 357,409 exports (wheat 207,224 imports and 163,355 exports); iron and steel, 422,484, and 296,040; copper, 194,277 and 174,508; textiles, raw and manufactured, 128,788 and 128,199; coal, 113,560 and 47,430; rice, 100,457 and 64,879; timber, 107,388 and 67,571; coffee, 57,734 and 30,090; butter, 2739 and 30,170; margarine, 23,218 and 48,718; sugar, 34,903 and 76,166; cheese, 98 and 18,063; paper, 9819 and 80,782; vegetables, 6000 and 56,700; bulbs, shrubs, etc., 2639 and 15,156; flax, 1010 and 20,691; seeds (flax, colza, etc.), 42,510 and 23,269.

The table below gives countries of origin and destination in the 1912 trade, values in millions of guilders; it must be borne in mind, however, that while overseas trade is generally credited to the country of first origin, trade by the frontiers is credited to the immediate transmitter, so that much of the trade with France is classed as Belgian, etc.:

	Imps.	Exps.		Imps.	Exps.
Germany	1,051.1	1,555.0	Rumania	59.2	6.7
D. E. Ind.	495.8	154.2	Norway	47.0	22.4
U. K.	354.4	604.7	Brazil	31.6	2.1
Belgium	343.6	370.7	France	30.6	25.0
U. S.	362.0	135.5	Italy	13.2	23.5
Russia	291.7	25.1	Turkey	10.6	19.2
Spain	103.9	9.1	Africa	9.4	18.9
Br. E. Ind.	87.3	7.9	Other	261.8	105.6
Sweden	59.8	27.5			
			Total	3,613.0	3,113.1

There entered at the ports in the 1912 trade 15,753 steamers, of 48,082,431 cubic meters capacity (Dutch, 3897, of 11,948,537); cleared, 13,619, of 47,752,633 (3903, of 12,067,558). Sail entered, 1247, of 978,169 cubic meters capacity (Dutch, 708, of 247,276); cleared, 1531, of 1,024,797 (873, of 278,637). Holland is practically free-trade and the only duties levied are of a fiscal character. Merchant marine, January 1, 1912, 780 vessels, of 1,747,020 cubic meters capacity.

COMMUNICATIONS. Railway lines in operation, January 1, 1913, 3256 kilometers. Telegraph lines (state), 7738 kms.; wires, 38,242 kms.; stations, 1553 (1168 state). Urban telephone wires, 204,973 kms.; interurban, 77,418. Post offices, 1525.

FINANCE. The guilder (worth 40.2 cents) is the unit of value. In the table below are given the details of the budget for 1914, with totals for that and foregoing years:

Revenue	1000 gl.	Expenditure	1000 gl.
Excise	62,340	Interior adm.	43,630
Direct taxes	51,330	Interior dept.	41,458
Stamps, etc.	30,860	Justice	11,768
Customs	16,680	Marine	20,848
Domains	1,479	War	34,965
Posts	18,475	Debt service	38,593
Tels. and tels.	5,480	Finance, etc.	39,449
Lottery	655	Colonies	2,701
Licenses	166	Agriculture, etc.	16,734
Pilot dues	3,760	Civil list	885
Mine duties	40	Cabinet, etc.	811
Railways	4,388	Foreign affairs	1,464
Various	32,778	Other	500
Total 1914	228,416	Total 1914	253,346

The total capital of the public debt stood (1914) at 1,148,379,900 guilders; interest, 32,471,613; amortization, 6,121,500.

ARMY. The army of the Netherlands consists of a militia organized under the terms of the militia law of 1901, as amended on February 2, 1912, which provides for a total militia service of six years, every citizen being liable to service. After completing this period in the militia, five years is spent in the Landwehr, and then up to the age of 40 in the Landsturm. The recruits for the militia are obtained by lot so as to provide an annual contingent of 23,000 men, those enrolled serving for variable periods from 8½ to 24 months, depending on the time of year and the arm of the service. This system aims to secure a constant average strength at all times, so that the kingdom may be guarded against sudden attack during mobilization. The organization of the field army consists of four divisions of all arms, each division having a strength of about 19,000 men and duplicating itself on mobilization. The peace strength, comprising the cadres and the men under training, is 22,000, but the war strength is estimated at 200,000 men.

NAVY. The strength in ships built and building, October 31, 1913, was as follows: 9 armored and 6 protected cruisers, of 66,430 aggregate tons; 4 mine-layers, of 1880 tons; 3 gunboats, of 1140 tons (building); 4 torpedo-boat destroyers built and 4 building, of 4000 tons; 38 torpedo boats built and 12 building; 5 submarines built and 4 building.

Four destroyers built at Flushing, 2 completed in 1911 and 2 in 1912, were for the East India service; they displace 515 tons, speed, 30 knots, range, 2600 miles. The 4 under construction are also for the East India service; they will displace 480 tons, and have a speed of 30 knots. Of the torpedo boats building, 8 were authorized in 1913; they will displace 200 tons, and have a speed of 26 knots. The 3 gunboats will displace 540 tons, speed, 16 knots. Two of the submarines building (350 tons submerged displacement) are for the Indies, and 2 (200 tons) for home waters. The report,

dated July, 1913, of the commission of inquiry into the question of naval defense for the Indies urged the construction of 9 dreadnoughts (21,000 tons), 6 torpedo cruisers (1200), 8 destroyers, 44 torpedo boats, 22 submarines.

GOVERNMENT. By the constitution of 1848 (amended 1887) the executive power rests in a sovereign and the legislative in the sovereign and a parliamentary body composed of 2 chambers. The upper chamber has 50 members, elected for 9 years by the provincial states and possesses powers of approval or rejection, not of amendment. The lower, composed of 100 popularly elected members, possesses solely the right of legislative initiative. A consultative state council of 14 members is appointed by the sovereign.

Wilhelmina, the reigning queen, was born August 31, 1880; she succeeded her father November 23, 1890, her mother acting as regent till August 31, 1898. She married, February 7, 1901, Duke Henry of Mecklenburg-Schwerin. The heiress-apparent is Princess Juliana, born April 30, 1909. The ministry, as constituted August, 1913, was as follows: Jhr. Dr. J. Loudon, foreign affairs; Dr. P. W. A. Cort van der Linden, interior; Dr. B. Ort, justice; Captain J. J. Rambonet, marine; A. E. J. Bertling, finance; Colonel N. Bosboom, war; Dr. C. Lely, internal administration; Dr. M. W. F. Treub, agriculture, etc.; Dr. Th. B. Pleyte, colonies.

HISTORY. The coast defense bill was passed in May by a vote of 54 to 35 (Liberals and Socialists voting in the negative) in the Second Chamber, providing for the fortification of Flushing and the expenditure of approximately 12,000,000 guildens on defense works. The work was to be executed under the direction of the department of defense, which had superseded the old departments of war and marine. Defense occupied the States-General almost to the exclusion of other measures, but time was found before dissolution to pass a law for compulsory insurance against sickness and old age. Elections for the new Second Chamber were held in June under the provisions of the electoral reform act of 1896, which enfranchised about 63 per cent. of the number of male citizens of 25 years and older. The Catholic party lost one of its 26 seats; other elements of the Right also suffered. Consequently the Right, with only 45 seats, no longer controlled a majority, and Dr. Theodorus Heemspereck was obliged to resign with his cabinet. The Liberal party, with 37 representatives, was likewise unable to form a ministry, unless it could gain the support of the 18 Socialists. An attempt was made to form a coalition ministry in which the Socialists should have three, and the Liberals six, portfolios; this was vetoed, however, by the Socialist congress at Zwolle on August 10 (for a more complete discussion see *SOCIALISM, Netherlands*). Although unwilling to share in a coalition ministry, the Socialists agreed to support an extra-parliamentary cabinet formed by State Councillor Cort van der Linden (Moderate Liberal), on condition that electoral reform and old-age pensions would be incorporated in the ministerial programme. The States-General were convened on September 16 by Queen Wilhelmina, whose speech from the throne foreshadowed measures for (1) universal suffrage, (2) old-age pensions, and (3) the

draining of parts of the Zuyder Zee at an estimated cost of \$46,000,000.

NEVADA. POPULATION. The population of the State in 1910 was 81,875. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 94,722.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1912	1,000	34,000	\$ 40,000
	1913	1,000	30,000	29,000
Wheat	1912	39,000	1,081,000	887,000
	1913	39,000	1,137,000	1,137,000
Oats	1912	11,000	473,000	307,000
	1913	10,000	400,000	208,000

	1913	12,000	2,136,000	1,282,000
Hay	1912	235,000	646,000	7,106,000
	1913	227,000	681,000	5,925,000

c Tons.

MINERAL PRODUCTION. The yield from the mines of the State in 1913 was estimated by the United States Geological Survey to be valued at \$36,374,000. This includes gold, silver, copper, lead and zinc. The total value of the mineral products of the State in 1912 was \$39,111,828, compared with \$34,501,832 in 1911. Of the total for 1913, which is about 5 per cent. less than in 1912, the value of copper forms the largest part of 37 per cent. The mine production of gold decreased about 10 per cent., or from \$13,456,180 in 1912 to \$12,072,000 in 1913. Nevada in 1913 was the leading State in the production of silver, which came mainly from the silver mine at Tonopah. The mine production increased to about 15,300,000 ounces, or about 7 per cent. There was an increase of about 2 per cent. in the mine production of copper, or from 86,477,794 pounds in 1912 to about 88,368,890 in 1913. The lead output decreased from 19,500,000 tons in 1912 to 15,300,000 tons in 1913, or about 21 per cent. The output of spelter from zinc ores increased from 13,322,988 pounds in 1912 to 15,137,000 pounds in 1913.

The State is an important producer of copper. The production in 1912 was 83,413,900 pounds, as compared with 65,561,015 pounds in 1911. The increase in the production in 1912 was largely due to the output from the Yerrington district, which became an important factor in the copper industry until 1908 when production began from the Ely district. At the close of 1912 the State had a recorded production of 286,914,012 pounds, the larger part of the output coming from the Ely and Yerrington districts.

The gold production of the State in 1912 was valued at \$13,456,180, compared with \$18,193,397 in 1911. The largest decrease was \$4,047,328 from the mines of the Goldfield district. Other districts of the State suffered losses. Placer and surface mines worked by hydraulic and sluicing methods and by drift mining produced \$231,653 in gold in 1912. By far the greater part of the gold production of Nevada is from amalgamation and cyanidation of the dry or siliceous ores, more than half of which is from Goldfield, in Esmerelda County,

and nearly one-fourth in Tonopah, in Nye County. Esmerelda County led in production in 1912 with \$7,014,559, compared with \$11,198,602 in 1911. Of the total production, Nye County, chiefly Tonopah, produced 10,210,296 ounces in 1912, compared with 10,918,263 in 1911.

EDUCATION. The reports of the State superintendent of education are for the biennial period 1911-12. The total number of children of school age in the State in 1912 was 12,695. The enrollment was 11,098, and the average attendance 8190.

POLITICS AND GOVERNMENT. There was no election for State officers during the year, as the terms of Governor Oddie and the other State officials do not expire until December 31, 1914. The next State election will be held on November 3, 1914.

LEGISLATION. The legislature met in 1913 and passed several important measures. These include a workmen's compensation act, an act prohibiting child labor, an act creating a State tax commission, a food and drugs act, an act providing for a uniform system of public roads, acts putting into effect the amendment adopted in November, 1912, providing for the article on public officers, an inheritance tax law, a uniform warehouse receipts law, a corrupt practices act limiting candidates to an expenditure of 20 per cent. of one year's salary, and a provision providing for submission to the people of a woman suffrage amendment to the Constitution. Below there will be found further consideration of certain of the more important measures just enumerated.

The legislature voted for the Seventeenth Amendment, providing for the direct election of senators, and passed a virtually new election law. While the legislature approved the amendments to the Constitution relating to the election of United States senators by direct vote of the people, it failed to enact any provision for the election of the senators to be elected in 1914. A special session of the legislature for the purpose of passing necessary laws was contemplated in the event of the failure of a general law on the subject by Congress.

There was a material change in the divorce law, which, as passed in 1913, required *bona fide* residence of one year before filing complaint in all cases except where both parties reside in the State, in which case there must be a six months' residence. This law was to become effective January 1, 1914.

A new and comprehensive tax law was passed giving a State tax commission power to supervise and equalize State and county taxes. It resulted in a very large increase in total assessed valuations and promised materially to reduce the State and county tax rates.

An industrial insurance act was also passed to govern all persons employing two or more. Acceptance of the law is elective with both employer and employe on condition, however, that, if rejected, the person rejecting is subject to all common-law defenses or denied common-law defenses, as the case may be. Employers are required to contribute premiums to the insurance commission which settles claims for damage.

STATE GOVERNMENT. Governor, Tasker L. Oddie; Lieutenant-Governor, G. C. Ross; Secretary of State, George Brodigan; Treasurer,

William McMillan; Comptroller, Jacob Eggers; Superintendent of Public Instruction, J. E. Bray; Attorney-General, George B. Thatcher—all Democrats, except Oddie, Eggers, and McMillan, Republicans.

JUDICIARY. Supreme Court: Chief Justice, G. F. Talbot, Democrat; Justices, P. A. McCarran, Democrat; Frank H. Norcross, Republican; Clerk, Joe Josephs, Democrat.

STATE LEGISLATURE, 1913. Democrats: Senate, 12; House, 32; joint ballot, 44. Republicans: Senate, 8; House, 19; joint ballot, 27. Independents: Senate, 1; House, 1; joint ballot, 2. Socialists: Senate, 1; House, 1; joint ballot, 2. Democratic majority: Senate, 2; House, 11; joint ballot, 13.

The names of senators and representatives to Congress will be found in the article UNITED STATES, section *Congress*.

NEVADA, UNIVERSITY OF. A State institution of higher education, founded at Reno, Nev., in 1886. The total enrollment in all departments in 1913 was 175. The faculty numbered 50. S. P. Doten was appointed director of the Experiment Station in place of G. H. True, resigned. The university received the gift of the income on approximately \$20,000 from the estate of David B. Russell. The yearly income from all sources is about \$180,000. The library contains about 25,000 volumes. The president is Joseph David Stubbs, D.D., LL.D.

NEW BRUNSWICK. A province of the Dominion of Canada. Area, 27,085 square miles; population (census of June 1, 1911), 351,889 (331,120 in 1901). Fredericton, the provincial capital, had 7208 inhabitants in 1911. A lieutenant-governor administers the province—Josiah Wood in 1913 (appointed March 6, 1912). Premier in 1913, James K. Fleming. See section so entitled under CANADA, DOMINION OF.

NEW CALEDONIA. A French Melanesian colony which, with the Loyalty Islands and other dependencies, covers 19,823 square kilometers, with 50,680 inhabitants. The dependencies are Wallis Archipelago, 96 square kilometers and 4500 inhabitants; Fortuna and Alofi, 159 square kilometers and 1500 inhabitants; Chesterfield Islands, 0.8 square kilometers. The capital of the colony is Nouméa, with 6968 inhabitants. Imports (1911), 15,156,000 francs; exports, 13,099,000. The 1911 budget balanced at 3,867,000 francs. Debt, January 1, 1912, 10,362,000 francs. Railways, 16 kilometers; telegraph lines, 1042 kilometers (wire, 1650). Governor (1913), A. Brunet.

NEWFOUNDLAND. A British colony; an island on the northeast side of the gulf of St. Lawrence. Area, 42,734 square miles. Population (1911), 242,619, including 3949 in Labrador, of which the coastal portion comprehended between Hudson Strait and Blanc Sablon, including the Hamilton basin, is attached administratively to Newfoundland. Capital, St. John's, with 32,292 inhabitants. There were (in 1911) 1071 schools, denominational and charging fees, with 50,246 scholars. The fisheries occupy the majority of the population, cod being the chief export—1,182,720 quintals, valued at \$6,544,604, in 1910-11, besides 300,000 quintals retained for local consumption. Agriculture, mining, and lumbering are carried on. At Grand Falls and Bishop's Falls are large pulp and paper mills. The gov-

ernment railway from St. John's to Harbor Grace is 84 miles long, and the branch to Placentia is 27 miles. The line to Exploits is 200 miles long; and the line, recently completed, from Exploits to Port-aux-Basques, 285 miles. Total length, with branches to Brigus, Tilton, Carbonear, and Burnt Bay, about 638 miles. Length of lines under construction, to Trinity, Bonavista, Heart's Content, Trepassay, Fortune Bay, and Bonne Bay, about 300 miles. Trade and finance statistics are given below:

	1908-9	1909-10	1910-11	1911-12
Imps.	\$11,402,337	\$12,799,696	\$13,383,910	\$14,733,490
Exps.	10,848,913	11,824,997	11,975,747	13,874,809

Ship.*	1,858,161	2,099,698	2,251,595

* Tonnage entered and cleared.

Customs revenue (1910-11), \$2,898,615. Public debt, June 30, 1912, \$27,489,957 (including municipal debt of St. John's, \$1,062,174). Governor, W. E. Davidson, appointed 1913.

The general election, held on October 29, 1913, hinged chiefly on the issue of the ministerial policy of rapid railway extension and resulted in a victory for the government of Sir Edward Morris, who has been prime minister since 1909.

NEW GUINEA. The largest of the East Indian Islands. See DUTCH EAST INDIES; GERMAN NEW GUINEA; PAPUA.

NEW HAMPSHIRE. POPULATION. The population of the State in 1910 was 430,572. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 436,740.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1913	22,000	814,000	\$529,000
	1912	23,000	1,058,000	794,000
Oats	1913	12,000	420,000	235,000
	1912	12,000	468,000	225,000
Potatoes	1913	17,000	2,074,000	1,721,000
	1912	17,000	2,380,000	1,452,000
Hay	1913	495,000	a 495,000	8,514,000
	1912	501,000	626,000	9,390,000
Tobacco	1913	100	b 165,000	30,000
	1912	100	170,000	31,000

a Tons. b Pounds.

MINERAL PRODUCTION. The principal mineral production of the State is granite, the value of which represents about two-thirds of the total value of the mineral production of the State. The clay resources are used in the manufacture of common brick and pottery. Less important mineral products are occasional gems, mica, mineral waters, and scythe stones. The granite quarried in 1912 was valued at \$1,311,488, compared with \$1,017,262 in 1911.

TRANSPORTATION. The total steam railroad mileage in the State in 1913 was 1259.47 miles. This includes 6.37 miles of new construction on the Boston and Maine Railroad.

EDUCATION. The total number of children of school age in the State in 1912 was 37,806. There were 2058 public schools, 1406 graduate

schools, and 71 high schools. The school houses numbered 1707. The men teachers numbered 84, and the women teachers 445. The average monthly salary of men teachers was \$67.37, and of women teachers \$41.92. The total expenditures for education in the State were \$1,883,589.

FINANCE. The report of the State treasurer shows a balance at the beginning of the fiscal year 1913 of \$567,827. The total receipts for the year were \$3,209,759, and the disbursements \$3,273,675, leaving a balance at the end of the fiscal year of \$503,902. The chief sources of revenue are the State tax, corporation taxes, automobile fees, etc., and the chief expenditures are for highway construction, ordinary State expenses, bond maturities, and interest, etc. The funded debt of the State at the end of the fiscal year was \$1,156,000.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions under the control of the State are the following: The New Hampshire State Industrial School at Manchester, the New Hampshire School for Feeble-Minded Children at Laconia, the New Hampshire Soldiers' Home, the New Hampshire State Sanitarium, and State almshouses, asylums and prison. There are in addition a number of private institutes which are indirectly under the supervision of the State board of charities and correction. The deaf, dumb, and blind beneficiaries of the State are educated in schools in Maine and Massachusetts.

POLITICS AND GOVERNMENT. There was no election for State officers during the year, as the term of Governor Felker does not expire until January 1, 1915. The next State election will be held on November 3, 1914. The most interesting political events of the year were connected with the election of governor and United States senator by the legislature. The election for governor, held in November, 1912, resulted in the following vote: Felker, Democrat, 34,203; Worcester, Republican, 32,504; Churchill, Progressive, 14,405; and others about 2000. Under the constitution of the State as it then stood, a majority rather than a plurality was necessary for an election, and there was no choice by the people as a result of this vote. The election was therefore thrown into the legislature of 1913. Eleven senators were elected on the Republican ticket, and nine on the Democratic, with no choice in four districts, because of the majority ruling above alluded to. For the house, 208 were elected as Republicans, and 197 as Democrats. Following the election, the State committee of the Progressive party advanced the claim that about thirty of those elected on the Republican ticket were Progressives and would not be bound to support the Republican nominees. On January 2, 1913, by coalition of the Progressives and Democratic members of the legislature, Samuel D. Felker was elected governor, and W. J. Britton was elected speaker of the House of Representatives. For the election of United States senator to succeed Senator Burnham, whose term expired in 1913, the Progressives and Democrats attempted to unite to elect a Progressive senator. This attempt did not succeed, however, and a deadlock ensued which lasted from the middle of January until March 13, when Henry F. Hollace, a Democrat, was elected. The legislature ratified the Seventeenth Amendment, providing for the direct

election of senators. A woman suffrage bill was defeated in the House on March 18. The House of Representatives on April 16 expelled Clifford L. Snow for attempting to sell his vote.

LEGISLATION. The legislature met in 1913 and enacted the following important measures: An act authorizing the public service commission of the State to establish rates on railroads; a measure creating a legislative reference bureau for the assistance of legislators; a mothers' pension law; a family desertion act; a law creating a department of agriculture; laws to assist in the suppression of tuberculosis; a measure providing for medical inspection of pupils in public schools; an act limiting the hours of labor in certain occupations for women and minors to 11¼ hours per day and 55 hours per week; a measure establishing a board for the arbitration of labor disputes, an act providing for the primary election of delegates to constitutional conventions, and an enactment providing for the registration of foreign corporations doing business in the State.

STATE GOVERNMENT. *Governor, Samuel D. Felker, Democrat; Secretary of State, Edward N. Pearson, Republican; Treasurer, George E. Farrand, Democrat; Auditor, Frank A. Musgrove, Progressive; Adjutant-General, Herbert E. Tutherly, Progressive; Attorney-General, J. P. Tuttle, Republican; Superintendent of Public Instruction, Henry C. Morrison, Republican; Commissioner of Insurance, R. J. Merrill, Republican.

JUDICIARY. Supreme Court: Chief Justice, Frank N. Parsons, Republican; Associate Justices, Robert J. Peaslee, Democrat; Reuben E. Walker, Republican; John E. Young, Republican; one vacancy; Clerk, Arthur H. Chase, Republican.

STATE LEGISLATURE, 1913. Republicans: Senate, 12; House, 210; joint ballot, 222. Democrats: Senate, 8; House, 195; joint ballot, 203. Republican majority: Senate, 4; House, 15; joint ballot, 19.

The names of senators and representatives to Congress will be found in the article UNITED STATES, section *Congress*.

NEW HEBRIDES. A group of Melanesian islands jointly administered by France and Great Britain through the French and English high commissioners for the Pacific. The seat of government is Vila, in the island of Efate. The British resident commissioner in 1913 was M. King; French resident-commissionership, vacant.

NEW JERSEY. POPULATION. The population of the State in 1910 was 2,537,167. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 2,749,496.

AGRICULTURE. The area, production, and value of the principal crops in 1913, are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1913	275,000	10,862,000	\$8,146,000
	1912	273,000	10,274,000	7,054,000
Wheat	1913	80,000	1,408,000	1,352,000
	1912	79,000	1,462,000	1,433,000

* Governor elected by legislature which convened January 1, 1913; November, 1912, election not conclusive.

	Acres	Prod. Bu.	Value
Oats	1913 70,000	2,030,000	954,000
	1912 67,000	1,849,000	814,000
Rye	1913 70,000	1,260,000	1,008,000
	1912 72,000	1,260,000	995,000
Potatoes	1913 94,000	8,930,000	7,323,000
	1912 92,000	9,936,000	6,558,000
Hay	1913 361,000	4,469,000	8,911,000
	1912 362,000	521,000	10,420,000

a Tons.

MINERAL PRODUCTION. The total value of the mineral products of the State in 1912 was \$36,081,930, compared with \$34,663,435 in 1911. New Jersey is one of the most important clay-working States of the Union. It is third in value of production, and second only to Pennsylvania in variety of products. It is second in value of pottery products, and fourth in the value of brick and tile products. The value of the clay products in 1912 was \$19,838,503. Of this \$10,902,633 were brick and tile, and \$8,935,920 were pottery. This is an increase of nearly 10 per cent. over 1911. The leading clay product is sanitary ware. Common brick is second.

TRANSPORTATION. The total railway mileage in the State on January 1, 1913, was 5683 miles. Of this, first track comprised 2419 miles; second track, 928 miles; third track, 157 miles; fourth track, 140 miles; and sidings, 2037 miles.

EDUCATION. The total enrollment in the public schools in the school year 1913 was 478,935. The average daily attendance was 337,366. The number of teachers, male and female, was 14,275. The average yearly salary of teachers, both male and female, was \$816.38.

CHARITIES AND CORRECTIONS. The institutions under State control with their populations in 1913 were: The State Hospital for the Insane at Morris Plains, 2302; State Hospital for the Insane at Trenton, 1543; State Home for the Feeble-Minded at Vineland, 247; New Jersey State Home for Epileptics, 392; New Jersey State Prison, 1527; New Jersey Reformatory, 505; State Home for Boys, 519; State Home for Girls, 226; Soldiers' Home at Kearney, 531; Soldiers' Home at Vineland, 348; Sanatorium for Tuberculous Diseases, 189. A reformatory for women at Clinton was opened January 1, 1913. It is equipped for 25 inmates, but new buildings will be erected to provide for the accommodation of more persons.

POLITICS AND GOVERNMENT. Woodrow Wilson continued to be governor of the State until March 1. On January 14 he sent to the legislature his last message, in which he urged many reforms. The most important of these concern the regulation of trusts, and for this purpose he recommended the passage of seven bills. One of his last important acts as governor was the affixing of his signature to these bills, which were promptly passed by the legislature. These will be found discussed at some length in the article

TRUSTS. The passage of these measures fundamentally changed the position of New Jersey with regard to corporations. In past years the leniency of the laws of the State made it desirable for corporations which did not wish to be trammelled by severe restrictions to incorporate in that State. This condition was changed by the passage of these measures. They brought into effect the principle of resisting the modern tendency toward combination. Monopoly was specifically declared to be illegal, as is any combination or agreement to limit the production or increase the prices of merchandise; to pre-

vent competition in making, transporting, or dealing in merchandise or any commodity; or to make any agreement or to arrive at any understanding by which there is prevented free or unrestricted competition among those who make the agreement or among any purchasers of their commodities. The forming of "holding companies" was prohibited. The amendment for the direct election of United States senators was ratified by the legislature, as was also the income tax amendment. In the latter part of February, Governor Wilson sent to the legislature recommendations for the passage of measures radically changing the method of selecting juries in the State. These measures, however, were not passed until after he had ceased to be governor. (See below.) On March 1 Governor Wilson retired, and was succeeded by James F. Fielder, who up to that time had been president of the Senate. The legislature on January 28 elected Edward E. Grosscup State treasurer, and William Hughes United States senator. Mr. Fielder was inaugurated governor on March 2. One of his first official actions was to call a special session of the legislature to consider the passage of the bills relating to jury reform. These measures had the support of Mr. Wilson, when he was governor, as noted above, and his interest in them did not cease on his inauguration as President. Indeed, when he ceased to be governor of the State, he declared that his interest in New Jersey affairs would continue, and if the necessity arose, he would not hesitate to take an active part in the political affairs of the State. Accordingly, he came from Washington to New Jersey on May 1, and on that day, and the day following, urged in conference and in public address that the legislature should pass the measures changing the system of selecting juries. These changes were opposed by certain men identified with machine politics in the Democratic party of the State. These men President Wilson severely arraigned in his addresses. His journey to New Jersey was interpreted as a resumption of the conflict with these elements which he had carried on as governor. A caucus of Democratic members of the legislature on May 5 voted to adopt the suggestions for compromise on the bill made by President Wilson, and on May 6 the legislature met in special session to vote. A deadlock in the Senate followed, but the Assembly passed the bill advocated by President Wilson with the addition of a referendum clause. On May 25 the bill, amended in certain details, passed the Senate, adding a condition which submitted the question to the people for final decision. On November 4, the jury reform law was approved, on referendum, by the voters. On July 22 Archibald C. Hart, Democrat, was elected to Congress from the sixth district to succeed Lewis J. Martin, deceased. Campaign for the nomination of governor of the State began in the summer. It was known that President Wilson favored the election of Mr. Fielder. H. Otto Wittpenn, Democrat, declared himself a candidate, but on July 26 made public a letter in which he announced his retirement as a result of a letter from President Wilson. Edward C. Stokes, former Republican governor of the State, was candidate for the Republican nomination and Everett Colby, for many years a leader in reform movements in the State, was

a candidate for the Progressive nomination. Primary elections for nominations were held on September 23. These resulted in the nomination of Messrs. Fielder, Democrat, Stokes, Republican, and Colby, Progressive. State elections were held on November 4. These resulted in the election of James F. Fielder, Democrat, who received 173,148 votes; Edward C. Stokes, Republican, receiving 140,298, and Everett Colby, Progressive, 41,132. As a result of the election the Democrats retained control of the legislature, but with reduced majorities. Mr. Fielder resigned as Governor several days before the election, and Leon R. Taylor, speaker of the House, became acting governor. On April 15 the voters of Jersey City adopted a commission form of government.

LEGISLATION. The legislature met in 1913, and in addition to the measures noted above, passed the following laws: A measure amending and supplementing the employers' liability act, anti-trust and anti-discrimination acts, a measure prohibiting corporations from acquiring stocks or securities from other corporations, a measure creating an employers' liability commission, several laws relating to highways, a measure amending the laws relating to juvenile courts, and an eight-hour law for workmen on public works. See also LIQUOR REGULATION.

STATE GOVERNMENT. Governor, James F. Fielder, Dem.; Secretary of State, D. S. Crater, Dem.; Treasurer, Edward E. Grosscup, Dem.; Comptroller, Edward I. Edwards, Dem.; Attorney-General, Edmund Wilson, Rep.; Adjutant-General, Wilbur F. Sadler, Jr., Rep.; Commissioner of Education, Calvin N. Kendall, Dem.; Commissioner of Insurance, G. M. La Monte, Dem.

JUDICIARY. Supreme Court: Chief Justice, W. S. Gummere, Rep.; Justices, Charles W. Parker, Rep.; T. W. Trenchard, Rep.; Samuel Kalisch, Dem.; C. G. Garrison, Dem.; James J. Bergen, Dem.; Williard P. Voorhees, Rep.; James F. Minturn, Dem.; F. J. Swayze, Rep.; Clerk, William C. Gebhardt, Dem.

STATE LEGISLATURE, 1913. Republicans: Senate, 10; House, 23; joint ballot, 33. Democrats: Senate, 11; House, 37; joint ballot, 48. Democratic majority: Senate, 1; House, 14; joint ballot, 15.

The names of senators and representatives to Congress will be found in the article UNITED STATES, section Congress.

NEW MEXICO. POPULATION. The population of the State in 1910 was 327,301. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 370,185.

AGRICULTURE. The area, population, and value of the principal crops in 1913, are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1913	85,000	1,572,000	\$1,179,000
	1912	93,000	2,083,000	1,562,000
Wheat	1913	65,000	1,221,000	1,184,000
	1912	59,000	1,232,000	1,109,000
Oats	1913	50,000	1,500,000	900,000
	1912	53,000	1,839,000	828,000
Potatoes	1913	9,000	612,000	857,000
	1912	9,000	900,000	585,000
Hay	1913	192,000	399,000	4,828,000
	1912	187,000	436,000	3,706,000

a Tons.

MINERAL PRODUCTION. The total value of the

mineral products of the State in 1912, was \$14,391,355, compared with \$8,176,220 in 1911. According to the estimates of the United States Geological Survey, made in December, 1913, the production of metals in New Mexico in that year showed large increases over 1912. The mine production of gold showed an increase of \$100,000. That of silver showed an increase of 100,000 ounces, of lead, a decrease of 800,000 pounds, of copper, an increase of 20,000,000 pounds, of zinc, an increase of 8,000,000 pounds. Despite lower average prices for copper and zinc, the total value in the output showed an increase for 1913 of over \$3,000,000.

Considerable quantities of copper are produced in the State. The production of blister copper in 1912 was 29,170,400 pounds, a notable increase over that of 1911, which was 2,860,400 pounds. The large increase was due to the beginning of the important production by the Chino Copper Company, of the Santa Rita district. Up to the end of 1912, the State had a recorded output of 124,353,963 pounds of copper. The principal production has been from the districts in Grant County.

The total gold production of the State in 1912 was \$784,446, against \$762,808 in 1911. The greater part, \$525,629, was produced in the Socorro County. Siliceous gold ores furnished \$609,884, copper ores, \$150,589, and placers, \$16,926. The output from siliceous ores decreased in 1912, but that of copper ores increased largely, particularly in Grant County.

The output of silver in the State in 1912 was 1,536,701 fine ounces, compared with 1,354,540 in 1911. Socorro County produced 1,526,429 ounces in 1912, compared to 1,109,545 in 1911. The coal production of New Mexico in 1913 is estimated slightly in excess of that of 1912. It would have been considerably greater but for the disastrous explosion in October, which wrecked one of the mines of the Stag Canyon Fuel Company, and resulted in a loss of 263 lives and a decreased output. The total coal production of the State in 1912 was 3,536,824 short tons, valued at \$5,037,051. This was an increase over the production of 1911, which was 3,148,158 tons, valued at \$4,525,925. The output in 1912, the largest ever made, exceeded that of 1910, the previous record of production. Notwithstanding the increased production, there were fewer men employed in the coal mines in 1912 than in 1911. In the former year, the men employed numbered 3928, and the latter 4007. There were 15 fatal accidents in the coal mines of the State in 1912, compared with 21 in 1911. All the fatalities in 1912 occurred underground. There were no strikes in the coal mines of the State during the year.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions under the control of the State include the New Mexico Insane Asylum, at Las Vegas, the New Mexico State Penitentiary, at Santa Fé, and the New Mexico Reform School, at Springer. There was also a deaf and dumb asylum at Santa Fé, and a minors' hospital at Raton.

TRANSPORTATION. The total railway mileage in the State, on January 1, 1913, was 3060. The Atchison, Topeka, and Santa Fé has the largest mileage, 1194. The El Paso and Southwestern had 635; the Atchison, Topeka, and Santa Fé coast lines, 242; the Denver and Rio Grande, 217; the Southern Pacific, 167; and

the New Mexico Central, 115. The El Paso and Southwestern system, constructed during 1913, has 13 miles of track in New Mexico, from White Water to Tyrone. The St. Louis, Rocky Mountain, and Pacific Railroad was purchased by the Atchison, Topeka, and Santa Fé system in 1913.

EDUCATION. The report of the superintendent of education is for the biennial period 1911-12. The enrollment in 1912 was 61,027, with an average daily attendance of 40,018. There were 1088 women teachers, and 510 male teachers. The average monthly salary of men teachers was \$60.41, and of women, \$66.72. The total expenditures for public, elementary, and high schools was \$954,407. In the Indian schools of the State, there were enrolled 2085 pupils, and in the private and sectarian schools 4052. There were about 30 government Indian schools operated in the State. The State institutions of higher learning are the University of New Mexico, the New Mexico College of Agriculture and Mechanic Arts, the New Mexico School of Mines, the New Mexico Military Institute, the New Mexico Normal University, the Normal School at Silver City, the Spanish-American Normal School at El Rito. In addition there are schools for the blind, deaf, and dumb.

POLITICS AND GOVERNMENT. There was no election for State officers during the year, as the terms of Governor McDonald and the other State officials do not expire until December 31, 1915. The next State election will be held on November 3, 1914. The legislature ratified the income tax amendment on February 3. On January 28 the legislature reelected A. B. Fall United States senator.

LEGISLATION. The legislature met in 1913, and passed four important measures. These were a white slave law, a local option law, a measure providing for a commission form of government for cities, and a comprehensive act relating to weights and measures. See also LIQUOR REGULATION.

STATE GOVERNMENT. Governor, William C. McDonald, Dem.; Lieutenant-Governor, E. C. de Baca, Dem.; Secretary of State, Antonio Lucero, Dem.; Treasurer, O. N. Marron, Dem.; Auditor, William G. Sargent, Rep.; Attorney-General, Frank W. Clancy, Rep.; Superintendent of Education, Alvan N. White, Dem.

JUDICIARY. Supreme Court: Chief Justice, Clarence J. Roberts, Rep.; Associate Justices, Richard H. Hanna, Prog.; and Frank W. Parker, Rep.; Clerk, José D. Sena, Rep.

STATE LEGISLATURE, 1913. Republicans: Senate, 15; House, 29; joint ballot, 44. Democrats: Senate, 7; House, 17; joint ballot, 24. Progressives: Senate, 2; House, 3; joint ballot, 5. Republican majority: Senate, 6; House, 9; joint ballot, 15.

The names of senators and representatives to Congress will be found in the article UNITED STATES, section Congress.

NEW ORLEANS, SOUTHERN STATES EXPOSITION AT. See EXPOSITIONS.

NEW SOUTH WALES. A state of the Commonwealth of Australia. Area (exclusive of the Federal Capital Territory), 309,460 sq. miles. Population (census of April 3, 1911), 1,646,734, exclusive of full-blooded aborigines. Sydney is the capital and the largest city in Australia. Population (1911), 107,133; population of the local government area, 112,921; with suburbs, 629,503. Governor, in 1913, Sir

Gerald Strickland (appointed in 1912). Premier, W. A. Holman. (See AUSTRALIA.) The latest reports available of railway progress in this state in 1913, indicated that over 100 miles had been opened, of which 83 miles formed part of the Main North Coast Line, while there were under construction 534 miles, including 110 miles for the North Coast Railway, and 8 other lines in the various districts, many of which were light line extension and branches. The report stated that about 3930 miles were in operation in the state.

HISTORY. In June, the state government underwent a change of *personnel*, but not of party. Mr. McGowan, the Labor leader and premier, was succeeded by his colleague, Atty-Gen. W. A. Holman. In the new cabinet, Mr. McGowan consented to take a subordinate place as minister of labor and industry, and other portfolios were distributed as follows: Public works, Mr. Griffith; colonial treasury, Mr. Cann; colonial secretariat, Mr. Flowers; lands, Mr. Trefle; justice, Mr. Hall; education, Mr. Carmichael; mines, Mr. Edden. The Opposition moved its usual vote of censure, but was disregarded by the ministry. A full legislative schedule was announced in the speech from the throne on July 22, including measures for a super-tax on large estates, model suburbs, rent regulation, the protection of deserted wives and children, an eight-hour working day, mining acts, workmen's compensation, and a minimum wage law. In the stormy parliamentary session that ensued, most of these measures were rushed through the Legislative Assembly, only to be rejected by the Legislative Council. A bill consolidating the land laws of the state passed both houses. The state elections in December gave the government an increased majority in the new assembly, which was composed of 50 Labor members (gain, 4), 38 Liberals (loss, 1), and 2 Independents (loss, 3). Parliament met on December 23, to vote a three-months' supply bill and then adjourned to March, 1914. The government house at Sydney, recently withdrawn from the use of the Australian governor-general, was converted into an art museum. A new railway, constructed by the state and opened in April, rendered the extensive Manning River district accessible to settlers.

NEW YORK. POPULATION. The population of the State in 1910 was 9,113,614. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 9,712,954.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13, are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

	Acreage	Prod. Bu.	Value
Corn1913	527,000	15,020,000	\$12,186,000

a Tons. b Pounds.

MINERAL PRODUCTION. The total value of the mineral products of the State in 1912 was \$38,406,473, compared with \$34,317,594 in 1911. New York ranks fourth among the States in production of iron ore. There were mined in 1912, 1,116,272 long tons, compared with 1,061,279 long tons in 1911. The pig iron production, in which the State also ranks fourth, was 1,939,231 long tons in 1912, compared with 1,562,756 in 1911. New York is the fifth State in the value of clay products. The value of these in 1912 was \$12,058,858. Of these, \$9,653,326 were in brick and tile, and \$2,405,532 in pottery. Common brick was the principal clay product. The production of petroleum in the State in 1912 was 874,128 barrels, compared with 952,515 barrels in 1911. The production in the State had decreased every year for many years, and the yield was so small that even the increase in price had not stimulated much drilling of new wells.

TRANSPORTATION. The total mileage of first track railroad operated in the State on June 30, 1913, was 8405.07 miles. Outside of New York City, there were 1981.09 miles of electric railway. There was a very small construction of railway mileage in 1913. The electric railways within New York City had a mileage of 1561 miles. Of this, 261 miles were in Manhattan; 568 in Brooklyn; 203 in the Bronx; and 207 in Queens. The number of passengers carried on these lines was 1,769,889,284. The total transportation revenue was \$88,353,613.

FINANCE. The report of the treasury for the fiscal year ending September 30, 1913, showed a balance at the beginning of the year of \$35,882,937. The receipts for the fiscal year were \$107,763,064, and the disbursements \$101,495,444, leaving a balance, on October 1, 1913, of \$42,150,557. The chief sources of revenue are the inheritance tax, the corporation tax, State tax, excise tax, and automobile licenses, and the chief disbursements are for the barge canal, State institutions, State officers, agriculture, and the national guard.

EDUCATION. The total school population of the State for the school year ending July 31, 1912, was 2,143,585. The total enrollment was 1,442,139. In addition, there were 15,252 persons over 18 years of age enrolled. The average daily attendance in the schools was 1,164,992. The teachers employed numbered 44,193. The average yearly salary of teachers in the State was \$888.50.

POLITICS AND GOVERNMENT. The political record of the State during 1913 was one of the most remarkable in its history. It included the inauguration of a new governor, who attempted to pass important bills through a hostile legislature and failed; the impeachment and removal from office of the governor; and his subsequent election as a member of the Assembly. It included, too, an unparalleled number of investigations into the management of State departments and institutions.

William Sulzer, until his election as governor in 1912, a representative to Congress from the State, was inaugurated on January 1. His inaugural address was awaited with considerable interest, as it was believed that he would make some suggestions for legislation of a rather radical nature. This was to some extent realized. He first urged the ratification of the proposed amendment, providing for the popular election of United States senators. In this con-

nection he said: "If the people cannot be trusted, then our government is a failure and the free institutions of the fathers are doomed." He recommended to the legislature in general terms that action should be taken to reduce the cost of the necessities of life. More specific were his recommendations in regard to the question of wages and the betterment of the condition of employees. He said: "We must now convince employers that any industry that saps the vitality and destroys the initiative of the workers is detrimental to the best interests of the State and menaces the general welfare of the government." He urged enforcement of compulsory education, together with restrictions upon child labor. He emphatically repudiated the necessity of employing children and declared that no commerce that depended upon child labor for its success had a right to exist. Perhaps the most important of his recommendations was that of a minimum wage law. In this connection he said: "To secure for those less accustomed to the competitive struggle, protection that other workers have won for themselves through organization, we should carefully consider the establishment of wage boards, with authority to fix a living wage for conditions of work below which standards no industry should be allowed to continue its operations." His other recommendations included means for the conservation of the natural resources of the State, a reform in civil and criminal law, measures for the promotion of agriculture and good roads, and the enforcement of the principle of home rule in cities.

All political parties in the State had, in 1912, included in their platform declarations in favor of a direct primary law. An attempt to pass such a law had been one of the chief concerns of Governor Hughes, but he was obliged to leave office without having achieved his purpose. A primary election law, which was satisfactory neither to the advocates nor opponents of the direct primaries, was passed by the legislature in 1911. It was known that Governor Sulzer was heartily in favor of a thoroughgoing direct primaries measure, and it was in connection with attempts to pass such a measure that he first came into direct conflict with the State legislature, which was controlled by the Democratic machine in New York City. Early in April, the governor sent a message to the legislature in favor of such a measure. Following this action he met in conference representatives of all three parties—the Democratic, Republican, and Progressive—in order to arrange for their support for the measure which he wished to pass. In spite of his efforts, however, the legislature defeated the bills favored by him by a large majority, and passed in their places a substitute which the governor promptly vetoed, with a message declaring that the bill was an insult to the intelligence of the New York electorate, and that it was his intention to begin a campaign throughout the State for the passage of such legislation as he wished. On May 3, the legislature came to an end, having failed to pass satisfactory primary measures of any sort. Governor Sulzer then began a campaign throughout the State for the purpose of raising the support for his primary measures. In this he was assisted not only by the Democrats, but by Progressive Republicans, who were heartily in favor of his

measures. Theodore Roosevelt wrote a letter to the governor in which he promised his hearty coöperation and assistance in passing bills through the legislature.

During the session of the legislature, there had been indications that unfriendly relations existed between the governor and those in control of the Democratic machine in New York city, and who also controlled the State organization. In a speech delivered on March 26, the governor declared his independence of Tammany Hall. He was bitterly attacked, both inside and outside the legislature, and various charges were brought against him in the press. These included an assertion that he had been partly responsible for concessions granted to Americans in Guatemala while he was a member of Congress, that a suit had been brought against him in former years in Vermont for a fee unfairly exacted in a lawsuit, and other charges of a similar nature, referring chiefly to his personal character. All these charges Governor Sulzer denied.

In his campaign for the primary measures, he made addresses in Buffalo, Elmira, and other cities of the State, including New York City. He concluded the campaign in the latter city on June 15, with a bitter attack on the Democratic bosses. On June 17, an extraordinary session of the legislature called by him to act again upon these measures again took session. On June 25, the Assembly voted against the bill 54 to 92, and on the following day the Senate defeated it by a vote of 38 to 10.

About this time rumors began to be published regarding the use of campaign funds which had been collected for the campaign in which Governor Sulzer had been elected. Charges were also published to the effect that he had been interested in contracts in Cuba, and that legislation had been passed through Congress largely through his efforts to benefit contractors who were engaged in constructing public works in Cuba.

A committee of the State Senate, headed by Senator Frawley, was appointed to investigate the charges relating to campaign contributions. Governor Sulzer denied the legality of this committee, and challenged its powers. It continued, however, to hold sessions and examined witnesses. Governor Sulzer's transactions in the stock exchange were examined into, and it was shown that he had turned over to a firm of stock brokers many checks which had been received for campaign contributions. On August 10 Governor Sulzer issued a denial of the charges in which he declared that he did not use campaign contributions for personal use or speculation. On August 12 a resolution for the impeachment of the governor was introduced in the Assembly, and on the following day this resolution was passed by a vote of 79 to 45. There were eight articles of impeachment, and in substance they were as follows:

That Governor Sulzer filed with the secretary of State a false statement of his receipts and other monetary transactions involved in his campaign for governor.

That he committed perjury in this statement to the secretary of State relative to his campaign receipts and expenditures.

That he bribed witnesses to withhold testimony from the legislative committee, which investigated his campaign expenditures and receipts.

That he suppressed evidence by means of threats, to keep witnesses from testifying before the legislative and investigating committee.

That he prevented and dissuaded a particular witness from attending, under subpoena, the sessions of the investigating committee.

That he committed larceny in speculating in stocks with money and checks contributed for his campaign.

That as governor, he threatened to use his office and influence to affect the vote or political action of certain public officers.

That while governor he corruptly used his authority or influence to affect the current prices of securities on the New York Stock Exchange in some of which securities he was at the time interested.

Governor Sulzer refused to acknowledge the power of a legislature called in extraordinary session to act on articles of impeachment, and he declared that he would not resign office during the impeachment trial.

The court of impeachment met on September 18. It included the members of the Senate and the judges of the Court of Appeals. There were present at the opening of the trial 48 senators—31 Democrats, and 17 Republicans, and 9 judges of the Court of Appeals. The counsel who advocated Governor Sulzer were D. Cady Herrick, Irving G. Vann, Harvey D. Hinman, Austen G. Fox, Louis Marshall, Roger P. Clark, Elihu Root, Jr., and James Gay Gordon. The counsel for the prosecution of the governor were Alton B. Parker, John B. Stanchfield, Edgar T. Brackett, Eugene Lamb Richards, Hiram C. Todd, and Henderson Peck. Mr. Herrick, at the opening of the trial, objected on behalf of the governor to the presence of 4 senators who had been members of the committee which had reported for the impeachment. The court decided that these senators should be allowed to remain. The court of impeachment on September 22, by vote of 50 to 1, decided that the Assembly, at its extraordinary session, had the power to impeach the governor.

After remaining in session until October 16, and hearing a large number of witnesses, the court found Governor Sulzer guilty of three of the eight articles of impeachment. These were articles making accusations of falsifying election returns, of perjury in declaring that his statement was true, and an article charging him with practicing deceit and fraud and using threats and menaces to suppress testimony desired by the Frawley committee. All the judges voted for the impeachment except Judge Cullen, the chief judge of the Court of Appeals. He explained his vote as follows: "I find that the respondent did take advantage of his nomination and candidacy for office to seek to personally enrich himself by diverting the contributions which he might receive for campaign purposes. I find that he did verify that by his oath, knowing it to be false. At the same time I shall vote not guilty of these articles for reasons which seem to me to dictate such a course, whatever may be my personal opinion of the acts done and committed by this respondent. . . . The use of this money for his own purpose other than political work was not an offense. On the contrary, it is very doubtful whether it was not within his legal right to use it for any purpose to which he saw fit. . . ."

As to his filing a false certificate, in my opinion, it is a matter of law that the corrupt practices act, now a part of the election law, did require him to state the amounts and sources of all election contributions, and in my judgment nearly all, possibly with two or three exceptions, of the moneys paid to him were such contributions. I find, however, this: That his oath to the truth of his statement was extra-judicial, as far as it related to his receipts. The election law does not require that that statement should contain the receipts of the party making the statement. It is, therefore, plainly extra-judicial to the oath and is elementary law. . . . I am frank to say that if these acts had been committed during his incumbency of office, I should have regarded his moral offense great enough to require his removal, but I am of the opinion that it cannot be considered as ground for impeachment and that it would be an eminently dangerous doctrine to treat them as such."

On October 18 the court voted to remove Governor Sulzer from office. It was agreed that he would not be disbarred from holding future office.

Until September 23 Governor Sulzer continued to assert his right to act as governor. This was disputed by Lieutenant-Governor Glynn, and from September 18 to that date both men acted as governors in different parts of the Capitol. Following the removal of Governor Sulzer, Mr. Glynn was sworn in as governor. Two days after his removal from office Mr. Sulzer was nominated for the Assembly on the Progressive ticket, in a New York City district. In the election, held on November 4, he was elected.

On December 8 Governor Glynn called the legislature in another special session and recommended legislation providing for the Massachusetts form of ballot, the direct primary law abolishing State conventions, and a workmen's compensation law. These measures passed both houses by an almost unanimous vote. Other measures passed provided for a constitutional convention to be held April, 1915, and passed a measure putting into effect the constitutional amendment for the direct election of United States senators. In addition to these laws the legislature passed an important workmen's compensation act. See WORKMEN'S COMPENSATION.

Reference was made at the beginning of these paragraphs to a number of investigations undertaken during the year. Most of these were set on foot by Governor Sulzer and were continued by Governor Glynn. The latter also began other investigations. Among the departments in which examination was held were the State architect's office, the executive department, the department of highways, the banking department, the department of prisons, and other State departments. In nearly all cases where investigations were carried on, conditions of corruption or mismanagement were found. In particular, evil conditions were found to exist in some of the State prisons, especially the Sing Sing prison.

As a result of charges brought against State Senator Stephen J. Stilwell, he was found guilty of bribery on May 24, and was sentenced to State prison.

The State elections on November 4 were for members of the legislature and members of the Court of Appeals, and municipal officers. The

vote for the chief justice of the Court of Appeals was so close that a recount was necessary. This resulted in the election of William E. Werner, Republican. Frank H. Hiscock, Republican, was elected associate justice. The Republicans made gains in the legislature, which resulted in the Democrats losing control of that body. Of 48 Democrats who voted to impeach Governor Sulzer and who stood for reelection, 29 were defeated. The cities of Albany, Binghamton, Rochester, and Poughkeepsie elected Republican mayors; Buffalo, Troy, and Utica elected Democrats, and Syracuse, Progressive. In Schenectady, Mayor Lunn, Socialist mayor, was defeated by a Fusion candidate. Constitutional amendments removing obstacles to a liberal workmen's compensation act and permitting excess condemnation in making public improvements were passed. Particulars of the election in New York City are given below.

NEW YORK CITY. In New York City the year was marked with many important political and civic events. The results of the revelations of corruption in the police department in 1912 continued to be felt, and in March the aldermanic committee which had been holding hearings on police conditions made a preliminary report, with recommendations for legislation. Its first recommendation was for a larger measure of home rule in respect both to the enactment and the enforcement of the regulations under which the people of the city live. It further recommended that responsibility for the administration of the police be concentrated. The committee recommended that the police commissioner be appointed by the mayor for a term of eight years, and be removable by the governor or mayor, only upon charges. These charges might be preferred either by the mayor, the board of estimate and apportionment, or the board of aldermen. The other recommendations with regard to the organization of the police were in accordance with the principle that there should be no division of responsibility. The committee expressed its opposition to a suggestion that corruption in the police department could be eliminated by the creation of a special department or board to deal with vice. This, it declared, would simply turn corruption from one direction into another, with an actual loss of efficiency. On May 6, four former inspectors of the New York police force were convicted for conspiring to prevent a witness in testifying against the police graft system.

The campaign for the election of a new mayor in November was begun early in the year. Mayor Gaynor, who had served for four years and was elected on a Tammany or Democratic ticket, was a candidate for reelection, but the Tammany Hall leaders refused him the renomination. On September 3 he was renominated at an Independent mass meeting held on the steps of the City Hall. The opponents to Tammany Hall including the Republican and Independent organizations formed a committee of seven to select candidates for mayor and other city officers. Their final choice was John Purroy Mitchel, president of the Board of Aldermen. The Democrats nominated Judge Edward E. McCall, who had been appointed chairman of the Public Service Commission by Governor Sulzer. The campaign which followed these nominations was one of the most aggressive and bitter in the political history of the city. The

JOHN PURROY MITCHELL

Elected Mayor of New York November 4, 1913

NEW YORK

death of Mayor Gaynor on September 10 removed him as a candidate, and greatly increased the chances of Mr. Mitchel. Of particular interest were the speeches made by John E. Hennessy, who had acted as an investigator in various State departments by appointment of Governor Sulzer. He assailed Tammany Hall and its leaders in a series of fiery speeches in which he made plain charges of corruption. He claimed that the downfall of Governor Sulzer had been directly due to the enmity of Tammany Hall leaders which he had incurred as a result of his opposition to their efforts to dictate the policy of his administration.

The election of November 4 resulted in the most decisive defeat which Tammany Hall has suffered in its history. Mitchel, the Fusion candidate, received a plurality of over 120,000 votes, the largest on record. The entire Fusion city and county ticket, with minor exceptions, was elected. All the members of the Board of Estimate and Apportionment, the actual governing board of the city, were elected on the Fusion ticket, with the exception of the president of the Borough of Queens, who was elected by the Democrats. This gave the Fusionists 14 of the 16 votes of that board. Directly after the election, there was a movement to further cripple the Tammany organization and to deprive it of all power in politics. This was understood to have the approval of President Wilson and other members of his Cabinet. George W. Loft and Jacob A. Cantor were elected members of Congress to fill vacant seats.

On May 10 a memorial statue of Carl Schurz was unveiled with appropriate ceremonies. Contracts for the new subway system continued to be made during the year. A full discussion of the subway will be found in the article RAPID TRANSIT. The borough of the Bronx was created into a new county by the legislature of 1913. It had heretofore been joined with Manhattan.

LEGISLATION. The legislature met in 1913. In addition to its activities noted above, it passed many important measures. Among them were the following: Several laws relating to safety of factories, etc., fire prevention, employment of women and children, the hours of labor for railroad employes and other classes of employment. An eight-hour law for workmen on public works was passed and provision was made that eight hours shall constitute a legal day's work in all classes of private employment except farm and domestic services. The law does not, however, prohibit contracts of private employment for a longer day for an increased consideration. A measure was enacted, restricting the hours of labor for women and minors under 16 to 54 hours a week in certain employments. Several amendments as to the making of articles in tenements were made to the existing labor law. The conservation law providing for the conservation of waters, forests, fish, and game, was amended. The tenement house law was amended so as to impose additional restrictions on the erection of such houses. Additional legislation relating to vocational and industrial education in public schools was enacted, a medical inspection of pupils in public schools was provided for. A vital statistics act was passed which placed that subject under the State department of health. Several measures were enacted aiming at curbing existing evils in connection with stock speculation and the operation

of stock exchanges. These laws place restrictions on the manner in which brokers shall deal with orders from customers, and prohibiting false representations concerning securities, deception of the public by wash sales, and the manipulation of markets. An anti-bucket shop law was enacted as was a loan-shark law. The latter creates the office of a supervisor of small loans, and fixes the maximum rate of interest at 3 per cent. per month. A commission to investigate the subject of pensions for widowed mothers was created. An act was passed regulating the sale of cocaine. Provision was made that when the constitutionality of a statute is brought in question on the trial of any case, the court may make an order directing notice thereof to be given the attorney-general, who may be permitted to appear in court in support of the constitutionality of the statute. A State commission for improving the condition of the blind was established, and a State board of estimate for the purpose of preparing the annual State budget was created. A measure was enacted creating a department of efficiency and economy in the public service. A commission was appointed to make preparations for the celebration of the 300th anniversary of the beginning of the regularly chartered commerce of what is now the State of New York, under the auspices of the States-General of the United Netherlands, in the year 1614. All limitations on the holding and disposing of real property by aliens were removed, and they are placed on a par in this respect with native-born citizens. A State labor department was reorganized. A board of statutory consolidation was created and was authorized to prepare and present to the legislature a practice act, rules of court, and short forms, as recommended by the board in its report to the legislature of 1913. See also LIQUOR REGULATION.

STATE GOVERNMENT. Governor, Martin H. Glynn, Albany; Lieutenant-Governor, Robert F. Wagner, New York; Secretary to Governor, Frank A. Tierney, Albany; Secretary of State, Mitchell May, New York; Comptroller, William Sohmer, New York; State Treasurer, John J. Kennedy, Buffalo; Attorney-General, Thomas Carmody, Penn Yan; State Engineer and Surveyor, John A. Bense, New York; Superintendent of Insurance, William T. Emmet, New York; Superintendent Banking Department, George C. Van Tuyl, Jr., Albany; Superintendent State Prisons, John B. Riley, Plattsburg; Superintendent Public Works, Duncan W. Peck, Syracuse; State Fire Marshal, Thomas J. Ahearn, New York; Commissioner of Education, John H. Finley, New York.

LEGISLATURE, 1913. Democrats: Senate, 32; Assembly, 48; joint ballot, 80. Republicans: Senate, 17; Assembly, 79; joint ballot, 96. Independent Democrats: Senate, 1; Assembly, 2; joint ballot, 3. Progressive Republican: Senate, 1; joint ballot, 1. Progressives: Assembly, 19; joint ballot, 19. Progressive Democrat: Assembly, 1; joint ballot, 1. Independent: Assembly, 1; joint ballot, 1.

The names of senators and representatives to Congress will be found in the article UNITED STATES, section Congress.

NEW YORK CITY. See ARCHITECTURE; CITY PLANNING; NEW YORK, section New York City.

NEW YORK SUBWAYS. See **RAPID TRANSIT.**

NEW YORK UNIVERSITY. An institution of higher education in New York City, founded in 1831. The enrollment in all departments of the university in the autumn of 1913 was 5030. The faculty numbered 460. Dr. Lyman P. Powell, professor of business ethics, resigned to become president of Hobart College. The university appointed a substitute trustee under the Theodore Greeley White fund, for the support of work among men and boys on the west side of New York City. The income of the university in 1912-13 was \$1,370,450. The library contains 110,000 volumes. The president is Elmer Ellsworth Brown.

NEW ZEALAND, DOMINION OF. An autonomous British dependency, composed of three principal and four smaller southern Pacific islands, with annexed groups of small islands and islets, many practically useless for settlement. The table below shows area, European population for comparative census years, and Maori population, 1911 census.

	Sq. m.	Pop. 1901	Pop. 1911	Maoris
North Island.....	44,648	390,571	563,729	46,632
South ".....	58,525	381,661	444,120	2,681
Stewart ".....	665	272	357	63
Total N. Z.....	103,658	772,504	1,008,206	49,376
Chatham Islands	375	207	258	219
Kermadec ".....	13	8	4	249*
Total	104,046	772,719	1,008,468	49,844

* Maori wives of Europeans (enumerated in European census) scattered among the various islands.

Total area inclusive of outlying islands, (with the Cook and other groups), 104,751 sq. miles. The total population in 1881 was 499,933, exclusive of Maoris; 1871, 256,393; 1881, 99,021; 1888, 59,413. In 1911 the rural population numbered 496,779, or 49.26 per cent. of the total: the borough population, 505,598, or 50.14 per cent. In the rural population are included inhabitants of towns not constituted municipal boroughs, while with the urban population are classed persons in outlying districts who frequently follow agricultural pursuits. Remaining population is accounted for by number of persons on shipboard, railways, and in adjacent islands not included in any county or borough. The city of Auckland had (1911) 40,536 inhabitants, 102,676 with suburbs; Wellington (the capital), 64,372 and 70,729; Christchurch, 53,116 and 80,193; Dunedin, 41,529 and 64,237; Invercargill, 12,782 and 15,858; Wanganui, 10,929 and 14,702; Napier, 10,537 and 11,736; Timaru, 11,280; Palmerston North, 10,991; Gisborne, 8196.

Of the total population (1911), of all races (1,058,312), 558,385 were males, 499,927 females. Population of Cook and other annexed Pacific islands, 12,598 (6449 males and 6149 females). Total population of New Zealand proper, (North, South, and Stewart islands), the dependencies (Chatham and Kermadec groups), and of Cook and other annexed Pacific islands, 1,070,910. Average per square mile, 9690 (7427 in 1901; 4693 in 1881; 1641 in 1864). Protestants are greatly in the majority and of these the predominant church is the Church of England, with 413,842 adherents (or 41.14 per cent. of the whole); the Presbyterian next, with 234,662.

Persons classed as actively engaged in agricultural pursuits numbered 130,581 (exclusive of dependents); among these are included those occupied in mines and quarries 14,775, and in fisheries 925; in pastoral pursuits 55,287; in soil cultivation, etc., 54,738; in forestry, or the acquisition of raw products yielded by natural vegetation, 3376; in water-conservation, 389. Persons actively engaged in industrial pursuits, 133,555; commercial, 65,762; domestic, 44,267; transport and communication, 36,433; professional, 32,716; various, 10,803; not stated, 300. Non-breadwinners (dependent wives and children, etc., and persons supported by public or private charity), 554,051.

AGRICULTURE. Under occupation in 1910-11 40,238,126 acres, as follows: 1,015,822 under cereals and pulse, under green crops 713,682—a total under crops of 1,729,504 acres; 5,000,226 acres in sown grasses on plowed land, and 9,214,515 on land not plowed; 23,972,236 in native grass and unimproved land; 209,973 fallow; 780 in vineyards. Under wheat in 1912-13, 76,836 hectares (provisional figures from 1913-14, 67,582 hectares), barley, 15,170 (12,950), oats 156,525 (146,494), corn 1895 (2428). The livestock census for 1911 returned 23,996,126 sheep (of which the Maoris owned 486,922), 2,020,171 cattle (61,300), 404,284 horses (48,222), 348,754 swine (33,290).

Leading products and exports are wool, frozen meat, preserved and salt meats, smoked hams, frozen fish, dairy products, etc. There are extensive coal mines and rich gold fields. Coal output in 1910, 2,197,362 tons, valued at £1,219,737; gold, 478,288 oz., valued at £1,896,328; silver, 1,711,235 oz., valued at £171,562.

COMMERCE AND COMMUNICATIONS. In the table below is shown the trade with the United Kingdom, the colonies, other countries, and totals for three years:

	1909	1910	1911
Imports:			
U. K.....	£ 9,287,786	£10,498,771	£11,787,800
Colonies	4,267,176	3,967,053	4,710,040
Other	2,119,757	2,585,759	3,048,539
Total	£15,674,719	£17,051,583	£19,546,879
Exports:			
U. K.....	£16,193,188	£18,633,118	£15,134,748
Colonies	2,449,691	2,468,119	2,966,952
Other	1,019,117	1,078,972	926,796
Total	£19,661,996	£22,180,209	£19,028,490

Value of the wool, 1911 export, £6,491,707; frozen meat, £3,503,406 (wool £8,308,410, frozen meat £3,850,777 in 1910). Total shipping entered and cleared, 2,949,780 tons, of which 2,855,862 tons British.

There were in operation in the Dominion March 31, 1912, 2798 miles of government and 29 of private railway; under construction by the government, 242 miles. The principal railway construction of the year was the Toke-Stratford line connecting the west coast with the main line of the North Island, and the Napier-Gisborne and the Picton-Flaxmere lines. Six short lines, aggregating 52½ miles, were opened during the year and grade reductions and improvements were in progress. The construction of the Otago Tunnel was undertaken by the government, as the contractors failed to complete the work. Miles of telegraph line, 11,805; wires, 39,370. A scheme is in process of development for utilizing

the water power at Lake Coleridge in the generation of electric power to be transmitted to Christchurch for lighting, railway (including street), industrial, and manufacturing purposes.

ARMY. The principle of compulsory military training, inaugurated by the terms of the defense act of 1909 and extended by later supplementary legislation, has been vigorously and persistently put in practice. The aim of this legislation was to secure more thorough training and to make it of a kind to harmonize with that adopted by the neighboring military forces of Australia. The New Zealand plan includes drill and general training for junior cadets of from 12 to 14 years of age, for senior cadets of from 15 to 18 years of age, and for adult territorial recruits. The intention is to develop eventually a force of 65,000 men of from 19 to 25 years of age. Throughout 1913 the reorganization of the forces was progressing satisfactorily on the whole, in spite of difficulties with recalcitrants akin to those experienced in Australia. The plan above referred to calls for a staff corps of 100 officers. To secure the proper training, the New Zealand officers were attached to the imperial forces.

NAVY. Built for the imperial navy at the cost of the Dominion was the battle cruiser *New Zealand*, completed early in 1913. She left Portsmouth, February 6, 1913, on her maiden voyage to New Zealand, where she remained for three months, returning to England, via Vancouver and the West Indies, in November.

FINANCE, ETC. In the table below are shown financial statistics for succeeding years:

	1909-10*	1910-11*	1911-12
Revenue.....	£9,238,917	£10,297,023	£11,032,544
Expenditure.....	8,990,922	9,343,106	10,340,368

* Financial year ending March 31.

Gross public debt March 31, 1912, £84,353,913; accrued sinking fund, £2,160,603; net debt, £82,193,310.

Arthur Foljambe, Earl of Liverpool, was governor in 1913.

HISTORY. Mr George Massey's "Reform" government, which came into power in July, 1912, was twice thwarted in its endeavor to reform the Legislative Council. Its Legislative Council elections bill of 1912 was rejected by the Legislative Council, as noted in the 1912 YEAR BOOK. In 1913 a new Legislative Council bill was introduced, having in common with its predecessor the provision that the legislative councilors, at present appointed by the government, should be elected by popular suffrage with proportional representation. Each of the two islands was to be divided into two constituencies with representation proportionate to population, the northern island returning 22 councilors and the southern 18. The Legislative Council conceded that its members should be elected, but not by direct popular suffrage. The obstinacy of the upper chamber made it impossible to pass the bill at present; but by next session the terms of 15 Liberal councilors will have expired and if "Reformers," are appointed to fill the vacant seats, the bill may then be carried.

The session of the General Assembly, which lasted from June to December 15, was by no means exclusively occupied with the discussion of constitutional reform; in addition it enacted

a naval law, a land law, a native land law, a law for the repeal of second ballots, and a labor dispute law. The land law authorized the minister of lands to borrow £500,000 for land-purchase and £100,000 for road-construction; provision was made for the extensive conversion of crown land into freehold, reserving minerals to the crown; landowners might be compelled to divide unimproved land; and safeguards were enacted against the aggregation of large landed estates. In his budget speech on August 6, Mr. Allen promised that "so soon as details are settled, the government will submit to Parliament a policy which will recognize to the full the necessity for *one control for imperial purposes*" of whatever warships might be constructed at the Dominion's expense. The government was anxious to secure adequate naval protection for New Zealand and a greater participation by New Zealand in the work of defense, yet was reluctant to follow Australia's lead in constructing a separate naval unit. The defense estimates amounted to £505,000. Under the defense act, 52,000 recruits had been enlisted, but there had been a large number of defaulters from compulsory military service, 3100 of whom were convicted. The "inhuman" treatment of such defaulters was deprecated by a deputation of the Labor Congress, but Colonel Allen denied the justice of the complaint. The organized labor movement, exceptionally strong in New Zealand, entered on a new phase in 1913, when the "Labor Unity Congress" in July, representing over 50,000 workers, gave birth to two new organizations; the Social Democratic Party and the United Federation of Labor. The former is the successor of the United Labor Party of New Zealand which was formed at Easter, 1912, and aims through political propaganda to secure Socialistic legislation. Among other measures, it demands the enactment of a Right-to-Work Law providing for a minimum wage and a maximum working day of six hours; the non-interference of the army in industrial disputes was also desired. The United Federation of Labor was a purely industrial organization, the enlargement of the New Zealand Federation of Labor. It is a federation of local trade unions, with a national executive consisting of four officers elected by *plébiscite* of the United Federation, together with representatives of each of the ten national industrial departments (mines, railways, etc.); all officers are subject to recall or instruction by *plébiscite*. A trial of the new organization took place in October, when a general strike paralyzed industry and made it necessary to land British marines at Auckland and at Wellington. In order to prevent illegal strikes in the future the premier introduced an arbitration bill imposing fines of £10 on workmen and £500 on employers who should disobey arbitration decisions. The stringent anti-trust laws were upheld by the Court of Appeals in the case of the sugar trust.

NICARAGUA. A Central American republic, between Honduras on the north and Costa Rica on the south. The capital is Managua.

AREA AND POPULATION. The estimated area is 49,552 square miles, slightly more than the area of the State of New York. The population, which is largely Indian and mestizo, is estimated at 600,000. There is a very small proportion of pure whites in the country. The larger towns are: León, with about 63,000 inhabitants; Man-

agua, 40,000; Granada, 25,000; Matagalpa, 16,000; Bluefields and Masaya, 15,000 each. Illiteracy is prevalent. There are upwards of 350 elementary schools and a few institutions for secondary instruction.

PRODUCTION AND COMMERCE. The instability of political conditions in Nicaragua discourages foreign investments there, and little progress can be expected of the natives. Three crops are of some commercial importance—coffee, bananas, and sugar. Sugar-cane is grown more or less throughout the country; coffee is produced in the western districts on plantations controlled largely by Americans and Germans; the banana lands are chiefly in the Bluefields region. Other crops are corn, beans, cacao, and tobacco. Grazing is of considerable importance. The forests contain mahogany and other valuable woods, of which there is some exploitation. Various metals occur in paying quantity, but mining is almost limited to gold. Manufactures are little developed.

Imports and exports in 1908 are reported at \$2,958,878 and \$3,647,984 respectively; in 1909, \$2,583,257 and \$3,989,428; in 1910, \$2,856,305 and \$4,545,076. The leading imports are cotton fabrics, flour, and provisions. The coffee export in 1909 is stated at about 93,640 metric quintals, valued at \$1,546,919; gold, \$1,037,892; woods, \$415,575; rubber, \$229,871. In 1910, the United States furnished imports \$1,581,000 and received exports \$1,553,000; Germany, \$369,000 and \$821,000; United Kingdom, \$664,000 and \$656; and France, \$157,000 and \$1,025,000.

COMMUNICATIONS. There is a railway line, which, with short branches has a total length of 171 miles. It connects the Pacific port Corinto with Chinandega, León, Managua, Masaya, Diriamba, and Granada. Steamers ply between Granada, on Lake Nicaragua, and San Juan del Norte, on the Caribbean Sea. There are some 20 miles of private railway. Telegraph offices are reported to number 148 and post offices 151.

FINANCE. In 1912 a new monetary unit was introduced, the gold córdoba, equivalent to the American dollar. The paper peso is greatly depreciated; its value has been about 16 cents. Revenue and expenditure in 1909 were 12,994,275 and 18,639,308 pesos respectively; in 1910, 15,182,852 and 34,573,125 (of which 22,520,277 extraordinary on account of the 1909 revolution). Of the revenue in 1910, 9,793,717 pesos were derived from customs, 1,427,095 from liquor taxes, and 1,319,025 from tobacco taxes.

GOVERNMENT. The legislative power is vested in a single chamber of 36 members elected for six years. The president, according to the constitution, is elected by direct vote for four years. In 1913 the president was Adolfo Díaz, who as vice-president succeeded to the executive office May 11, 1911, upon the resignation of General Juan J. Estrada. On October 7 following, the Congress chose General Luis Mena president for four years from January 1, 1913. This election was declared illegal, and Mena headed a revolt, which was suppressed with the assistance of American marines, to whom Mena surrendered September 25, 1912. On November 2, Díaz, as the unopposed Conservative candidate, was elected president. He was inaugurated January 1, 1913.

HISTORY. The Congress met on August 20, to discuss the economic situation and revise the budget. Sr. Maximo H. Zepeda was elected

speaker, and Sr. Salvador Chamorro first designate to the presidency (vice-president). There was considerable discussion of a proposed treaty which would have given the United States a quasi-protectorate over Nicaragua. (See UNITED STATES, *Foreign Affairs*). The essential condition which would incline Nicaragua to such an arrangement, namely, the need of financial backing, was somewhat relieved by a transaction with New York bankers who invested heavily in the capital stock of the National Bank of Nicaragua.

Many political arrests were made as the result of a happily frustrated plot to assassinate the president and legislators. Salvador Mendieta, the leader of the Liberal party, and Adán Espinoza were arrested, together with many of their followers, and two newspapers, *La Informacion* and *El Noticiero*, were suppressed.

In November the government of Nicaragua issued a requisition for the arrest of ex-President José Santos Zelaya in the United States on the charge of murdering two of his countrymen in 1909. Gen. Zelaya was detained eight days in the Tombs prison of New York City on the warrant of the United State District attorney of New York, but was released on December 3. It was understood that Gen. Zelaya had no intention to reënter Central American politics, and that he would henceforth reside in Spain.

NIGER, MILITARY TERRITORY OF. See MILITARY TERRITORY OF THE NIGER.

NIGERIA. An order in council of November 22, 1913, provided that on January 1, 1914, the British protectorates of Northern Nigeria and Southern Nigeria (q.v.) should be amalgamated to form a single protectorate with Sir Frederick Lugard as governor-general. To assist Sir Frederick a Nigerian council was to be constituted, in which there should be six native representatives; four European members nominated by the crown to represent commerce, shipping, mining, and banking; a member of the Lagos Chamber of Commerce, one of the Calabar Chamber of Commerce, and one of the projected Chamber of Mines; and, as *ex officio* members, the governor-general with his executive council and other officials. Railway construction in Nigeria was proceeding actively during the year with the object of opening up the country and the Bauchi branch line was in active progress as far as Bukeroo. It was proposed to build a new railway line from a recently discovered harbor named Port Harcourt 140 miles to the Udi Coal fields, and thence northward to the Benue River and the Bauchi Plateau connecting with the Nigeria Railway system at Kadina.

See also NORTHERN NIGERIA and SOUTHERN NIGERIA.

NILES, KOSSUTH. A rear-admiral (retired) of the United States navy, died December 6, 1913. He was born in 1849 at Belleville, Ill. During the Civil War he served as a private in the 142d Illinois Volunteers, and at the end of the war he entered the United States Naval Academy, from which he graduated in 1869. After serving in various stations, he was appointed lighthouse inspector for the eighth district in 1901, serving until 1903. From 1905-08 he was general inspector of ordnance at the New York navy yard. He commanded the battleship *Louisiana* on the cruise around the world in 1908-09,

and in 1909-11 was a member of the lighthouse board. In 1910-11 he was a member and president of the national examining and retiring boards. In the latter year he was retired on account of old age.

NITROGEN. See CHEMISTRY; CHEMISTRY, INDUSTRIAL; and FERTILIZERS.

NOBEL PEACE PRIZE. See ARBITRATION, INTERNATIONAL; and NOBEL PRIZES.

NOBEL PRIZES. These prizes are awarded annually from an income of \$8,400,000 by the will of Dr. Alfred Bernhard Nobel. The interest from this fund is to be distributed annually to those persons that shall have contributed most materially to benefit mankind during the year immediately preceding. The value of each prize is approximately \$40,000, and is given for work in chemistry, physics, medicine, literature, and for the advancement of peace. The prizes awarded from the foundation of the fund, including those of 1913, are given in the table below:

Physics

Name	Year	Nationality
Wilhelm Konrad Röntgen	1901	German
H. A. Lorentz	1902	Dutch
Pieter Zeeman	1902	Dutch
Henri Becquerel	1903	French
Pierre Curie	1903	French

Alfred Fried	1911	Austrian
Elihu Root (awarded 1913)	1912	American
Henri La Fontaine	1913	Belgian

Short biographies of the Nobel Prize winners of 1913 are given in the alphabetical order of their names. For the first time since the establishment of the prize, an award was made to a native of Asia: the prize for the greatest work in idealist literature was given to a Hindu. The prize in physics went for the fourth time to a Dutchman, thus bringing Netherlands on a par with Germany at the head of the list in this field. In 1912 no award was made of the Peace Prize, but in 1913 the prize for the former year was given to Senator Elihu Root in recognition of his efforts in behalf of international peace and arbitration.

NORTH CAROLINA. POPULATION. The population of the State in 1910 was 2,206,287. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 2,307,809.

AGRICULTURE. The area, production, and value of the principal crops in 1912-1913 are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

		Acres	Prod. Bu.	Value
Corn	1913	2,835,000	55,282,000	\$48,648,000
	1912	2,808,000	51,106,000	42,418,000
Wheat	1913	605,000	7,078,000	7,503,000
	1912	598,000	5,322,000	5,907,000
Oats	1913	230,000	4,485,000	2,736,000
	1912	204,000	3,794,000	2,352,000
Rye	1913	45,000	474,000	465,000
	1912	44,000	409,000	429,000
Potatoes	1913	30,000	2,400,000	1,968,000
	1912	30,000	2,550,000	1,938,000
Hay	1913	320,000	4,419,000	6,914,000
	1912	293,000	3,811,000	6,363,000
Tobacco	1913	250,000	167,500,000	30,988,000
	1912	179,000	110,980,000	17,757,000
Cotton	1913	1,526,000	785,000	45,959,000
	1912	1,545,000	865,000	50,373,000

	1912	400,000	10,000	9,000

a Tons. b Pounds. c Bales.

MINERAL PRODUCTION. The total value of the mineral production of the State in 1912 was \$3,368,923, compared with \$2,793,825 in 1911. The State produces a small amount of copper. In 1912 this amounted to 63,776 pounds, as compared with 13,699 pounds in 1911. The output is entirely from Cullowhee district, Jackson County. The value of the clay products of the State in 1912 was \$1,465,653, an increase of \$185,527 over 1911. The chief product was common brick.

TRANSPORTATION. The railway mileage in the State on January 1, 1913 was 4799. During 1913 there were constructed 52 miles by the

Raleigh, Charlotte, and Southern Railway, and 21 miles by the Watauga and Yadkin River.

EDUCATION. The report of the superintendent of education is for the biennial period 1911-12. The total school population in 1911-12 was 762,607, of whom 515,289 were white, and 247,318 were colored. The enrollment in the schools for white children was 525,507, and in the schools for colored children 152,273. The average daily attendance of white children was 242,798, and of colored children 89,748. The total number of teachers was 11,915. Of these 9017 were in the schools for white children, and 2898 in the schools for colored children. The average annual amount paid to each white teacher was \$219.45, and to each colored teacher \$119.60. The total expenditures for schools in 1911-12 were \$4,078,120.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions under the control of the State, with their populations in 1913 are as follows: Hospital at Morganton, 1365; Hospital at Raleigh, 1866; Hospital at Goldsboro, 813; Epileptic Colony at Raleigh, 191; School for the Blind, Raleigh, 176; School for the Colored Blind and Deaf, Raleigh, 176; School for the White Deaf, Morganton, 260; Soldiers' Home, Raleigh, 130; Jackson Manual Training and Industrial School at Concord, 60; Orphanage for White Children at Oxford, 332; Orphanage for Colored Children, Oxford, 218; State's prison, Raleigh, 855. The total number of inmates in these institutions was 5511 on November 30, 1913. The second annual Social Service Conference was held in the State in 1913. The State Mental Hygiene Society was finally organized during the conference, and a State society under the National Congress of Mothers was successfully started. The legislature of 1913 placed the tuberculosis sanatorium under the State board of health, and this institution is to be used as a school for victims of this disease. A broad tuberculosis campaign will be carried on by the board of health during 1914.

POLITICS AND GOVERNMENT. There was no election for State officers during the year, as the term of Governor Craig does not expire until January 1, 1917. The next State election will be held on November 3, 1914. The legislature passed the Seventeenth Amendment providing for the direct election of senators. The extra session of the legislature was held in 1913. Measures passed were almost entirely of local importance. A constitutional commission submitted to the extra session amendments providing for the initiative and referendum. The General Assembly, however, failed to include that recommendation among amendments to be submitted to the people in the autumn of 1914. On October 20 Governor Craig named "good roads days," in which work was to be done by volunteers on the State roads.

LEGISLATION. The legislature met in 1913 and passed only one measure of general importance. This was a measure reducing the peremptory challenges permitted a defendant charged with capital felony from 23 to 12, and making it possible for courts to draw a jury from another county instead of making the change of venue. See also **LIQUOR REGULATION.**

STATE GOVERNMENT. Governor, Locke Craig; Lieutenant-Governor, E. L. Daughtridge; Secretary of State, J. B. Grimes; Treasurer, B. R. Lacy; Auditor, W. P. Wood; Attorney-General,

T. W. Bickett; Superintendent of Education, J. Y. Joyner; Commissioner of Agriculture, W. A. Graham; Commissioner of Insurance, J. R. Young—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, Walter Clark, Dem.; Justices, Geo. H. Brown, Dem.; Wm. A. Hoke, Dem.; Wm. R. Allen, Dem.; P. D. Walker, Dem.; Clerk, L. Seawell, Dem.

STATE LEGISLATURE, 1913. Democrats: Senate, 47; House, 104; joint ballot, 151. Republicans: Senate, 1; House, 6; joint ballot, 7. Progressives: Senate, 2; House, 10; joint ballot, 12. Democratic majority: Senate, 44; House, 98; joint ballot, 132.

The names of senators and representatives to Congress will be found in the article **UNITED STATES**, section *Congress*.

NORTH CAROLINA, UNIVERSITY OF. A State university for higher education, founded at Chapel Hill, N. C. in 1793. The total enrollment in all departments of the university in 1913 was 870. The faculty numbered 59. There were no noteworthy changes in the faculty during the year and no important benefactions were received. The productive funds of the university amount to \$215,446. The library contains 69,750 volumes. The president is Francis P. Venable, Ph.D.

NORTH DAKOTA, POPULATION. The population of the State in 1910 was 577,056. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 660,849.

AGRICULTURE. The area, production, and value of the principal crops in 1912-1913 are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

	Acres	Prod. Bu.	Value
Corn 1913	275,000	10,800,000	\$ 5,616,000
..... 1912	328,000	8,758,000	3,766,000
Wheat 1913	7,510,000	78,855,000	57,564,000
..... 1912	7,990,000	143,820,000	99,236,000
Oats 1913	2,250,000	57,825,000	17,348,000
..... 1912	2,300,000	95,220,000	20,948,000

..... 1912	52,000	6,656,000	1,864,000
Haye 1913	340,000	338,000	2,250,000
..... 1912	364,000	510,000	2,805,000

• Tons.

MINERAL PRODUCTION. The total value of the mineral production of the State in 1912 was \$1,021,741, compared with \$957,425 in 1911. The State is not important as a producer of coal. In 1912 the production was 499,480 short tons, valued at \$765,105. All the coal mined in the State is lignite. The production of 1911 was 502,628 short tons. The number of men employed in the coal mines in 1912 was 622, compared with 640 in 1911. There were no fatal accidents in 1912.

TRANSPORTATION. The railway mileage of the State on January 1, 1912, was 4703. During 1913, the following mileage was constructed: The Fairmont and Veblen, a line running from Fairmont, North Dakota, to Veblen, South Dakota, about 12 miles in North Dakota; Minneapolis, St. Paul, and Sault Ste. Marie, from Ambrose, west to Montana State line, about 28 miles; Great Northern, from the Montana line to Mohauk, N. D., about 50 miles; extension of the Northern Pacific, Stanton line, about 25 miles. When these lines are completed, about 500 miles

will have been added to the railroad lines in the State.

CHARITIES AND CORRECTIONS. The institutions under the control of the State include the State Penitentiary, State Hospital for the Insane, State Industrial School, State Institutions for Feeble-minded, School for the Deaf, State Reform School, and the State School for the Blind.

EDUCATION. The total school population of the State in the school year 1912 and 1913 was 167,326. The total enrollment in public schools was 139,361, and the average daily attendance 99,686. The teachers, both male and female numbered 7569, and the average monthly salary of the teachers was \$55.03. Among the important measures enacted by the legislature of 1913 were those providing for a teachers' insurance and retirement fund and a State Board of Education. The new high school laws and laws providing for aid to rural, graded, and consolidated schools, were also passed.

FINANCE. There was a balance in the treasury on November 1, 1912, of \$840,663. The total receipts for the fiscal year ending October 30, 1913, was \$4,258,526. The expenditures were \$3,115,514, leaving a balance on hand on June 30, 1913, of \$1,983,675. The chief receipts are from taxation, and the chief expenditures are for education, State institutions, and State officers.

POLITICS AND GOVERNMENT. There was no election for State officers during the year, as the term of Governor Hanna does not expire until January 1, 1915. The next State election will be held November 3, 1914. The legislature passed a number of measures affecting elections in the State. These related to a presidential primary, non-partisan judiciary elections, and nominations, non-partisan school elections and primaries, and corrupt practices acts, and also a somewhat novel measure for the benefit of those absent from the State, particularly commercial travelers, allowing them to vote by affidavit wherever they may be at the time. Resolutions providing for the initiative, referendum, and recall having passed the legislature in 1912 and 1913, will be submitted to the people in the general election held in November, 1914. Wonderful progress was made during the year in the way of better farming, and greater prosperity has resulted. Railway development during 1913 was far in excess of that of the country at large. The year 1914 will be the twenty-fifth anniversary of statehood, which will be appropriately celebrated, exhibiting the wonderful progress made along all lines in the past quarter of a century.

LEGISLATION. The legislature met in 1913 and passed several important measures. A measure was passed to prevent procreation by confirmed criminals, insane, idiots, and defectives; another to regulate the practice in District and Supreme Courts. By this latter enactment all exceptions on trial are made unnecessary, exceptions being required only in charge to the jury. Typewritten transcripts may be used on appeal instead of printed abstracts. Provision was made for the submission to the people of a constitutional amendment providing for woman suffrage. An inheritance tax law was passed. Teachers' insurance and retirement funds were established. Provision was made for providing for a submission to the people of a constitutional amendment, providing for the initiative and referendum, and also for a pro-

posal to amend the constitution by initiative petition.

STATE GOVERNMENT. Governor, L. B. Hanna; Lieutenant-Governor, A. T. Kraabel; Secretary of State, Thomas Hall; Treasurer, Gunder Olson; Auditor, C. O. Jorgenson; Attorney-General, Andrew Miller; Superintendent of Education, E. J. Taylor; Commissioner of Agriculture, W. C. Gilbraith; Commissioner of Insurance, W. C. Taylor—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, B. F. Spalding, Justices, Chas. J. Fisk, E. T. Burke, E. B. Goss, A. A. Bruce; Clerk, R. D. Hoskins—all Republicans, except Fisk.

STATE LEGISLATURE, 1913. Republicans: Senate, 44, House, 103; joint ballot, 147. Democrats: Senate, 6; House, 8; joint ballot, 14. Republican majority: Senate, 38; House, 95; joint ballot, 133.

The names of the senators and representatives to Congress will be found in the article UNITED STATES, section Congress.

NORTH DAKOTA, UNIVERSITY OF. A State institution for higher learning, founded at Grand Forks, in 1883. The total number of students enrolled in the several departments of the university in the autumn of 1913 was 671. The faculty numbered 94. Dr. Henry Brush was appointed to succeed Professor Henry L. Daum, deceased, as professor of romance languages. There were no noteworthy benefactions during the year. The productive funds of the university amount to about \$1,700,000, and the income which is derived chiefly from the State legislature, \$227,000. The library contains about 52,000 volumes. The president is Frank L. McVey, Ph.D., LL.D.

NORTHERN, WILLIAM JONATHAN. A former governor of Georgia, died March 25, 1913. He was born in Jones County, Ga., in 1835; graduated from Mercer University in 1853; and for several years he taught school. He engaged in farming in 1874; was president of the State Agricultural Society from 1886-88; in 1877-78 a member of the State House of Representatives; and in 1884-85 a member of the State Senate. He was elected governor in 1890, serving until 1894. On his retirement from the governorship he became manager of the Georgia immigration and investment bureau, which position he continued to hold until the time of his death. He was the vice-president of the American Tract Society and of the American Bible Society.

NORTHERN NIGERIA. A British west African protectorate, covering an area of 255,700 sq. miles and including the empire of the Fulani, whose head is the sultan of Sokoto, with its dependencies; together with Idah, and the pagan countries of Borgu and Bornu. Pagan tribes inhabit the southern part of the protectorate, the Kabba country, and the north and east bank of the Niger. The Hausa states of the Fulani empire contain, roughly, about eight million highly civilized Mohammedan inhabitants. The chief station and garrison is Lokoja, at the junction of the Niger and the Benue. At Jebba (the capital till 1902) the limit of navigation is reached and the railway bridge crosses the Niger. Zungeru, near the Kaduna River, is the capital. The protectorate maintains a commercial station at Burutu (Forcados River mouth in Southern Nigeria) for the transshipment of goods and travelers. Palm oil and palm kernels are the chief exports of the lower

Niger valley; other products are rubber, hides, ground nuts, shea butter, ivory, chillies, and medicinal plants. Cassiterite is mined—1470 tons exported in 1911. Duties are levied only on imports and are collected by Southern Nigeria, which compensates by contributing to the Northern Nigeria revenue. Imports via Idah, the inland frontier station, are given from the reports of commercial firms in 1911 at £360,364 and £391,777. The Baro-Kano Railway traverses 356 miles, and has a branch to Zungeru, where it connects with the Lagos line. In 1911 a light railway from Zaria was begun, to end at Narguta (Bauchi district) and was completed, March, 1912, as far as Rahama (88½ miles). (See also SOUTHERN NIGERIA.) Local revenue (1911-12), £545,291; grant-in-aid, £347,000; Southern Nigeria contribution, £70,000—total, £962,291. Expenditure, £827,939. Governor (1913), Sir F. J. D. Lugard.

See also NIGERIA.

NORTHWESTERN UNIVERSITY. An institution for higher education founded at Evanston, Ill., in 1851. The total enrollment in November, 1913, was 4490. The faculty numbered 378. Among the new appointments to the faculty were those of Harland Updegraff, Ph.D., professor of education; Edward Leroy Schaub, Ph.D., professor of philosophy; Walter Edward Lagerquist, Ph.D., assistant professor of economics; Horace Secrist, Ph.D., assistant professor of economics; Lewis Omer, director of physical training. These were all in the college of liberal arts. There were also new appointments in the medical school, the school of pharmacy, school of music, and the school of commerce. The important benefactions received during the year included \$250,000 from Mr. Norman W. Harris, and \$450,000 from two other sources. The productive funds of the university amount to about \$4,600,000. The library contains about 184,000 volumes. The president is Abram W. Harris, LL.D.

NORWAY. A constitutional European monarchy, situated in the western portion of the Scandinavian Peninsula. Capital, Christiania.

AREA AND POPULATION. The total land area is 119,549 sq. miles; the total area including fresh waters, 124,675. The total *de facto* population, December 31, 1910, was 2,357,790; *de jure* population, 2,391,782 (estimated December 31, 1911, 2,411,948). Of the total *de facto* population, 1,662,513 resided in the rural communes, and 695,277 in towns. Males numbered 1,123,160, females 1,234,630. Agriculture and allied industries supported 898,259; fisheries, 134,685; mines, furnaces, etc., 247,077; manufactures, etc., 238,722; small enterprises, and public utilities construction, 111,832; commerce, banks, and internal transportation, 279,866; navigation, 77,636; public administration and the liberal professions, 109,492; domestic labor, 101,865; without occupation, 45,701. Total population over fifteen years of age, 1,525,564. In 1911 the marriages numbered 14,800, births 61,000 (4080 illegitimate), deaths 31,300, emigrants, 12,477. Christiania had (1910) 241,834 inhabitants (*de jure*); Bergen, 76,867; Trondhjem, 45,335; Stavanger, 37,261. Lutherans are in the majority. All creeds except Jesuitism are tolerated.

PRODUCTION. The agricultural census of 1907 returned 1,111,949 acres under cultivation, 854,701 under sown and natural grasses and 69,114 under forest. The total value of sown crops in 1911 was reckoned at 184,907,600 kronen (cereals

36,497,200, potatoes 35,604,400, hay 112,806,000); in 1910, at 200,712,400; in 1908, at 270,872,500; in 1905, at 220,836,100; in 1903, at 211,927,000. The cereal production by no means keeps up with the consumption; in 1910 the total cereal production (including dried legumes) was 292,691,000 kilos; the total cereal import, 598,355,000 kilos. Potato yield in 1910, 568,289,000 kilos; import, 13,122,000 kilos. The following table shows the area in hectares and the production (final returns) in quintals of main cereal crops in 1911 and 1912, with quintals per hectare in 1912:

	Hectares		Quintals		Qs. ha.
	1911	1912	1911	1912	
Wheat	5,021	5,021	73,513	90,038	17.9
Rye	15,066	15,066	240,615	264,401	17.6
Barley	35,917	35,917	584,024	706,917	19.7
Oats	106,279	106,279	1,479,373	1,963,373	18.5

The 1907 livestock returns were as follows: 172,468 horses, 1,094,101 cattle, 1,393,488 sheep, 296,442 goats, 318,556 swine, 142,623 reindeer. Poultry is raised in considerable numbers. Persons employed in the 670 creameries, 68 cheese, and 4 condensed-milk factories, etc., in 1910, 1021 men and 1710 women; these establishments received during the year 277,761,763 kilograms of milk and turned out 3,707,231 kilos of butter and 7,796,739 kilos of cheese.

The cod fisheries employed, in 1911, 86,301 fishermen and 19,407 boats (93,608 and 20,055 in 1909; 75,999 and 19,878 in 1902). Output: 65,051 cod, 127,874 hectoliters of livers, 40,461 hectoliters of roes (56,208, 138,985, and 46,321 in 1909; 45,217, 73,755, and 32,881 in 1902); valued at 25,891,000 kronen (18,146,000 in 1909; 12,895,000 in 1902). Output of herring fisheries: 2,989,000 hectoliters valued at 12,902,000 kr. (9,903,000 in 1909; 7,923,000 in 1902). The salmon and salmon trout fisheries brought in 952,255 kilos in 1908, valued at 1,324,844 kr.

The mines in 1910 employed 6246 persons and produced 543,709,000 kilograms valued at 11,220,000 kr. Industrial establishments at end of 1911 numbered 5788, employing 129,238 persons and 612,701 horse power.

COMMERCE. Below is shown the trade for comparative years in kroner:

	1909	1910	1911
Imports.....	386,616,600	429,228,800	495,749,100
Exports.....	264,326,000	309,780,400	325,406,900

Some of the principal imports are cereals (66,649,400 kr. in 1911), colonial products (40,590,400), boats, vehicles, machinery etc., (68,178,700), minerals (41,085,100), textiles (37,437,400), textile material (13,664,600), metals (27,200,600), metal manufactures (29,726,600), alimentary animal products (13,141,000), other animal products (19,339,500). Among the exports are alimentary animal products (103,978,800 domestic and 3,198,000 reexport), wood, raw and partly worked (34,188,200 and 14,900), wooden wares (43,870,400 and 5400), animal products other than alimentary (19,203,000 and 459,000), oils, resins, etc. (12,773,500 and 418,700), paper and paper goods (21,042,600 and 10,300), minerals (12,775,300 and 1,109,600), mineral manufactures (13,274,000 and 649,500), metals, raw and partly raw (10,657,500 and 96,700), metal manufactures (2,226,500 and 606,000). Germany contributed imports valued at 147,988,000 kr. and

received exports valued at 67,173,000 kr.; United Kingdom, 127,400,000 and 87,173,000; Sweden, 57,797,000 and 20,003,000; Russia and Finland, 35,357,000 and 11,744,000; United States, 30,987,000 and 28,497,000; Denmark, 21,950,000 and 7,579,000; France, 11,898,000 and 11,613,000.

Vessels entered during 1911 numbered 11,294, of 5,128,068 tons; cleared, 11,622, of 5,117,416 tons. There were, January 1, 1911, in the merchant marine, 1842 steamers, of 895,869 tons, and 1205 sailing, of 630,287.

COMMUNICATION. In 1910-11 there were 3085 kilometers of railway in operation (2057 in 1900; 1562 in 1890; 887 in 1878; 68 in 1860). Receipts for the year, 25,659,471 kr.; expenditure, 19,068,447. Length of highways and local roads (1910), 31,876 kilometers (16,091 in 1850). Post offices, 3496; receipts (year 1911), 8,963,223; expenditures, 8,235,475. State telegraph and telephone lines (June 30, 1912), 21,683 kilometers; wires, 168,963; offices, 1305; receipts for the year, 6,615,808.78 kr.; expenditure, 4,702,049.05.

FINANCE. The krone (worth \$.268) is the monetary unit. In the following table are shown revenue and expenditure for comparative years (budget):

	1909-10	1910-11	1911-12
Revenue.....	122,243,829	128,279,596	140,730,210
Expenditure.....	116,751,005	120,905,430	132,932,368

The principal sources of revenue were estimated in 1911-12 as follows: Finance and customs, 82,801,792 kr.; public utilities, 40,178,526; instruction, 3,755,626; justice, 2,101,258; from loans, 5,817,333; agriculture (including state forests), 1,404,032; with divers other receipts the total revenue was estimated at 140,730,210 kroner. The principal revenues of expenditure were public utilities, 50,301,105 kroner; defense, 23,181,460; finance, 23,214,120; instruction, 14,999,668; justice, 9,250,689; commerce and industry, 3,055,860; council of state, 1,940,572; foreign affairs, 1,019,810; civil list, 747,833; Storting, 680,017; these estimates with miscellaneous additions make up a total of 132,932,368 kroner. The total public debt stood, June 30, 1912, at 362,805,563 kroner—149.86 kr. per capita, as calculated upon the *de jure* population (estimate) of June 30, 1912. Of the total, 17,839,195 kr. represent the internal and 344,966,368 the external debt.

ARMY. The Norwegian army is based on universal and compulsory service with few exceptions, but the annual contingent required is not sufficiently large to make the service very onerous. There are three lines, the active army, or Ligne, in which there is a period of service of 12 years, the Landvaern, with eight years' service, and the Landsturm, in which citizens are enrolled until the age of 50. The duration of service is twelve years in the line and eight in the Landvaern, while a Landsturm to take in young men from 18 to 22 years of age and those from 43 to 55, who had passed the period for required service in the first and second lines, was projected, but had not been put into execution. The recruits are in active service for a number of days of various years of their period amounting from 144 days, in the case of the infantry, to 198 days in the case of the cavalry, and various other periods for other branches of the service. The kingdom is divided into ten

divisions for recruitment, at the head of which are retired officers and there are sub-divisions each furnishing from three to six battalions, making a total of 47 battalions in all. The annual contingent of men for the infantry is from 9000 to 10,000, while the contingent for the other arms of the service is 425 men for the cavalry, 546 for the field artillery, 120 for the heavy artillery, 120 for the fortress artillery, and 416 for the engineers. The Norwegian forces are divided into six brigades with headquarters at Fredrikshald, Kristiania, Kristiansand, Bergen, Trondjem, and Harstad. The active army is maintained on a skeleton, or cadre, basis, the organization being filled out in the training season by men called to the colors for various periods of service from 72 days per annum in the case of the infantry to 126 days per annum for the artillery. In 1912, 8000 men formed the infantry contingent. As a result of this organization the military force available for service beyond the frontier would number about 30,000, while a total armed strength of 70,000 could be mobilized. The regiment is the unit under the scheme of the organization adopted in 1909, but there is also a brigade formation for all arms and full arrangements for the mobilization of troops.

NAVY. Included in the active fleet are 4 coast-defense vessels, of 16,300 aggregate tons; 2 monitors, of 3500; 3 first-class gunboats, of 3250; 8 second-class gunboats, of 2270; 2 torpedo-boat destroyers, of 1100; torpedo dispatch boat, of 410; 10 first-class torpedo boats, of 1020; 27 second-class torpedo boats, of 1840; and 1 third-class, of 30; 1 submarine, of 200. Building are one torpedo-boat destroyer, a torpedo boat, and four submarines.

GOVERNMENT. The executive power is vested in a king (1913, Haakon VII., elected November 18, 1905), aided by a council of state composed of responsible heads of departments. The Storting (representative), made up of the Lagthing and the Odelsting, is the legislative body.

Heir-apparent, Prince Alexander, born July 2, 1903; renamed Olaf upon his father's accession to the throne.

The council as constituted January 31, 1913, was as follows: G. Knudsen, premier and minister of state and agriculture; N. Ihlen, foreign affairs; A. O. Bryggessaa, worship and instruction; L. Abrahamsen, justice and police; J. Castberg, commerce, etc.; A. T. Urbye, public works; A. T. Omholt, finance, etc.; H. V. D. Keilhau, defense.

HISTORY. The elections of November, 1912, as noted in the 1912 YEAR BOOK, greatly strengthened the Left (Radicals and Democrats) at the expense of the government bloc of the Right and the Liberals. The bloc now had only 41 instead of 54 seats, while the Left had increased its representation from 44 to 49, and the Socialists from 25 to 33. The new Storting assembled on January 23 to hear the speech from the throne, which foreshadowed (1) the reorganization of the civil procedure, (2) the regulation of industrial disputes, (3) modification in the bastardy law. On the following day the Bratlie ministry resigned in acknowledgment of the fact that it no longer controlled a majority in the Storting. Gunnar Knudsen, who had been premier until defeated in the elections of 1909, was returned to power, with the cabinet

given above. The duties of the minister of commerce and labor were enlarged, it should be noted, to include the preparation and application of pension laws, obligatory insurance, inspection of labor conditions, and public hygiene. The programme which the ministry hoped to enact with the support of the Radicals, Democrats, and possibly the Socialists, included measures for (1) the protection of national economic independence against the inroads of foreign financiers, (2) ecclesiastical reforms to be carried out in a "liberal and democratic" spirit, (3) old-age pensions, (4) the inspection of labor conditions, (5) democratic reforms in the army which would make it possible for able men to rise from the ranks. On June 11 the Storting unanimously passed a bill removing the restriction on female suffrage in parliamentary elections; henceforth all women over 25 years of age are entitled to vote regardless of the amount of their income tax. On June 26 a bill was passed by 92 to 23 votes abolishing the royal veto. A bill to abolish the badges of orders received 75 affirmative and 47 negative votes, thus failing to secure the necessary two-thirds majority. On July 31 the Frithjofstatue presented to Norway, by Emperor William II., was unveiled; the occasion gave opportunity for a cordial interchange of compliments by the monarchs of Norway and Germany.

NORWOOD, THOMAS MANSON. An American jurist and former United States senator from Georgia, died June 21, 1913. He was born in Talbot County, Ga., in 1830, and graduated from Emory College in 1850. Two years later he was admitted to the bar and began practice in Savannah. At the outbreak of the Civil War he enlisted in the Confederate army and served throughout the war. At the close of it, he engaged again in the practice of law and also took a prominent part in State politics. In 1871 he was elected United States senator from Georgia, serving until 1877; in 1880 he was candidate of one of the two factions of the Democratic party for governor of the State. He was a member of the State House of Representatives from 1885-89, and from 1896-1908 he was judge of the City Court of Savannah. In this office he came into contact with thousands of negroes, and he had strong opinions on the education of negroes, which he insisted was a mistake, holding the negro incapable of intellectual development. He wrote *Plutocracy, or American White Slavery* (a novel, 1888); *Patriotism, Democracy or Empire—a Satire* (1900).

NOVA SCOTIA. A province of the Dominion of Canada. Area, 21,428 square miles; population (census of June 1, 1911), 492,338 (459,574 in 1901). Halifax is the provincial capital, with 46,619 inhabitants in 1911. A lieutenant-governor administers the province—James Drummond McGregor in 1913 (appointed October 18, 1910). Premier in 1913, George H. Murray. See section so entitled under CANADA, DOMINION OF.

NURSES, SCHOOL. See EDUCATION IN THE UNITED STATES, *School Hygiene*.

NUTRITION. See ALCOHOL, and FOOD AND NUTRITION.

NYASSALAND PROTECTORATE. A British central African possession lying between German and Portuguese East Africa and North-eastern Rhodesia and Lake Nyassa. Area, 39,801 square miles; population (March 31, 1910), 773 Europeans, 463 Asiatics (exclusive of Sikh troops), and 999,423 natives. Chief town, Blan-

tyre; administrative headquarters, Zomba. The principal products and exports are cotton (3392 bales of 400 pounds in 1911-12), maize, wheat, tobacco, rice, rubber, and coffee. Imports and exports in 1911-12 (exclusive of goods in transit), £247,548 and £198,577 (£199,710 and £168,911 in 1910-11). Revenue (1911-12), £128,856 (£97,356 local, £31,500 grant-in-aid); expenditure, £118,070. The protectorate is traversed (808 miles) by the African Trans-continental Telegraph Company's line. One hundred and thirteen miles of railway are in operation. The extension of the Blantyre-Port Herald line to Kaia on the Zambesi, was contracted for. In addition to this extension of the original line, 113 miles in length, there was to be an ultimate extension to Beirax. Governor in 1913, Sir W. H. Manning (February, 1911).

OATS. The world's production of oats in 1913 amounted to about 4,290,000,000 bushels as compared with 4,585,000,000 bushels in 1912. This reduction was the result mainly of smaller yields in Russia and the United States. The Russian yield was estimated at 1,025,000,000 bushels, or over 25,000,000 bushels less than the year before, while the crop in the United States was shorter by about 300,000,000 bushels. Germany produced 647,980,000 bushels, the largest crop for 10 years, and the average rate of yield was 56 bushels per acre. Other heavy-yielding countries were Canada with 395,000,000 bushels, France with 358,000,000, the United Kingdom with 193,000,000, Austria with 158,000,000, Hungary with 98,000,000, and Italy with 41,600,000 bushels. In all of these countries except Austria better crops were secured than in 1912. In Italy the production was more than 50 per cent. and in Hungary more than 25 per cent. greater than in the previous year. The highest average yields per acre were reported by the Netherlands and Belgium, being 69 and 63 bushels respectively, while the lowest, 7.2 bushels, was reported by Spain. The Russian acre yield was also low, being only 8.1 bushels. The world's acreage was slightly above that of last year. The supply of oats is sufficient to satisfy the demands of international markets.

The United States in 1913 produced the third largest crop of oats in its history on the largest acreage ever devoted to the cereal. The production amounted to 1,121,768,000 bushels on 38,399,000 acres, as compared with 1,418,337,000 bushels on 37,917,000 acres the year before. The average yield for the two years was 29.2 and 37.4 bushels per acre respectively. Based on the farm price of 39.2 cents per bushel on December 1, the valuation of the total crop reached \$439,596,000, as against 31.9 cents per bushel and \$452,469,000 for the crop of the previous year on the corresponding date. The crop in the different States ranged from 52,000 bushels in Rhode Island to 168,360,000 bushels in Iowa, and these two States also had the lowest and highest acreage respectively. Following Iowa, Minnesota produced 112,644,000, Illinois 104,125,000, Wisconsin 83,038,000, Nebraska 59,625,000, North Dakota, 57,825,000, and Ohio 54,360,000 bushels. All of these States except Nebraska reported smaller yields than a year ago. The lower yields in the principal oat-growing States were due to a severe drouth which injured all spring-sown grain crops. The average yield per acre in some of the drouth-stricken sections dropped to one-half of normal. In rate of yield as usual the extreme Northwest again led all sections. Wash-

ington reported an average yield of 48 bushels, Idaho and Utah of 46, and Montana of 44 bushels per acre. The New England States as in the previous year also ranked high in acreage yield, Maine leading with 40 bushels. The areas of winter oats in the Southern States were larger as a rule than in the previous year and in most States the average yield per acre was also better.

OBER, FREDERICK ALBION. An American author and ornithologist, died June 1, 1913. He was born in Beverly, Mass., in 1849, and was educated in the public schools and by private study. In 1872-74 he hunted birds in Florida and explored the Lake Okeechobee region. In 1876-81 he made ornithological investigations in the Lesser Antilles, discovering twenty-two new species of birds and adding many types to the collection of the Smithsonian Institution. He traveled much in Mexico, Spain, North Africa, South America, and in the West Indies, of which islands he was a commissioner for the Chicago Exposition in 1891-92. In addition to his ornithological writings he was best known as a writer of boys' stories. He wrote also *Porto Rico and Its Resources* (1892); *A Brief History of Spain* (1897); *Storied West Indies* (1900); *Our West Indian Neighbors* (1904); *History of Mexico, Central America and Cuba* (1904); *A Guide to the West Indies* (1907); and *The Heroes of American History* (12 vols., 1907).

OBERLIN COLLEGE. An institution for higher education founded at Oberlin, Ohio, in 1833. The total enrollment in all departments in the autumn of 1913 was 1809. The faculty numbered 160. There were no notable changes in the faculty during the year, and no especially noteworthy benefactions were received. The productive funds of the college amount to about \$3,750,000. The library contains 120,000 bound volumes and 125,000 pamphlets. The president is Henry C. King, D.D.

OCCUPATIONAL DISEASES. Brass founders' or zinc ague, a frequent but unrecognized illness occurring among brass workers, was carefully investigated by E. R. Hayhurst, of Chicago. Workmen exposed to the fumes of molten metals are likely to become poisoned. In the case of lead and mercury this had long been known, but the fumes of metal such as brass, bronze, German silver, also frequently poison, and the dust inhaled by those engaged in polishing or handling such metals has not infrequently the same effect. Brass founders' ague was believed to be due to zinc, brass being a compound of copper and zinc. The most important symptom is the chill, with some fever and sweating; besides this, the throat is dry, there is a dry cough, constriction of the chest, a metallic taste in the mouth, loss of appetite, headache and sometimes severe backache and pains in the legs. Nausea and vomiting may or may not occur. After the chill, which lasts from one to three hours, the patient feels weary, but otherwise well. The chills are more likely to occur in the latter part of the afternoon or in the cool of the evening. Hayhurst found that 70 to 80 per cent. of workmen in these trades are susceptible to poisoning, and that 75 per cent. of the remainder develop a certain degree of tolerance to the poison, while the other 25 per cent. suffer more or less regularly. Investigations also showed that men employed in this work were frequently addicted to alcohol, owing to the belief that whisky is an antidote. It was also shown that these men did not live as long as the aver-

age mechanic and the mortality from tuberculosis is very high among them.

The fourth National Conference on Occupational Diseases was held at Rome, in June, 1913. Italy had long had an institute at Milan devoted exclusively to research on industrial affections and their treatment, the first of the kind in the world. It published a semi-monthly journal *Il Lavoro*, now in its sixth volume, which discusses questions connected with the hygiene of wage-workers and prophylaxis of occupational injuries. It was edited by L. Devoto, incumbent of the chair of occupational affections in the University of Milan.

Leuenberger, after reviewing the death certificates of the city of Basel over the period 1901-10, found that tumors of the urinary tract were thirty-three times more numerous in anilin-dye workers than in workmen of other classes. Statistics of the Basel University clinic indicated that over one-half of all cases of tumors of the bladder in patients admitted to the hospital during the last fifty years have occurred in anilin-dye workers. Carcinomas have been most numerous. Leuenberger believed that chemical irritation of the mucous membranes was greater in the urinary tract, because the toxic substances occur there in greater concentrations than in any other part of the body. In 1895 Rahn described tumors of the urinary bladder in fuchsin workers and concluded that the liberation of such products as toluidin, nitrobenzene and anilin, when crude fuchsin is heated, was the cause of these tumors. The skin and respiratory tract are considered the most important avenues by which this poison enters the body. Daily baths are recommended and the wearing of impervious clothing and gloves, together with masks against dust and vapors, to be worn in the workrooms. (See also **LABOR LEGISLATION, Accidents and Diseases.**)

OCEANOGRAPHY. See **EXPLORATION**, under section *Oceanography*.

OHIO. POPULATION. The population of the State in 1910 was 4,767,121. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 4,965,169.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1913	3,900,000	146,250,000	\$92,138,000
	1912	4,075,000	174,410,000	78,484,000
Wheat	1913	1,950,000	35,100,000	31,590,000
	1912	1,220,000	9,760,000	9,565,000
Oats	1913	1,800,000	54,360,000	21,744,000
	1912	2,120,000	93,280,000	30,782,000
Rye	1913	97,000	1,600,000	1,104,000
	1912	57,000	884,000	663,000
Potatoes.....	1913	160,000	10,240,000	8,704,000
	1912	186,000	20,832,000	11,041,000
Hay	1913	2,960,000	23,848,000	49,254,000
	1912	2,960,000	4,026,000	52,338,000
Tobacco ...	1913	81,900	661,425,000	7,002,000
	1912	86,200	79,300,000	7,217,000

a Tons. b Pounds.

MINERAL PRODUCTION. The total value of the mineral products of the State in 1912 was \$111,229,656, compared with \$97,090,284 in 1911. Ohio is one of the chief States in the production of coal. There were mined in 1912 34,528,727 short tons, valued at \$37,083,363. This production was the highest in the whole mining history of the States, and represented an increase over the

production of 1911 of 3,768,741 short tons or 12.25 per cent. The largest output previously reported was in 1910, when on account of the labor troubles in Illinois and Indiana, Ohio coal was in great demand, and the production was 34,209,668 tons. Following the suspension of mining on April 1, 1912, employes in the coal mines secured an advance of wages amounting to about five and a quarter to five and a half per cent. The chief factors in stimulating the production in 1912 were first, the large farm crop and the resultant prosperity in agricultural districts; second, a general increase in manufacturing, particularly in iron and steel; and third, the labor troubles in the Cabin Creek and Paint Creek districts in West Virginia, which reduced competition with, and stimulated the demand for Ohio coals in the lake trade. Fewer men were employed in the coal mines of Ohio in 1912 than in 1911, but there was a marked increase in the number of days work. In 1912 there were employed 45,527 men who worked an average of 201 days, against 46,035 for an average of 179 days in 1911. Ohio leads in the percentage of coal mined by the use of machines. In 1912 over 87 per cent. of the coal produced was mined by machinery. The fatalities in the coal mines in Ohio in 1912 numbered 133, of which 125 were underground, 4 in shafts, and 4 on the surface. Only 1 death was due to an explosion of gas.

According to the estimates of the United States Geological Survey, the production of coal in 1913 was slightly in excess of the output of 1912, and amounted to a little over 34,500,000 short tons. In the late spring, mining operations in the State were affected by the great floods, which tied up transportation and prevented operations for about one month.

Ohio ranked second in the production of pig iron. There were produced in 1912 6,802,493 long tons, compared with 5,110,506 in 1911. A small amount of iron ore was mined in the State.

The petroleum production in 1912 was 8,969,007 barrels, compared with 8,817,112 barrels in 1911. The chief production is in the Lima and southeastern districts, and in the latter there were produced 5,113,051 barrels, in the former 3,955,897 barrels in 1912. The latter figure includes the production of Michigan. The total number of completed wells in the State in 1912 was 1717.

Ohio was the leading State of the Union in the value of clay products. The value of these products in 1912 was \$34,811,508, over 20 per cent. of the total for the country. This was an increase of \$2,147,612 for 1911. The brick and tile production in 1912 was valued at \$19,302,773, and the pottery production at \$15,508,735. The principal clay product is white ware.

TRANSPORTATION. The total mileage in the State on June 30, 1912, was 9,233.19. The total stock of the railroad line amounted to \$987,206,947. The railroads having the longest mileage in the State are the Lake Shore and Michigan Southern, 390; Detroit, Toledo, and Irington, 330; Cleveland, Cincinnati, Chicago, and St. Louis, 336; Cleveland, Akron, and Cincinnati, 325; Toledo and Ohio, 394; Wheeling and Lake Erie, 474; Pittsburgh, Cincinnati, Chicago, and St. Louis, 335; and the Toledo, Columbus, and Ohio River, 337.

EDUCATION. The school population of the State on August 31, 1913, was 1,245,900. The

total enrollment was 870,612, and the average daily attendance was 683,999. The teachers numbered 29,191, of whom 20,939 were women and 8252 were men. The average salary for men teachers was about \$89 a month, and for women teachers \$55. The total expenditures for educational purposes in 1913 were \$32,455,752. The educational policy of the State is undergoing great changes. A survey of the schools was taken during 10 months of 1913, and as a result of this survey many important legislative measures will be introduced in the legislature of 1914.

FINANCE. The report of the State treasurer for the fiscal year ending November 15, 1913, showed a balance in the treasury at the beginning of the fiscal year of \$4,781,327. The total receipts for the same period were \$21,491,137. The disbursements for the same period amounted to \$14,882,868, leaving a balance at the close of the fiscal year of \$6,211,092. The chief sources of revenue are county tax settlements, liquor traffic tax, insurance taxes, annual fees of domestic and foreign corporations, excise tax, and public utilities tax. The chief expenditures are for the administration of public institutions, State highway departments, the Ohio State University, and the judiciary. The State has no bonded debt.

POLITICS AND GOVERNMENT. There was no election for governor or other State officials, as the term of Governor Cox does not expire until January 11, 1915. The next State election will be held on November 3, 1914. Governor Cox was inaugurated on January 14, 1913. On the same day the governor sent a message to the legislature. It contained a recommendation for the passage of the amendment providing for the direct election of senators. This amendment was adopted by the legislature. Municipal elections through the State were of unusual interest owing to the fact that the State constitutional changes made in the summer of 1912 allowed the cities of the State to adopt each its own form of government. For the first time, therefore, municipal elections varied as to form. They occurred on November 3. At this election the city of Dayton, having previously adopted a new charter, elected its first commission under its chosen city-manager plan. The city of Springfield likewise adopted the commission form of government and chose its first governing board. In several cities during the year proposed charters establishing the commission form of government, or some slight variation of it, were rejected at the polls. In general at the November election the Republicans made gains. In Cincinnati, Henry T. Hunt, the reform Democratic mayor, was defeated by Frederick S. Spiegel, Republican. Karl Keller, Republican, was elected mayor of Toledo to succeed Brand Whitlock, Independent, who was not a candidate for renomination. The election in Cleveland was of importance, owing to the fact that partisanship had been wholly eliminated by the new charter, approved on July 1, and candidates for mayor and council ran as nonpartisan candidates. Mayor Newton D. Baker, elected two years previously as a Democrat, was reelected by a reduced majority. At these elections four proposed amendments to the State constitution were submitted, but only one of them was approved. Amendments to establish the short ballot in State and county offices and to exempt local bonds from taxation were re-

jected; one making women eligible to appointment for certain State offices was indorsed. The new license law went into effect on November 22. Under the amendment to the constitution providing for home rule for cities, a new charter was proposed for the city of Cleveland in June. Under this charter nomination for city office was to be by petition only, and a nonpartisan ballot in municipal elections was provided for. The short ballot is included, as is also the recall for mayor and councilmen. No party designation is permitted by the ballot. According to the charter the mayor is to have a cabinet composed of the directors of the departments of law, finance, service, safety, and welfare. The department of service is to have charge of such public functions as thoroughfares, street-cleaning, garbage, sewerage, water supply, filtration, and a municipal lighting plant. The department of welfare is to comprise the divisions of health, charities and corrections, and public recreation. The last named division comprises the recreational uses of parks, playgrounds, bathing beaches, etc. The welfare department has large powers. It includes a vocational guidance bureau, which will have the coöperation of a general commission which has been making an exhaustive study of the subject.

LEGISLATION. The legislature met in 1913 and passed an unusual number of important measures. Among these were the following: An act compelling lobbyists to file a statement with the secretary of State and obtain a certificate. They must also file statements of disbursements. A measure was passed that in civil actions a jury may render a verdict upon the concurrence of three-fourths or more of its number. A legislative reference bureau was established. Measures were passed providing for indeterminate sentences to the penitentiary for all felonies except treason and murder in the first degree. A stringent white slave law was enacted. A commission was appointed to investigate rural credits, to coöperate with the Southern Commercial Congress, and to visit Europe with that congress. A law was passed that wages must be paid at least each calendar month by all employers who employ five or more regular employees in the State. An enactment was passed providing for a ten-hour day for females in certain employments and other provisions regulating conditions for their employment. Various State boards having to do with labor and industrial matters were abolished, and in their place was created an industrial commission composed of three members with very broad powers. An eight-hour law for workmen on public works was enacted. An agricultural commission was established and measures were passed, putting into effect the Torrens' land title system. The legislature enacted a corrupt practices act. Measures were passed providing for a system of primary election for members of Congress, State, county, and municipal officers, delegates to national and State conventions, and members of controlling committees of political parties. A long act provides for several plans for municipal government called the commission plan, the city manager plan, and the federal plan. Each plan provides that all laws pertaining to the initiative, referendum, and recall in municipalities shall apply to each such plan. Ten per cent. of the voters of any municipality may by petition have the question of organizing under any one of the plans submitted to vote. A measure

was passed regulating the circulation of initiative and referendum petitions. Persons circulating these must file sworn statements of disbursements, and it is made a crime for any person to accept anything of value for signing a petition. Measure was passed for providing the use of school grounds and houses and other State buildings as social centres for the entertainment and education of the people. A State board for the censorship of motion-picture films was created. A public utilities commission of three members was established. This succeeds to the powers of the former railroad commission. See also LIQUOR REGULATION.

STATE GOVERNMENT. Governor, James M. Cox; Lieutenant-Governor, W. A. Greenlund; Secretary of State, Charles H. Graves; Treasurer, J. P. Brennan; Auditor, A. V. Donahey; Attorney-General, Timothy S. Hogan; Adjutant-General, G. N. Wood; Commissioner of Insurance, Edmund H. Moore; Superintendent of Education, Frank W. Miller—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, Hugh L. Nichols, Democrat; Associate Justices, James G. Johnson, Democrat; John A. Shauk, Republican; Maurice H. Donohue, Democrat; J. F. Wilkin, Democrat; O. Newman, Democrat; R. M. Wanamaker, Progressive; Clerk, Frank McKean, Democrat.

STATE LEGISLATURE, 1913. Republicans: Senate, 7; House, 33; joint ballot, 40. Democrats: Senate, 26; House, 87; joint ballot, 113. Progressives: Senate, 0; House, 3; joint ballot, 3. Democratic majority: Senate, 19; House, 51; joint ballot, 70.

The names of senators and representatives to Congress will be found in the article UNITED STATES, section Congress.

OHIO STATE UNIVERSITY. An institution of higher learning, founded in 1870 at Columbus. The total enrollment in all departments in December, 1913, was 3715. The faculty numbered about 200. There were no notable changes in the faculty during the year, and no noteworthy benefactions were received. The productive funds amount to about \$1,000,000. There are about 130,000 volumes in the library. The president is W. I. Thompson, E.D., LL.D.

OHIO UNIVERSITY. An institution for higher education at Athens, Ohio, founded in 1804. The enrollment in all departments in the collegiate year 1912-13 was 2037. The faculty numbered 85. A head of the College of Music was appointed in 1913. No noteworthy benefactions were received during the year. The productive funds amount to about \$120,000, and the income from all sources to about \$324,000. The library contains about 45,000 volumes. The president is Alston Ellis, Ph.D., LL.D.

OHIO VALLEY FLOOD. One of the most serious floods and catastrophes that ever befell the United States occurred during the last week of March and early part of April, 1913, along the Ohio Valley, resulting in damages estimated by the United States Geological Survey at \$180,-873,097, including damage to railroads and traction lines, but exclusive of municipal and county improvements, such as water works, sewers, roads, bridges, etc., which were estimated at \$10,-662,183, while the direct loss of life was estimated at 415, though, of course, the indirect mortality due to exposure and incident disease must have reached larger figures.

The flood was due to excessive rainfall over a comparatively large area whereby the rivers of

northern Indiana and Ohio, notably the Miami, the Scioto, and the Muskingum were swollen to such dimensions that the ordinary channels were unable to take care of the flow of water which carried with it sudden and far-reaching disaster and ruin. There was no failure of storage dams, or the general failure of dams of any kind. It was simply a case of the rivers being unable to carry the large amount of precipitation and as a result their banks were overflowed and the effect was manifested, not only on the tributary systems, but on the Ohio itself so far down as Cairo, Ill., where it joins the Mississippi. In addition, the tributaries of the Ohio from the east and south were discharging also large volumes of water which were in excess of the average flood amounts, but not up to their previously recorded maximum. The damage done extended from such sites as Dayton, Ohio, and Hamilton, Ohio, where estimates of \$100,000,000 and \$15,000,000 respectively, were made on the losses sustained by these cities which were submerged, to the rural districts where farm buildings were destroyed together with animals, and agricultural land washed away leaving, instead of fertile soil, barren gravel. The effect of the flood was further increased by the fact that the ground of the watershed was not frozen, but being practically saturated by previous rains, was unable to store any considerable amount of the moisture so that it was discharged rapidly into the various streams which, at the time, were all of them well filled. Furthermore, for an emergency of this kind, the natural waterways themselves had been in nowise prepared, for various encroachments had taken place and the banks and the channels were contracted or obstructed often by bridge piers, abutments, and embankments, in fact, all conditions were very favorable for such a flood as resulted from the unusual rainfall.

On March 22 a storm had passed down the St. Lawrence Valley and was accompanied by rain of moderate intensity, which served to moisten the soil of the Ohio basin. On the five days from March 23 to March 27 two storms occurred with continuous rain, which produced a total precipitation for the five days of 11.10 inches at Bellefontaine, Ohio, and ran from 6 to 10.7 inches in other parts of the State. The first of these storms struck Ohio from the west and extended generally throughout the country in its easterly course. On the night of the 23rd of March there were small tornadic storms

in Michigan, Illinois, Iowa, and Nebraska, where a tornado at Omaha resulted not only in damage, but in the loss of numerous lives. The Miami River was the first large stream to reach alarming proportions, and at Dayton, Ohio, a crest stage of 29 feet, or about 8 feet higher than the previous record flood stage, 21.3 feet in 1866, was reached at 1 A.M., on March 28, and further down the river at 3 A.M., a maximum flood stage of 34.6 feet was attained. This condition was reflected on the Scioto River, though the crest of 37.8 feet, 9.5 feet higher than the previous maximum of March 24, 1898, was reached at 11 A.M., March 26. The same general condition was observed on the Muskingum River. All through Ohio new high water records were established and these conditions soon began to be reflected in the Ohio River itself. Record stages occurred at Marietta, Parkersburg, Huntington, Catlettsburg, Portsmouth, Maysville, Mount Vernon, Paducah and Cairo. Below Cairo the Mississippi River overflowed its banks in many places and at points broke through the levees, but the high water stage of 1912 was not reached.

Nor were the floods of March-April restricted to the States on the Ohio. Throughout eastern Indiana, Ohio, northern West Virginia, and northern New York there was a heavy rainfall and all of the streams were swollen. In New York State the Genesee, Mohawk, and upper Hudson rivers were unable to carry the water in their normal channels and their banks were flooded overflowing the city streets. The result was that gas and electric supply was out of service, street car lines were interrupted, and the water pipes and sewers were also impaired. Railway and structural work naturally suffered and the effect was seen along the New York State Barge Canal.

As soon as the extent of the disaster was realized and the distress and other consequences likely to follow, the governor of Ohio ordered out the militia and declared martial law on the stricken districts. President Wilson sent all the available men of the public health service and of the medical department of the army to the stricken territory with such government supplies as were available. General Leonard Wood, the chief of staff of the army, was sent in person, and his ability as a physician, as well as a military officer, was of special value in restoring order and preventing the outbreak of dis-

ESTIMATE OF DAMAGES IN OHIO VALLEY BY FLOOD OF MARCH-APRIL, 1913.

(Total population, 14,400,000; drainage area, 203,000 square miles)

State	Towns which re- ported *	Lives lost	Buildings flooded	Bridges destroyed	Total	Municipal and county im- provements †
Illinois	11	2	380	...	\$ 1,003,750	\$ 7,250

THE OHIO VALLEY FLOOD

OHIO RIVER AT CINCINNATI, OHIO, APRIL 4, 1913

Photograph taken from Newport, Kentucky, just above the mouth of the Licking River. The crest of the flood was four feet higher than the point shown on the pier of the suspension bridge on the left

ease. The relief of suffering was under the direction of the National Red Cross Association, which had just begun work at Omaha in relieving the distress occasioned by the tornado. The relief work in the Ohio Valley was well organized and was conducted with an efficiency in striking contrast to that manifested in previous catastrophes. There were competent direction and efficient distribution of the food and supplies that were hurried to the stricken district as fast as the railway facilities were restored and communication established. The Red Cross Society expended \$2,343,601 in connection with its relief work and in addition there were local relief funds amounting to about \$600,000, these items not being included in the estimates of damage made by the United States Geological Survey.

Naturally a vast amount of damage was done to telegraph lines and railways, the telegraph wires being put out of commission early in the disaster, while the flood carried away bridges and tracks to an extraordinary degree that was reflected in diminished net earnings for the railways involved. On the Pennsylvania lines alone 24 bridges were lost and 50 damaged, while the repairs and replacements of such structures were estimated at \$1,027,116. The temporary trestles built by this system to replace damaged bridges aggregated in length 3.92 miles, while the length of road requiring repairs was equivalent to 189.6 miles of single track. The aggregate damage to the Pennsylvania system alone was estimated at \$3,800,000. Other systems were correspondingly affected and the restoration of normal conditions occupied the railway engineers the greater part of the spring, but traffic was eventually restored.

There have been other floods in the Ohio Valley, notably in March-April, 1907, and in February, 1884, both of which were due also to the heavy rainfall, but the flood of 1913 was especially noteworthy on account of the exceptional magnitude and intensity of the storms, which were its direct cause and the fact that the greatest damage was done along the tributaries of the Ohio River, which in previous years had not been particularly effective in the production of floods on the Ohio River itself. Its origin was in the comparatively small area of the headwaters of the Muskingum, Scioto, Miami, and Wabash rivers, these four tributaries being responsible for the great damage and loss of life and for the high stages reached on the Ohio at and below Marietta. The southern tributaries of the Ohio, while they contributed a fair proportion of the water in the main stream, had but little disastrous effect.

As a result of the floods on the Ohio and Mississippi rivers and the great damage done, much attention was given to the discussion of various means for their control, or prevention, and an engineering commission was appointed by the United States government, while the various cities in the flood district which had been damaged for the most part employed expert advice to guard against similar damage in the future. In general, the main points of discussion were whether control reservoirs should be provided, and they were advocated by a number of authorities both for the headwaters of the Mississippi and for various tributary streams. So far as the Mississippi was concerned, it was the consensus of the best engineering opinion that the improvement in construction of levees was the most advantageous means of protecting the land

along the banks and that the levees, rather than increasing the danger, had done much to diminish it, and their inadequacy, rather than the system itself, was at fault. Likewise on the Ohio River it was recommended, especially at Cincinnati, that levees be built, and it was also recommended that the various cities which were threatened should face the situation fairly and provide for bridges of adequate span and protection to the banks, avoiding encroachment by building other structures which would be affected by the flood at time of high water. In connection with the bridges it was found in the damaged district that there had been a widespread tendency to diminish the length of spans by running abutments out into the channel so that in time of flood an abnormal strain was put upon piers and abutments.

It is estimated that the average annual loss by flood in the United States is in excess of \$50,000,000, and this fact alone has aroused interest in the national, State, and local investigations that were in progress during the year for the amelioration of conditions. The national government, both through its corps of engineers of the United States army and the division of hydrography of the United States Geological Survey, had under way important investigations. Studies were made of the flood of 1913 in comparison with other floods and the Geological Survey published Water Supply Paper 334, "The Ohio Valley Flood of March-April, 1913." The commission of army engineers also published an illuminating report on this subject.

So important was the recognition of the need for national regulation of rivers and waterways that many schemes were proposed, one of which was embodied in a bill introduced in Congress by Senator Newlands, of Nevada, which appropriated \$60,000,000 per annum for river regulation, though no particular means were prescribed for undertaking the work. This bill failed of passage, as it was the general belief that the problems should be completely investigated in view of the meteorological, hydrological, hydrographical, and other conditions before a definite campaign, involving large expenditures, was undertaken.

OHIO WESLEYAN UNIVERSITY. An institution for higher education, founded under the auspices of the Methodist Episcopal Church at Delaware, in 1842. The number of students enrolled in the college departments in 1913 was 813. In the department of music, were 116; in the academy, 40; in the art department, 12; in the post-graduate students, 6; special students, 81. The faculty numbered 66. There were no noteworthy changes in the faculty during the year and no large benefactions were received. The productive funds amount to about \$1,000,000, and the annual income to about \$150,000. The library contains about 65,000 volumes. The president is Herbert Welch, D.D.

OIL, CRUDE. See **PETROLEUM.**

OIL FUEL. See **BATTLESHIPS.**

OKLAHOMA. POPULATION. The population of the State in 1910 was 1,657,155. According to the estimates of the Bureau of the Census, made in 1913, the population of that year was 1,938,761.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in

the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1913	4,750,000	52,250,000	\$37,620,000
	1912	5,448,000	101,878,000	41,770,000
Wheat	1913	1,750,000	17,500,000	14,350,000
	1912	1,570,000	20,098,000	15,072,000
Oats	1913	1,030,000	18,540,000	8,343,000
	1912	936,000	23,494,000	7,988,000
Rye	1913	5,000	48,000	41,000
	1912	4,000	48,000	42,000
Potatoes.....	1913	32,000	1,920,000	2,016,000
	1912	29,000	1,740,000	1,618,000
Hay	1913	450,000	382,000	3,973,000
	1912	385,000	481,000	3,559,000
Cotton	1913	3,019,000	2,820,000	44,740,000
	1912	2,665,000	1,021,000	55,241,000

c Tons. d Bales.

MINERAL PRODUCTION. The total value of the mineral products of the State in 1912 was \$53,614,130, compared with \$43,036,253 in 1911.

The oil fields of Oklahoma are included in the Kansas-Oklahoma fields. In the volume of oil produced, the State ranks second, being surpassed only by California. The production in 1912 was 51,427,071 barrels, a decrease from the production of 1911, which was 56,069,637 barrels. Several oil pools of considerable extent were discovered in 1912. A pool was developed in Creek County which yielded 150 barrels a day. This was in the sand found at 2180 feet. Indications point to other discoveries in similar locations. The total number of wells completed in the State in 1912 was 5993. Of these 4712 were in oil.

The total coal production of the State in 1912 was 3,675,418 short tons, valued at \$7,867,331. In 1911 the production was 3,074,242 short tons. The year 1912 was the first in the ten years to encourage the coal mine operators of Oklahoma. For this period the industry in the State had been practically at a standstill. The reason for the increased activity in 1912 appeared to be the diminution in the supply of natural gas and fuel oil, in the markets tributary to Oklahoma coal. The number of men employed in the coal mines of the State in 1912 was 8785, compared with 8790 in 1911. There were 99 fatal accidents in the coal mines of the State in 1912. This large number was due to the loss of 73 lives in an explosion of gas at the San Bois mines and at the McCutcheon mines March 23, 1912.

CHARITIES AND CORRECTIONS. The latest report of the commissioner of charities and corrections of Oklahoma is for the year ending October 1, 1912. The State institutions include the Oklahoma State Home at Pryor; the Oklahoma School for the Blind at Fort Gibson; the Industrial Institute for the Deaf, Blind, and Orphans (colored); the Confederate Soldiers' Home at Ardmore; State School for the Deaf at Sulphur; the Oklahoma State Training School at Paul's Valley; the Sanatorium Company Hospital at Norman; the State Penitentiary at McAlester; and the State Reformatory at Granite.

TRANSPORTATION. The total number of miles of single track steam railway in the State on January 1, 1913, was 6323. Of this, the St. Louis and San Francisco Railroad had the largest mileage, 1497. The Chicago, Rock Island, and Pacific had 13,026; the Atchison, Topeka, and Santa Fé 850; and the Missouri, Kansas,

and Texas 691. During 1913 the Clinton and Oklahoma Western Railroad constructed 30 miles of track; the Missouri, Oklahoma, and Gulf Railroad, 102 miles; and the Wichita Falls and Northwestern Railroad 151.

EDUCATION. The total school population in the State in 1912 was 541,828. The total enrollment in public schools was 438,901. The average daily attendance was 271,694. There were 3390 male teachers and 8350 female teachers. The average salary for male teachers in schools of the first grade was \$80.97, and for females \$60.79.

POLITICS AND GOVERNMENT. There was no election for State officers, as the term of Governor Cruce does not expire until 1915. The next State election will be held on November 3, 1914. On January 21, the legislature reflected Robert L. Owen United States senator. Two important decisions made by the Supreme Court during the year affected Oklahoma. On May 26 the decisions were passed down, declaring that the employers' liability law as applied to interstate commerce, was superseded by the federal law. The other decision prohibited the introduction of liquor in counties occupied by Indians. See also LIQUOR REGULATION.

The location of the permanent seat of State government was finally determined in favor of Oklahoma City in a suit in the Supreme Court which denied the validity of the referendum petitions on the Capitol appropriation measure.

STATE GOVERNMENT. Governor, Lee Cruce; Lieutenant-Governor, J. J. McAlester; Secretary of State, Ben. F. Harrison; Treasurer, Robert Dunlop; Auditor, J. C. McClelland; Attorney-General, Charles West; Commissioner of Insurance, A. L. Welch; Commissioner of Education, R. H. Wilson; President Board of Agriculture, G. T. Bryan; Adjutant-General, F. M. Canton—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, John B. Turner; Associate Justices, Mathew J. Kane, Robert L. Williams, Jesse J. Dunn, and Samuel W. Hayes; Clerk of the Court, W. H. L. Campbell—all Democrats.

STATE LEGISLATURE, 1913. Republicans: Senate, 8; House, 19; joint ballot, 27. Democrats: Senate, 36; House, 80; joint ballot, 116. Democratic majority: Senate, 28; House, 89; joint ballot, 117.

The names of senators and representatives to Congress will be found in the article UNITED STATES, section Congress.

OLD-AGE PENSIONS. The chief development in 1913 in the world-wide old-age pension movement was the enactment of a universal compulsory law in Sweden. This is the first and only universal scheme ever enacted. Public systems are now found in Austria, Australia, Belgium, Denmark, Finland, France, Germany, Great Britain, Ireland, New South Wales, New Zealand, Sweden, and Victoria. In the United States agitation for old-age pensions continued, but no public action of importance was taken. The American Association for Labor Legislation (q.v.) at a conference on social insurance discussed the pros and cons of private *versus* State, contributory *versus* non-contributory, voluntary *versus* compulsory pensions for Americans. At present the principal provision for retirement pensions is made by the great corporations, and civil pensions also have become more common in recent years.

HIGH STREET, HAMILTON, OHIO, AT DAYBREAK, MARCH 26, 1913

THE WATER HAD FALLEN**

THE OHIO VALLEY FLOOD

Photographs from United States Geological Survey, Water-Supply Paper 334

Practically all railroads and the leading combinations make provision for retirement at ages ranging from 60 to 70. This is done on grounds of efficiency from the productive standpoint. See **WORKMEN'S COMPENSATION** and **WIDOWS' PENSIONS**.

SWEDEN. After more than twenty years agitation an old-age pension law was enacted in Sweden on July 24, 1913. This had been preceded by the appointment of an old age commission in 1905 which reported in 1907. Thereafter numerous attempts at legislation were defeated by the conservative element in Parliament. The Swedish law is unlike that of any other nation in that it is universal, applying to every man, woman, and child over sixteen years of age. Moreover, it is obligatory. People are divided into four classes according to their annual income: Class 1, those receiving under 500 kroner; Class 2, those with incomes of 500 to 799 kroner; Class 3, those receiving from 800 to 1099 kroner; and Class 4, those receiving 1100 kroner or over. These classes respectively pay annual premiums of three kroner (82½ cents), five kroner, eight kroner, and thirteen kroner. These premiums must be paid from the sixteenth to the sixty-sixth year, unless the person become incapacitated for labor. Unmarried women must pay their own premiums; fathers are expected to pay for their children between sixteen and eighteen years and husbands for wives. If a citizen is unable to pay, his premium must be paid by his commune. Employees of state railways, state telegraph, civil service already pensioned, and the clergy of the established church, together with their wives are exempted. Paupers also are exempted.

It was at first provided that persons with incomes exceeding 6000 kroner (\$1650) should receive no pension; but later the act was made thoroughly democratic, pensions being authorized for every one over 66 years of age. The law provides higher pensions for men than for women. Every man will receive each year from his 67th year, or from the time of permanent incapacity, 30 per cent. of the premiums he has paid into the fund. Every woman will receive as an annual pension 24 per cent. of the sum she has contributed. On this basis the pensions of men will be 45, 75, 120, or 195 kroner according to class. Those of women will be 36, 60, 96, or 156 kroner. In order to increase these very meager pensions the act also provides for a supplementary payment whenever the total yearly income amounts to less than 300 kroner (\$82.50). The state will pay three-fourths of this additional pension and the commune one-fourth. The administration of the law is simplified through the fact that both commune and state taxes have been assessed in proportion to income. There exists therefore adequate information regarding incomes. The administration is controlled by a central board of management. A representative of this board and a local committee for each commune will collect premiums and assign pensions.

OLIVE OIL. See **HORTICULTURE**.

OLLIVIER, EMILE. A French statesman and historian, died August 20, 1913. He was born at Marseilles in 1825. His father was a republican of a somewhat advanced type, and the youth was thrown into the society of men

who were not only republicans, but believers in radical-racial reconstruction. He devoted himself early to the cause of individual liberty, and was ready to accept any form of government which could reconcile liberty with order. He conceived that such a government was about to exist in a liberalized empire to be established by Napoleon III., but his dream was shattered when Napoleon seized the supreme power in December, 1851. In 1857 he began his active political career. At this time the fear of anarchy which had contributed largely to the establishment of the Second Empire, had begun to fade, and those who opposed the government saw a chance of capturing some cities in the legislative assembly. Ollivier was put forward as a contestant for one of these divisions and was elected. He was one of the famous five who represented the opposition feeling in Paris when the Second Empire was at its zenith. During the years that followed, he was one of the most conspicuous champions of the cause of reasonable liberty, both in France and in other countries of Europe. When the empire began to decline, and Napoleon saw the feasibility of bringing about a form of constitutional government, he opened negotiations with Ollivier, the most brilliant of advocates of constitutional reform, and in January, 1870, the latter was called upon to form what proved to be the last ministry of the Second Empire constructed with the full approval of the emperor. Ollivier was at the head of affairs on the outbreak of the war with Germany in 1870, but he soon found his position impossible and resigned. He devoted the remainder of his life to writing on current questions, notably those affecting the church. His greatest work, *L'Empire Liberal*, began to appear in 1894. In the fourteenth volume of this work Ollivier made a detailed defense of his conduct in the days preceding the war, and appealed from the judgment of his countrymen to that of history. The last volume, published in 1913, dealt with the opening battles of the war in 1870, and the overthrow of the Ollivier ministry. Ollivier preserved a youthful figure to a great age. He was a powerful orator, with a voice distinguished for its quality. His literary gifts were remarkable, and the sketches of various men of letters, theologians, and philosophers, which he drew in his history of the Second Empire are likely to live. In addition to the works already mentioned, he wrote *Démocratie et Liberté*; 19th Janvier, 1869; *L'Eglise et l'Etat au Concile de Vatican* (1877); 1789-1889 (1889); *Michel Ange* (1890); *Marie Magdaleine* (1896).

OLMSTED, MARLIN EDGAR. An American public official, former member of Congress from Pennsylvania, died July 19, 1913. He was born in Potter County, Pa.; received an academic education; was admitted to the bar in 1878; engaged in practice at Harrisburg; was elected to the Fifty-fifth Congress in 1897; reelected to successive Congresses up to and including the Fifty-seventh from the fourteenth Pennsylvania district; elected to the Fifty-eighth Congress from the eighteenth district; and was reelected successively up to and including the Sixty-second Congress of 1913. He was a prominent member, and was for a time chairman of the committee on insular affairs.

OMAN. An independent Mohammedan state in southeastern Arabia, under a sultan, subsidized by the Indian government, which retains

a political agent at his court with the right to restrain the cession of territory to any power other than Great Britain. The area is about 82,000 square miles, the population about 500,000. The capital is Muscat, with 25,000 inhabitants. The main article of consumption and export is dates; other products are pearls, limes, mother-of-pearl, fish, fruits, hides, and skins. Imports 1912-13, Rs. 6,953,363 (British India Rs. 3,211,578, Great Britain Rs. 1,399,818, Belgium Rs. 1,515,398); exports Rs. 4,522,163 (dates Rs. 1,469,485, limes Rs. 100,950, cottons Rs. 56,199, hides and skins Rs. 48,830, mother-of-pearl Rs. 39,250, pearls Rs. 18,400. Vessels entered 133, of 168,516 tons. The inhabitants are Ibadites. The sultan, Seyyid Timor bin Feysal (born 1886) succeeded his father, Seyyid Feysal bin Turki, October 5, 1913. Major S. G. Knox was British agent in 1913.

HISTORY. A revolt against Sultan Seyyid Feysal bin Turki broke out at Nizwa, a town in the interior, on May 19. The rebellious factions—the Hinawia and Ghafria parties—set up Salem bin Rashid as a rival to Seyyid Feysal and rapidly subdued Rustak, Zaki, Awabi, and other places. In July 400 sepoys were sent from India to the sultan to hold his position at Muscat. The revolt was at least partially due to the sultan's coöperation with British authorities in stopping the illicit Muskat traffic in firearms.

ONNES, HEIKE KAMERLINGH. A Dutch scientist, awarded in 1913 the Nobel Prize for the greatest discovery in physics. He was born in 1853. His most notable work has been in connection with low temperatures. In 1911 he went farthest in the direction of absolute zero, coming within two degrees of the point which marks the complete absence of heat. He achieved this result by boiling helium in a vacuum. He is professor of physics at the University of Leiden, and has written many works dealing with physics.

ONTARIO. A province of the Dominion of Canada. Area, 260,862 square miles; population (census of June 1, 1911), 2,523,274 (2,182,947 in 1901). Including that portion of the Northwest Territories annexed to Ontario in 1912, the area is 407,262 square miles, and the population 2,527,292. Toronto is the provincial capital and after Montreal the largest city in Canada, with 376,538 inhabitants in 1911. A lieutenant-governor administers the province—Colonel Sir John Morison Gibson in 1913 (appointed September 22, 1908). Premier in 1913, Sir James P. Whitney. See section so entitled under CANADA, DOMINION OF.

ORANGE FREE STATE, THE. One of the four original provinces of the Union of South Africa (q.v.). Bloemfontein is the seat of the provincial government, with (May 7, 1911) 26,925 inhabitants; Jagersfontein had 9019; Harrismith, 6799; Kroonstad, 5700; Ladybrand, 3323; Bethlehem, 3172. Two railway lines, 74 miles in length, were opened during the year. Administrator (1913), Dr. A. E. W. Ramsbottom. See SOUTH AFRICA, UNION OF, for area, population, etc.

ORCHESTRAS. See MUSIC.

ORE DEPOSITS. See GEOLOGY.

OREGLIA DI SANTO STEFANO, LUIGI. An Italian Roman Catholic cardinal, died December 6, 1913. Born at Bebe Vagina in 1828, he entered the church at an early age, and in 1866 became titular archbishop of Dami-etta. In 1873 he was created cardinal by Pius IX. He was more than once mentioned as a possibility for Pope. His life was almost entirely passed in Rome, and was devoted to work of the Curia. Reactionary in spirit as well as in ideas, his bitter opposition to attempts to liberalize and modernize the doctrine and administration of the church resulted in a great deal of resentment on the part of the younger generation of churchmen. Although he had in late years ceased to take an active part in the affairs of the Holy See, he was entirely in sympathy with the campaign conducted by Pius X. against modernism. As the last of the cardinals appointed by Pius X., he long possessed a peculiar prestige.

OREGON. POPULATION. The population of the State in 1910 was 672,765. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 756,988.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

		Acres	Prod. Bu.	Value
Corn	1913	21,000	598,000	\$ 419,000
	1912	20,000	630,000	472,000
Wheat	1913	750,000	15,717,000	11,788,000
	1912	842,000	21,018,000	15,132,000
Oats	1913	360,000	15,228,000	5,787,000
	1912	359,000	13,714,000	5,623,000
Rye	1913	20,000	350,000	262,000
	1912	22,000	352,000	246,000
Potatoes	1913	50,000	6,750,000	3,915,000
	1912	65,000	10,075,000	3,123,000
Hay	1913	825,000	41,732,000	15,588,000
	1912	790,000	1,738,000	14,425,000

a Tons.

MINERAL PRODUCTION. The total value of the mineral products of the State in 1912 was \$2,553,649, compared with \$3,192,679 in 1911. The gold production of the State in 1912 was \$770,041, compared with \$633,407 in 1911. The largest yield of gold came, as usual from Baker County, the output of which was \$484,041. The total output of deep mine gold was \$580,945 and that from placers was \$189,096. The silver output in 1912 was 57,081 fine ounces, compared with 45,221 ounces in 1911. The State produces a small amount of copper. In 1912 this amounted to 311,860 pounds, in 1911 125,943 pounds. The largest production in recent years has been from the Waldo district in Grant County. The production of coal is small. In 1912, it amounted to 41,637 short tons, valued at \$108,276. On account of the large increase in the use of oil for fuel on the Pacific coast, the quantity of coal mined in the State decreased in recent years.

TRANSPORTATION. The total miles of main line of railroad in the State in 1913 was 1354.80. The railroad having the longest mileage was the Southern Pacific. The Oregon and California Railroad, a branch of this company, had 367 miles of track; the Oregon Trunk Railway had 156; the Corvallis and Eastern Railway

140; the Pacific Railway and Navigation Company 91; the Oregon Western Railway and Navigation Company 95. During 1913 there were about 70 miles of railway construction. The mileage of electrical railways in the State in 1913 was 388.85.

EDUCATION. The total school population in June, 1913, was 196,675. The total enrollment was 133,622, and the average daily attendance 91,593. The male teachers numbered 1084, and the female 4406. The average monthly salary of male teachers was \$84.53 and the female \$61.79. The legislature of 1913 passed several important measures. Among them were laws establishing trade schools in districts of 20,000 inhabitants, measures relating to the improvement of evening schools, and providing for institute and teachers' training schools and for free text books.

FINANCE. The report of the State treasury is for the biennial period 1910-11-12. There was a balance in the treasury on October 1, 1912, of \$424,913. The receipts for the two-year period ending September 30, 1912, was \$8,307,182. The disbursements for the period amounted to \$7,738,859, leaving cash in the treasury on October 1, 1912, of \$993,736. The chief receipts are from taxation, and the chief expenditures are for education, State institutions, and State officers. There is no bonded debt.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State include the State Hospital, Salem; the Eastern Oregon State Hospital, Pendleton; Oregon State Penitentiary, Salem; State Training School, Salem; the State Tuberculosis Hospital, Salem; the State School of the Deaf, Salem; State Institution for Feeble-minded, Salem; State School for the Blind, Salem; Oregon Soldiers' Home, Roseburg; and the Industrial School for Girls, Salem. Provision was made for the establishment of the last-named institution in 1913, and appropriations for the purchase of grounds and building, also. The school will be for delinquent girls between the ages of 12 and 25. While it is under the State board of control, an advisory board consisting of three women in the State will be appointed by the governor. In addition to these institutions, there are a number of private institutions receiving State aid.

POLITICS AND GOVERNMENT. There was no election for State officers during the year, as the term of Governor West and the other State officials does not expire until January 1, 1915. The next State election will be held November 3, 1914. On January 21 the legislature elected Harry Lane, Democrat, United States senator to succeed Jonathan Bourne, Republican. The legislature of 1913 passed a number of amendments to the election laws of the State. Among these is a law providing for the permanent registration of voters. This law has since been declared unconstitutional. Other amendments covered the filing of nominating petitions and certificates of nomination, and the printing of pamphlet copies of any measures which may be referred to the people at subsequent elections. On September 24 the industrial welfare of the State adopted a ruling which fixed a minimum wage of \$9.25 per week for adult women clerks who are not apprentices, and set 50 hours as the minimum week's work. In the election held on November 3, the workmen's compensation act was approved by the people,

and a bill for the sterilization of habitual criminals was rejected by a State referendum. The Hood River County judge and commissioners were recalled. The county judge of Clackamas County met the same fate. A campaign for the extermination of rabbits was undertaken by the farmers of eastern Oregon in December.

LEGISLATION. The legislature met in 1913 and passed many important measures. Enactments were passed putting into effect the woman suffrage constitutional amendment, adopted in the election of November, 1912. Provision was made for the submission to the people of the constitutional amendment restricting suffrage to the citizens of the United States of both sexes, and eliminating persons of foreign birth prior to their full admission to the citizenship. Laws for the suppression of tuberculosis were enacted. A uniform warehouse receipts act was passed. The legislature enacted a measure providing for mothers' pensions. Delegates were appointed to investigate rural credits in Europe. Amendments were made to the direct primary and corrupt practices act. The Supreme Court was divided into two departments, which are to alternate in hearing and deciding cases—this for the more expeditious disposition of court business. A measure was passed abating disorderly houses. Another measure provides that male applicants for marriage license must produce a physician's certificate as to freedom from certain diseases. Still another measure authorized the sterilization of habitual criminals and degenerates. An industrial commission created supervisory authority over employment and wages of women and minors. An eight-hour law for workmen on public works was enacted, and other labor laws relating to safety devices, security of payments of wages, etc., were passed. The workmen's compensation act was adopted, but was suspended until November, 1913, for submission to vote by the people. Measures providing for old-age pensions and insurance by laborers against sickness and unemployment were considered, but not enacted. See also LIQUOR REGULATION.

STATE GOVERNMENT. Governor, Oswald West, Dem.; Secretary of State, Ben. W. Olcott, Rep.; State Treasurer, Thomas B. Kay, Rep.; Superintendent of Public Instruction, J. A. Churchill, Rep.; Adjutant-General, W. E. Finzer, Dem.; Attorney-General, A. M. Crawford, Rep.; Commissioner of Insurance, J. W. Ferguson, Dem. **JUDICIARY.** Supreme Court: Chief Justice, Robert Eakin; Justices, Thomas A. McBride, Frank A. Moore, Henry J. Bean, and George H. Burnett; Clerk, J. C. Moreland—all Republicans.

STATE LEGISLATURE, 1913. Republicans: Senate, 28; House, 48; joint ballot, 76. Democrats: Senate, 2; House, 5; joint ballot, 7. Republican Progressive: Senate, 0; House 6; joint ballot, 6. Democrat Progressive: Senate, 0; House, 1; joint ballot, 1. Republican majority: Senate, 26; House, 36; joint ballot, 62.

The names of senators and representatives to Congress will be found in the article UNITED STATES, section *Congress*.

OREGON, UNIVERSITY OF. A State university for higher education, founded in 1876 at Eugene. The students enrolled in the several departments of the university in the autumn of 1913 numbered 1257. The faculty numbered 121. There were no noteworthy changes in the

faculty during the year, and no important benefactions were received. The productive funds amount to about \$190,000, and the annual income to about \$360,000, most of which is appropriated by the State. The library contains 47,000 volumes. The president is Prince L. Campbell, LL.D.

ORNITHOLOGY. In the United States, the Audubon Society continued its agitation for bird preservation with gratifying results. By the provisions of the McLean act, in effect October 1, 1913, the Federal government assumed control of all migratory birds and game birds who do not remain permanently within the limits of one State. Regulations which were adopted and published in Circular No. 92 of the Bureau of the Biological Survey, U. S. Department of Agriculture, established a continuous closed season on all insectivorous birds, forbade hunting at night, and put various closed seasons on game birds. Attorney-General Carmody, of New York State, declared some of the provisions of this bill unconstitutional, but no decision on this matter had been reached by the end of the year. A provision in the United States tariff law, of 1913, forbade the importation of skins or feathers of birds, a measure aimed especially at the importation of plumage of birds of paradise, and of aigrettes. In this connection it should be noted that the German Colonial Office announced that no permits would be issued in 1914 for the killing of birds of paradise in German New Guinea.

In various writings of economic ornithologists in 1913 more recognition than usual was given to the fact that insectivorous birds do not confine their attention to harmful insects, but eat the beneficial species as well. Beal thought that the flycatchers, on the whole, do much good, though about one third of their food is composed of bees and wasps. Probably their greatest harm is done in killing parasitic hymenoptera. In California grasshopper outbreaks have to a large part been held in check by the work of blackbirds, kingbirds, shrikes, and meadow larks. Crows and crow blackbirds kill a great many white grubs, the larvae of a beetle, which are due to appear in large numbers in 1914, in certain parts of the United States.

In the Southern United States it has been claimed that anthrax, hog cholera, and blackleg might be carried by turkey buzzards, in flying from carrion. Experiments by Darling and Bates indicated that the danger from this source has been overestimated, since when even pure cultures of anthrax were introduced into the alimentary canal of buzzards, none were to be found in the feces. They might, however, carry germs adhering to their feet or feathers and thus spread contagion.

As stated in the YEAR BOOK for 1907, an attempt has been made to save the heath hen from extermination by providing a refuge on Martha's Vineyard. Field reported in 1913 that from four to five hundred birds were on the island. F. M. Chapman conducted an expedition to the Colombian Andes, to secure material for a habitat group of the bird life of Magdalena Valley. The expedition made an ornithological survey of this region, and collected 2300 birds. The British Museum acquired during the year 3315 specimens of humming birds from Mr. R. J. Balston. This, with the Gould

collection, gives the museum one of the finest, if not the finest, collection of humming birds in the world.

ORB, JAMES. A Scotch theologian and educator, died September 6, 1913. He was born in 1844, and was educated at Glasgow University and the Theological Hall of the United Presbyterian Church, Scotland. He became a minister of this church in 1874, and continued in active pastorate until 1891. In the latter year he was elected to the chair of church history in the Theological Hall. Ten years later he was transferred to the chair of apologetics and theology in the Glasgow College of the United Free Church. In 1891 he was Kerr lecturer; and he lectured in America. His published writings include *Christian View of God and the World* (1893); *Early Church History and Literature* (1901); *The Problem of the Old Testament* (1905); *The Bible under Trial*. (1908); *The Virgin Birth of Christ* (1907); *The Resurrection of Jesus* (1908); and *Sin as a Problem of To-day* (1910).

ORROCK, JAMES. An English artist and writer, died May 9, 1913. He was born in Edinburgh in 1830; educated at Edinburgh University; began life as a dental surgeon, but at the age of thirty-five he gave up business to gratify his ambition to become an artist. He studied under Stuart Smith, John Burgess and at the Nottingham School of Art. In 1868 he was elected an associate of the Institute of Water Color Painters and became a constant exhibitor of landscapes. He was also an influential member of the council of the institute and was mainly responsible for the new galleries in Piccadilly, the reconstruction of the institute, and the grant of the title "Royal." In addition to his work as an artist he became a well-known collector and connoisseur. He presented to the South Kensington Museum and the Glasgow Corporation Gallery many important pictures and water-color drawings. Among his published writings were: *Essays on Turner, Muller, Cox, Barrett, Hunt, Constable; Essays on English Art; Trus Art; The English Water-colour Art; Light and Water-colour.*

PAGE, WALTER HINES. American ambassador to Great Britain. He was born in Cary, N. C., in 1854; graduated from Randolph-Macon College in 1876; studied at Johns Hopkins University, where he won a Greek fellowship; and on leaving Johns Hopkins he began work as a newspaper writer and became a reporter on the *Gazette* of St. Joseph, Mo. His success in securing the acceptance by the *Atlantic Monthly* of *A Social Study of an Old Southern Borough* encouraged him to travel through the South, writing letters to several important newspapers in the North. For two years he was special correspondent to the *New York World*, one of his investigations being among the Mormons of Utah. He then established the *State Chronicle* at Raleigh, S. C. This he soon discontinued on account of a lack of financial success. After having inspired the creation of the industrial and mechanical college at Raleigh, Mr. Page removed

to New York. For a time he wrote editorials for the *Evening Post*, and contributed to *Harper's Weekly*, and the *Atlantic Monthly*. In 1880 he joined the staff of the *Forum*, and in 1890 became editor of that magazine. Five years later he was asked to become literary adviser to Houghton, Mifflin & Company, and in the following year he took the editorship of the *Atlantic Monthly*. After three years in this position he returned to New York, and for a short time was literary adviser to Harper & Brothers. He also edited the *Harper-McClure Encyclopædia*. In the same year, however, he became a member of the newly established firm of Doubleday, Page & Company, which in 1900 established the *World's Work*, of which Mr. Page became editor. He continued in this position until his appointment as ambassador. Mr. Page, in addition to writing many articles for the *World's Work*, contributed to other periodicals, and took an active interest in public affairs. He was one of the most prominent advocates and workers for the nomination and election of President Wilson. Always particularly interested in the industrial development of the South, he is the author of *The Rebuilding of Old Commonwealths* (1902), a series of essays on the progress of the South. See also *GREAT BRITAIN, History*; *MEXICO, History*; and *UNITED STATES, History*.

PAHANG. The easternmost state of the Federated Malay States (q.v.). The inhabitants practice agriculture and mining. Area in 1909, planted to rubber, 20,271 acres; rice, 36,793; coconuts, 15,735; tapioca, 2202. Tin export in 1911, 1,436,156 Straits Settlements dollars; tin ore, 2,693,819; gold (bullion), 262,160; rubber, 28,319; tapioca, 24,645; copra, 17,185; rattans and canes, 54,008; gutta, 47,891; etc.—total exports, 4,890,639 (4,048,025 in 1910). Total imports, 2,277,768 S. S. dollars (rice, 480,233; opium, 285,256; tobacco and mfrs., 91,367; spirits, 46,622; swine, 78,248; hardware, 225,451; beer and stout, 21,679; cotton goods, 22,738 plain and 26,036 printed; 17,969, tea; etc.), against 2,140,973 in 1910. The Gemas-Semantan Railway is being extended to the borders of Kolantan. The Pahang is navigable for small craft for 232 miles. The capital of the state is Kuala Lipis. The sultan (Ahmad Maatham Shah bin Almerhum Ali) and the regent reside at Pekan, the old capital, near the mouth of the Pahang. The British resident (1913) is E. J. Brewster.

PAINTING AND SCULPTURE. The distinguishing point about the year's activities in art in America is the spread of all the various new movements which have come to a head in Europe. Little exhibitions of post-impressionists, and of representatives of later revolutionary movements, more ephemeral in character, have been held in America, from time to time in the last few years, at odd intervals and in odd corners. But this year the post-impressionists, cubists, futurists, expressionists, etc., have been brought before a wider public. They have penetrated established galleries, much to the disturbance of many people and the delight of others.

Compared to the great mass of regular standard exhibitions the showing of the revolutionists has been small; but they have created much excitement, affecting certain artists vitally, while others have only mocked, and dividing

the public in the same manner between those who laughed and those who were seriously interested. Certainly this has been a year of awakening, offering wider opportunities than ever before to the unofficial artist to show his work to the public. It is not, perhaps, too much to say that 1913 marks the beginning of a new era in the creative efforts of our painters and sculptors, how important an era the future will tell; but, at least, the impetus is sufficiently great to exhilarate the rising generation of artists to an extent that is unparalleled in America. These developments, however, have not hindered the large general exhibitions, most of which have been comparatively little affected by the new influences.

Late in December, 1912, the Corcoran Art Gallery in Washington opened an exhibition of contemporary art, which remained on view during the first part of 1913. This exhibition is held once in two years, and is made up entirely of paintings, affording the visitor an excellent opportunity to study the progress of the American contemporary painter. Following the custom which guides most of our large exhibitions, little space is given to the type of painting which is not acceptable to a reasonably conservative jury. On the whole, a high percentage of the pictures were excellent examples of what might be called the acceptable type of painting.

A group of portraits by John Sargent was shown, including the immensely clever portrait of Joseph Pulitzer. The "Fencing-Master," by Gari Melchers, was a full-length of undoubted power, the most satisfying painting that Mr. Melchers has shown in some years. Cecilia Beaux, Elmer Schofield, Frank Benson, and Ben Foster were well represented by typical examples. Two of the most beautiful landscapes were by Ernest Lawson and Alden Weir; and Arthur B. Davies, with a poetical composition, Mary Cassatt with a group picture, and George Bellows with his "Polo Crowd," added to the artistic scope of the exhibition. Good pictures were shown by Childe Hassam, Frederick Frieseke, Willard Metcalf, Thomas Dewing, Paul Dougherty, Leopold Gould Seyffert, Ralph Clarkson, Fred Wagner, and Eugene Speicher, while Kathleen McNery and A. G. Warshawsky brought the general tone of the exhibition as closely as could be expected to the unconventional. On the whole, it was a sound, conservative showing, that struck a truly American note, in which the arrived painter dominated and a high standard of workmanship was maintained.

Early in February, the Architectural League of New York opened its annual exhibition in which painters, sculptors, and architects take part. The architectural department of the exhibition is necessarily made up mostly of photographs and space does not permit of an extensive display of semi-completed mural decorations. A number of sketches for decorations were exhibited, and served to indicate how rare is the good mural decorator. The most interesting part of the exhibition was made up of sculpture, particularly of the work shown by the scholarship student of the American Academy at Rome, Paulanship, whose archaistic formula is happily combined with a solid understanding of sculptural form. Within the year, Mr. Manship has gained an unprecedented success, partly due, no doubt, to the favor

he has met with in the eyes of more than one good architect, who has grasped the unusually decorative possibilities of his pronounced style. As a rule, the Architectural League exhibition is unsatisfactory, not merely because it is timid and conservative in the kind of painting and sculpture that it brings out, but because the architect is under such a heavy handicap. If he presents his work in the manner that would be of most interest to his fellow worker he takes the risk of meeting with no attention from the general public. And if he appeals to the general public he is compelled to eliminate much material that would be of greatest interest to the practicing architect.

February is a month of great activity, and before the architects' exhibit had closed in New York, the 108th annual exhibition of the Pennsylvania Academy opened in Philadelphia. This event has with justice ranked, in the past, as one of the most comprehensive exhibitions of the work of the contemporary American painter, and it also gives considerable space to sculpture.

But the international exhibition of modern art, which will be referred to later, has brought out the fact that the managers of most of our large exhibitions have more and more fallen into the habit of inviting paintings by the same artists year after year. And the Pennsylvania Academy, although the most courageous of the annual exhibitions, has come in time to consist largely of the works of painters who are continually appearing on all official occasions. A great percentage of the works of well-known men had previously been shown in other parts of the country. Once more we are brought face to face with the fact that we have many capable artists of sound traditions, especially among the landscape painters, while, as in all other countries, the artist of rich imagination and power is rare to say the least. Most of the paintings may be described as of the type suitable for the home, easel pictures of moderate size with here and there a larger canvas.

Among the painters, good work was shown by George Bellows, Robert Henri, Leopold Gould Seyffert, Gari Melchers, Alden Weir, Lydia Emmet, Howard Cushing, George and Amiard Oberteuffer, Arthur B. Carles, Anne Goldthwaite, and Helen Turner. The group that helped most to give the exhibition a non-academic flavor consisted of William Glackens, Ernest Lawson, James Preston, Arthur B. Davies, Kathleen McNery, Putnam Brinley, Henry Glintenkamp and Gus Mager, all of whom showed paintings of distinct individuality. In sculpture there were many good small works of beauty. "On the Threshold" was shown by Edith Woodman Burroughs, and capable modeling was seen in works by Mahonri Young, Chester Beach, Paul Bartlett, Linsey Morris Sterling, and a long list of other artists. The fact is that the American sculptor has little opportunity to show anything but small models and these in a manner which does not allow of their being seen under favorable conditions.

By far the most important exhibition of the year and, in fact, of many years, was the International Exhibition of Modern Art, held by the American Association of Painters and Sculptors in New York. No prizes were awarded, and the exhibition was characterized throughout by its antipathy to official forms.

The official commercial picture, manufactured to sell, which plays such an important part in most exhibitions, was blackballed. Many inept paintings were shown, but the ineptitudes were technical rather than spiritual. There was a long list of beautiful pictures, and withal a remarkably high standard of spontaneity and sincerity. The avowed object of the exhibition was to show to the American public the development of painting throughout the nineteenth century, and in spite of immense difficulties this object has to all intents and purposes attained. The large armory where the exhibition was held, was divided into eighteen galleries, and over a thousand works were shown, for the most part paintings and drawings.

Much adverse criticism was caused by the fact that the cubists, the expressionists, and the post-impressionists were represented, and few people not in sympathy with the large idea back of the exhibition stopped to consider and to separate the genuine from the specious manifestations in modern art. The association holding the exhibition behaved neither as jury nor judge, issuing a statement to the effect that: "In getting together the works of the European moderns the society has embarked on no propaganda. It proposes to enter no controversy with any institution. Its sole object is to put the paintings, sculptures, and so on, on exhibition so that the intelligent may judge for themselves by themselves."

With the earlier nineteenth century painting as a starting point, it was possible to gain some idea of the direction in which painting is now going, and it was possible to comprehend to some degree in a manner hitherto not permitted in this country, the thought of the American and European painters of to-day.

From beginning to end the exhibition attracted great numbers of visitors, some among them drawn by certain notorious pictures, but for the most part, the crowd was intensely interested, and ardent serious discussion for or against was heard on all sides. Agreeable chatter was replaced by interest, discussion, and the clashing of prejudices, tending on the whole toward increased liberality of spirit. For the first time it was brought home to the great public that the chief function of art is not to represent, but to express a point of view, through the medium of representative interpretation.

The exhibition brought to public notice here in America the work of painters who have been accepted in Europe for a generation, such as Paul Cézanne, interesting not only for himself, but because he has influenced scores of European painters and begins strongly to affect many of our own younger men. Daumier, Manet, Degas, Puvis de Chavannes, Monet, already known here, were duly represented, if not by work of preëminent importance. But the line of development was visible, from these men onward. They had already been accepted here, but Gauguin and Van Gogh, who with Cézanne, have been legitimately followed as well as servilely imitated, were shown for the first time.

To go back a little, a glimpse of the early nineteenth century was given in the copy of Ingres's "Andromeda," by Whistler, a fair Delacroix, two fine Daumiers, one Courbet, and two Corots, several delicate Mathew

Maris, several paintings and drawings by Puvion de Chavannes, brought the spectator nearer to his own time. The impressionists were more fully represented. There were three Manets, none of them great examples, four fine Monets, several landscapes by Pissarro and Sisley, four lovely Benois, a number of canvases by Toulouse-Lautrec, an excellent Mary Cassatt, so that a certain coherent development, culminating in the work which truly represents our own time could be observed. Cézanne, Gauguin, and Van Gogh continued the development. With Matisse and the cubists a violent dislocation occurred, although even in Matisse, with all his arrant affectations, we see vaguely what the living artists of to-day are attempting, namely to liberate themselves from what might be called the domination of the third dimension.

Of our own artists, Alden Weir and Childe Hassam both sent works that showed their art at its best. Arthur B. Davies, Ernest Lawson, William Glackens, Allen Tucker, Putnam Brinley, Robert Henri, George Bellows, John Sloan, George Luke, Jerome Myers, Eugene Higgins, a painter of somber imaginative power, Maurice Prendergast, James Preston, and a long list of well-known men, some of them familiar to the regular exhibition visitor, others debarred from official sanction, sent strictly uncommercial and genuine artistic work, which helped to make the American half of the exhibition hold its own amazingly. And in addition there were a great number of pictures which no regulation academic jury would have passed, but which maintained the fine uncommercial standard of the exhibition, and proclaimed the cause of spontaneity and sincerity.

Art must either be abstract design or interpretation by means naturalistically recognizable. The cubists neither designed with distinction, nor interpreted imaginatively, but the gallery devoted to their work attracted both earnest admiration and extreme ridicule. The cubists, however, were but a small part of the modern work shown in America for the first time. Among French artists widely-known abroad, and never shown here, may be mentioned Pierre Bonnard, Maurice Denis, Felix Vallotton, Vuillard, and other men of importance with whose work the European amateur is familiar. The present day artistic thought of France was further illustrated by many other men, while Germany, Sweden, and England were represented by Slevogt, Munch, Augustus John, Charles Conder and other artists who are not met with in every-day exhibitions.

The Americans were represented by comparatively few of the names that appear over and over again. There was nothing by Sargent or his school; but Theodore Robinson, John Twachtman, Albert P. Ryder, all genuine artists, who have never received proper tribute, were represented. Great care was evidently used to keep out unsympathetic work, and to lend the exhibition the life-giving quality of a certain homogeneity.

Neither in the spring or in the winter exhibition of the National Academy was there a trace of the influences set at work by the International Exhibition of Modern Art, and this was, in a sense, fortunate, for healthy growth demands the presence of the conservative ele-

ment as well as the radical. In holding to the principles which it represents, the academy deserves praise; but for its own good as well as for the cause of art in general, it is well that the academy's too exclusive control of the exhibition facilities throughout the country should feel the force of an opposing current.

Among the works in painting and sculpture which played a prominent part in the spring academy, were the exhibits of Paul Dougherty, Gardner Symons, Cecelia Beaux, Helen Turner, Elmer Schofield, George Bellows, and Chester Beach. The winter exhibition was not noticeably different in general character from that of the spring, work worthy of special attention being shown by Ernest Lawson, Childe Hassam, Leon Kroll, Gifford Beal, Robert Spencer, Paul Manship, Janet Scudder, Phimister Proctor and Mahonri Young.

Among the regularly recurrent events of the year, the only one which is international in character is that held at the Carnegie Institute in Pittsburgh, which opened last year in April. On that occasion the flavor of internationalism from which the American artist might justly expect helpful stimulus, was somewhat mild, the management abiding to a great extent by the policy of showing the work of artists already known in this country and officially recognized abroad. In connection with the large general exhibition, a special room was devoted to the work of the French painter, Lucien Simon.

Most of the well-known American painters mentioned in connection with the other exhibitions appeared at Pittsburgh and among the foreigners were to be found artists of established reputation from France, Holland, Russia, Germany, and England.

The British art, at the Carnegie Institute in Pittsburgh, gave a fair index of what was to be expected in the exhibition of the Royal Academy in London, a number of the same artists taking part in each. The Royal Academy remains, as ever, conservative in character, true to its traditions, making a wide appeal through the large proportion of pictures which gratify the average popular taste. Official portraits of the royal family played a conspicuous, if not markedly artistic, part. The sculpture expressed in general artistic ideals more or less of the same order, in their kind, as the paintings. Altogether, it was a normal Royal Academy.

The New English Art Club has, for many years, stood for the less conventional element in British art, and its summer exhibition, much smaller, of course, than that of the Royal Academy, offered many pictures of interest. This exhibition was marked by a general tone of independence and individuality and the inequality of the work was in contrast with the academy's average standard. This club reflects the less commercial side of English painting and its appeal is consequently to a more limited, if more discriminating, public. The exhibition included drawings and water colors, as well as oil paintings, and notable works were shown by William Orpen, P. Wilson Steer, Lucien Pissarro, Mark Fisher, William Rothenstein, Augustus John, and others.

The exhibition of the Royal Scottish Academy, which was open in Edinburgh through the greater part of the summer, gave indication of

HISTORY. The tariff system was amended so as to place higher duties on some commodities; the establishment of bonded warehouses was authorized for the storage of dutiable merchandise. As the result of a law obliging Chinese residents to pay a registration fee, the government had considerable trouble with the Chinese element of the population. The Chinese consul-general Owang King, who was reported to have advised his countrymen to refuse obedience to the law, had his *exequatur* returned to him in September by the government of Panama. In November over a thousand Chinese retail merchants and laundrymen closed their stores as a protest against registration.—Panama received a gift of \$10,000 from King Alphonso of Spain as a contribution towards the erection of a statue of Balboa, discoverer of the Pacific ocean.—The government of Panama formally invited all American States, including Canada, to participate in the National Exposition of Panama, November 3, 1914 to April, 1915.

PANAMA-CALIFORNIA EXPOSITION. See EXPOSITIONS.

PANAMA CANAL. The end of 1913 saw the practical completion of the canal as far as the works of excavation and the construction of locks were concerned. There only remain minor details to be completed which, although requiring considerable time, are relatively unimportant compared with the magnitude of the work already done.

There were several important changes in the organization of the canal commission during the year. S. B. Williamson, division engineer of the Pacific division, had retired on December 11, 1912, and as he considered that the work of this division had advanced to such a state that the commission was not warranted in continuing it, this action necessitated a reorganization of the work on the Pacific side of the canal. That part of it relating to terminals, which considering the previous fiscal year had been assigned to the Pacific division, was transferred to the second division, which had charge of preparing the designs for the shops, dry docks, and coaling stations.

Lieut.-Col. D. D. Gaillard (q.v.), who had charge of the division in which was included the Culebra Cut, died November 28, 1913. R. L. Metcalf was appointed head of the department of civil administration in August, and several other changes were made in the civil administration of the zone. Paragraphs on the construction during the fiscal year follow:

FIRST DIVISION. This division, under Col. H. F. Hodges, continued during the year in charge of the locks, dams, regulating works, and accessories; the design and construction of aids to navigation; the inspection of the manufacture and erection of the lock gates, operating machinery, gates and valves, etc., and placing of such concrete in the locks as was omitted until the installation of the machinery. The designing work for the locks was completed, and the force in charge of the designs was disbanded on June 1, 1913.

During the year, 14 gates and one caisson for the spillway at Miraflores were completed. The construction and erection of the lock gates was continued during the year. All shop drawings were completed as was the manufacture of all material for the gates, aggregating

57,500 tons. The final shipment of these was made in April. At the beginning of the fiscal year, work was in progress on half the total number of locks on the canal, but none had been entirely completed. On June 30, 1913, over 97 per cent. of all material was assembled in the gates. All the guard gates were complete except those at the lower end of Miraflores locks, and the guard gates at both ends of Gatun locks had been permanently closed at the end of the fiscal year.

During the year the scheme for the control of the various locks was completed. This contemplates the control in the central station of every piece of machinery in the lock walls. This central station is situated on the centre wall of the upper locks, where an uninterrupted view of the entire locks or flight of locks may be had. In this house is located a control switchboard connected with every local control panel and indicating mechanism.

The plans for illuminating the locks were practically completed during 1913. A hollow concrete pole with concrete bracket arms and reflectors supports the lamp for exterior illumination of the locks and grounds. These poles are approximately 100 feet apart, and the lamps 30 feet above the coping level. The lighting units are 110-volt, 500-watt Mazda lamps. During the year the shop drawings for the emergency dams were completed and approved. The assembling of the east dam at Gatun was completed on March 1, 1913. The erection of the east and west dam was practically completed on March 1, 1913. On May 20, the contractor began the final tests of the dam on the east side, the total time for closing on the first test being one hour, one minute, and thirty seconds. In later tests, the passage was closed in forty-two minutes and seventeen seconds.

Twelve range towers were completed in the Gatun Lake section. These towers are of reinforced concrete with heights from base to focal plane varying from 28 feet 10 inches to 87 feet and 10 inches. Three skeleton tower beacons marking the edges of the channel between Balboa and Miraflores, were also completed.

ATLANTIC DIVISION. This division embraces the construction of the locks and dams at Gatun, the breakwater at Limon Bay, and municipal improvements in Colon, and the various settlements embraced within the limits of the division. It is in charge of Lieut.-Col. William L. Sibert.

It was estimated in 1912 that the concrete work of the Gatun locks would be completed by July 1, 1913. By shortening the north approach piers 200 feet, all the concrete, except miscellaneous finishing, was completed on June 14, 1913. At the close of the previous fiscal year, the Gatun Dam had been raised to an elevation of 103.35 feet for a length of 1000 feet east of the spillway, and for the balance of this portion of the dam, the dry fills had reached a general elevation of 96 feet and the hydraulic fill between them a general elevation of 85 feet. At the close of the year sufficient material had been added to raise the dam to practically its full height with 3 to 5 feet additional along the axis to allow for settlement. At the beginning of the fiscal year the spillway dam had been completed.

CENTRAL DIVISION. This division embraces

CANALS

CULEBRA CUT. Looking north from east bank between Culebra and Empire. Tug towing first ladder dredge to operate in Canal. October 22, 1913.

CULEBRA CUT, CULEBRA. Looking north from west bank. Dredges excavating at Cucaracha slide and channel at that point 150 feet wide. December 15, 1913.

PANAMA CANAL

the excavation between Gatun Dam and Pedro Miguel locks, including diversion channels, the construction of the Naos Islands breakwater, and municipal improvements within the division limits. In this section is included the Culebra Cut. Of this, it was estimated that 5,899,200 cubic yards were the result of slides. The amount remaining at the end of the year was again increased as a result of slides, and aggregated 8,200,000 yards, which was an increase of 9,280,237 cubic yards over the estimates made in 1912. The total amount of material due to slides as removed since the beginning of the work was 22,570,000 cubic yards. No treatment has proved effective against slides, when once developed. The Cucaracha slide, of which it was predicted in 1912 that it had reached the end of its activity, was the largest part of the delay in the work of excavating in 1913. The bottom grade of the canal had been reached and the widening cuts had progressed satisfactorily until within an approximate of 60 feet of the line of the prism was reached on the east side, when on January 20, the basalt rocks broke, and there slid in the cut approximately 2,000,000 cubic yards of material extending completely across it, topping the tracks on the 67-foot level and completely stopping the passage of trains from the north. Bottom grade was subsequently reached for a sufficient width to put in drainage pipes for handling the water from the north, but the rains, saturating the loosened material, caused a flattening of the slope. This produced another movement, and the weight of the superimposed mass broke the pipes. Work was continued on the slide throughout the fiscal year, but principally for the purpose of maintaining tracks on the 67-foot level open for the passage of trains. On October 10, as will be noted below, water was turned into the cut and the process of removing the material deposited by the slide was carried on by dredges. Other slides in the cut during the year made it necessary to remove large quantities of material. The total excavation in the cut up to December 31 is shown in the table below.

FIFTH DIVISION. As noted above, the resignation of Mr. S. B. Williamson, previously in charge of the Pacific division, resulted in a reorganization of that division into the fifth and sixth divisions. The fifth division had charge of the construction of the locks, dams, spillway, excavation, and other operations. Excavation in connection with the Pedro Miguel locks was completed at the end of the fiscal year by the removal of 3044 cubic yards from the locks proper. The Miraflores locks, including excavations for foundations in the placing of concrete, were carried to completion during the year. The total amount of concrete laid in the Pacific locks up to July 1, 1913, aggregated 12,382,983 cubic yards.

SIXTH DIVISION. As it was decided in February, 1913, to flood Culebra Cut in October, 1913, by removal of the dike at Gamboa, which kept out the waters of the lake, about 350,000 cubic yards of material had to be removed from the lake section north of Gamboa and this could be done most economically by dredging. The Cucaracha slide could not be removed economically by steam shovels after the heavy rains had set in, but could be handled efficiently by suction dredges. It was decided,

therefore, that subsequent to the admission of water into the cut in October, the work remaining could be handled most expeditiously and economically by the use of the dredging fleet. The sixth division was organized to get the fleet in condition to handle the work and to take charge of the dredging after the blowing up of the dike. The division was in charge of W. G. Comber, the resident engineer. On October 10, President Wilson, by the pressure of an electric button in Washington, gave the signal for blowing up the dike. For this there was employed 100 tons of dynamite, which was planted in a thousand holes in the dike. This loosened the earth, and the 30-foot head of water in Gatun Lake began at once to sweep it away. After the cut had been filled with water, there remained only one other obstacle for a continuous passage through the canal. This was the debris deposited by the Cucaracha slide. For the remainder of the year dredges were employed in removing the material occasioned by this slide.

On August 15 Lieutenant-Colonel Gaillard, in charge of the work at the Culebra Cut, was obliged to take a leave of absence, as the result of a nervous breakdown. Colonel Gaillard later died, as noted above. On September 11 the working force of the canal was reduced by about 9000 men. The first vessel passing through Gatun Lake was a government tug boat, which made the passage on September 26. Early in October there was a series of earthquakes in the canal zone, and it was feared that some portions of the canal had suffered damage. Examination, however, showed that this was not the case. On October 19 three dredges and twelve other vessels were lifted to Gatun Lake through the Gatun locks, and on October 25 a suction dredge passed through the locks at Miraflores and Pedro Miguel. Dredges cut a channel through the Cucaracha slide, the last obstruction in the Culebra Cut, on November 17. Another slide occurred on November 28. This was finally pierced on December 13, and on December 15 the obstruction was cleared away sufficiently to permit the passage of vessels.

On December 27 the gates and operating machinery at the spillway of the Gatun Dam were tested. The testing began at ten o'clock in the morning, and was continued in the afternoon. All the 14 gates were raised and lowered smoothly, and the tests were regarded as satisfactory. Prior to the operating tests, forces of the hydrographic office had made measurements of the leakage around the edges of the closed gates. Operations were carried on continuously for 48 hours, the flow being recorded every hour. The measurements showed a total leakage from all the gates of from .08 cubic foot per second, to a maximum of 2.4 cubic feet per second. The variation in leakage is in direct proportion to the temperature, the minimum occurring in the cool of the night, and the maximum in the hottest time of day. This is because the heat of the sun expands the top part of the gate, causing a slight buckling of the centre. When the gate was opened on December 27 to lower the surface, the elevation of the lake was 84.76 feet above the sea level.

GOVERNMENT OF THE CANAL ZONE. The question of the form of government for the Isthmian Canal Zone, following the completion of the canal, was much discussed during the year. Mr. Metcalfe, head of the civil govern-

ment, recommended a government by a commission of three. Colonel Goethals on the other hand favored a government under one head. In December, Mr. Garrison, Secretary of War, declared that there would be no commission government, and that a military officer would be appointed to govern the zone. It was practically settled at the end of the year that Colonel Goethals would be offered the position of governor of the zone, but the actual form of government had not been decided.

THE OPENING OF THE CANAL. The slides in the Culebra Cut above referred to prevented the completion of the canal at a date as early as had been prophesied in 1912, but for this it is believed that the canal would have been completed shortly after January 1, 1914. It had been planned that Captain Amundsen, commander of the *Fram*, a vessel famous in Arctic and Antarctic explorations, should be the first to pass through the completed canal, but Captain Amundsen was not able to delay the departure of the *Fram* to the date necessary to bring this about. It has been practically decided that the opening of the canal will be celebrated by a great international display of war ships. The governments of Germany, England, Russia, and Austria have promised to send battleships.

FORTIFICATIONS. By an act approved on August 24, 1912, an appropriation of \$1,000,000 was made for the gun and mortar batteries for the defense of the canal against naval attack, making the total appropriation \$3,000,000, which was considered sufficient for the completion of this portion of the work. In addition, \$200,000 was appropriated for land defenses. Work was continued during the year on the gun and mortar batteries. The detailed surveys necessary for the location of land defenses were well advanced to completion, and work was begun on July 1, 1913, on the construction of redoubts in accordance with plans prepared by a board appointed for the purpose and approved by the Secretary of War. Early in December the first division of the Atlantic fleet submarine flotilla sailed to the Atlantic terminal, and mortars were sent to the forts later in the month.

CANAL TOLL RATES. In 1912 Congress passed laws providing for the operation of the canal and regulating the passage of vessels through it. These measures included a provision that American coastwise ships should be exempted from the payment of tolls. This exemption was protested by the British government on the ground that it violated treaties between the United States and Great Britain. There was strong opposition to the inclusion of this provision in the Senate, but the measure finally passed and was signed by President Taft. The Sixty-third Congress took no definite action in regard to modifying this law, although in a general way President Wilson gave it to be understood that he favored the repeal of the clause objected to by Great Britain.

On November 13, 1912, President Taft issued a proclamation announcing the rates to be paid by ships passing through the canal. This rate is \$1.20 per net ton for vessels carrying cargo or passengers, or both, each 100 cubic yard of earning capacity to be counted as a ton; 40 per cent. less, or 72 cents per ton, for vessels in ballast without passengers; 50 cents for each displacement ton of warships; \$1.20

per net ton for army or navy transports, colliers, hospital ships, and supply ships. There is no *per capita* charge for passengers carried on vessels. The rates declared by President Taft were practically the same as those which went into effect on the Suez Canal on January 1, 1913. On November 21, 1913, President Wilson issued a proclamation establishing the rules for the measurement of vessels passing through the canal.

CANAL TERMINALS. An act of 1902, authorizing the construction of the canal directed the president to "also construct such safe and commodious harbors at the termini of said canal as shall be necessary for the safe and convenient use thereof." Early in the progress of the work it was evident that the terminal facilities required by the Panama Railroad Company would not be adequate for the probable needs of shipping that would use the canal, and in view of the fact that the saving on the estimates would probably enable the construction of such facilities as a part of the canal work, this was advocated in 1910.

Congress on August 24, 1912, approved an act authorizing the President to establish, maintain, and operate through the Panama Railroad or otherwise, dry docks and other terminal facilities for the purpose of providing coal and other materials for vessels of the government of the United States and for supplying these at reasonable price to passing vessels. Active operations for the construction of these were begun in the fall of 1912. The terminal facilities will not be completed by the time the canal is ready for the passage of vessels.

The Pacific terminals consist of a main dry dock capable of docking any vessel that can utilize the locks, a smaller dry dock for the use of smaller craft, a plant for supplying coal and fuel oil to vessels, the necessary wharves and piers for commercial purposes, and the permanent shops for use in connection with dry docks.

The Atlantic terminals will consist of wharves and piers at Cristobal, including the Cristobal mole, all of which are being constructed by the Panama Railroad at its own expense; and of the main plant for supplying coal and fuel oil to vessels. The cost of the coaling plant will be divided between the commission and the Panama Railroad Company.

The larger dry dock at the Pacific terminal will be able to dock a vessel 1000 feet long, and will have an entrance width of 110 feet. This dock will rest on rock and for a considerable portion of its depth will be in solid rock. The smaller dry dock will have a sufficient length to dock a vessel 350 feet long, a width at entrance of 71 feet. This dock will be founded on a rock and the greater part of its walls will be of gravity section.

The wharves and docks contemplated will consist of a quay wall 1238 feet long, between the head of Slip No. 1 and the northeast end of the new Panama Railroad concrete dock, and one pier 1000 feet long by 201 feet wide. Including the length of the wharf constructed for the Panama Railroad Company, the total water frontage under construction will be about 4650 feet long.

The coaling station on the Pacific side will be adjacent to the site of the dry dock and will be capable of handling and storing 100,000 tons of coal with a possible increase of 50 per cent.

CANALS

OPERATION OF GATUN LOCKS. Dredging fleet entering upper lock, west chamber. Looking north. Water 45 feet above sea level. October 9, 1913.

PANAMA CANAL

The permanent repair shops will be erected near the dry docks, and will consist of 18 buildings including tool shops, a forge shop, a steel storage shed, general storehouse, foundry, and other buildings. The work of preparing the foundation for the construction of these buildings was carried on during 1913, and considerable progress was made in the construction of some of them during the year.

LABOR. The force of laborers on the canal increased steadily during the first nine months of the fiscal year, until on March 26, 1913, the number reached the highest point in the history of the canal work. On that date the effective working force was 44,733, of which 39,089 were on the pay rolls of the commission and the Panama Railroad, and 5644 on the pay rolls of the contractors handling the work on the lock gates, emergency dams, and other contracts, in connection with the work. The average number of Americans employed on the rolls of the commission during the year was 4340, and on the rolls of the Panama Railway 870, a total of 5110. On June 30, 1913, there were 23,184 men, women and children occupying commission quarters. The demolition of the old settlements of Balboa and Gorgona, as a result of the completion of the work on the canal, made it necessary to establish quarters for many persons in other places. The force of laborers on the canal was reduced by 9000 in September. Other reductions were made during the year.

COST OF THE CANAL. The total appropriations for the Panama Canal to June 30, 1913, amounted to \$328,369,830. For the fiscal year 1913, additional appropriations amounting to \$16,265,393 were made. Of the total amount appropriated, \$5,806,950 was for fortifications and about \$6,000,000 was for other purposes not connected with the canal construction, leaving the net amount available for expenses of the canal proper \$316,684,630. The total expenditures to June 30, 1913, amounted to \$298,985,812 divided as follows: Department of Sanitation \$16,250,164; Atlantic Division \$53,504,462; Central Division \$33,942,510; Pacific Division \$47,355,130; general items including construction of buildings, subsistence, payments to the Republic of Panama, sanitary work in Colon and Panama, etc., \$87,866,003.

The following table shows the canal excavation and the amount remaining to be excavated on December 31, 1913. On that date, it will be noted that there remained in the Culebra Cut 6,185,357 cubic yards, which was more than the amount to be excavated in December 31, 1912, which was 5,351,419 cubic yards. This is the result of the slides in the Cut mentioned above.

Totals by Sections and Amounts to Be Excavated

PANAMA TOLLS. See ARBITRATION, INTERNATIONAL, *passim*; and PANAMA CANAL, Canal Toll Rates.

PAPER. The paper industry during 1913 continued to be interested in proposed tariff changes and especially in the new schedules for paper which were being prepared during the early part of the year by the committee of ways and means of the House of Representatives. News-print paper valued at 2½ cents and under was placed upon the free list, subject to no retaliatory or countervailing duty, as was also wood pulp, and the average ad valorem rate of duty on paper, which had been 18.80 per cent. was reduced to 12 per cent. Writing and fine paper were reduced over 8 per cent. Wrapping paper was continued at the old rate of 35 per cent. and rates on materials used in paper manufacture, such as bleaching powder, china clay, caustic soda, sal soda, and refined sulphur were all materially reduced, or, in the case of sulphur, removed.

The bill, as reported, passed the House and in the Senate an amendment was introduced abolishing the duty on Canadian chemical pulp and, in fact, all retaliatory duties on all papers valued at 2½ cents per pound and under. The bill was signed by the President on October 3. The question of the countervailing duty and the dispute over the favored nation treaty argument outlined in the YEAR BOOK for 1912, was concluded on May 13, when the Customs Court of Appeals decided against the government in favor of the importers and, as a result, there was involved the refund of duties paid under protest amounting to about \$3,000,000. The Ohio floods had a serious effect on the paper industry, while the question of water power and its relation to the manufacture of paper was also seriously discussed in view of legislation in New York and other States. During the year there were no serious disturbances in the labor market and the work of manufacture proceeded evenly and effectively.

As regards news-print paper, the consumption was 1,594,323 tons, or about 6 per cent. more than the consumption of 1912, and there was less paper on hand December 31, 1913, than at the corresponding time in the previous year. The domestic production was 1,371,044 tons and the imports from Canada were 223,222 tons. Prices during the year were somewhat weak due to the influx of Canadian paper immediately preceding the passage of the new tariff, but towards the end of the year conditions improved. The imports of printing paper in 1913 amounted to 437,587,640 pounds, of which 385,659,092 pounds were free and

51,928,548 pounds were dutiable, as compared with 169,259,726 pounds, the total imports in 1912, of which 125,125,066 pounds were free and 44,134,660 pounds were dutiable. Canada, of course, furnished the bulk of the printing paper imported, supplying 218,793 tons in 1913, as compared with 84,630 tons in 1912, this paper being valued at 2½ cents per pound, or less. In book paper a total production of 696,861 tons was recorded for 1913, as against 693,784 tons in 1912, which was 94 per cent. of the normal capacity of the mills, while the shipments amounted to 697,459 tons, or more than the actual production. There was keen competition during the year and it was thought that there would be increased imports of foreign paper. In coated paper the production was 113,473 tons, or 9716 tons less than was produced in 1912, the mills running about 13,000 tons short of their actual capacity, while the shipments were also less than in the previous year.

In fine, or writing papers, the actual production was 181,837 tons, against 174,059 tons in 1912, while in manila and fibre papers the actual production was upward of 564,000 tons of wrapping paper, as compared with 526,000 tons in 1912, the mills reporting a production of about 89 per cent. of their total capacity. In paper boards a total production of 827,819 tons, or an increase over 1912 of 16,108 tons, was recorded, or an actual production amounting to about 86 per cent. of the normal capacity of the mills. In tissue papers a good volume of business was done and prices were maintained, while in kraft paper the production increased considerably and it was supplementing manila paper for many purposes.

In 1913 the total imports of paper and manufactures of paper were valued at \$24,359,927 as compared with \$18,723,877 in 1912, while the exports of paper were valued at \$21,174,217, as compared with \$21,166,566 in 1911. Crude paper stock to the amount of \$7,724,663 was imported in 1913, as compared with \$6,927,908 in 1912, and wood pulp, mechanically ground, or chemical wood pulp, imported, amounted to \$16,355,517 in 1913 as compared with \$14,903,218 in 1912. Pulp wood valued at \$7,007,350 was imported in 1913, as compared with a value of \$6,227,346 in 1912.

The vast quantity of wood consumed annually in the manufacture of paper was strikingly illustrated in estimates of consumption prepared by Dr. Klein and published in the *Papier Zeitung*. He stated that for chemical pulp alone there was required 20,000,000 cubic meters of wood, while Snellman, another authority, estimated that 13,000,000 cubic meters were required for mechanical pulp, and 5,000,000 cubic meters for cards and boards. The annual consumption in 1913, therefore, was about 38,000,000 cubic meters, or a 30 per cent. increase in the six years from 1907, or at a rate of 5 per cent. per year. The extent of the industry was further emphasized by the fact that at the time when the estimates were prepared towards the end of the year, there had been produced already over 4,000,000 tons of chemical pulp, of which about 90 per cent. was sulphite pulp, and the remainder either soda or sulphate. In this production the United States took first rank with a production of 1,500,000 tons, and was followed by Sweden,

with 740,000 tons; Germany, with 700,000 tons; Norway, with 280,000 tons; Austria-Hungary, with 260,000 tons; Canada, with 210,000 tons; Finland, with 180,000 tons; and Russia, with 130,000 tons. Out of 55 per cent. of the cellulose contained in wood, 80 to 85 per cent. can be recovered by the sulphite process, while the sulphate process yields 65 to 70 per cent. and the plain soda process from 60 to 65 per cent. of the total amount of cellulose in the wood.

The demand for newspaper continued during the year and was marked by the usual contest between the manufacturers and the publishers. In 1913 imports of chemical pulp were beginning to come to the United States in substantial quantity from Sweden and new steamship lines were being established which anticipated considerable cargoes of this material. See also CHEMISTRY, INDUSTRIAL.

PAPUA, TERRITORY OF. Formerly British New Guinea. A dependency of the commonwealth of Australia, composed of part of the island of New Guinea and a number of small islands lying mostly to the southeast. Area, 90,540 square miles; white population June 30, 1912, 1064. The native population is generally assumed to be between four and five hundred thousand. The industries of Papua are not numerous, but they are becoming more diversified. Area under coconuts March 31, 1912, 15,993 acres; rubber, 4496; sisal hemp, 2757; coffee, 14; other cultures, 1447—total, 24,707 acres, divided among 192 plantations. The natives are compelled by the government to plant coconuts for food, and about 350,000 acres have now been so planted. There are many indigenous products of great economic possibilities. The timber and pearl-fishing industries are of importance. On March 31, 1912, the livestock in the territory consisted of 372 horses, 6 donkeys, 1286 head of cattle, 82 mules, 144 sheep, 585 goats, 95 swine, and 5267 fowls. The introduction of rabbits, foxes, hares, and monkeys is prohibited. Gold output, 1911-12, 17,047 ounces, valued at £60,608; 1910-11, 18,497 ounces, £68,803. Imports, 1911-12, £235,369; exports, £99,990; revenue, £51,035; expenditure, £85,636; tonnage entered and cleared, 275,803. Lieutenant-governor in 1913, John Hubert Plunkett Murray, born 1861.

PARAGUAY. An interior republic of South America, bounded by Bolivia, Brazil, and Argentina. The capital is Asunción.

AREA AND POPULATION. The Bolivian frontier has not been definitely fixed, and the estimates of Paraguay's area vary widely, in accordance with the recognition given to the claims of either country. In 1913 a territorial status quo was agreed upon by Paraguay and Bolivia, pending a treaty in settlement of the dispute or a submission of the case to a court of arbitration. At present the area quoted by the better authorities is 253,100 square kilometers (97,722 square miles), which is about equivalent to the area of Wyoming. The census of 1899 returned a population of 643,852. An estimate of 1911 is 800,000, but it is not unlikely that this figure is too large; some authorities believe that, on account of political disturbances, the number of inhabitants decreased between 1904 and 1912. The population is largely a mixture of Spanish, Guarani, and negro. The larger towns, with estimated population: Asunción, 84,000; Villa Rica,

30,000; Concepción, 25,000; Carapeguá, 15,000; Luque, 15,000. Immigration is small, amounting in 1910-11 to 418 and in 1911-12 to 605.

Public schools, as reported for 1912, numbered 484, with 995 teachers and 43,214 pupils. The state religion is Roman Catholicism.

PRODUCTION AND COMMERCE. Paraguay is a country of exceptional agricultural promise, being capable of producing successfully almost all of the important sub-tropical crops. Unfortunately large blocks of land have been alienated to foreign capitalists and syndicates, and economic progress has been retarded by internal conflicts. Comparative tranquillity in 1913 noticeably bettered agricultural and business conditions. The leading farm products include yerba maté, tobacco, corn, beans, alfalfa, manioc, and various fruits, especially oranges. The quantity of domestic tobacco marketed in 1910 was 12,396,031 pounds; in 1911, 14,187,395 pounds. Paraguayan tobacco has recently been improved by the introduction of seed from Cuba. Sugar-cane and cotton are crops of increasing importance.

Imports and exports have been valued as follows, in thousands of gold pesos (worth 96.5 cents):

	1908	1909	1910	1911	1912
Imports.....	4,073	3,788	6,248	6,479	5,283
Exports.....	3,732	5,127	4,785	4,829	4,211

The leading imports are cotton goods and foodstuffs, followed by hardware and alcoholic beverages. Principal exports in 1910 and 1911, in thousands of pesos: Hides and skins, 1178 and 1010; timber, 1038 and 1055; tobacco, 572 and 714; quebracho extract, 782 and 590; yerba maté, 522 and 568. Imports and exports by countries in 1911, in thousands of pesos: United Kingdom, 1850 and 1; Germany, 1818 and 1020; Argentina, 765 and 2722; Italy, 352 and 25; Spain, 414 and 158; France, 432 and 75; United States, 390 and 2; Uruguay, 51 and 729; other, 396 and 97; total, 6479 and 4829.

COMMUNICATIONS. The length of railway open to traffic in 1911 was 373 kilometers (232 miles). Asunción is connected by rail with Encarnación, which is on the Paraná River opposite the Argentine town Posadas. A ferry between these towns was opened in the summer of 1913, thus insuring through service between Buenos Aires and Asunción. During 1913 a branch of the Paraguay Central Railway (the Asunción-Encarnación line) was under construction; this branch is projected to extend from Borja (a short distance south of Villa Rica) eastward to a point on the Paraná opposite Iguassu (Brazil). There are about 2500 miles of telegraph line and 385 post offices.

FINANCE. For 1911 the estimated revenue was 2,738,000 pesos gold and 9,190,500 paper; estimated expenditures, 999,412 pesos gold and 32,687,228 paper. (The gold peso is valued at 96.5 cents, and the paper peso at about 7 cents.) The budget for 1913 showed estimated revenue of 3,248,000 pesos gold and 21,688,200 paper, and estimated expenditure, 1,862,582 pesos gold and 48,301,645 paper. Import and export duties were estimated at 2,521,200 and 610,800 pesos respectively. Public debt as reported for March 31, 1912: Foreign, 4,105,085 pesos gold; internal, 1,812,270 pesos gold and

76,597,425 pesos paper (including outstanding paper money); floating, 998,320 gold and 2,261,550 paper.

ARMY. The authorized military expenditure for 1913 was £157,603, or nearly 15 per cent. of the total expenditure of the republic, an increase of 25 per cent. over 1911. There was increased pay of all ranks, private soldiers in many cases receiving as much as 50 per cent. increase. The army consisted of 145 officers and 2016 other ranks and was divided into five military zones.

GOVERNMENT. The constitution (of 1870) provides for the election of a president and vice-president by indirect vote for four years. Five members constitute the cabinet. The Congress consists of the Senate and the Chamber of Deputies, members of both houses being elected directly. The president in 1913 was Eduardo Schaerer, elected for four years from August 15, 1912; vice-president, Dr. Pedro Bobadilla. The ministry appointed in 1912 was altered by the nomination of Col. Patricio A. Escobar to succeed Manuel Gondra as minister of war; Severiano Zubizarretta, minister of finance, was appointed director-general of posts and telegraphs.

HISTORY. On April 1 at the opening session of the Congress, President Schaerer delivered the presidential message, reviewing with gratification the recent achievements of his administration, among which he counted the present amicable foreign relations, the mounted police service, and the prosperity of the postal and telegraph departments. Among the measures presented for the approval of Congress was a homestead law which would allow the government to allot a small holding of 15 hectares of land to each applicant who would agree to cultivate the land and build a house on it. The Paraguayan consul at Hamburg was endeavoring to obtain the services of German army officers to drill the Paraguayan army. The budget for the fiscal year 1913 balanced at 1,862,581 pesos gold and 21,688,200 pesos paper. See URUGUAY.

PARALYSIS, INFANTILE SPINAL. See POLIOMYELITIS.

PARCEL POST. The system of parcel post put into operation on January 1, 1913, met with almost instantaneous success. Considerable objection being made to the requirement of special stamps an order was issued abolishing it. After a half-year's experience certain improvements were made. It was provided that packages might be sent C. O. D. by the payment of ten cents additional, which would cover not only cost of collection but also insurance. Under the authority of the postal express law of 1912, giving the postmaster-general with the Interstate Commerce Commission authority to alter rates, classifications, and zones by administrative order, rates were reduced on August 15.

Plans of Postmaster-General Burleson for a further extension of the parcel post were approved by the Interstate Commerce Commission on December 6. The weight limits of parcels in the first and second zones were increased from twenty to fifty pounds; the weight limit in zones beyond the second was raised from eleven to twenty pounds; books were admitted; and rates in the third, fourth, fifth, and sixth zones were reduced. The rate

reductions on the first pound were respectively from 6c to 5c, 7c to 6c, 8c to 7c, and 9c to 8c in the third, fourth, fifth, and sixth zones; and for each additional pound from 5c to 2c in the third zone, from 7c to 4c in the fourth; from 7c to 6c in the fifth; and from 9c to 8c in the sixth. These reductions became effective January 1, 1914. As to books, the postal rate of one cent for each two ounces or fraction up to eight ounces was retained; but to books weighing more than eight ounces the new zone parcel post rates apply. This ruling will be effective March 1, 1914. It was made as a result of urgent request by circulating libraries, schools, colleges, and publishers. These further reductions were made in consequence of records showing that the previous reductions in August had been followed by an increase of one-sixth in the number of parcels and of about one-third in the average postage per parcel. These extensions involved additional burdens for the railroads which were already complaining of inadequate payment; the postmaster-general therefore promised to present data upon which Congress could determine a fair and more adequate compensation. A congressional committee was investigating this question at the close of the year.

The express companies objected to these reductions, but their objections received little public support. The position of the express companies had been greatly altered by an order of the Interstate Commerce Commission, effective October 15. This introduced the block system of rate-making, greatly reduced rates, required uniform classifications, joint rules, and regulations of the companies, and instituted a new form of express receipts. These new rates were expected to greatly reduce express company business and dividends, and led to surmises as to the probable future of the companies.

COST OF LIVING. Much attention was given to the possible utilization of the parcel post to reduce the cost of living. An abundance of evidence was brought forward showing great disparity between the prices received by farmers for fruits, vegetables, eggs, and other foods and the prices paid by the city consumer. Proposals for the development of municipal markets vied with proposals for perfecting the rural delivery and parcel post systems as methods of bringing producer and consumer closer together and eliminating one or more middlemen.

Representative David J. Lewis, a member of the congressional joint committee on a general parcel post proposed that organizations such as the People's Institute of New York undertake to bring producers and consumers into direct relations. Any such responsible organization could, he thought, by advertising and other forms of publicity, secure lists of farmers and what they had to sell and lists of consumers and what they wished to buy. Some effort to standardize forms of shipment would be necessary. He also thought this system would be of great value to workmen who might give up their work in the city at age fifty to sixty and engage in truck farming, using the parcel post to dispose of their products. He declared that conditions warranted an increase in the weight limit to 100 pounds, a new zone system with 100 miles to each zone, and such a reduction of rates as would make the cost

only one-half cent per pound in the first 100-mile zone, one cent a pound in the second, and one and one-half cents in the third.

PARESIS, GENERAL, OF THE INSANE. See INSANITY.

PARSONS EBEN BURT. An American clergyman and educator, died January 24, 1913. He was born in Pittsfield, Mass., in 1835, and graduated from Williams College in 1859. From that year until 1862 he was principal of the high school at Greenfield, Mass. After studying theology at Union and Auburn Theological Seminaries, he was pastor from 1868-88 of the Presbyterian Church at Baldwinsville, N. Y. In the latter year he was elected secretary of the faculty of Williams College, and served in this capacity until 1909. He was the author of the *Obituary Record of Williams College* (5 volumes); and the *Phi Beta Kappa Handbook and General Catalogue*.

PAVEMENTS. See ROADS AND PAVEMENTS.

PEABODY MUSEUM OF HARVARD UNIVERSITY. An institution for anthropological and archaeological research, founded in 1866 by George Peabody. On May 28, 1913, the one hundred and sixth anniversary of the birth of Louis Agassiz, the sod was broken for the erection of the remaining portion of the great University Museum at Harvard. This, the ninth and last period of construction, will soon complete the building planned by Louis Agassiz and begun in 1859. This new section will furnish additional space for the Peabody Museum collections in American and comparative archaeology and ethnology. It will also give more room for the rapidly growing library, for offices and work rooms, and for a better lecture room for the students' division of anthropology.

During 1913 archaeological researches were conducted by Mr. C. C. Willoughby in the Southwest, in the Tsonitson Cañon which opens into the Chinlee Valley; in the Delaware Valley by Mr. Ernest Volk; in Tennessee by Mr. Bruce W. Merwin; in Nebraska by Mr. Frederick H. Sterns; and in Massachusetts by Mr. Samuel J. Guernsey. Prof. Roland B. Dixon spent his sabbatical year traveling in southern and southeastern Asia, where he made anthropological researches among the native tribes, studied the museum collections, visited the archaeological sites, and collected valuable ethnological material for the museum collections. Dr. Charles Peabody made personal researches in France, Italy, and England, and obtained most interesting material from the prehistoric sites in these countries. The Central American expedition started in November, 1913, for Guatemala, under the direction of Dr. E. R. Merwin, who is accompanied by C. W. Bishop, fellow in Central American research for 1913-14.

In accordance with the agreement of the institutions forming the International School of Archaeology in Mexico, it was Harvard's turn to furnish a director for the school. Prof. A. M. Tozzer has been appointed director for the session of 1913-14, and he and Mr. C. L. Hay, the Harvard fellow, started in November, 1913, for the City of Mexico.

Dr. William C. Farabee has resigned his offices of instructor in anthropology and assis-

tant in somatology in the museum to accept the office of curator of archaeology in the museum of the University of Pennsylvania and director of the South American expedition sent out by that university. Dr. Ernest Hooton has been appointed instructor in anthropology and associate curator of somatology in the museum to fill the vacancy caused by the regrettable resignation of Dr. Farabee. Mr. A. V. Kidder has been added to the museum force with the title of associate curator of archaeology. Mr. Richard F. Carroll has been appointed assistant librarian in the museum. The titles of curator and assistant curator have been changed to director and assistant director, and the officers having title of assistant have been given the title of curator.

In the year 1913 the museum issued vol. vi. of its *Memoirs*,—*Maya Art*, by Dr. H. J. Spinden; and also the fifth number of its *Papers*, vol. iii., completing that volume.

PELLAGRA. A new theory of the cause of pellagra was announced by Alessandrini and Scala, who had done extensive work at the Institute of Experimental Hygiene at Rome. These investigators abandoned the idea that pellagra was of parasitic origin and have apparently shown that the cause lies in the silica which exists in colloidal solution in drinking water. All drinking water contains some silica, but this is neutralized when alkaline salts are present in the water. When the salts are present in insufficient amounts or are absent there is danger of pellagra. In their experiments sodium and calcium carbonates prevented an injurious influence from the colloidal silica, while calcium chloride aggravated it. The silica acts by causing the fixation of sodium chloride in the tissues, which in turn results in excessive amounts of free hydrochloric acid. This induces reactions which cause the symptoms of pellagra, the latter being essentially an intoxication by mineral acids. The action of mineral acids is most intense on the tissues exposed to sun and air. The practical results of this research were shown in the treatment of pellagrins by daily injections of a weak solution of trisodium citrate. Even severe and chronic cases gained weight and strength while under the treatment, and were free from digestive and other disturbances; no change was made in their habits of life, food, or occupation. Dogs suffering from pellagra also recovered apparently normal health in a short period under

the same treatment. Alessandrini and Scala suggested that the addition of minute pebbles of calcium carbonate to the sources of the water in pellagra districts would restore the proper balance and put an end to the excess of colloidal silica. This measure had already been applied empirically in some districts, with excellent results, small limestone pebbles being used as a filter for the water without knowledge of the specific chemical action of calcium carbonate on the silica. Equally plausible evidence in favor of the theory of a parasitic origin was not lacking, however. Harris of New Orleans inoculated monkeys with a filtrate obtained from the tissues of an undoubted case of human pellagra and succeeded in producing all the essential symptoms of the disease both in the skin and nervous system. He believed that the disease was due to a filterable virus or micro-organism capable of passing through a Berkefeld filter. It would appear, therefore, that the question was still far from solution. See *INSANITY*, and also *YEAR BOOK* for 1912 for bibliography, etc.

PENANG. See STRAITS SETTLEMENTS.

PENFIELD, FREDERIC COURTLAND. An American diplomat, born in Connecticut in 1855. He graduated from the Russell's Military School, New Haven, and then took special studies in Germany. Subsequently he was for five years on the editorial staff of the *Hartford Courant*. In 1885 he was appointed vice-consulate-general at London; from 1893 to 1897 was diplomatic agent and consulate-general to Egypt, with the rank of minister resident. He traveled extensively in Africa, India, China and Japan. He received the Cross of the Medal of Honor from France in 1904, in recognition of his prominence in discussing the merits of canal routes. He also received decorations from the sultan of Turkey, the khedive of Egypt, and the czar of Russia, for services rendered to the governments of these countries. In July, 1913, he was appointed United States ambassador to Austria-Hungary. He was author of *Present-Day Egypt* (1899); *East of Suez* (1907); and was a frequent writer of articles on economic and international subjects in American magazines.

PENNSYLVANIA. POPULATION. The population of the State in 1910 was 7,865,111. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 8,107,942.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1913 are for estimates only.

		Acreage	Prod. Bu.	Value
Corn	1913	1,463,000	57,057,000	\$41,081,000
	1912	1,449,000	61,532,000	38,797,000
Wheat	1913	1,286,000	21,862,000	19,894,000
	1912	1,240,000	22,320,000	21,204,000
Oats	1913	1,154,000	35,774,000	16,456,000
	1912	1,099,000	36,377,000	14,915,000
Rye	1913	280,000	4,900,000	3,626,000
	1912	282,000	4,935,000	3,800,000
Potatoes.....	1913	265,000	23,320,000	18,656,000
	1912	265,000	28,885,000	16,464,000
Hay	1913	3,141,000	64,146,000	61,775,000
	1912	3,173,000	4,537,000	70,777,000
Tobacco ...	1913	38,900	646,680,000	3,501,000
	1912	44,200	64,090,000	5,448,000

a Tons. b Pounds.

MINERAL PRODUCTION. The total value of the mineral products of the State in 1912 was \$445,790,022, compared with \$414,426,962 in 1911.

The coal production in 1913 according to the estimates of the United States Geological Survey broke previous records. Combined production of hard and soft coal was estimated to have amounted to about \$267,000,000 short tons. The total output of anthracite coal was estimated at 79,830,000 long tons, 4,500,000 tons more than that of 1912. The production of bituminous coal showed increases of 10 to 20 per cent. in various parts of the State. In the production of coal, Pennsylvania not only exceeds by far any other State in the Union, but also exceeds that of any other country in the world except Great Britain, and Germany, and is closely rivaling the latter. The total production in 1912 was 246,227,286 short tons, valued at \$346,993,123. Of this 75,325,855 long tons, equivalent to 84,361,598 short tons, was anthracite. Its value was \$177,622,626. The production of bituminous was 161,865,488 short tons, valued at \$169,370,497. The increase in the total production over 1911 was 11,201,762 short tons. The production of anthracite coal in 1912 was less than in 1911 by 5,448,633 long tons. This was due to the suspension of operations on April 1. The value of anthracite, however, showed an increase over 1911 of \$2,670,211. The production of bituminous coal increased 17,304,231 short tons over 1911. Notwithstanding the decrease in the production of anthracite in 1912, more men were employed in the anthracite mines than in 1911, whereas, in the bituminous mines, the production showed a material increase with fewer employes. The number of men employed in the anthracite mines in 1912 was 174,030, compared with 172,585 in 1911. The bituminous workers in 1912 numbered 165,144, compared with 168,199 in 1911. The average number of working days in the anthracite region decreased from 246 in 1911 to 231 in 1912, and in the bituminous mines, the average working time increased from 233 days in 1911 to 252 in 1912. The total number of men employed in the mines of the State in 1912 was 339,174, compared with 340,784 in 1911. (For account of labor troubles in the anthracite region in 1912, see STRIKES.) There were 584 fatal accidents in the anthracite mines in 1910. In the bituminous mines 437 men were killed; a decrease of 92 from 1911. The chief cause of accident was falls from roof and coal, which caused the death of 242 miners.

The production of petroleum in the State in 1912 was 7,839,948 barrels, compared with 8,248,158 barrels in 1911. The production continued to show a decline. A number of new wells were drilled in 1912, several in Allegheny yielding as much as 25 barrels a day. A 100-barrel well was struck in Penn Township and another in Green County.

The production of iron ore in 1912 was 517,081 long tons, compared with 537,506 in 1911. Pennsylvania ranks first in the production of pig iron. There were made in 1912 12,552,131 long tons, compared with 9,807,073 in 1912.

A small amount of copper is produced in the State. In 1912 this amounted to 248,378 pounds of blister copper, compared with 661,621 pounds in 1911. The copper is recovered as a by-product in the treatment of pyritiferous mag-

netite at the Cornwall mines in Lebanon County.

CLAY. Pennsylvania is the second State in the value of clay product. It is first in the production of brick and tile products, and fifth in the production of pottery. The total value of the clay products in 1912 was \$21,537,221, an increase of \$1,267,188 over 1911. The principal clay product is fire brick.

TRANSPORTATION. The total railway mileage in the State on December 1, 1912, was 8188. Of this, 5115 was mileage of twenty companies operating in the State but having their lines also outside the State, and 3073 was the mileage of independent roads entirely within the State. The roads with their chief mileage are the following: Baltimore and Ohio, 633; Erie, 441; New York Central and Hudson River, 448; Pennsylvania, 1080; Philadelphia and Reading, 456.

EDUCATION. The total enrollment in the public schools of the State in 1913 was 1,343,055. The average daily attendance was 1,281,256. The total number of teachers, both male and female, was 37,956. The average salary for male teachers was \$65.82, monthly, and for female teachers \$48.69.

FINANCE. The report of the State treasurer for the fiscal year ending November 30, 1913, shows receipts for that period of \$35,348,615, and disbursements for the same period \$37,566,196. There remained in the treasury at the end of the fiscal year a balance of \$7,564,269. The chief revenue is obtained from corporation taxes, and the chief expenditures for public schools, charitable institutions, etc.

CHARITIES AND CORRECTIONS. In 1913 provision was made for the construction of three new institutions, a State industrial home for women, at a cost of \$250,000; a village for feeble-minded women, at a cost of \$40,000; and a State institution for inebriates, for which \$20,000 was appropriated to secure land. The legislature of 1913 passed a measure which largely increased the power of the board of public charities over jails and almshouses. It also provides for the manner of making reports from hospitals and homes to the board. Appropriations for penal, reformatory, and charitable institutions in 1913 was \$16,855,391.

POLITICS AND GOVERNMENT. There was no election for State officers in 1913, as the 1909 amendment to the constitution provides for municipal elections only in odd-numbered years, except that judges may be elected any year. The terms of Governor Tener and other State officers do not expire until January, 1915. The next State election is November 3, 1914. The legislature ratified the amendment providing for the direct election of senators on April 2. A woman suffrage amendment was agreed to by the legislature and if agreed to in the 1915 legislature it will go to the voters for approval that fall. The legislature made an appropriation to provide for the entertainment of the veterans of the Union and the Confederate armies which participated in the Battle of Gettysburg. They met on the battlefield of Gettysburg on the fiftieth anniversary of the battle. The encampment began June 29 and ended July 6. This reunion was the most notable event of its kind ever held. About 55,000 survivors of the Battle of Gettysburg attended. President Wilson was present and made an address on July 4.

In November two members of the Superior Court were elected on a non-partisan ticket. They were John J. Henderson of Crawford County, and John W. Kephart of Cambria.

In Philadelphia the officers elected in November were district attorney, city treasurer, register of wills, and receiver of taxes. The term of Mayor Blankenburg does not expire until 1915. The contest was between the Republican machine and a Fusion ticket. The object of the Fusionists was to obtain control of the minor departments of the city government, and to extend to these the reforms which Mr. Blankenburg has brought about; to control the councils and to replace political administration by business management. Mayor Blankenburg made the claim that while his departments had saved money during his administration, the councils had wasted it. Charges of corruption were made by the officials against James P. McNichol, State senator, and William S. Vare, contractor, who for years had a practical monopoly of city contracts. In the election held on November 4, the Republicans were victorious, increasing their majority of the Common Council and electing a full county ticket.

In Pittsburgh Joseph G. Armstrong defeated Stephen G. Porter for the mayoralty. Two members of the City Council were reelected and two members were defeated for reelection. This election was the first in which a mayor and city councilmen were elected on a non-partisan ticket. Seven candidates for mayor presented themselves for the primaries in September. The contest was between Armstrong, supported by business men and Republicans, and Porter, supported by the retiring city administration which sought to intrench its machine in power, and the Progressive Republicans. Porter had 300 more votes than Armstrong in the primaries. A wholesale purging of the voting lists which had been fraudulently padded, and a rallying of the hosts of good government who feared a restoration of the bossism of William Flinn through the election of Porter, resulted in Armstrong's election by 2500 majority. Richard H. Jackson, Republican, was elected district attorney of Allegheny County; Samuel C. Jamison, Republican, was reelected coroner; and George W. Richards, Republican, was elected sheriff.

LEGISLATION. The legislature met in 1913, and passed many important measures. Among them were the following: A public utilities act which does away with the railroad commission, was passed. A maximum of ten hours per day and 54 hours per week for women in certain employments was provided for. A department of labor and industries was created, and vocational training in the public schools was provided for. A measure provides for semi-monthly wage payments unless otherwise stipulated in the contract. Measures were passed providing for State-wide primaries, for the direct nomination of all public officers from United States senators and governor down. Provision was made for the submission to the people of the constitutional amendment providing for woman suffrage. Electrocution was substituted for hanging as a death penalty. A number of pure food laws were passed. These include a stringent cold storage law. A State board of censors for motion-pictures

was created. A mothers' pension act was enacted, as was a loan-shark act, and an act providing for the abatement of disorderly houses. See also **LIQUOR REGULATION.**

STATE GOVERNMENT. Governor, John K. Tener; Lieutenant-Governor, John M. Reynolds; Secretary of the Commonwealth, Robert R. McAfee; Treasurer, R. K. Young; Auditor-General, A. W. Powell; Adjutant-General, Thomas J. Stewart; Attorney-General, John C. Bell; Superintendent of Public Instruction, N. C. Schaeffer; Insurance Commissioner, C. Johnson; Commissioner of Agriculture, N. B. Critchfield—all Republicans, except Schaeffer, Democrat.

JUDICIARY. Supreme Court: Chief Justice, D. Newlin Fell; Associate Justices, J. Hay Brown, William P. Potter, John Stewart, Robert Von Moschzisker, S. L. Mestrezat, and John P. Elkin—all Republicans, except S. L. Mestrezat. Prothonotary, Eastern District, James T. Mitchell; Prothonotary, Middle District, William Pearson; Prothonotary, Western District, George Pearson.

STATE LEGISLATURE, 1913. Democrats: Senate, 15; House 57; joint ballot 72. Republicans: Senate 34; House, 127; joint ballot, 161. Progressives: Senate, 1; House, 14; joint ballot, 15. Keystone: Senate 0; House, 9; joint ballot, 9. Republican majority: Senate, 18; House, 47; joint ballot, 65.

The names of senators and representatives to Congress will be found in the article **UNITED STATES**, section *Congress*.

PENNSYLVANIA, UNIVERSITY OF. The total number of students enrolled in the university in the autumn of 1913 was 6332, of whom 2008 were in the college; 914 in the Towne Scientific School; 1803 in the Wharton School of Commerce; 470 in the Graduate School; 374 in the Law School; 284 in the School of Medicine; 588 in the School of Dentistry; and 118 in the School of Veterinary Medicine. The instructors in all departments numbered 560. The university is the most cosmopolitan of American colleges or universities. In the student list there were 254 names enrolled from foreign countries. There were 44 foreign countries represented. The students in the United States are from practically every State and Territory. Among the promotions and new professors for the academic year 1914 are the following: Thomas D. Cope, assistant professor; Engelhardt A. Eckhardt, assistant professor; Grover G. Huebner, assistant professor of commerce; Arthur F. E. Ungnad, Clark research professor of assyriology; James C. Ballagh, professor of political science; Harlan Updegraff, professor of educational administration. The gifts and bequests received during the year will be found in the article **GIFTS AND BEQUESTS**. The provost of the university is Edgar F. Smith.

PENNSYLVANIA ACADEMY, ANNUAL EXHIBITION OF. See **PAINTING AND SCULPTURE**.

PENNSYLVANIA STATE COLLEGE. An institution of higher learning at State College, Pa., founded in 1855. The enrollment in all departments in the autumn of 1913 was 29,037. The faculty numbered 200. There were no noteworthy changes in the faculty during the year, and no notable benefactions were received. The productive funds amount to about \$567,000, and the income to about \$446,000. The library con-

tains about 52,000 bound volumes. The president is Edwin E. Sparks, LL.D.

PENOLOGY. A very considerable change is taking place in the traditional attitude of society toward criminals and the methods of their treatment with the growth of the sense of social responsibility. The criminal has come more and more to be viewed as a victim of bad social conditions rather than a vicious enemy of society. He is treated, therefore, not in a spirit of revenge but with a desire to reform and rehabilitate him. Old types of prisons are being replaced by new, as shown by the movement to abolish Sing Sing Prison in New York. The convict lease system whereby convicts have been exploited in mines and lumber camps has been abolished in all but two Southern States. The prison contract system whereby prisoners are hired to private contractors within the prison is being replaced by the State-use and other system of profitable employment by the State. During the year twenty-five governors declared that the employment of convicts on road work is the best solution of the problem of prison labor in their States; fourteen others thought prison farms to be better; three favored employment on public roads; and four favored production for State consumption. Following up the reform begun by Woodrow Wilson when governor, the State of New Jersey established a farm colony and extended the State-use system. Investigation at the State prison, Jackson, Mich., showed that nine of every ten persons had failed to complete a common school course. A system of instruction of both common and high school grade and largely vocational in character was introduced. As shown below, there has also been an adoption of probation and parole systems and the indeterminate sentence. Tennessee during the year passed an indeterminate sentence law and authorized the parole of prisoners with good records. California also provided for parole and for the payment of wages to convicts during imprisonment. See JUVENILE COURT.

PAROLE OF LIFE PRISONERS. Gradually in recent years the belief has spread that the best interests of society and the individual may be served by the extension of the principle of parole even to convicts serving life sentences. Former Attorney-General Wickersham strongly supported this idea. He stated that there were early in 1913 more than 200 life prisoners in Federal penitentiaries whose only hope of release, however exemplary their conduct, was the President's pardon. A bill to parole United States life prisoners passed Congress and was signed by President Taft in January. At that time it was brought out that life prisoners are paroled in Minnesota after they have served 35 years less "good time" allowances; in Nebraska, Ohio, and Utah after serving 25 years; in Louisiana, Virginia, and Oregon after 15 years; in Texas after 10 years; in California after 8 years; and in Kentucky after 5 years.

ARKANSAS. In 1912 former Governor Donaghey of Arkansas had made every effort to secure the abolition of the convict lease system. To this end he released 360 prisoners in December. In May a law was passed abolishing the system and instituting in its place a State farm. This law placed the penal institutions under the control of a new board of

penitentiary and reform school commissioners. This board of three members, of which two must be farmers, will devote its entire time to its official duties. A farm of 8000 acres was secured. The reasons leading to the adoption of farm work were: Less competition with free labor than in manufacturing; health of prisoners; and vocational training leading to self-sufficiency upon release.

INDIANA. Since 1897 Indiana has had parole and indeterminate sentence laws applicable to all men over sixteen years and all women over seventeen years of age, unless convicted of treason on first or second degree murder. Up to September 30, 1912, the State prison, women's prison, and reformatory had granted conditional releases to 6945 persons. Of these, 4000 completed the parole period satisfactorily; 449 were discharged because the full time of their sentence had expired; 120 had died; 573 remained under supervision; and 1803 or 25.9 per cent. of the total had broken their parole. Of the 4171 paroled from the reformatory, 26 per cent. proved delinquent; of the 2580 men from the State prison, 25.5 per cent. proved delinquent; and of the 194 from the women's prison, 29.3 per cent. proved delinquent. While under supervision those paroled reported earnings aggregating \$1,887,000 and expenses of \$1,568,000. In addition to this surplus of \$319,000, the State had saved \$1,152,000 in prison expenses.

PROBATION: CHICAGO. The first annual report of the adult probation offices of Cook County showed that, in the year ending September 30, 1912, there were placed on probation 1074 persons. Of these 430 were of ages 17 to 20. Those passed from probation numbered 235, of whom 171 were reported as improved, 42 unimproved, 1 dead, and only 21 committed. Those on probation and employed earned during the month of September, \$30,905. In addition 31 men were managing their own business, 16 were working, but earnings were unknown, and 43 were housewives or girls working at home. The report claimed that the net saving to society was \$439,970.

National interest attached to the appointment of probation officers of the Juvenile Court of Chicago. The State Supreme Court had excluded such officers from the civil service law with the result that their appointment had fallen into the hands of politicians. This corrupt system was ousted at the 1912 elections and the appointments given to the circuit judges. The latter delegated the duty to Judge M. W. Pinckney, who asked five distinguished and interested men and women to assist him. They gave both written and oral examinations to over 750 applicants and then selected the thirty-eight best fitted by experience, knowledge, and character to fill the vacancies. The court then had 74 probation officers.

MASSACHUSETTS. The fourth annual report of the Massachusetts commission on probation stated that in 1912 there had been paroled 17,538 persons. From them probation officers had collected \$136,512. Of this sum \$36,248 was from men sentenced for non-support of wife or family. The total sum collected greatly exceeded the entire cost of the probation system.

MISSOURI. The Missouri legislature in 1911 passed a law abolishing the prison contract system on December 31, 1913. But the 1913 legislature following an investigation voted to extend the date for abolishing the system to December 31, 1915. The report of the investigating committee showed that there were in the penitentiary 2403 prisoners; that 1600 were employed under the contract system, most of them at 70 cents per day; that the earnings for the two years 1911-1912 were \$710,000. The report declared that the State would require an extension of time in order to enable it to purchase at a cost of about \$1,000,000, the machinery and other equipment of the industries now in the prison. The new law placed the normal contract price at 75 cents per day per prisoner; continued the State binding twine factory; and provided that a number not exceeding one-fourth of the convicts should be employed on the public roads and in the manufacture of school furniture.

NEW YORK. The sixth annual report of the probation commission of New York State for the year ending September 30, 1912, showed that the number of publicly-paid probation officers had increased from 35 in 1907 to 159; that the number of cities using the system had grown from 16 to 38; and the number of counties using it in felony cases from 11 to 39; and in town and village courts from 2 to 22. But in 13 of these 61 counties no one had been placed on probation. During the year about \$300,000 had been collected from probationers under court orders for family support, restitution, and installment fines. Over 20,000 persons were under the oversight of probation officers, 14,687 of them representing new cases that year.

In New York City greater efficiency was secured in the probation service by the establishment of a central probation bureau from which each officer will receive his assignments. Formerly the officers remained in court during sessions; and some would have as many as 150 cases while others had but 20. Under the new system cases will be more evenly distributed and the officers can give their entire time to field work.

A commission on prison reform was created to formulate a complete system for the control and reformation of prisoners. Its chairman was Thomas M. Osborne. The other members were: Prof. George W. Kirchwey; Judge Charles M. Hough; Prof. Howard T. Mosher; Edward Bates; E. Staggs Whitin; Mary Garret Hay; Margaret Wilson; Hannah Blum; and Judge Riley, superintendent of prisons. In order to secure accurate impressions of prison conditions Mr. Osborne and Madeline Z. Doty and Elizabeth Watson, as investigators for the commission, spent some days in actual voluntary incarceration in the State prisons at Auburn. They pronounced conditions barbarous. Shortly thereafter Superintendent Riley announced in December changes in discipline in the women's prison that would give greater freedom. The first report of the commission made among others the following recommendations: Private bathing for new arrivals; an extra suit of underwear; permission to read papers and magazines; freer communication by letter with friends and family; a graded system of punishment; aboli-

tion of the policy of silence; better regulation of the sale of tobacco; use of matches instead of flint and steel; and provision for rainy days.

The Prison Association of New York began a widespread campaign for the abolition of Sing Sing Prison. They desired to substitute for it a prison farm. Following an investigation, the Westchester County grand jury had reported it to be a scandal to the State of New York. It found the prison to have all faults of the date of its construction, 1825. The air space is less than that required by law in lodging houses; confinement in such a cell was declared a terrible punishment. Vermin were found to swarm in the cells; the walls were damp; convicts were found in every stage of tuberculosis; there was no separation of the foul and the clean; methods of punishment were declared inhuman; and this was especially true of confinement in the "cooler," which had driven men to insanity or suicide.

In July a fire in the Sing Sing prison mat factory due to incendiarism was followed by open mutiny among the 1447 prisoners. This was quelled in a few days, partly by the removal of 125 to Auburn and partly by the good sense and courage of the new warden, J. N. Clancy.

WISCONSIN. A very unique law was passed by the State legislature providing that an innocent person sentenced to prison through an error of justice should be compensated by the State. The governor and members of the State board of control were created a commission to pass on petitions for such compensation. The maximum compensation was fixed at \$5000.

CONVICT ROAD. Colorado was the first State to employ convicts in the construction of public highways under the honor system. The plan spread to other western States, notably Washington and Oregon, and in 1913 was tried by Warden Allen of the Joliet, Ill., penitentiary. Forty-five prisoners were placed in a practically unguarded camp. They traveled in black suits and worked in khaki suits and cotton shirts. The prisoners, largely out of loyalty to the convicts left behind the bars and partly out of loyalty to the warden, organized their own court and detective system to prevent escape and to strengthen any one of their number who might waver. The warden declared the experiment successful. It built up the men physically and morally. Governor West of Oregon stated that gangs of fifteen to twenty-five convicts under a free foreman had been successfully employed 300 miles from the prison. See also CHARITIES, *passim*.

PENSIONS. See UNITED STATES, *Pensions*.
PENSIONS, OLD-AGE. See OLD-AGE PENSIONS.

PENSIONS FOR MOTHERS. In 1908 agitation was begun by social workers for the pensioning of poor widows with minor children in order that the children might have the advantages of home life and the care of their own mothers. Up to the close of 1913, seventeen States and two cities had made provision for widows' pensions; bills were pending in eight States; and New York had a commission making investigation. According to an analysis of the American Association for Labor Legislation, the States with laws in force were

California, Colorado, Idaho, Illinois, Iowa, Massachusetts, Michigan, Minnesota, Missouri, Nebraska, New Jersey, Ohio, Oregon, Pennsylvania, South Dakota, Utah, and Washington; and the cities, Milwaukee and St. Louis. The laws of California, Colorado, Illinois, and Michigan apply to any parent unable to support a child; in Massachusetts, Michigan, and Utah the laws apply to mothers only; in New Jersey widows only are included; and in all other States the laws extend to 'dependent mothers as well as widows. Such mothers in some laws include deserted wives, and in other laws, mothers whose husbands are in prison or in insane asylums, or incapacitated for labor. In Michigan alone are divorced and unmarried mothers included. In California and Colorado, if neither parent is deemed fit, a guardian may be appointed and receive the pension.

The maximum age of a child for whom a pension may be received was placed at fourteen years in Iowa, Massachusetts, Minnesota, Missouri, and South Dakota; fifteen in Idaho, Utah, and Washington; sixteen in New Jersey and Oregon; and in Nebraska, if the child be delinquent; seventeen in Illinois if a male child, and in Michigan; eighteen in Illinois if a female child, and in Nebraska if merely neglected and dependent; legal working age, in Ohio and Pennsylvania. No limit was set in California and Colorado.

The maximum allowance for one child varied in the different laws from \$2.00 a week in Iowa and \$6.25 a month in California to \$3.00 a week in Michigan and \$15.00 a month in Ohio, South Dakota, and Washington. The amount for each additional child varied from \$5.00 to \$12.00 per month. Colorado, Illinois, Massachusetts, and Washington set no maximum.

The administration of the law was entrusted to juvenile courts in California, Illinois, Missouri, Ohio, and Washington; to juvenile or other county courts in Colorado and Oregon; to juvenile courts or county commissioners in Utah; to other courts in Idaho, Iowa, Michigan, Minnesota, Nebraska, New Jersey, and North Dakota; to overseers of the poor in Massachusetts; and in Pennsylvania to an unpaid board of five to seven women residents of the county to be appointed by the governor.

The Massachusetts mothers' act differed from most acts in that it created no new machinery and provided not pensions but relief. The local overseers of the poor were required by it to aid all mothers with dependent children under fourteen, if such mothers be deemed fit to bring up their children. Those aided are not to be deemed paupers because of such aid. The overseers must search out relatives and secure all possible assistance from them and from organizations and individuals. They must visit each family at least once every three months and must reconsider each case at least once a year. The State board of charity must report on the work done to the legislature. The State will reimburse the city or town giving aid to the extent of one-third of the bills approved by the State board.

PEPPER, GEORGE DANA BOARDMAN. An American theologian and educator, died January 30, 1913. He was born in Ware, Mass., in 1833; graduated from Amherst College in 1857; and from the Newton Theological Institution in 1860; and in the last-named year was or-

dained to the Baptist ministry to become pastor of the First Church at Waterville, Me. Here he served until 1865, when he was appointed professor of ecclesiastical history at the Indian Theological Institution. After two years in this chair, he became professor of systematic theology at the Crozer Theological Seminary. In 1882 he was chosen president of Colby University, now Colby College, and after remaining in this position until 1889 he resigned because of ill health. He remained the professor of Biblical literature at Colby College until 1900. His published writings include *Outlines of Theology*; and sermons, articles, and addresses for theological reviews and other periodicals.

PERAK. The most northerly state of the Federated Malay States (q.v.). The agricultural area was divided in 1909 as follows: 68,278 acres under rubber, 75,346 under rice, 63,225 under cocoanuts, 7000 under sugar-cane. Tin and gold are mined. Export of tin (1911), 9,188,008 Straits Settlements dollars; tin ore, 31,946,988; rubber, 10,994,087; copra, 973,811; rice, 730,983; grain, paddy, 463,714; hides, 37,116; sugar, 234,424; rattans and canes, 22,633; gutta, 15,596; ataps, 68,835; areca nuts, 81,217; etc.—total exports, 55,535,590 (44,084,758 in 1910). Total imports, 29,349,243 S. S. dollars (opium, 5,098,881; tobacco and cigars, 1,423,583; spirits, 652,025; beer and stout, 333,771; rice, 6,109,072; hardware, 1,173,304, etc.), against 21,784,361 in 1910. The main railway from Penang traverses the state. Taiping is the capital, Ipoh the trade centre. Reigning sultan in 1913, Idris Merisid-el-Ahazam Shah. The British resident is R. G. Watson.

PERIM. A dependency of Aden (q.v.).

PERRY, ALEXANDER JAMES. An American soldier, died March 26, 1913. He was born in New London, Conn., in 1828; and graduated from the United States Military Academy in 1851. In the same year he was appointed second lieutenant in the second artillery. In 1861 he was promoted to be captain and assistant quartermaster. In 1862-63 he served as lieutenant-colonel and quartermaster of volunteers, and from 1864-67 was colonel and quartermaster. After the Civil War he served as quartermaster and rose to the rank of colonel and assistant quartermaster-general. In 1892 he was retired by operation of law. He was breveted with the rank of brigadier-general retired, by the act of April 23, 1904. He was breveted major, lieutenant-colonel, and colonel for services during the Civil War and brigadier-general for services in the quartermaster's department during the war.

PERRY MEMORIAL. See EXPOSITIONS.

PERSIA. A constitutional Asiatic monarchy, hereditary in the Shiite dynasty of the Kadjars since 1794; it lies between the Caspian Sea and the Gulf of Oman. Teheran is the capital.

AREA, POPULATION, ETC. The area is estimated at 1,645,000 square kilometers (635,135 square miles), and the population at about 9,000,000, of whom about 2,500,000 are nomads. The country is for the most part an arid tableland enclosed on three sides by mountains rising in the north to over 18,000 feet. A salt desert occupies the central and eastern portions. The Karun is the only navigable

river. The principal products are cereals, cotton, tobacco, opium, gums, dried fruits, and silk. The country possesses valuable mineral resources, little worked except for the oil fields in the south. The nomads graze herds of sheep and goats and bring a fine grade of wool into the market. The forests are valuable. Carpets, shawls, and silk and cotton fabrics are manufactured.

COMMERCE AND COMMUNICATIONS. The total imports in 1912-13 were valued at 567,576,000 krāns (cottons, 155,059,000 krāns; sugar, 127,761,000; tea, 33,052,000; cotton yarn, 9,846,000; woollens, 9,301,000; petroleum, 8,388,000). Exports, 436,333,000 (cotton, 73,963,000; fruits, 61,430,000; carpets, 48,871,000; rice, 34,772,000; opium, 22,500,000; skins, 20,902,000; silk and cocoons, 19,043,000; gums, 16,303,000; wheat, 14,213,000; wool, 11,523,000). Russia has first place with imports and exports in 1912-13, valued at 328,980,000 and 300,878,000 krāns respectively; Great Britain, 86,382,000 and 34,328,000; British India, 66,799,000 and 22,270,000; Turkey, 23,389,000 and 37,927,000; Germany, 21,388,000 and 2,928,000; France, 11,031,000 and 4,829,000; Austria-Hungary, 8,042,000 and 567,000; Belgium, 7,929,000 and 408,000; Afghanistan, 4,360,000 and 2,443,000; Italy, 2,738,000 and 8,004,000; Oman, 1,047,000 and 7,378,000; China, 789,000,000 and 3,474,000; United States, 947,000 and 6,375,000; other, 2,481,000 and 2,376,000. Vessels entered (1911-12) at Persian Gulf ports, 4969, of 1,667,914 registered tons, of which 1038, of 1,309,119 tons British; at Caspian ports, 2755, of 718,765 tons, all Russian. Merchant marine, 1 sailing vessel, of 107 tons net.

There are only eight miles of railway open, and transport is mostly by pack animals over the great caravan routes. A branch of the Transcasian Railway, to run from Askhabad to Meshed, is under consideration. No great success had attended the opening up by the Indian government of a direct trade route along the Baluch side of the Afghan border from Quetta to Seistan.

ARMY. The army of Persia continued in a rather unsatisfactory condition, although attempts were being made to realize the scheme of reorganization adopted in 1905. There is naturally a large proportion of mounted men in the service and a cossack brigade commanded by Russian officers consists of four cavalry regiments, an infantry battalion, and two four-gun batteries. There are irregular tribal cavalry numbering about 20,000 and a large force of irregular infantry. There were said to be 15 batteries whose armament varied from old-type Austrian guns to modern Schneider field pieces in a semi-regular organization. The peace strength of Persia was estimated at 115,000, exclusive of the regular cavalry. It was proposed during the year to reorganize the gendarmerie.

FINANCE AND GOVERNMENT. Under the Anglo-Russian convention the collection and expenditure of all revenues is under supervision by a European treasurer-general. No accurate statement of revenue can be given, as a large part is derived from taxes in kind. The burden of taxation falls heavily upon the lower classes. The expenditure regularly exceeds the receipts. The Russian loan of 1900

is for 22,500,000 rubles; of 1902, 10,000,000 rubles. British loan of 1911, £1,250,000. Floating debt, 104,870,000 krāns; annuities, 14,000,000 krāns. A further joint loan by Great Britain and Russia amounts to £500,000, £300,000 of which are to be applied to the gendarmerie.

The reigning monarch is Ahmed Shah Kajar (born 1898); regent, Abou'l Kassim Khan Nasr-el-Mulk. Heir-presumptive, Mohammed Hassan Mirza (born 1899), brother of the shah. Of actual government properly so-called there is none. The country is roamed by warring tribes who live by murder and rapine. The caravan routes are infested with brigands. The provincial governors have nominal but no actual control and no power to suppress feuds between tribal factions; the central government remains powerless to help them. Elections to the national council (Mejliss) were held (for the first time since its dissolution in December, 1911) in the autumn of 1913.

HISTORY

THE CABINET. The shooting of the British Captain Eckford in December, 1912, by lawless tribesmen gave weight to the arguments of the reactionaries, who claimed that a firm hand was needed to maintain order and who, therefore, set on foot a movement to place Saad-ed-Dowleh at the head of the government. Agitation against the ministry was still further stimulated by the fact that Bakhtiaris were able with impunity to insult Treasurer-General Mornard (a Belgian). The anti-ministerial propaganda at length resulted in the resignation of the cabinet and the formation of a new ministry in January, 1913, with Ala-es-Sultaneh as premier and with the influential Ain-ed-Dowleh in charge of the important department of the interior. From the first it was apparent that the new government was not disposed to resent foreign influence. In order to obtain financial assistance it made important concessions to Russian and British interests. In February the Persian Discount Bank (Russian) was authorized to construct a railway from Julfa to Tabriz, with a branch to Urmia and possibly to Kazvin, and to exploit mineral resources within a 40-mile zone on either side of the railway. Simultaneously it was announced that a British syndicate would construct a railway from Mohammerah, at the head of the Persian Gulf, to Khoremmabad. The announcement of these concessions was speedily followed by a decision of the British and Russian governments jointly to advance \$2,000,000 to Persia, in addition to a special British advance of \$500,000 for the gendarmerie at Fars. The British government further manifested its good will by withdrawing the British Indian troops hitherto maintained at Shiraz. The millennium was not at once ushered in, however. Russia remained in virtual possession of the northern provinces, with garrisons aggregating 17,500 men; in the south the British were demanding protection against turbulent tribes and brigands had captured a large rug caravan on the road from Kirman to Bender Abbas. The pretender, Salar-ed-Dowleh seemed to be the cause of continual turmoil. Nationalists were lending energetic support to Sardar Assad's propaganda in favor of a new Mejliss (Parliament). Moreover,

there was open criticism of the recent concessions, and Foreign Minister Vosuk-ed-Dowleh sought to avert a cabinet crisis by resigning in May. The ministry did survive, but lost one of its most influential members when Ain-ed-Dowleh resigned the portfolio of the interior. In the collection of taxes serious obstacles were encountered, especially in the province of Azerbaijan, where Persian treasury officials were arrested and the Belgian treasury agent, failing to find favor with the Russian authorities, and thwarted in all his activities by the governor-general, Shuja-ed-Dowleh, resigned in despair.

THE GENDARMERIE. Brighter prospects for the future were promised by the gendarmerie. Half of the two-million-dollar loan was devoted to the organization of the gendarmerie. By the end of the year there was under the direction of 34 Swedish military officers a force of 6000 gendarmes (of which 2000 were mounted), available for the patrolling of the trade route from Enzeli (on the Caspian) through Karbin, Teheran, Ispahan, and Shiraz to Bushire on the Persian Gulf, and the route from Kirman to Bender Abbas. The work of the new police was propitiously begun by a victory in September over a band of cattle-raiding Lurs at Burujird (near Sultanabad, between Kirman and Bender Abbas). With a loss of only 3 men the body of gendarmes succeeded in capturing 33 and killing 70 of the Lurs. In November the gendarmerie registered another success in the neighborhood of Kazerun on the Shiraz-Bushire route. These successes were only to a slight extent counteracted by natural misunderstandings between the Swedish officers and the natives. An unfortunate incident occurred at Teheran in August, when an officer of the gendarmes had 2 Bakhtiari shot; but the result was not altogether undesirable. In a street fight on August 7 the gendarmes used their Maxims and machine-guns to such advantage that the truculent Bakhtiari *sowars* were completely cowed. The Bakhtiari in Teheran had been guilty of repeated breaches of law and order, and it was therefore with a feeling of relief that the city saw over half of the 700 *sowars* sent back to the Bakhtiari country. In addition to the gendarmerie the government planned to raise a force of 1000 regulars, to be commanded by the American Colonel Merrill and to assist the governor-general of Fars in pacifying the restless tribes of the south. For the maintenance of this force Great Britain advanced \$500,000 to the Persian government.

SALAR-ED-DOWLEH. Salar-ed-Dowleh, the ex-Shah's half-brother, was reported in January to be in command of an insurrectionary force somewhere between Meshed and Teheran. In March the government attempted to conciliate him by giving him an appointment as governor general of Ghilan. The experiment failed, however. In June he was taken in custody by a Persian cossack force, but escaped in July and fled towards the Turkish frontier. Finally he was cornered at Kermanshak, where he took refuge in the Russian consulate. Anxious to eliminate his disturbing personality from Persian politics the Persian government agreed to pay Salar-ed-Dowleh an annual pension of 10,000 toman (about \$9000) if he would take up his residence in Switzerland.

RETURN OF THE REGENT. The "regent who refused to govern" at last decided, after a conference in Paris with Minister Vosukh-ed-Dowleh and Mustaufi-el-Mamelik, that his presence was needed in Persia. Soon after his return, which took place in September, ex-Minister Ain-ed-Dowleh was reconciled and consented again to assume the portfolio of the interior. Ahmed Shah Kajar was not to ascend the throne until his next birthday; meantime he was to learn the art of ruling from Regent Nasr-el-Mulk. The agitation for the election of a new Mejlis was opposed in Azerbaijan by Governor-General Shuja-ed-Dowleh; but late in December it was reported that elsewhere the order for parliamentary elections had been issued.

THE BOUNDARY DISPUTE. The boundary dispute has caused constant irritation in Turco-Persian relations ever since the failure of the first boundary commission of 1850 to establish a definitive frontier between Turkey and Persia in accordance with the provisions of the Treaty of Erzeroum. At the instance of Great Britain and Russia a delimitation commission was nominated in 1913 and was expected to begin work in 1914. In the north and in the south Turkish encroachments impinged upon Russian and British, as well as Persian, interests. It was therefore anticipated that in these regions Persia would be favored, whereas Turkey would be compensated in the region of the Zohab oil fields.

PERU. A South American republic, on the Pacific coast, south of Ecuador and Colombia. The capital is Lima.

AREA AND POPULATION. There are boundary disputes with Ecuador and Columbia, and accordingly the territorial extent of Peru cannot be definitely stated. The disputed country includes a large rubber and timber area in the region of the upper Amazon. In his message to the congress, July 28, 1913, the president stated that the Peru-Bolivia boundary survey was being satisfactorily carried on, that a protocol arranging for the delimitation of the Peru-Brazil boundary was signed in the preceding April that the Peru-Colombia dispute would be settled by arbitration, and that negotiations were in progress for the settlement of the boundary dispute with Ecuador. The area of Peru given by the Lima Geographical Society is 1,769,804 square kilometers (683,335 square miles). This figure does not include the area of Tacna department, which appears to be definitely attached to Chile. The number of inhabitants, which in 1896 was estimated at 4,559,550, is not known with even approximate accuracy. It seems probable that the present number is less than the 1896 estimate. About one-half of the population is Indian, and most of the remainder mestizo. The larger towns, with estimated population, are: Lima, 150,000; Arequipa, 35,000; Callao, 34,500; Cuzco, 30,000; Ayacucho, 20,000; Iquitos, 20,000.

EDUCATION. Illiteracy is prevalent, and, although primary instruction is nominally compulsory, a large proportion of the children do not attend school. For 1911, there were reported 2152 public primary schools, with 146,400. The number of children who should have been in attendance at these schools is stated at 407,987. In 1911, there were 27 national

"colleges," with 4674 students enrolled, of whom 2077 were in the preparatory and 2597 in the higher courses. There are universities at Lima, Cuzco, Arequipa, and Trujillo. The state religion is Roman Catholicism, and the public exercise of any other religious form is prohibited.

PRODUCTION AND COMMERCE. The mineral deposits of Peru have been its chief source of wealth. The principal metals mined are copper and silver; to some extent gold, lead, coal, and petroleum are exploited. Copper production in 1912 is reported at 27,400 long tons, against 26,000 in 1911. The agricultural products include sugar-cane, cotton, rice, coffee, cacao, wheat, and corn. Some coca is produced, and large quantities of rubber are gathered in the northeastern districts. The production of wool, from sheep, alpacas, and llamas, is a growing industry. Manufactures are not largely developed.

Imports and exports are reported as follows, in soles (the sol is one tenth of the Peruvian pound):

	1909	1910	1911	1912
Imports..	42,986,270	49,806,970	54,382,500	51,676,860
Exports..	64,926,700	70,740,760	74,160,280	94,385,810

The principal imports are cotton and woolen goods, machinery and metal wares, and food-stuffs. Principal exports in 1909 and 1912 respectively, in thousands of soles: Minerals and metals, 16,380 and 22,120; sugar, 11,600 and 14,070; rubber, 11,370 and 12,790; cotton, 12,460 and 11,050; petroleum, 1520 and 7550; wool, 3940 and 3850; spirits, 3790 and 3790; guano, 1550 and 1810; hides and skins, 1240 in 1912. In 1911 the United Kingdom sent imports valued at 17,201,330 soles and received exports 22,466,990 soles; United States, 12,489,520 and 20,962,960; Germany, 9,459,070 and 5,784,950; France, 2,895,430 and 3,914,390; Belgium, 3,339,820 and 1,017,800; Chile, 769,960 and 13,426,700. At the port of Callao, there entered in 1912, 562 vessels, of 1,387,919 tons (steam, 479, of 1,279,588 tons).

COMMUNICATIONS. The length of railway in operation in September, 1912, was 2766 kilometers (1719 miles). Several extensions and new lines have been surveyed, and on some of them construction was in progress in 1912 and 1913. Telegraphs in 1912: offices 317; line, 15,000 km.; wire, 57,000 km. There is a system of wireless telegraphy, whose development continued in 1913. Post offices in 1912, 781.

FINANCE. Peru is a gold-standard country. The monetary unit is the libra, or pound, equivalent to the British pound sterling (\$4.86656); it is divided into 10 soles. In 1910, revenue and expenditure amounted to 27,957,750 and 26,853,220 soles respectively; in 1912, 34,424,580 and 37,204,050. The 1914 budget showed an estimated revenue of 35,478,360 soles, and an estimated expenditure of 31,098,360 soles. The estimated receipts were: Customs, 15,051,120 soles; taxes, 7,304,280; monopolies, 7,407,280; posts and telegraphs, 1,667,200; miscellaneous, 4,048,480; total, 35,478,360. Estimated disbursements: Finance and commerce, 8,882,240; war and marine, 8,323,860; administration, 5,106,130; justice and instruction, 4,813,450; public works, 2,005,110; legislative, 1,079,430; foreign affairs, 888,140;

total, 31,098,360. The public debt recognized by the government January 1, 1913, is reported at £4,023,006.

ARMY. The reorganization of the Peruvian army has been under the direction of French officers. Military service is obligatory between the ages of 20 and 50, but in actual practice the regular army is recruited by voluntary enlistment, the recruits serving two years with the colors and seven years in reserve, while the remaining time of liability is spent in the second reserve, and national guard. The peace strength of the forces is about 8000, with about 24,000 fully trained capable of serving in the first line on a war basis, while the reserves number about 100,000 and are more or less untrained. The organization consists of six battalions of infantry, eight squadrons of cavalry, six field batteries with Schneider guns, a battalion of foot artillery, and 14 mounted batteries.

GOVERNMENT. The Congress consists of the Senate (52 members) and the House of Representatives (116 members), all members being elected by direct vote. The president and the two vice-presidents are elected for four years by direct vote. The president is ineligible for the following term. Responsible to him are the members of his cabinet, six in number. On September 24, 1912, Augusto B. Leguia was succeeded as president by Guillermo Billinghurst, for the four-year term; first vice-president Roberto Leguia. Early in 1914, as the result of a brief revolutionary movement in Lima, President Billinghurst was deposed, imprisoned, and finally expelled from the country.

HISTORY

THE MINISTRY. Three cabinet crises were caused by questions of financial, military, and religious policy. Sr. Elias Malpartida's cabinet was overthrown by a vote of censure in the Senate. Don Aurelio Souza then formed a ministry in which Francisco T. Varela had charge of foreign affairs; Sr. Muro, justice; Rear-admiral Carbajal, war; Don José Balta, finance; and Castro Iglesias, fomento (public works and worship). In the latter part of July the Souza cabinet went the way of its predecessor, and General Enrique became president of the council and minister of war. Francisco T. Varela was retained as minister of foreign affairs, and Col. Gonzalo Terado was appointed minister of the interior; Baldamero Maldonado, finance; Col. Pedro Portillo, fomento; Carlos Paz Soldan, justice. The third crisis occurred in October when two of the ministers resigned because of the president's refusal to call an extra session of Congress.

CONGRESS. The regular opening of the congressional session on July 28 was attended by disorders in Lima, during the course of which a bomb was thrown at the house of Sr. Villanueva, president of the Senate, and an attack was made on the home of ex-President Leguia. Sr. Leguia was subsequently reported to be in Boston, U. S. A.; according to current rumors, he and his son had been exiled by President Billinghurst. In the last week of November a handbill purporting to have been written by ex-President Leguia at Panama was published in *La Nación*. The writer made furious attacks on President

Billingshurst and subjected the latter's foreign policy to scathing sarcasm. The president's message read before Congress on July 28 called attention to the fact that the Bolivian boundary was being surveyed, that a protocol had been signed with Brazil in April for the delimitation of the boundary, that an exchange of students with Cuba had been arranged, and that the treaty of commerce signed with Germany in August, 1912, awaited congressional ratification.—The President also recommended the authorization of a loan of \$28,500,000, although the budget, as presented, showed a balance of over two million dollars. A tax-collecting company had signed a contract with the government on February 25 for the collection (in behalf of the state) of the excise tax on alcohol, sugar, matches, and the stamp, registration, chattel, sealed paper, transfer, mines, customs-paper, cornerstone, and port taxes. Three of the nine directors of the company were appointed by the government. A revision of the customs tariff had also been accomplished, permitting the free importation of mining and agricultural machinery.

An important constitutional amendment was passed by the Chamber of Deputies on October 3 by a vote of 64-4, having previously been approved by the Senate. The amendment so modified article iv. of the constitution as to permit the building of Protestant churches and mission schools. It will be recalled that hitherto the public service of any religion other than Catholic Christianity had been legally prohibited, but tolerated in practice. The marriage of non-Catholics had been legalized by the acts of 1897 and 1903. The Protestant missionaries were not content with toleration, however, and conducted an agitation of which the present measure is a result. At first some of the Catholic clergy were inclined to protest; they encountered powerful opposition, however, and accepted the amendment with good grace. Another interesting sidelight on the religious situation was afforded by the passage of a law which provided that the Bible shall be studied regularly in the first to fifth years of public school instruction.

MISCELLANEOUS. On July 11 a decree was issued to create a national school of aviation; the sum of \$27,150 was appropriated for this purpose. The temperance movement received a great impetus from a decree of President Billingshurst ordaining the use of an anti-alcoholic text-book in the public schools. As an experiment in town-planning the government purchased a tract of land in the Malambo district near the capital for the construction of 40 model houses for workingmen. Dr. Guillermo Romero was appointed to revise the mining-code.

On November 7, a severe earthquake destroyed the town of Abancay, in the centre of the volcanic region of Peru. Probably 300 lives were lost at Abancay out of a population of 3000, and 250 casualties were reported from the city of Chalhuanca.

FOREIGN RELATIONS. On April 30 a new protocol was signed at Rio de Janeiro to provide for the delimitation of the boundary between Peru and Brazil by a mixed commission. The location of the Bolivian boundary was rendered especially troublesome by the value of the rubber-lands in question and the difficulty

of surveying in densely-forested regions; nevertheless the boundary commissions agreed without trouble on a provisional boundary. As a result of the visit of Hon. Robert Bacon to Lima, in the interests of the Carnegie endowment, a Peruvian institute of international law was formed to act in conjunction with the institutes already existing in many American countries on questions concerning the politics and general welfare of Pan-American interests.

THE PUTUMAYO ATROCITIES. In the spring of 1913 a select committee of the British House of Commons investigated the alleged cruelty of the administration of the rubber industry in the Putumayo district of Peru. The report of the commission was issued as *White Paper 148* on June 9. The commission held that Señor Arana, together with his partners, was responsible for the atrocities committed by his agents. The British directors of the Peruvian Amazon Company were severely censured for culpable negligence in the matter of labor conditions, but no evidence was found that they had made themselves individually parties to any overt act which would expose them to prosecution. The committee recommended an extension of the British law to cover similar cases which might arise in the future.

As a result of the investigation carried on by the government of Peru, thirty-two warrants were issued for the arrest of persons suspected of complicity in the oppression of the native rubber workers. Referring to the matter in his message to Congress on July 28, President Billingshurst said, "Everything possible is being done to bring the blessings of civilization and Christianity to the savages of Putumayo, and in the cause of justice care has been taken to appoint men of ability and integrity to judicial and administrative posts there. Results obtained to date have been highly satisfactory, and the reports and rumors which so adversely affected the prestige of the nation have disappeared forever."

Nevertheless the scandals of the rubber industry were revived in November, this time implicating Brazil and Colombia as well as Peru. On November 15 the Anti-Slavery Society informed the British government that the oppression of native laborers was not confined to the Putumayo region, but existed also in Bolivian and Brazilian rubber districts along the upper Amazon. Men, women, and children were kidnaped, bought and sold, and shamefully beaten, it was charged. Action on these allegations was delayed, however, possibly for diplomatic reasons. See **BRAZIL**, **CHILE**, and **ECUADOR**.

PETROLEUM. The increased production of petroleum which characterized the industry in recent years continued in 1912, when the total in barrels of 42 gallons each reached 222,113,218, compared with 220,449,391 barrels in 1911. Except in California, higher prices prevailed than in 1911 and even in the latter State there was no considerable decline. The average price per barrel in 1912 was nearly \$.74, as compared with about \$.61 in 1911. The total value of the product in 1912 was therefore \$163,802,334, or 22.2 per cent. above the value for 1911. California continued to hold first place in the production of petroleum, and the quantity produced in 1912 was 864,450,767 barrels, compared with 81,134,391 bar-

rels in 1911. Oklahoma was second in the production, with 51,427,071 barrels in 1912, compared with 56,069,637 barrels in 1911. Illinois with third rank produced in 1912 28,601,308 barrels, compared with 31,317,038 barrels in 1911. These three States furnished over

three-fourths of the production. In 1912 West Virginia displaced Louisiana as the fourth producer, and Texas advanced from sixth to fifth place. The quantity and value of the petroleum produced in 1911-1912, and the average price per barrel is shown in the following table:

TOTAL QUANTITY AND VALUE OF PETROLEUM PRODUCED IN THE UNITED STATES AND THE AVERAGE PRICE PER BARREL IN 1911 AND 1912, BY STATES, IN BARRELS							
State	1911			1912			Average price per barrel
	Quantity	Value	Average price per barrel	Quantity	Value	Average price per barrel	
California	81,134,391	\$38,719,080	\$0.477	86,450,767	\$39,213,588	\$0.454	
Colorado	228,928	228,104	1.005	206,052	199,661	.973

a Included in Ohio.

b Includes Michigan.

The petroleum producing area of the United States is divided into six chief fields. The Appalachian, the Lima-Indiana, the Illinois, the Mid-Continent, the Gulf, and the California fields. Of these, the Lima-Indiana, the Illinois, the Mid-Continent, and the Gulf fields show a decrease in 1912 over the production of 1911. The Appalachian fields, and the California fields are the only fields showing an increase. The total number of wells completed in 1912 was 17,178, compared with 13,768 in 1911. Of the total for 1912, 11,512 were oil wells, 1811 were gas wells and 2855 were dry. The yearly increase in petroleum during each year of the twentieth century was maintained in 1913. The amount produced in that year according to the estimates of the United States Geological Survey exceeded 240,000,000 barrels. The rate of increase at the end of the year was greater than at the beginning. The production of Colorado increased at least 10,000,000 barrels over 1912, reaching a production of almost 100,000,000 barrels. Oklahoma also showed an increase as did Texas, Louisiana, and Wyoming. Other States generally showed a decline, which was greatest in Illinois. The entire mid-continent field showed an increase with a record total output.

FUEL OILS. Of the total production of 222,113,418 barrels of fuel petroleum in 1912, about 85,000,000 barrels or over one-third were burned as fuel for power purposes. Railroads consumed 33,605,598 barrels in 1912, an increase over the amount consumed in 1911 of nearly

13 per cent. The number of miles of railroad operated by the use of oil, however, declined from 30,039 in 1911 to 28,451 in 1912. The decrease in the number of miles operated was due to the return of a few railroads to coal. Considerable quantity of oil was used in the production of power for industrial purposes. This was especially true on the Pacific Coast.

On the western coast of the United States oil had been adopted almost exclusively for vessels of the coastwise trade, and this use might be expected to extend to the east coast with the opening of the Panama Canal. The United States government definitely abandoned the use of coal in future designs of its battle-ships. All new destroyers, submarines, and battleships are designed for oil burning. About 100 square miles of oil producing lands in the Elk Hills and Buena Vista fields of California were set aside by the government as navy petroleum reserves. Storage for oil for naval purposes is provided in many cities of the United States and in Cuba and Hawaii.

WORLD PRODUCTION. Russia ranked next to the United States as a producer of petroleum. The production increased in 1912 to 68,119,268 barrels, compared to 66,183,691 barrels in 1911. The production in Rumania also increased in 1912. There were produced in that country 12,991,913 barrels, an increase of 17 per cent. over the production of 1911. The following table shows the world production of petroleum in 1908-1912:

WORLD'S PRODUCTION OF CRUDE PETROLEUM, 1908-12, BY COUNTRIES, IN BARRELS AND METRIC TONS								
Country	1908	1909	1910	1911	Rank	1912 Barrels	Metric tons	Per- centage of total produc- tion

PHARMACY, SCHOOLS OF. See UNIVERSITIES AND COLLEGES.

PHELPS, CHARLES. An American surgeon, died December 30, 1913. Born in Milford, Mass., in 1834, and graduated from Brown University in 1855, he took his degree from the College of Physicians and Surgeons, New York, in 1855. During the Civil War he served as volunteer surgeon, and afterwards began the practice of medicine in New York City. He was several times president of the New York State Medical Association, and was president of the Bellevue Medical Hospital. He was surgeon of many other hospitals in New York City. He was the author of *Traumatic Injuries of the Brain* (1890), and various monographs on surgical subjects.

PHILIPPINE ISLANDS. AGRICULTURE. Agricultural conditions during 1913 were for the most part good. The rice crop during the fiscal year ended June 30, 1913, was one of the largest ever harvested and was fully 100 per cent. greater than the crop for the previous year. As a result of this unusually large crop, importations of rice decreased to the value of about \$2,500,000. Conditions in regard to sugar were not so favorable. Sugar exports for the year increased approximately 30,000,000 kilos, although there was a decrease of nearly \$1,000,000 in value owing to the low grade and low prices. The copra crop suffered severely from two causes. First, the unusual drought of the previous year, and second, the severe typhoons which occurred throughout the copra districts. The tobacco crop was slightly greater than in 1912, and planters on the islands are beginning to give more attention to modern methods of growing and curing tobacco. The exportation of cigars increased from 175,000,000 in 1912 to 207,000,000 in 1913, while the exportation of leaf and miscellaneous tobacco also increased. The total exports of tobacco for the fiscal year amounted to \$5,350,000. The exportation of abaca (hemp) was the largest in the history of the industry, owing to the unusual high price of the product. Although six per cent. less was exported than in the previous year, its value was over 41 per cent. more. The total exports amounted to more than \$23,000,000. In many parts of the islands there is a tendency to give more attention to crops other than those which have heretofore composed the great bulk of the export. The agricultural bank which was opened for business on October 1, 1908, had made by the fiscal year 1913 390 loans amounting to \$880,126. Of these loans, 122 were for amounts of not more than \$500; 155 for amounts between \$500 and \$2500; 56 for amounts between \$2500 and \$5000; 39 for amounts between \$5000 and \$10,000; and 18 between \$10,000 and \$17,500.

The increase in the business of the bank during the year was very noticeable. Loans made amounted to \$514,375, compared with \$403,673 in 1912.

COMMERCE. The total value of foreign commerce for the fiscal year 1913 amounted to \$110,010,859, as compared with \$104,869,811 for the previous year. There was during the year continued development in the commercial activities of the islands. Imports amounted to \$56,327,533 and exports to \$53,683,526, as compared with \$50,319,836 for the previous year. Of the total commerce of the islands, 41 per cent. was with the United States. Hemp occupied first place among exported articles in which it was forced last year by copra. As noted above, the value of hemp exported was greater than ever before. Shipments of sugar were also larger during 1913 than ever before.

TRANSPORTATION. The total length of railroad lines authorized by law constructed in the Philippine Islands is 1793 kilometers. Of this in 1913, 1050 had been constructed and put in operation, 88 constructed and not in operation, leaving 655 to be constructed. Progress was made during the year on the Baguio branch of the Manila railroad and the equipment ordered was expected during 1914. The branch was 24 miles in length and was under construction by a force of about 3500. The line included three tunnels and 123 bridges. Eight miles of the road involved a rack track. On June 30 four miles of track had been laid and the roadway had been completed for seven miles at either end.

IMMIGRATION AND EMIGRATION. During the year 1913 18,365 persons sought admission to the islands, as compared with 15,198 in the previous year; and 21,436, as compared with 19,606 for 1912, departed from the islands. Of the number who entered, 4408 were immigrants, and those who departed 768 were emigrants.

POSTS AND TELEGRAPHS. The number of post offices in operation was increased from 587 on June 30, 1912, to 590 on June 30, 1913. Forty-two additional municipalities were provided with free delivery letter carrier service, making a total of 439 municipalities outside of the city of Manila in which such service is rendered.

The metric system of weights and measures was adopted for the Philippine Postal Service, taking effect January 1, 1913. Money order service was established at 22 additional offices, making a total of 275 money order offices in the Philippine Islands on June 30, 1913. The postal bureau handled a total of 687,307 telegrams during the year. On June 30, 1913, the total kilometers and the number of telegraph offices in operation was 290. Several new wireless stations were also constructed and opened

during the year. At the close of the year there were 437 postal savings banks in operation, and the number of accounts was 39,000. Of the total number of depositors, 32,906 were Filipinos. The amount of deposit was \$1,240,241.

EDUCATION. The standard of English instruction was raised materially during the year, and the campaign for better school buildings and grounds was vigorously continued with successful results. The number of Filipino teachers on duty at the close of the school year was 7013. This force showed great advancement in their average attainments and ability to teach. Filipinos are being assigned to positions of greater responsibility as rapidly as possible. The total number of school houses classed as permanent, in use during the year, was 592. During the year 440,995 pupils were enrolled with a daily attendance of 287,995. A new building was occupied by the Philippine Normal School at Manila during the year. Of those who graduated from this school during the last three years, 97 per cent. have entered the teaching service. The Philippine Arts and Trades School has steadily increased in popularity, and it has been necessary to turn away a number of candidates for admission. The School of Commerce also shows continued progress in the number and character of pupils admitted. The School of Household Industries completed the first year of its existence in 1913. Its purpose is to train adult women in certain selected home industries, particularly in embroidery and lace-making. The attendance is approximately 120 women.

PUBLIC WORKS. The Bureau of Public Works has charge of public works in the Christian provinces. These projects include the erection of buildings, roads, and bridges, the building and supervision of building of irrigation systems, the drilling of artesian wells or construction of other water supply systems, river control, sewerage systems, and power plants. The bureau maintains and operates all government and automobile lines, and is charged with the enforcement of the automobile law. During 1913 257 kilometers of first-class roadways were constructed, making a total of 2097 kilometers of first-class roads in the islands, not including Manila, Moro Provinces, except Benguet. During the year \$1,145,000 was spent in construction, and \$790,000 was spent in the maintenance of existing roads. The principal buildings constructed during the year by the administration was a University Hall in Manila. This was built of reinforced concrete at a cost of \$125,897.

FINANCE. The total bonded indebtedness in the municipal governments of the Philippine Islands at the close of the fiscal year 1913 was \$16,125,000, composed of Friar Land bonds, \$7,000,000, public works construction bonds, \$4,000,000, and City of Cebu bonds, \$125,000. The total amount of currency circulation in the islands on June 30, 1913, was \$26,017,104.

PUBLIC HEALTH AND SANITATION. The public health during the year was in the main excellent. The only untoward event was the outbreak just before the beginning of the year and continuing through the first six months of cases of bubonic plague, from which the country had been free since 1906. For the first time in many years there was no record of a case of cholera on the islands. Beriberri con-

tinued to be practically non-existent wherever the use of unpolished rice can be enforced. The general sanitation of the islands continued to improve during the year, though everywhere the need of sanitary improvements, education, and inspection is much greater than can be met with the funds available. No serious epidemic occurred during the year in any part of the islands. The legislature of 1913 made appropriation for opening the Southern Islands Hospital, which had been ready for nearly a year but had not been used on account of failure of appropriation.

USE OF THE ENGLISH LANGUAGE. On June 1, 1913, the English language replaced the Spanish as the official language of the courts, but the legislature adopted an amendment by which, while the English language remains the primary official language of the courts, Spanish remains to a certain extent an official language until January 1, 1920.

MILITARY OPERATIONS. In June trouble with the Moros on the island of Jolo or Sulu, resulted in a fierce battle between the United States troops and the natives. General Pershing who commanded the American troops declared in his dispatch there had been no fiercer fight since the American occupation. The island of Jolo is six or seven hundred miles from Manila, and its inhabitants differ entirely in characteristics from the civilized Filipinos. They are Mohammedans, fanatics, and fierce fighters. These Moros live not only in Jolo, but in the island of Mindanao in the northeast. In both islands the Americans have labored to advance the natives in commerce and civilization. In spite of these efforts hostility still continues to exist on the island of Jolo. General Pershing believed that to secure permanent peace in the mountain and island district, it was essential that these Moros should be disarmed. Some of the tribe resented this and entrenched themselves in the mountains. A long period of campaigning followed and came to its climax when the American troops, by fierce fighting, captured the main entrenchment of the natives on June 12. The loss of the Moros is not known, but it was great, and it is probable that few escaped alive. The American loss was 14 killed, and 25 wounded, including Captain Taylor A. Nichols.

In a dispatch sent to the War Department, Governor Forbes said that General Pershing had exhausted all the virtues of patience before attacking the rebels and that their punishment was required in the interest of good government. In reply to a request from the Secretary of War, Major General J. Franklin Bell, commanding the forces in the islands, also made a report. He said that the total number of Moros who had refused to give up their arms was between 5000 and 10,000, and that they were persecuting other Moros who had submitted. He highly commended General Pershing in the latter's management of the affair.

CHANGES IN THE GOVERNMENT. The inauguration of a Democratic administration foreshadowed the change of the higher administrative officers of the islands. The Democratic platform of 1912 pledged the independence of the Filipinos at a much earlier period than the Filipinos had been able to anticipate under President Taft's administration, and soon after Congress convened in 1913, a bill was intro-

duced by Representative Jones of Virginia, which provided for a prompt withdrawal of American authority in the Philippines. This bill provided in general that preparations for the withdrawal should begin at once, and that an independent republic of the Philippines should be established on July 1, 1921. No effort was made to show that President Wilson was in sympathy with this bill.

On September 2 President Wilson appointed Francis Burton Harrison governor-general, to succeed W. Cameron Forbes. Mr. Burton arrived at Manila on October 6. He was greeted there with a great demonstration. Soon after his landing, Mr. Harrison delivered an address. The significant portion which was considered a message of President Wilson to the people of the Philippines, was as follows: "We regard ourselves as trustees acting not for the advantage of the United States, but for the benefit of the people of the Philippine Islands. Every step we take will be taken with a view to the ultimate independence of the islands and as a preparation for that independence; and we hope to move toward that end as rapidly as the safety and the permanent interests of the islands will permit. After each step taken, experience will guide us to the next. The administration will take one step at once. It will give to the native citizens of the islands a majority in the appointive commission, and thus in the upper as well as in the lower house of the legislature. It will do this in the confident hope and expectation that immediate proof will thereby be given, in the action of the commission under the new arrangement, of the political capacity of those native citizens who have already come forward to represent and lead their people in affairs."

This assertion relating to the members of the commission foreshadowed the most radical change in the history of the administration of the islands in many years. Heretofore, the governor-general, with eight associates, constituted the Philippine commission. These members are appointed by the President and their work comes under the direction of the Secretary of War through the bureau of insular affairs. The Philippine commission at first consisted entirely of Americans. A few years ago one Filipino was appointed and subsequently one or two more, the majority remaining American. Each member of the commission is executive head of a department of the Philippine government, and the commission as a whole forms the upper chamber or Senate of the legislature. Governor Harrison acted on this promise, and appointed a sufficient number of active members of the commission to give to the Philippines a majority of the membership. The members appointed were the following: Rafael Palma, Jaime C. de Veyra, Vincente Ilustre, Vincente Singsong. The first of these was appointed secretary of finance and justice. At the same time other changes among the officials of the islands were made. Manuel Tinio succeeded Captain Charles H. Sleeper as director of the bureau of lands. In the bureau of internal revenue, 37 of the 85 American collectors employed were displaced by natives. Stephen Bonsal, the well-known correspondent and traveler, was appointed assistant executive secretary to succeed Thomas C. Welch. The chief administrative officers at the end of the year were as follows: Governor-general and president of

the commission, Francis Burton Harrison; secretary of the interior and member of the commission, Winfred T. Denison; secretary of commerce and police and member of the commission, Clinton L. Riggs.

LEGISLATURE. The first regular session of the third Philippine legislature began October 16, 1912, and ended February 3, 1913. A special session was convened at Manila in accordance with a proclamation of the governor-general and continued in session until February 11. The legislature failed, as it had the previous year, to pass the appropriation bill for current expenses of the government for the fiscal year 1914, so that it was necessary to pay the expenses of the government in accordance with the provisions of section 7 of the organic act. The only important legislation passed by Congress affecting the islands is contained in the tariff bill, approved October 3, 1913. This law affected the exportation of sugar, rice, and tobacco. It made the following changes in the previous law governing trade between the United States and the Philippine Islands:

1. The limit in the amount of sugar and tobacco authorized to enter the United States free of duty was removed, and these two products will hereafter enter the United States free of duty, without limit as to quantity.

The provision excepting rice produced in the Philippines or in the United States from free entry into the United States or the Philippines, respectively, was repealed. This is unimportant, as there is no tendency to ship rice either way, but it strikes from the law an irritating exception to the general rule.

2. The provision in the preceding tariff laws that goods entitled to free entry to the United States coming from the Philippine Islands, and *vice versa*, must come as a direct shipment has been changed in the present law to provide that they may be shipped on a through bill of lading. The effect of this will be to allow transshipments en route either way.

3. The tariff act of 1909 provided that a Philippine product, fulfilling all other conditions for free entry, should be admitted free of duty into the United States, if it did not contain foreign material to more than 20 per cent. of its total value. This 20 per cent. limit was inserted to protect the American tobacco industry.

It was hoped, in the revision of the tariff, that, while this 20 per cent. limit would be continued in the case of manufactures of tobacco, it would be increased to 50 per cent. for all other Philippine products. This would have given a much desired stimulus to the embroidery and lace industry in the islands which through the schools is being developed. There does not appear to have been any serious objection to making this change, but, although the bill as it passed the House contained this *proviso*, it was impossible to secure its adoption in the great rush of other matters confronting the conference committee. The effect, therefore, is to retain the provision of the old law in this respect.

The tariff bill affected existing Philippine legislation in other respects as follows:

1. All export duties on products shipped from the Philippine Islands were abolished regardless of the destination of the goods.

The importance of this legislation to the

American trade is in the fact that it deprives the American manufacturer of Philippine products, principally Manila hemp, of the differential granted him formerly by the fact that he was exempted from the payment of export tax on hemp, whereas the foreign manufacturer of Manila hemp was required to pay this export tax. It has the effect of relieving the Philippine producer of an annual tax of approximately \$1,500,000, \$1,000,000 of which accrued to the treasury of the Philippine Islands, and \$500,000 to the benefit of the consumer of hemp in the United States.

2. The provisions of former laws that all internal revenue collected in, or for account of the Philippine Islands, should accrue intact to the general government thereof and be paid into the insular treasury are continued, but the requirement that such revenues should be allotted and paid out by the Philippine commission until action by the Philippine legislature, approved by Congress, was stricken out.

This has the effect of giving to the Philippine legislature the same authority over these funds as over other revenues of that government.

3. The income-tax provisions of the present law were extended to the Philippine Islands, with the proviso that it should be collected in the Philippine Islands by their own internal revenue officers and accrue intact to the Philippine government.

SLAVERY AND AGITATION. As a result of charges of practical slavery in the islands, proceeding from different sources, including Dean C. Worcester, former secretary of the interior of the islands, the Senate on May 1 passed a resolution requesting the secretary of war to furnish any information that might bear on the truth of the charge that human slavery exists in the islands and that human beings are bought and sold as chattels. Mr. Worcester later submitted a report to the Secretary of War, designed to justify the position which he had taken. In this he alleged the existence of slavery peonage, and the barter of human beings in the islands. He alleged further that such conditions had existed for a number of years and that his efforts to bring about correction had not met the support to which he felt they were entitled. As a result of these charges, the Philippine legislature passed measures designed to put an end to such conditions as might exist.

PHILOLOGY, CLASSICAL. An important event, from a pedagogical point of view, and, in the opinion of many, from a scientific standpoint, also, was the completion of the report of the joint committee on grammatical nomenclature (see the *YEAR BOOK* for 1911, 1912). This report has had the approval, though, in some cases, without adequate discussion of its merits, of the National Council of Teachers of English, the Modern Language Association of America, and the American Philological Association. The report gives, in twelve pages, uniform grammatical terms to be used in the teaching of English, French, German, Greek, and Latin; fifty pages are devoted to discussion and illustration of these terms.

The Loeb Classical Library (see *YEAR BOOK* for 1911, 1912) was continued by the addition e.g. of translations of Petronius and the *Apocolocyntosis* of Seneca (in one volume), part of Lucian, part of Julian the Emperor, and Quintus Smyrnaeus, *The Fall of Troy*. The Oxford

Library of Translations was also extended; e.g. the excellent translation of Aristotle's works was carried further. Of special interest is a good translation of Varro's *Rerum Rusticarum Libri Tres*, under the title, *Varro on Farming*, by Lloyd Storr-Best (London, 1912). A less trustworthy translation of Varro is to be found in *Roman Farm Management: The Treatises of Cato and Varro done into English, with Notes of Modern Instances, By a Virginia Farmer* (New York).

Of the articles in periodicals, widely varied in scope, and for the most part highly technical or devoted to matters not of wide general interest, only a very few can find mention in this place. However, to indicate the tendencies of American classical scholarship, the articles which appeared in the leading American classical periodicals may be noted in some detail. In *The American Journal of Philology* appeared in opposition to the views of A. Gudeman, whose rejoinder was printed in the same volume, "The Dialogue of Tacitus," (a discussion of manuscript problems), W. Peterson; "Note on Satyrus, Life of Euripides, Oxyr. Pap. 9, 157-8," K. F. Smith (an article at once scholarly and entertaining, in which Professor Smith, *inter alia*, discusses the use of magic in affairs of the heart); "The Classical Origin and Tradition of Literary Conceits," (the conceits employed by the literary lover to praise the beauty of his lady are traced back to classical, and especially to Greek sources), M. B. Ogle; "Contributions to the Study of Homeric Metre," G. M. Bolling; "The Participial Usage in Cicero's Epistles," R. B. Steele; "Horace's View of the Relations between Satire and Comedy," H. R. Fairclough; "*Neve* and *Neque* with the Imperative and Subjunctive," E. B. Lease; "The Accusative of Exclamation in Epistolary Latin," R. C. Flickinger; "The Creation of the Tribe Ptolemais at Athens," A. C. Johnson. Under the caption "Brief Mention," Professor Gildersleeve discussed White's "The Verse of Greek Comedy," Wilamowitz's "Reden und Vorträge" and "Sappho und Simonides," and Humphreys's edition of Demosthenes's "De Corona." Three reviews deserve mention: By K. F. Smith, of "XAPITEZ Friedrich Leo zum Sechzigsten Geburtstag dargebracht" (part of the book deals with Roman elegiac poetry; there Professor Smith's review is of special value); by K. Prentice, of Drerup's "Das Fünfte Buch der Ilias. Grundlagen einer Homerischen Poetik" (Professor Prentice takes issue vigorously with the methods and the reasoning of the group of scholars who in recent years have maintained the unity of the Iliad and the Odyssey); by A. L. Wheeler, of Professor K. F. Smith's great edition of Tibullus (which was itself published in 1913).

From *Classical Philology* may be noted "Some Temporal Expressions in Suetonius," J. C. Rolfe; "The *Amphitruo* of Plautus," H. W. Prescott (an argument that in this play too Plautus "contaminated," that is, combined materials from two different plays, with the result that the play calls for a change of scene, a phenomenon rare in extant Greek and Roman dramas); "Preferred and Avoided Combinations of the Enclitic *Que* in Cicero," F. W. Shipley, a continuation of the author's studies in rhymical clausulae in Latin prose authors; "The Composition of the *Rudens* of Plautus,"

Cornelia C. Coulter (an argument that the Rudens also was "contaminated": see above); "The Interstate Use of the Greek Dialects," C. D. Buck; "Studies in Greek Noun Formation," E. H. Sturtevant; "Satura and Satire," B. L. Ullman (an interesting explanation of the puzzling term *Satura*, as a neuter plural adjective transformed into a feminine singular noun, and an examination of the occurrences of the word in Latin authors); "Homerica," W. A. Oldfather, a suggestive interpretation of certain terms in Homer; "Tragedy and the Satyric Drama," R. C. Flickinger; "The Vedic Path of the Gods and the Roman Pontifex," R. G. Kent (an interpretation of the Pontifex as the "Path-maker," the path being that between gods and men or between this world and the other); "The Assumed Duration of the War in the Iliad," John A. Scott; "The Future Periphrastic in Latin," R. B. Steele. Of the reviews one must be mentioned—a review, by several hands, of Gercke and Norden, "Einleitung in die Altertumswissenschaft."

In volume 43 of *The Transactions of the American Philological Association* we find the following papers, among others: "Are the Political 'Speeches' of Demosthenes to be regarded as Political Pamphlets?" C. D. Adams; "The Pronunciation of *cui* and *huic*," E. H. Sturtevant; "Parmenides' Indebtedness to the Pythagoreans," R. B. English; "On the Development of the Thank-Offering among the Greeks," J. W. Hewitt; "Officials Charged with the Conduct of Public Works in Roman and Byzantine Syria," K. Prentice; "Horace, Epistles, II., 1,139 ff. and Livy, VII., 2," C. Knapp; "The Development of Copulative Verbs in the Indo-European Languages," C. L. Meader (an interesting and valuable study of the substitutes and equivalents in various languages for such copulas as the English verb "to be" or the Latin *sum*; some of the Less Known MSS. of Xenophon's *Memorabilia*," W. W. Baker.

The Year's Work in Classical Studies, for 1912, gives control of the more important works in classical philology to the middle of the year 1912; the like volume for 1913 performs a similar service for the period ending June 30, 1913. Klusmann's *Bibliotheca Scriptorum Classicorum et Graecorum et Latinorum*, noticed in the last YEAR BOOK, was completed; it gives a list of works, books, and articles on both Latin and Greek authors from 1878-1896.

Of "Greek Inscriptions from Sardes," by Messrs. W. H. Buckler and D. M. Robinson, in *The American Journal of Archaeology*, noted in the last YEAR BOOK, two more installments have appeared; these deal with the honorific inscriptions. In the same periodical Professor Robinson has published "Inscriptions from the Cyrenaica," giving control of the inscriptional material found by the American excavators at Cyrene before their work was permanently interrupted by the Turco-Italian War. In *Publications of the Princeton University Archaeological Expeditions to Syria in 1904-5, and 1909, Division III.*, D. Magie, Jr., and D. R. Stuart deal with "Greek and Latin Inscriptions from South Syria." Volume 9, Fascicule 4, has appeared of *Ephemeris Epigraphica*, giving supplements to the great *Corpus Inscriptionum Graecarum*. Parts also of *Inscriptiones Graecae*, in an editio minor, under the supervision of the Royal Prussian Academy, have been published,

giving inscriptions from Attica, Arcadia, and Laconia. R. Cagnat, the well-known epigraphist, published *Melanges, Recueil des 25 Mémoires concernant l'épigraphie et les Antiquités Romaine*.

In palaeography far the most important work in English was E. M. Thompson's *An Introduction to Greek and Roman Palaeography* (1912), a sumptuous and richly illustrated revision of a work published by the author many years ago. A. W. Sitjhoff added volumes xvii. and xviii. to his incomparable collection of photographic facsimiles of Greek and Latin manuscripts, by publishing facsimiles of the "Codex Heinsianus (Leidensis 118)" of Cicero's *De Natura Deorum, De Divinatione, De Legibus* and of the "Codex Vossianus Quadratus" of Lucretius's *De Rerum Natura*. Two parts have appeared of volume i. of *Papyrusurkunde, Griechische, der Hamburger Stadtbibliothek*, edited by P. M. Meyer. To be specially named, also, are A. S. Hunt's edition, in the Oxford classical texts series, of *Tragicorum Graecorum Fragmenta Papyracea nuper reperta*; Gardthausen, *Griechische Palaeographie*, volume 2, 2d edition, dealing with *Die Schrift, Unterschriften und Chronologie im Altertum und in Byzantinischen Mittelalter*; Chroust, *Monumenta Palaeographica*, part 1; F. Preisigke, *Berichtungsliste der griechischen Papyrusurkunden aus Ägypten*, 1 Heft, and *Sammelbuch Griechischer Urkunden aus Ägypten*, 1 Heft; L. Mitteis and U. Wilcken, *Grundzüge und Chrestomathie der Papyrusurkunde*, 2 volumes, which give a general introduction to the study of the papyri, and a judicious selection of texts from papyri, especially those that are historical or legal in character; an article in *La Musée Belge*, by N. Holwein, giving select papyri, with translations and copious commentary; and, finally, an article by D. Bassi, in the *Rivista di Filologia e d'Istruzione Classica*, on the steps taken to preserve and make accessible the collection of papyri from Herculaneum to be found in the Museo Nazionale at Naples. Under the title *Dikaionmata*, there was published at Berlin a work giving "Auszüge aus Alexandrinischen Gesetzen und Verordnungen in einem Papyrus des Philologischen Seminars der Universität Halle." In 1912, Professor H. A. Sanders, of the University of Michigan, completed his publication of the manuscripts of the Old and the New Testament obtained a few years ago, from Egypt, by Mr. Charles A. Freer of Detroit; for a notice of Professor Sanders's work, and an indication of the value of the manuscripts see *The Classical Weekly* 6, 213-214.

In the field of religion we may note, first, that L. R. Farnell's *The Golden Bough* is undergoing revision in much extended form. Three essays by American women may be mentioned: *Religious Cults Connected with the Amazons*, Florence M. Bennett; *Cretan Elements in the Cult and Ritual of Apollo*, Mary H. Swindler; *The Cults of Ostia*, Lily Rose Taylor. Worthy of mention also are *Les Prêtres Danseurs de Rome*, R. Cirilli (a study of the Roman priests called the *Salii*); *Greek Divination: A Study of its Methods and Principles*, W. R. Halliday; *Cultes, Myths, et Religions*, S. Reinach; *Four Stages of Greek Religion*, G. Murray (1912); *Agnostos Theos. Untersuchungen zur Formengeschichte religiöser Rede*, E. Norden. In the last named article the author, starting with St.

Paul's speech at Athens and the altar-inscription ΑΓΝΩΣΤΩ ΘΕΩ, "tries to show that the speech conforms to a fixed type of Jewish-Christian missionary preaching, which can be traced back to old Greek prophetic addresses, but owed its special characteristics to later Hellenism as modified by Oriental and Jewish influences." See *The Classical Review*, 27, 199-200. In the Italian *Athenaeum*, founded in 1913, at Pavia, G. d'Amico had an article on the Roman cult of Fortuna in the oldest times. He held that the Sabines had a similar cult, though under a different name. The cult, developed first under Etruscan, then under Greek, influence, took more definite shape, and by the end of the Punic wars Fortuna became one of the chief divinities of Rome. In the kindred field of philosophy we may note *Stoics and Sceptics*, E. Bevan; *Die Anfänge der Griechischen Philosophie*, 2d edition, J. Burnet; *Aischines von Sphettos*, H. Dittmar, a valuable contribution to the literary history of the Socratic school. The fourth and last volume of *Greek Thinkers*, the English version of Th. Gomperz's great history of Greek philosophy, appeared late in 1912; it deals with Aristotle and his successors.

In *The Classical Quarterly* J. D. Denniston published "Some Recent Theories of the Greek Modes," in which he examined theories of Greek music set forth in Monro's well known *Modes of Ancient Greek Music*, in Macran's edition of Aristoxenus (a Greek writer of the fourth century B.C., the greatest student in Greek times of the science of music and rhythm), and in a paper by Professor Cook-Wilson. In the *Rivista di Filologia e d'Istruzione Classica*, M. L. de Gubernatis dealt with Roman music and poetry from its inception to Augustus; he held that the poems of Catullus and Horace were sung to a musical accompaniment.

For a good list and discriminating review of the more important work done in linguistics or comparative philology during the past four or five years see "Recent Literature on Comparative Philology," by E. H. Sturtevant, in *The Classical Weekly*, 6, 114-116. Brugmann's great "Griechische Grammatik," part of volume 2 of Müller's *Handbuch der Klassischen Altertumswissenschaft*, appeared in a fourth edition, the work of A. Thumb. Hirt's *Handbuch der Griechischen Laut- und Formenlehre* was issued in a second and much improved edition. Of Thumb's "Handbook of the Greek Vernacular," noticed in the last YEAR BOOK, a fine summary may now be found in *Classical Philology* for January, 1914. V. Magnien's *Le Futur Grec*, 2 volumes, should also be noted, as also A. Meillet's *Aperçu d'une Histoire de la Langue Grecque*, and R. B. Steele's *Case Usage in Livy IV. The Ablative*. Of Boisacq's *Dictionnaire Étymologique de la Langue Grecque*, the best work on Greek etymology, three parts (9-11) appeared, bringing the work down through ΣΚΤΑΟΝ. Much important work in these fields was published in the periodicals known as *Glotta*, *Indogermanischen Forschungen*, and *Zeitschrift für vergleichende Sprachforschung*.

In lexicography the most noteworthy event is the appearance of parts 1-2 of a revision of Passow's *Wörterbuch der Griechischen Sprache*, undertaken by W. Crönert. The work is to appear in 50 parts, of 80 pages each. H. Merguet's "Lexikon zu Vergilius" was brought to a close late in 1912; for a review of this work,

as of M. N. Wetmore's valuable "Index Verborum Vergilianus," by C. Knapp, see *The Classical Weekly* 6, 101-103, 109-111; Professor Wetmore published also an *Index Verborum Catullianus* (1912). Parts of volumes 5-6 of the monumental *Thesaurus Linguae Latinae* were published in the year. Volume 8 of Pauly-Wissowa's *Real-Encyclopädie der Classischen Altertumswissenschaft*, covering "Helikon-Hyagnis" was issued, with remarkable promptness (the completion of volume 7 was noted in the last YEAR BOOK).

In the fields of Greek and Roman history and life we must notice *Greek Imperialism*, W. D. Ferguson, a study of the development of imperialism under Macedonian rule; *Ancient History, and Readings in Ancient History*, H. Webster; *The Cambridge Medieval History*, volume 2, which contains a fine article on "Roman Law," by J. S. Reid; *The Municipalities of the Roman Empire*, J. S. Reid (the book seeks "to provide students with a survey of the Roman Empire, regarded in one of its most important aspects, that of a vast federation of commonwealths, retaining many characteristics of the old so-called 'city-state'"); *Antigonos Gonatas*, W. W. Tarn, an account of the history of Macedonia and Greece from 204-250 B.C., worked out in relation to a central figure; *The Hellenica Oxyrhynchia: Its Authorship and Authority*, E. M. Walker; *International Arbitration amongst the Greeks*, M. N. Tod; *L'Armée Romaine d'Afrique et Occupation militaire de l'Afrique sous les Empereurs*, R. Cagnat; *Geschichte der Carthage*, volume 3, O. Meltze; *Imperium Romanum*, volume 1, *Die Staatsverträge und Vertragsverhältnisse*, E. Täubler. Mr. Walker's book (see above) is a discussion of the fragments of a Greek historian published in the *Oxyrhynchus Papyri V.* (see the YEAR BOOK for 1908); he ascribes the fragments to Ephorus, a Greek historian of Cyme, in Asia Minor, who lived about 400-330 B.C. Another important book, published in 1912, is *Zur Geschichte der römischen Censur*, O. Leuze. Late in the year appeared E. H. Minn's *Scythians and Greeks*, a survey of ancient history and archaeology on the north coast of the Euxine from the Danube to the Caucasus; F. W. Hasluck, *Cyzicus*, a history of Cyzicus and the adjoining towns, and a study of their antiquities. Of importance, too, is a translation, with introduction and notes, of the *Constitution of Aristotle*, by F. G. Kenyon (1912). For works on the early civilization known as Aegean or Mycenaean or Minoan see "Crete and Cretan Archaeology," by T. L. Shear, in *The Classical Weekly*, 7, 82-85. Volume iv. of *Roman Life and Manners under the Early Empire*, a translation of Friedlaender's great work *Sittengeschichte des Roms*, giving a rendering of the excursuses and notes to Friedlaender's work, appeared. Note also E. S. Bouchier, *Life and Letters in Roman Africa*; F. Henkel, *Die römische Fingerringe der Rheinlande und der genachbarten Gebiete*. Under the general title of *Lehrmittel für den Geschichtsunterricht*, the Verlag A. Pichlers Witwe und Sohn (Vienna and Leipzig) published a very valuable series of "Wandtafeln und Modelle zur Veranschaulichung des Lebens der Griechen und Römer." Three works dealing with ancient Greek science deserve special notice—a pamphlet by D'Arcy Wentworth Thompson, the biologist, *On Aristotle as a Biologist*; a longer work, *Aristotle's Researches in Natural Science*, T. E. Lones; and T. Heath's

Aristarchus of Samos, giving a new Greek text of Aristarchus, with translation and commentary, a valuable contribution to the history of astronomy among the Greeks. Two books on Roman law must, finally, be named—*Elementary Principles of the Roman Private Law*, W. W. Buckland, and *Iustiniani Institutionum Libri Quattuor*, edited with introduction, notes, and excursuses, by J. B. Moyle.

In the field of Greek and Latin literature we note first *Geschichte der römischen Literatur. Erster Band. Die Archaische Literatur*, by F. Leo, an ardent champion of the doctrine that Roman literature has in it many important elements of originality. Part 2, second half of M. Schanz's invaluable *Geschichte der römischen Literatur*, appeared in the third edition, much improved and enlarged: it covers the period from the death of Augustus to the reign of Hadrian. Volume iii. of edition 6 of W. S. Teuffel's *Geschichte der römischen Literatur*, dealing with the literature from 96 A.D. to the end of antiquity, was also issued: the authors were W. Kroll and Franz Skutsch. The fifth edition of Christ's *Geschichte der Griechischen Literatur*, revised by W. Schmid, was brought to a close by the publication of part 2, second half, dealing with 100-530 A.D. Sandys's *Companion to Latin Studies* was issued in a second edition, which was, however, but slightly altered from the first.

From the host of new books worth mentioning the following may be selected: *A Companion to Classical Texts*, F. W. Hall (the book is a valuable aid for students who wish to orientate themselves in the textual criticism of Greek and Latin authors); *Histoire de la Comédie Romaine*, G. Michaut; *English Literature and the Classics*, a series of papers, by various scholars, on the relation of various departments of English literature to the Classics; *Aegean Days*, an account of long sojourns in the Greek islands, J. I. Manatt; *Reden und Vorträge*, Ulrich von Wilamowitz-Möllendorf, third edition (of the six new papers the most important is "Geschichte der Griechischen Religion, Eine Skizze"); *Sappho und Simonides, Untersuchungen über griechische Lyriker*, Wilamowitz; Usener, *Kleine Schriften*, 4 volumes (1912-13); *Die Hellenistisch-Römische Kultur*, an admirable book, richly illustrated, by F. Baumgarten, Franz Poland, R. Wagner, a continuation of their earlier book, *Die Hellenische Kultur*, which reached its third edition in 1913; F. Boll, "Die Lebensalter," in *Neue Jahrbücher für das klassische Altertum*, an elaborate survey of the conventional divisions of human life, down to Shakespeare's famous "Seven Ages of Man," in *As You Like it*. Much needed substitutes for obsolete parts of Müller's *Handbuch der Klassischen Altertumswissenschaft* are Th. Birt, "Kritik und Hemmenutik," and W. Lurfeld, "Griechische Epigraphik." The papers of the late Professor A. W. Verrall were published during the year in two volumes, *Literary Essays Classical and Modern*, and *Collected Studies in Greek and Latin Scholarship*.

Of work on special authors there is space to mention only T. Stangl, *Ciceronis Oratorum Scholiastæ*, volume 2, indispensable to editors of the text of Cicero's orations; M. W. Humphreys, edition of Demosthenes's *De Corona*; W. M. Lindsay's edition of the text of Festus, epitomizer of Verrius Flaccus, the Roman lexicographer, of the Augustan Age, which for the

first time makes these important fragments easily accessible; the second edition of C. Herschel's *Sextus Iulius Frontinus, On the Water Supply of the City of Rome*; E. Drerup, *Das Fünfte Buch der Ilias* (by examining the review of this book by A. Shewan in *The Classical Review* 27, 230-233, and that by K. Prentice in *The American Journal of Philology*, 34, 332-340, the reader will get the points of view of the two schools of Homeric criticism); Gætano Curcio, *Q. Orazio Flacco studiato in Italia dal Secolo XIII al XVIII*, a study of the treatment and interpretation of Horace by editors and professional scholars, and, more valuable, of his influence on Italian literature; R. Pichon, "Les Sources de Lucain" (1912), reviewed in 1913 by J. W. Basore, in *The American Journal of Philology*; J. Mussehl, *De Lucretiani Libri Primi Condizione et Retractatione* (for a favorable review and summary of the book see *The Classical Review* 27, 143 ff.); K. F. Smith, edition of Tibullus, complete, the best edition of that author in any language, summarized and reviewed in *The American Journal of Philology* 34, 461-470. In the Italian *Athenæum*, founded in 1913, Carlo Pascal discusses the poem known as the *Moretum*, ascribed by ancient tradition to Vergil. He decides against Vergilian authorship, and so is in interesting opposition to the tendency, marked in recent English scholarly work on Vergil, to regard as in fact from Vergil's hand the minor poems ascribed to him by tradition, but for a long time, viewed by scholars, on the whole, as not his work (for such English studies see *The Classical Weekly* 6, 110).

PHILOLOGY, MODERN. The year 1913 has been remarkable for the number and variety of productions made in all sections of this extensive field. While few monumental works were issued, a wealth of detailed dialect studies, so necessary for accurate research, more than made up for this defect. Special emphasis seems to have been laid upon the Germanic (particularly German and Scandinavian), Romance, and Celtic languages, while the comparatively new science of phonetics attracted considerable attention. In fact, by means of their more perfect methods and increased material, phoneticians are rendering invaluable service to general linguistics and comparative philology. The science of semantics or the development of meanings of words, received a great impetus by the publication of the fourth volume of Nyrop's *Grammaire historique de la langue française* (Paris, 1913), in which an effort is made for the first time to establish this subject on a firm basis. Michel Bréal, the founder of this science, and his immediate disciples had limited themselves to special examples, thereby indicating in a general way the wide range of possibilities for research in this hitherto virgin field. Though Professor Nyrop's study leaves much to be desired with regard to certain aspects of this science, it will serve without doubt as a guide for those who will continue the researches he has so well begun. We may expect therefore in the near future numerous contributions to this rich and valuable science. It may be added that in America Professor F. A. Wood of Chicago has been contributing for a number of years important articles on semasiology in the Germanic languages.

INDO-EUROPEAN. In the general Indo-European field the most important contribution is

without doubt the second revision of Brugmann's *Lehre von den Wortformen und ihrem Gebrauch*, which comprises the second volume of Brugmann and Delbrück's *Grundriss der vergleichenden Grammatik der indogermanischen Sprachen* (Strassburg, 1913). Feist's *Kultur, Ausbreitung und Herkunft der Indogermanen* (Berlin, 1913) is a useful repertory, while Gauthiot's *La Fin du mot en indo-européen* (Paris, 1913) traces the evolution of the endings of Indo-European words, and Halter, *Die Indogermanen* (Jena, 1913) discusses the language and the primitive home of the Indo-Europeans from linguistic and geological data.

SANSKRIT. The contributions to the study of Sanskrit philology and literature have not been as numerous as in previous years. Probably the most finished work in this line, revealing a remarkable depth of scholarship, is the translation of Subandhu's romance, the *Vasavadattā*, by Louis H. Gray (New York, 1913). The introduction and the lexicographical appendix, which contains words not to be found in the St. Petersburg dictionaries, are especially worthy of note. The first part of volume two of Winternitz, *Geschichte der Indischen Literatur* (Leipzig, 1913), which is devoted to Buddhist literature, is also one of the important publications of the year. In this connection Schroeder's *Reden und Aufsätze vornehmlich über Indische Literatur und Kultur* (Leipzig, 1913) should also be mentioned. Other works worthy of note are Wilke's *Kultur Beziehungen zwischen Indien, Orient und Europa* (Würzburg, 1913); Fick, *Praktische Grammatik der Sanskritsprache* (3rd ed., Vienna, 1913); Pargiter, *The Purana Text of the Dynasties of the Kali Age* (Oxford, 1913); and Kennedy, *The Satakas or Wise Sayings of Bhartrihari* (Boston, 1913). The translation of Foucher's *Beginnings of Buddhist art and other essays in Indian and Central-Asian archaeology* (by L. A. and F. W. Thomas, Paris) is to be published early in 1914. An excellent bibliography of one of the modern Indian dialects is contained in Blumhardt's *Supplementary Catalogue of Hindu Books in the Library of the British Museum acquired during the years 1893-1912* (London, 1913, 235 pp.).

ARMENIAN. Meillet's *Altarmenisches Elementarbuch*, published in the series of the *Indogerm. Bibliothek* (Heidelberg, 1913), is a very useful volume, stamped by the profound scholarship of this brilliant French philologist.

ALBANIAN. Among the European groups of the Indo-European family, the Albanian language has always been more or less of a puzzle. Dialect studies, such as Weigand's *Albanesische Grammatik im südgegischen Dialekt*, treating of the dialects of Durazzo, Elbassan, and Tirana (Leipzig, 1913), are helping to solve the problem. Mention should be made also of Lambertz and Pekmezi's *Lehr- und Lesebuch des Albanischen* (Vienna, 1913).

SLAVIC. Although attention has been focussed in recent years upon the numerous and widely varying Slavic dialects, which have offered so many difficult and interesting problems for the philologist, the contributions to their study during the past year have been few and of not far-reaching importance. An interesting introduction of the comparative study of the Slavic languages is contained in Mikkola's *Uralische Grammatik* (Heidelberg, 1913), which is published in the series of the *Indogermanische Bibliothek* edited by Hirt and

Streitberg. Jagić's *Entstehungsgeschichte der kirchenslavischen Sprache* (Berlin, 1913) contains a thorough explanation of the character of Old Bulgarian. Von Marnitz, *Russisches Elementarbuch mit Hinweisen auf seine Grammatik* (Leipzig, 1913), and Corovivo, *Serbo-kroatische Grammatik (Sammlung Göschel)*, Berlin, 1913 are good elementary text-books.

GOTHIC, OLD AND MODERN GERMAN, DUTCH, ETC. The Germanic group received considerable attention during the past year. Among the most valuable of these studies is Kluge's *Urgermanisch. Vorgeschichte der altgermanischen Dialekte* (3rd ed., Strassburg, 1913); Wilser's *Die Germanen* (vol. i, Leipzig, 1913); and the first part of Kauffmann's *Deutsche Altertumskunde* (Munich, 1913) which treats of the period *von der Urzeit bis zur Völkerverwanderung*. The first volume of the *Reallexikon der Germanischen Altertumskunde*, edited by J. Hoops, has finally been completed (Strassburg, 1911-13). It goes as far as the letter E. Schulz-Minden portrays admirably, though at times allowing his theories too much away, the state of civilization of the primitive Germans in his *Das germanische Haus in vorgeschichtlicher Zeit* (Würzburg, 1913). Förstemann's compendious *Alteutsches Namenbuch* (3rd ed., vol. 2, Bonn, 1913, 1766 cols.) is devoted to the origin and history of place names. Mention may also be made of Henrici's *Sprachmischung in älterer Dichtung Deutschlands* (Berlin, 1913); and the 3rd edition of Seiler's *Die Entwicklung der deutschen Kultur im Spiegel des deutschen Lehnworts* (Halle, 1913), which goes as far as the introduction of Christianity. Leyen's *Das Studium der deutschen Philologie* (Munich, 1913) and Loewe's *Germanic Philology* (English translation, 1913) are very serviceable for those desiring a general view of the subject. For the early religion, second editions of two well-known works appeared, that of Lehmann, *Die Religionen des Orients und die altgermanische Religion* (Leipzig, 1913) and Zehme, *Germanisch götter- und heldensage* (Leipzig, 1913). Finally the following work may be mentioned: Wuest, *Deutsch-lateinische Wortkunde* (Strassburg, 1913). For Gothic we have Wrede's edition of Stamm-Heyne's *Ulfilas* (Paderborn, 1913), containing the text, grammar, and vocabulary, and Rolfuss, *Ulfilas Schriftsprache: Beitrag zu Geschichte des Gotischen* (Dresden, 1913). As for Old High German, the following publications were of those that appeared: Wesle, *Die althochdeutschen Glossen des Schlettstadter Codex zu kirchlichen Schriften und ihre Verwandten* (Strassburg, 1913); Michel, *Die mit-abgeleiteten denominativen Verba im Altgermanischen* (Giessen dissertation, 1912); and Pongs, *Das Hildebrands Lied* (Marburg, 1913). The second edition of the first volume of Steinhäuser, *Geschichte der deutschen Kultur* (Leipzig, 1913) is a noteworthy addition to scholarship. The most important publications on Middle High German are without doubt the revised edition of Lexer's *Mittelhochdeutsches Handwörterbuch* (3 vols., Leipzig) and Matthaei, *Mittelhochdeutsche Minnereden* (vol. i., Berlin, 1913). Among the more valuable modern German dialect studies are the following: Pfalz, *Die Mundart des Marchfeldes* (Vienna, 1913); Bohnenberger, *Die Mundart der deutschen Walliser im Heimattal und in den Aussenorten* (Frauenfeld, 1913); Berger, *Die Laute der Mundarten des St. Galler Rheintals*

(*ibid.*) Frings, *Studien zur Dialektgeographie des Niederrheins zwischen Düsseldorf und Aachen* (Marburg, 1913); Glöckner, *Die Mundarten des Rhön* (Fulda, 1913); Lohss, *Beiträge aus dem landwirtschaftlichen Wortschatz des Schwäbisch-Württembergischen* (Heidelberg, 1913); Wrede, *Berichte und Studien über G. Wenkers Sprachatlas des Deutschen Reichs* (Marburg, 1913); and finally the *Schweizerisches Idiotikon* has now reached the seventh volume (*Stämme satz-satz*). In addition to the above studies, we may mention Fischer, *Schwäbisches Wörterbuch* (Tübingen), which has reached the forty-second *Lieferung*; Fromman's magnificent edition of Schmeller's *Bayerisches Wörterbuch* (Munich, 1912, 2 vols.), originally published in 1827. This extensive and valuable list of titles serves to show the emphasis laid on dialect study by German scholars. Two works of more general interest are Sütterlin, *Werden und Wesen der Sprache* (Leipzig, 1913) and Weise, *Unsere Muttersprache; ihr Werden und ihr Wesen* (Leipzig, 1912). Other works worthy of note are Kluge, *Abriss der deutschen Wortbildungslehre* (Halle, 1913); Klipstein, *Vergleichende Syntax des deutschen, französischen und englischen* (Hannover, 1913); Kauffmann, *Deutsche Grammatik: Kurzgefasste Laut und Formenlehre des Gotischen, Alt-, Mittel- und Neu-hochdeutschen* (6th ed.; Marburg); parts of the fourth, tenth, eleventh, thirteenth, fourteenth, and fifteenth volumes of the *Deutsches Wörterbuch* (Leipzig) of the Grimms were revised during the year; and Jelinek, *Geschichte der Grammatik von den Anfängen bis auf Adelung* (Erster Halbband, 392 pp., Heidelberg, 1913), all of which testify to the great activity of German scholars.

Before passing on to the Scandinavian languages, it behooves us to call attention to two works treating of Frisian and Dutch. The first is the monumental *Woordenboek der Nederlandsche Taal*, edited by Knuttel, Jagen, Heinisius and others, of which parts of the third, seventh, and eighth volumes made their appearance; the other is Sipma, *Phonology and Grammar of Modern West Frisian* (Oxford, 1913).

Craigie's *The Icelandic Sagas* (Cambridge, 1913) contains a general résumé of all that pertains to this well-worked field, and is therefore a very useful work. Niedner's *Inlands Kultur zur Wikingerzeit* (Jena, 1913) reconstructs, so to speak, the background of the sagas. To Heusler's *Altislandisches Elementarbuch* is joined the second edition of Kahle's *Elementarbuch* (Heidelberg, 1913), thereby bringing together the two best manuals of Icelandic that have been published thus far. From the learned Noreen we have the third edition of his excellent little *Abriss der altislandischen Grammatik*, which appears in the *Sammlung kurzer Grammatiken germanischer Dialekte*, and the *Spridda Studier III* (Stockholm, 1913). Zoëga's *Concise Dictionary of Old Icelandic* (Oxford) is a fairly complete and reliable dictionary intended for beginners. Other works that should be mentioned are Van Eeden, *De Codex Trajectinus van de Snorra Edda* (Leiden, 1913); the third edition of Noreen's *Geschichte der nordischen Sprachen besonders in altnordischer Zeit* (Strassburg, 1913); and Ederschiöld, *Studier över genussvårlingen i fornvästnordiska och fornsvenska* (Göteborg, 1913). The Swedish Academy's *Ordbok öfver svenska sproket* is now about half through the

letter D (Lund, 1913, 47 Heft). Jakobsen's *Etymologisk Ordbok over det norrøne Sprog fraa Shetland* (Copenhagen) is a pioneer work.

ENGLISH. In English philology the most important feature of the year was the revision of several of our well-known dictionaries. Following closely upon the heels of the revised *Century Dictionary* came the *Funk and Wagnalls New Standard Dictionary of the English Language* (New York, 1913), prepared by more than three hundred and eighty specialists. It is unnecessary to discuss the merits of these two valuable works in this brief summary, for the reader is without doubt thoroughly acquainted with them. The tenth volume of Dr. Murray's *New English Dictionary on historical principles* was completed, while Craigie's *Oxford English Dictionary* (London, 1913) is almost at the end of the letter S. On *Beowulf* we note the following: Holthausen, *Beowulf, nebst den kleineren Denkmälern der Heldensage* (3rd ed., Heidelberg, 1913); Heyne, *Beowulf. Mit ausführlichen Glossar* (10th ed., revised by Schücking; Paderborn, 1913); and Sedgfield, *Beowulf* (Manchester, 1913), edited with introduction, notes, glossary, etc. (2nd ed.). Grein's *Sprachschatz der angelsächsischen Dichter*, edited by Holthausen and Köhler, has reached the eighth *Lieferung* (Heidelberg, 1913). Other works worthy of note are Classen, *Vowel Alliteration in the Old Germanic Languages* (Manchester, 1913); Gesenius, *Grammatik der Englischen Sprache (Formenlehre und Syntax)* (22nd ed., Halle, 1913), a well-known text-book for German students; Brüll, *Untergegangene und veraltete Worte des Französischen im heutigen Englisch* (Halle, 1913); and Wood, *Some Parallel Formations in English* (Baltimore, 1913). The seventh volume of the Carnegie Institution's *Vulgate Version of the Arthurian Romances* contains *Le Livre d'Artus*, edited with a glossary by Sommer (Washington, 1913).

CELTIC. Celtic scholars have as usual been very active. This rich field affords such exceptional opportunities for research in philology, general linguistics, and literature that greater attention is paid to it from year to year. The second volume of Pedersen's valuable *Vergleichende Grammatik der keltischen Sprachen* (Göttingen, 1913), containing the morphology, has just been completed. This work is unfortunately so rich in details and presupposes so great a knowledge on the part of the reader that it is difficult for others than experienced philologists to use it with any degree of satisfaction. The twenty-first *Lieferung* of Holder's *Altceltischer Sprachschatz*, which consists of additions to the first volume, deserves to be noted (Leipzig, 1913). Windisch's compilation, entitled *Das keltische Britannien bis zu Kaiser Arthur* (Leipzig, 1913), contains some debatable points, though in the main it is a most praiseworthy contribution. Kuno Meyer's essay on *Learning in Ireland in the Fifth Century and the Transmission of Letters* (Dublin, 1913) is a review of the Golden Age of Irish learning. The same author's *Sanas Cormaic, an Old Irish Glossary* (Halle, 1912) is important, being a new edition of a work originally published by Stokes in 1862. Other works on Old Irish deserving of mention are the *Anecdota from Irish MSS.* (5 parts, Halle) by Bergin, Best, Meyer, O'Keefe, and others; *Miscellany presented to*

Kuno Meyer, edited by Bergin and Marstrander (Halle, 1912), in honor of Meyer's election to the chair of Celtic at the University of Berlin; Joyce, *Origin and History of Irish Names of Places*, being a sequel to two volumes which appeared in 1869 and 1871 (London); and Pokorný's *Der Gral in Irland und die mythischen Grundlagen der Gralsage* (Vienna, 1913). Now that we possess several good grammars on Old Irish, Dottin has relieved a long-felt want for a manual of Middle Irish by his *Grammaire de l'irlandais moyen* (Paris, 1914). The Royal Irish Academy, having acquired the rights to Meyer's *Contributions to Irish Lexicography*, have announced a new dictionary to be based mainly on Old and Middle Irish material collated from printed and ms. work. They have begun to publish the letter D, intending to leave A-C to the end (Dublin). Finally, Thurneysen's *Zu Irischen Handschriften und Litteraturdenkmälern* (2 vols., Berlin, 1912-13) and K. Meyer's *Zur Keltischen Wortkunde* (Berlin, 1912-13) deserve to be mentioned. In Welsh, the most important publication is probably the historical and comparative *Welsh Grammar* of J. Morris Jones (Oxford, 1913). A very comprehensive work is Loth's translation, with introduction and notes, entitled *Les Mabinogion du Livre rouge de Hergest, avec les variantes du Livre blanc de Rhydderch* (Paris, 1913, 2 vols.). Poisson's slender volume, *L'origine celtique de la légende de Lohengrin* (Paris, 1913) is not without interest.

ROMANCE. A work that will mark a revolution not only in the study of the early literature of France, but also in that of all the primitive literatures of Europe, is Bédier's *Les Légendes épiques. Recherches sur la formation des chansons de geste* (Paris, 1913), of which the third and fourth volumes have at last appeared. In 1910 we noted in these columns that this brilliant scholar had upset all the accepted theories regarding the origin of the *Chansons de geste*. The two final volumes of this great work contain the constructive part. Herein he shows that these poems were not outgrowths of older and simpler forms, but rather the product of the life and thought of the eleventh century—one of the most glorious epochs in the history of France. Bédier's methods are now being applied to other literatures. Meyer-Lübke's *Historische Grammatik der französischen Sprache* (Heidelberg) appeared in a third revised edition. The second edition of Bloch's translation of Schwan-Behrens, *Grammaire de l'ancien français* (Leipzig, 1913), based on the ninth German edition, was another welcome manual. The third part of this edition contains some specimen texts bearing the following title: *Matériaux pour servir d'introduction à l'étude des dialectes de l'ancien français*. Bartsch's *Chrestomathie de l'ancien français (VIIIe-XVe siècles)*, accompagné d'une grammaire et d'un glossaire (Leipzig, 1913), was reissued in an eleventh edition (by Wiese). Farnsworth has made an important contribution to the study of the survival of matriarchy in his dissertation, *Uncle and Nephew in the Old French Chansons de Geste* (New York, 1913). Other studies on French philology that deserve to be mentioned are Drevin, *Die franz. Sprachelemente in den latein. Urkunden des 11. und 12. Jahrh.* (Halle Diss., 1913); Faral, *Recherches sur les sources latines des contes et romans courtois*

du Moyen Age (Paris, 1913); Jorns, *Die Sprache des altfranzösischen Sachsenliedes* (Greifswald, 1913); Lecomte, *Les Francs dans le Vermandois et la Langue francisque du Ve. au XIe. siècle* (Saint-Quentin, 1913); Jeanroy, *Les Chansons de Guillaume IX, duo d'Aquitaine (1071-1127)* (Paris, 1913), which is very important for the study of the language of that period; Foerster's edition, with introduction, of *Kristian von Troyes Yvain, der Löwenritter* (Halle); the first part of Gröhler's *Ueber die Ursprung und Bedeutung der Französischen Ortsnamen* (Heidelberg, 1913), which contains the Ligurian, Iberian, Phœnician, Greek, Gaulish, and Latin place-names; Vossler, *Frankreichs Kultur im Spiegel seiner Sprachentwicklung* (Heidelberg, 1913), which comprises a brief history of the French language from the earliest times to the seventeenth century; Koschwitz, *Les plus anciens monuments de la Langue française, publiés pour les cours universitaires* (Leipzig), the first volume of which contains diplomatic texts and bibliographical notices, and the second volume the critical notes and glossary; Raynaud, *Mélanges de philologie romane* (Paris, 1913); Salverda de Grave, *L'influence de la langue française en Hollande, d'après les mots empruntés* (Paris, 1913); Longnon, *Origines et formation de la nationalité française* (Paris); Kjellman, *La Construction de l'Infinitif dépendant d'une locution impersonnelle en français des origines au XVe siècle* (Upsala, 1913); Voretzsch, *Einführung in das Studium der altfranzösischen Literatur im Anschluss an die Einführung in das Studium der altfranzösischen Sprache* (2d ed., Halle, 1913); Joret, *Les Noms de lieu d'origine non romane et la colonisation germanique et scandinave en Normandie* (Paris, 1913), etc. In later French, the most important work to appear is, in all probability, the first part of the fourth volume of Brunot's remarkable *Histoire de la Langue française* (Paris, 1913), which treats of the classic language from 1660 to 1715. For modern grammatical studies, we may note Herzog, *Historische Sprachlehre des Neufrenchösischen* (Heidelberg, 1913); Guillaume, *Etudes de grammaire française logique: Le lieu du mode dans le temps, dans l'espace* (Paris, 1913), which discusses the tenses; etc. The list of French dialect studies is a very long one. The following may be noted: Brunau, *Les Limites des dialectes wallon, champenois et lorrain en Ardenne* (Paris, 1913), as well as his *Etude phonétique des patois d'Ardenne* (ibid.), both of which are valuable linguistic studies; Roques, *Grammaire gasconne: dialecte de l'Agenais* (Bordeaux, 1913); Thorn, *Sartre-Tailleur, étude de lexicologie et de géographie linguistique* (Leipzig, 1913); Gilliéron et Roques, *Etudes de géographie linguistique d'après l'Atlas linguistique de la France* (Paris, 1912), a very important work; Urtel, *Autour du Rhume* (Lausanne, 1913), a study of a Swiss patois; volume 1 of Gauchat and Jeanjaquet, *Bibliographie linguistique de la Suisse romande* (Neuchâtel, 1912), which treats of the extension of French and the development of patois literature in Switzerland, etc. Among dictionaries we may note Clédât's *Dictionnaire étymologique de la langue française* (Paris, 1912), composed for popular use.

Provençal failed to receive as much serious attention as usual during the past year. Among the more important works we note that Levy's

Prov. Supplement Wörterbuch (Leipzig, 1913) has gone as far as the word *sezer* in the seventh volume; Morf, *Vom Ursprung der provenzalische Schriftsprache* (Berlin, 1912), in which the author shows that the language of the troubadours did not originate from the Limousin dialect as stated in Ramon Vidal's *Razos de trobar* written in the fourteenth century; Leroux, *Documents limousins des archives de Bordeaux et autres villes* (Tulle, 1912); Appel, *Provenzalische Chrestomathie mit Abriss der Formenlehre und Glossar* (4th ed., Leipzig, 1912); Adams, *Word-Formation in Provençal* (New York, 1913), etc.

Italians are giving more attention to literature than to philology—a fact that explains the paucity of works touching upon this subject. The most important is probably that of Bertoni, *L'Elemento Germanico nella Lingua Italiana* (Genoa), which bears the date of 1914. Among the dictionaries are Zamaldi, *Vocabolario Etimologico Italiano* (2d ed., Città di Castello, 1913); Tommaseo, *Dizionario dei Sinonimi della Lingua Italiana* (new ed., Milan, 1913); and Parnisetti, *Piccolo Glossario Etimologico del Dialecto Alessandrino* (Alessandria, 1913). As for dialect studies, the following appeared: Buonamici, *Il Dialecto Falisco* (Imola, 1913); and Centrelli, *Fonetica del Dialecto di Toritto in Terra di Bari* (Bari, 1913). Other works deserving mention are the second volume of Trombetti, *Saggi di Glottologia Comparata* (Bologna, 1913), which discusses the numerals; Camilli, *Il Sistema Ascoliano di Grafia Fonetica* (Città di Castello, 1913); and Mari, *Vocabolario Hapli della Lingua Italiana* (Milan, 1910-13), as yet unfinished.

In Spanish, the *Gramática Histórica de la Lengua Castellana* (Halle, 1913), of Hanssen is a greatly needed work, superior in most respects to that of Pidal (1904). Burnam's *Palæographia Iberica*, of which only the first fasciculus has thus far appeared (Paris, 1912), bids fair to be a most important work. It represents the first effort to give a complete and systematic history of writing in the Spanish peninsula. Among other works in this field we may mention Schevill, *Ovid and the Renaissance in Spain* (Univ. of California Publications, Berkeley, 1913); Fabo, *Rufino José Cuervo y la Lengua castellana* (3 vols., Bogotá, 1912); and Cejador y Franca, *Tesoro de la Lengua castellana; origen y vida del Lenguaje* (4th part, Madrid, 1913). Montoliu's *Estudis etimologics catalans* (Fasc. I, Barcelona, 1913), is an unpretentious, but useful, work devoted to the Catalan language.

The Rumanian Academy continues to publish its *Dictionarul Limbii Române* (Bucharest, 1913), which has now reached the end of the letter B. Other works are Densusianu, *Păstoriul la popoarele romanice; însemnătatea lui lingvistică și etnografică* (Bucharest, 1913); Tiktin, *Rumänisch-deutsches Wörterbuch* (Leipzig), of which the 20th *Lieferung* has made its appearance. For Rhetoroman, we have Walberg, *Trascrizione fonetica di tre testi altoengadini* (Leipzig, 1913).

PHONETICS. The ninth edition of Viëtor's *Kleine Phonetik des Deutschen, Englischen und Französischen* (Leipzig, 1913), and the sixth edition of the same author's *Elemente der Phonetik des Deutschen, Englischen und Französischen* (Leipzig, 1914), as well as the eighth edition of True and Jespersen's *Spoken English*

(Leipzig, 1913), were among the welcome contributions. Miss Soames' pioneer work, *Introduction to English, French, and German Phonetics* (London, 1913), passed into its third edition. The second edition of Jespersen's *Lehrbuch der Phonetik* (Berlin, 1913), and the seventh edition of Passy's *Les Sons du français* (Paris, 1913) were other important publications. Other works that deserve mention are Michaelis-Jones, *Phonetic Dictionary of the English Language* (Hanover, 1913); Raudnitzky, *Die Bell-Sweetische Schule* (1911), a brief, but thorough, history of the English School of Phonetics; Geddes, *French Pronunciation* (New York, 1913); Scripture, *Stuttering and Lipping* (New York, 1913); Grant, *The Pronunciation of English in Scotland* (Cambridge, 1913); Viëtor, *Statik und Kinematik im englischen Lautwandel* (Marburg, 1913); Martinon, *Comment on prononce le français* (Paris, 1913); Passy, *Petite Phonétique comparée des principales langues européennes* (2d ed., Leipzig, 1912), etc. A *Tract on the Present State of English Pronunciation* (Oxford, 1913) by the English poet-laureate, Robert Bridges, attracted considerable attention to this important question.

PHILOSOPHY. NEW TENDENCIES. There has been no change in the situation of philosophy, as it has been described in the pages of the *YEAR BOOK* during the last few years. The traditional rationalism and idealism are being attacked from many sides, and pragmatism, intuitionism, mysticism, neo-realism, positivism, relativism, and whatever names the new modes of thought may give themselves, are making converts for their cause. A keen and widespread interest is shown in the questions at issue, not only among the specialists in philosophy, but among the scholars of other fields and by a larger intelligent public. Numerous books are appearing for and against the new movements,—especially that led by Henri Bergson,—the philosophical periodicals are full of discussions of them, and even the popular journals open their pages to expositions, appreciations, and criticisms of the new ideas. At the annual meeting of the Western Philosophical Association a large part of the papers bore upon the theories of knowledge underlying the teachings of the contending schools, while the American Philosophical Association devoted four sessions to the discussion of the problem of value, and the presidential address considered the question of "Time and the Experience of Time," a subject which plays so important a rôle in the thought of Bergson. In their joint meeting at Yale University the American Philosophical Association and the American Psychological Association chose as their subject for discussion, "The Standpoint and Method of Psychology," which was treated by Professors Creighton, F. M. Urban, Yerkes, Dewey, and Münsterberg from different angles, according to the natural-scientific or philosophical standpoints of the speakers. The Germans are at present agitating the question of the separation of the departments of philosophy and psychology in their universities—a separation which has long ago been made in many American institutions. It is being urged by the experimental psychologists, but opposed by the veteran Wundt (*Die Psychologie im Kampf ums Dasein*), who would regard the change as a misfortune for both sides, in the belief that the

problems in the one field cannot be solved without a thorough understanding of those of the other. In the meanwhile, the professors of philosophy in Germany are protesting against the appointment of experimental psychologists to chairs of philosophy. All these controversies give evidence of deep-seated conviction, among many, of the incompatibility of natural science and philosophy.

It is only natural under the circumstances that questions concerning the theory of knowledge should occupy the central place in the recent literature, and that interest in ethical problems, which often form the underlying *motif* of the new movements, should be growing. For, after all, the predominant spirit of the present is one of dissatisfaction with the methods and results of a rationalistic philosophy and science that conceive the world either as a mental or a physical mechanism—the block-universe, as James called it—and make of the individual a mere cog in the universal wheel. The opposition of the anti-rationalists is nourished by many natural scientists, some of whom regard the scientific method as a mere instrument for obtaining practical results, and not as a help to the understanding of the fundamental nature of things, while others refuse to regard mechanism as the last word of science itself. Against all these anti-scientific tendencies, however, a group of neo-realists has arisen, who take up the cudgels for the scientific method and who criticize both the idealistic and the romantic philosophers, as we might call them, seeing nothing but disaster ahead of the divorce of science and philosophy.

RECENT LITERATURE ON THE NEW SCHOOLS. A book which attempts to give a picture of the present situation from the neo-realistic point of view is Perry's *Present Philosophical Tendencies*; from the camp of the pragmatists we have Caldwell's *Pragmatism and Idealism* and Marchesini's *La dottrina positiva delle idealità*. Thilly in his presidential address before the American Philosophical Association in 1912, "Romanticism and Rationalism" (*Phil. Rev.*, March, 1913), discusses the battle between the rationalists and their opponents. Delbet, *Science et réalité*, opposes the mystical tendencies of the day, and insists that philosophy must follow science, basing itself particularly upon biology. Dumesnil in his *Philosophie de mon temps* and *La sophistique contemporaine* attacks all the innovators, especially Bergson, Poincaré, and the sociologist Durkheim, and seeks to vindicate orthodox Catholicism against the new aberrations. Gaultier, the idealist, offers some criticisms of recent French writers in *Comment naissent les dogmes?* Brod and Weltsch undertake what would seem to be a sensible task in their joint volume, *Anschauung und Begriff*, in attempting to clarify the relation between mysticism and rationalism by a study of perception (intuition) and conception.

Among the works which deal with James and Bergson we mention: D. L. Murray, *Pragmatism*; Muller, *De kennisleer van het anglo-amerikaansch Pragmatisme*; Ubbink, *De Pragmatisme van W. James*; Reverdin, *La notion d'expérience d'après W. James*; Vorbrodt, "W. James' Philosophie," *Zeitschrift für Philosophie*, vol. 151, no. 1; Bloch, "Der Pragmatismus von James und Schiller," same journal, vol. 152, nos. 1 and 2; Le Roy, a follower of Bergson, gives a clear exposition of the mas-

ter's thought in *A New Philosophy: H. Bergson* (transl.), which with Carr's excellent little book on Bergson will serve as a good introduction to the study of the French philosopher; Kitchen, *Bergson for Beginners*; Dodson, *Bergson and the Modern Spirit*; Berthelot, *Un romantisme utilitaire*, vol. ii., (Bergson); Maritain, *La philosophie bergsonienne*; Grandjean, *Une révolution dans la philosophie* (Bergson); Segond, *L'intuition bergsonienne*; Schrecker, *Bergson's Philosophie der Persönlichkeit*. Columbia University has published a *Contribution to a Bibliography of Bergson*.

METAPHYSICS. In the field of systematic philosophy not much of value has been offered. The most conspicuous work is that of Professor Bosanquet, "perhaps the central and most typical member" of the Neo-Hegelian school, who presents his philosophy in the second series of his Gifford Lectures, *The Value and Destiny of the Individual* (the first series was entitled *The Principle of Individuality and Value*), and also subjects the latter-day reactions against idealism to criticism. A good translation of Bergson's *Introduction to Metaphysics* by Hulne has been published, which will enable those who cannot read the original to obtain an insight into Bergson's method. In the posthumous book of Fouillée, *Lesquisses d'une interprétation du monde* and in A. Guyau's *La philosophie et la sociologie d'Alfred Fouillée*, we have two accounts which illuminate the teachings of a man who was long a distinguished champion of idealism in France. Kleinpeter, a follower of Mach, offers a natural-scientific world-view in *Der Phänomenalismus*. H. Schwarz's *Grundfragen der Weltanschauung* discusses such fundamental problems as the relation of mind and body, the freedom of the will, and the God-problem. A number of introductions to philosophy have appeared, among them Eucken's *Einführung in die Philosophie*, a sixth edition of Külpe's able book, and works by Fletcher, J. E. Russell, and Menzer. Students of philosophy will also be interested in Poincaré's *Dernières pensées* Chiappelli, *Amore, morte e immortalità*; Royce, *Problem of Christianity*; Wundt, *Reden und Aufsätze*; Bergson, Poincaré, Langevin, and other French authors, *Les idées modernes sur la constitution de la matière*; Bateson, *Problems of Genetics*; Headley, *Life and Evolution*; Frazer, *Belief in Immortality and Worship of the Dead*.

LOGIC AND THEORY OF KNOWLEDGE. In view of what has been said before, it is not surprising that the publications in the field of epistemology should be numerous and varied. We mention some of the more important contributions: *Logik* (a series of papers by Windelband, Royce, Couturat, Croce, Enriques, Looskij), transl. from the German; Rickert, *Grenzen des Naturerkennens*; Meinong, *Abhandlungen zur Erkenntnistheorie und Gegenstands theorie*; Rehmke, *Anmerkungen zur Grundwissenschaft*; Driesch, *Die Logik als Aufgabe*; Aster, *Principion der Erkenntnislehre*; Ziehen, *Erkenntnistheorie*; Koppelman, *Untersuchungen zur Logik der Gegenwart*; Eucken, *Erkennen und Leben*; Baeumker, *Anschauung und Denken*; Philip, *The Dynamic Foundation of Knowledge*; Bosanquet, *Distinction between Mind and its Objects*; Enriques, *Scienza e razionalismo*; Herbertz, *Philosophie und die Einzelwissenschaften*; Dingler, *Grundlagen der Naturphilosophie*; Münch, *Erlebnis und Gel-*

tung; Bernays, *Ueber den transcendentalen Idealismus*; Mally, *Gegenstandstheoretische Grundlagen der Logik und Logistik*; Verweyen, *Philosophie des Möglichen*; Parker, *Metaphysics of Historical Knowledge*; Eibl, *Metaphysik und Geschichte*; Ehrlich, *Wie ist die Geschichte als Wissenschaft möglich?*; Steinmann, *Ueber den Einfluss Newtons auf die Erkenntnistheorie seiner Zeit*; Adamson, *Short History of Logic*; J. M. Baldwin, *History of Psychology* 2 vols.; Natorp, *Allgemeine Psychologie*.

ETHICS. The great interest which is manifested in social and political problems to-day is reflected in the contemporary works on ethics, many of which deal with the sociological aspects of the subject, and some of which represent a tendency of reaction against the emphasis placed on society. Of those dealing with general principles we mention: Eucken, *Ethics and Modern Thought*; Rashdall, *Ethics*; H. W. Wright, *Self-Realization*; Croce, *Philosophy of the Practical, Economic and Ethic* (transl.); Levy Bruhl, *La morale et la science des mœurs*; Gomer, *L'obligation morale raisonnée* (a protest against sociological ethics; finds the basis of moral disapproval in the consciousness of our individual value); Limentani, *Presupposti della indagine etica* (utility and morality should not be confused; moral conduct is defined as conduct conformable to the sentiment of duty); Buchenau, *Kants Lehre vom kategorischen Imperativ*; Bayet, *La casuistique chrétienne contemporaine*; Lutoslawski, *Volonté et liberté*; Martin, *Psychologie de la volonté*. Individualism is discussed in the following: Burckhardt, *Was ist Individualismus?*; Archambault, *Essai sur l'individualisme*; Palante, *Les antinomies entre l'individu et la société*; Pagano, *L'individuo nell'etica*; Palante, *Pessimism et individualisme*.

HISTORY OF ETHICS, MORAL EVOLUTION, ETC. Janet, *Histoire de la science politique dans ses rapports avec la morale*, 4th ed.; Myers, *History as Past Ethics*; Worms, *Le progrès*; Weber, *Le rythme du progrès*; Blease, *Short History of English Liberalism*; Nevins, *The Growth of Freedom*; J. B. Bury, *History of the Freedom of Thought*; F. Harrison, *The Positive Evolution of Religion: Its Moral and Social Reaction*.

SOCIAL PHILOSOPHY. Tönnies, *Gemeinschaft und Gesellschaft*; Coffin, *The Socialized Conscience*; H. Jones, *Social Power*; Parmelee, *Science of Human Behavior*; Murdoch, *Economics as a Basis of Living Ethics*; Friedrichs, *Klassische Philosophie und Wirtschaftswissenschaft*; Hobhouse, Rashdall, and others, *Property: its Duties and Rights*; Macdonald, *Syndicalism*; Krapotkin, *La science moderne et l'anarchie*; Cresson, *L'espèce et son serviteur*; Year-Book of Social Progress; Troeltsch, *Die Soziallehren der christlichen Kirchen*; Lorin, *Les bases économiques de la justice internationale*.

A conference on legal and social philosophy, attended by teachers of philosophy and of law, was held at Columbia University and at the College of the City of New York. Papers were read on "The Conception of Social Welfare" (Felix Adler), "Criteria of Social Ends" (Tufts), "The Content of Social Justice" (Patten), "The Social Sciences as the Basis of Legal Education" (Lewis), "The Philosophy of Law in America" (R. Pound). Abstracts of these and other papers are published in the *International Journal of Ethics*, October, 1913.

MORAL EDUCATION. MacCunn, *Making of Character*, 2d. ed.; Bouteux, *Education and Ethics* (transl.); F. J. Gould, *Moral Instruction: Its Theory and Practice*; Sneath and Hedges, *Moral Training in the School and Home*; Sharp, *Success: A Course in Moral Instruction for the High School*; Börner, *Charakterbildung der Kinder*; Dyserinck, *Mémoires sur l'éducation morale*, and *Compte rendu du deuxième Congrès international d'éducation morale*.

HISTORY OF PHILOSOPHY. *Allgemeine Geschichte der Philosophie*, by many German scholars, 2d. ed.; Messer, *Geschichte der Philosophie*; Schwarz, *Der Gottesgedanke in der Philosophie*; Beiträge zur *Geschichte der Philosophie*, volume in honor of Professor Baeumker; Deussen, *System of the Vedanta*, translated; Deussen, *Philosophie der Bibel*; Drews, *Der Monismus in Altertum*; Burnet, *History of Greek Philosophy*; Picavet, *Essai sur l'histoire générale et comparée des théologies et des philosophies médiévales*; Neumark, *Geschichte der jüdischen Philosophie im Mittelalter*, Appendix: Falckenberg, *Geschichte der neuern Philosophie*, 7th ed.; Siegel, *Geschichte der deutschen Naturphilosophie*; Külpe, *Philosophy of the Present in Germany*, translated; Feigl, *Der französische Neokriticismus*.

Löwenheim, *Die Wissenschaft Demokrits*; Meier, *Sokrates und sein Werk*; Field, *Socrates and Plato*; A. M. Adam, *Plato: Moral and Political Ideals*; Hackforth, *Authorship of Platonio Epistles*; Mauxion, *Physique aristotélique*; L. Cooper, *Aristotle on the Art of Poetry* (amplified version); Michelitsch, *Thomaschriften*; Wicksteed, *Dante and Aquinas*; Belmont, *Duns Scotus*; Sabrie, *De l'humanisme au rationalisme*; Pierre Charron; Croce, *Vico* (transl.); Barth, *Descartes' Begründung der Erkenntnis*; Cochlin, *Descartes*; Gilson, *La Liberté chez Descartes et la théologie*; Jüngst, *Verhältniss von Philosophie und Theologie bei den Cartesianern*; G. Richter, *Spinozas philosophische Terminologie*; Bellange, *Spinoza et la philosophie moderne*; Köhler, *Begriff der Repräsentation bei Leibniz*; Didier, *Hume*; Dedieu, *Montesquieu*; Séverac, *Condorcet*; Fonsegrive, *Rousseau*; Sakmann, *Rousseau*; A. D. Lindsay, *Kant*; Simmel, *Kant*; Sentroul, *Kant et Aristote*; Heinemann, *Aufbau von Kants Kritik der reinen Vernunft*; Bund, *Kant als Philosoph des Katholizismus*; Miller, *Moral Action and Moral Law in Kant*; Miller, *Kant's Doctrine of Freedom*; Macmillan, *Crowning Phase of Critical Philosophy*; Sydow, *Kant-Kommentar*; Simmel, *Goethe*; M. Wundt, *Goethes Wilhelm Meister*; Wesselsky, *Forberg und Kant*; Croce, *Saggio sullo Hegel*; Roques, *Hegel, sa vie et ses œuvres*; Archambault, *Hegel*; G. Gentile, *La riforma della dialettica hegeliana*; Siegmund-Schultze, *Schleiermachers Psychologie*; Dupuy, *Positivisme d'A. Comte*; Hubert, *Comte*; Bottinelli, *Cournot*; Petersen, *Die Philosophie Trenelburgs*; M. Wentscher, *Lotze*; E. Bergmann, *Philosophie Guyaus*; R. M. Meyer, *Nietzsche*; Windrath, *Nietzsches geistige Entwicklung*; More, *Nietzsche*; Raab, *Philosophie des R. Avenarius*; Rashdall, *The Metaphysics of F. H. Bradley*; Passkönig, *Psychologie Wundts*; Lamarque, *Ribot*; H. Naville, *E. Naville*; Memelet, *Le relativisme philosophique chez Simmel*; Hadley, *Some Influences in Modern Thought*.

DICTIONARIES, TRANSLATIONS, NEW EDITIONS, ETC. Hastings, *Encyclopædia of Religion and*

Ethics; Schmidt, *Philosophisches Wörterbuch* (pocket edition); transl. of Aristotle (Smith and Ross) and Descartes (Haldane and Ross); new editions of Philo (by Cohn), of Kant (by Prussian Academy, Cassirer, Vörländer, Gross), of Schelling, Hegel, Schleiermacher, Herbart, Schopenhauer, Lotze, Renouvier, Bolzano. *Lettres inédites de Locke*; Royer-Collard, *Fragments philosophiques*; Dammköhler, *Briefwechsel Schellings mit Niehammer*; G. Lasson, *Neue Briefe Hegels*; Gruber, *Briefwechsel Schopenhauers mit Lindner*. Hegel-Archiv, ed. by G. Lasson, devoted to the study of Hegel's philosophy. *Jahrbücher der Philosophie* gives a critical survey of contemporary philosophy. Ruge, *Philosophie der Gegenwart*, vol. iii., gives bibliography of philosophy for the year 1911.

PHIPPS PSYCHIATRIC CLINIC. See INSANITY.

PHOSPHATE ROCK. The total quantity of phosphate rock mined in 1912 was 3,190,587 long tons, compared with 3,182,415 long tons in 1911. A marketed production of 1912 was 2,973,332 long tons, valued at \$11,675,774. This was a slight decrease over the marketed production of 1911. The largest quantity was produced in Florida, where 9,461,297 long tons were mined in 1912. Tennessee produced 1,640,476 long tons, South Carolina 524,760, and various Western States 49,241. During 1912 there were exported 1,206,520 long tons of phosphate rock, valued at \$8,996,456, a decrease in both quantity and value as compared with 1911.

IMPORTS OF FERTILIZER MATERIALS. The total quantity of these materials imported to the United States in 1912 was 999,338 long tons, valued at \$889,090. This was a slight decrease from the imports of 1911. Of the fertilizers imported, the largest quantity was kainit, 7,511,976 tons, brought into the United States. See FERTILIZERS.

PHOTOGRAPHY. In the year 1913, progress was made in telephotography, particularly the transmission of colored photographs electrically from one place to another. Experiments were also rife in the taking of photographs from kites and other aerial devices for use in time of war. These resulted in the production by inventors of some ingenious contrivances such as kite and rocket cameras. One experimenter secured pictures by attaching a camera furnished with a special kind of suspension to a steel piano wire carried up by means of a kite of the kind used for meteorological observation; but vibration of the wire caused by wind and difficulties in operating the shutter of the camera made the resulting negatives somewhat blurred and unreliable. Several inventors perfected rocket cameras, one of which was said to have been in successful use by the Bulgars in the Balkan war for taking photographs of a Turkish camp at night. The camera, attached to the head of a specially constructed rocket, and shot into the air to a height of 2000 feet or more, is automatically held in the proper position for exposure by means of an ingeniously constructed gyroscope attached to it, while a timing device releases the shutter at the proper moment. As soon as this has taken place, a parachute is caused to open and thus permit the safe descent of the camera to the ground at a moderate speed, and its recovery for subsequent use. A similar device was adopted by the German army. Some idea of the possibilities of the method may be derived from the

consideration of the fact that the stick of the rocket is 15 to 16 feet long, and that it can carry a camera of sufficient size to use an eight-by-ten-inch plate.

In telephotography, or the transmission of photographs from one place to another by electricity, the Marino system of color telephotography was considerably improved. It consisted in illuminating the colored plate at the sending station by a powerful arc light whose radiation was allowed to pass through regularly spaced perforations in a sheet of paper moved at uniform rate in front of the plate between it and the arc. The light passing through the plate is refracted by a prism, and the spectrum so produced is received upon a number of strips of selenium placed in a shunt circuit of an arc lamp situated in front of and close to the receiving plate. The receiving circuit has three wave detectors in three resonant circuits, each with the frequency of one set of waves emitted by the Poulsen arcs, which influence three receiving arcs, in front of which colored filters are placed corresponding to the three groups of selenium cells. It was said that this method gave highly satisfactory results.

In the attempt to photograph objects under water some good results were obtained with a camera manipulated by an operator placed in a cylindrical shaft provided with plate glass windows, through which the light from the objects to be photographed may reach the camera. In some experiments in the waters of Hampton Roads, Virginia, a source of light consisting of a number of incandescent electric lamps aggregating 1000 candle power was placed under water near the point, or objects, to be photographed, and successful negatives were obtained at depths as great as 30 feet; while at a depth of 15 feet and with an exposure of from one-tenth to 1/75 of a second, and with daylight illumination only, satisfactory results were secured and photographs of fish, marine plants, etc., were made.

An ingenious device was tried for night photography to a limited extent for kinetoscope projection, as well as for other optical purposes. It was called by Dussaud, its inventor, an apparatus for producing "cold light." His machine consists principally of a wheel on the circumference of which a number of Tungsten lamps are placed, connected, each one in turn, to a source of electricity. By the rotation of the wheel each lamp, at a particular point on the wheel, is in turn illuminated and cut off from the supply, the speed of rotation of the wheel making it possible to light any one lamp for an exceedingly short interval, and the succeeding lamps furnishing, in turn, a source of illumination. There is produced on the retina of the eye of the observer the impression of a continuous luminous source. This being so, Dussaud operates his machine at such a rate that the period of darkness for any lamp is more than twice the duration of its brightness, and it is therefore possible, he finds, to supply a much higher voltage than that at which the lamp is rated. Furthermore, the short period of time during which the lamp is luminous allows the development of a very small amount of heat, measurable, of course, yet so small as to be unobjectionable, hence the title, "cold light." Tests have shown that with from 50 to 160 watts applied to 16 lamps ranging from 25 to 80 candle power, there was obtained a brightness equal to from 250 to 800 candle power for

several hours continuously. It will be at once understood that such an arrangement, in connection with a moving picture machine, allows the latter to be run at any desired speed, and even to be stopped, without danger of igniting the film; and as regards the intrinsic brightness of the source of light, it has been shown that pictures projected on a screen 15 feet square in a perfectly satisfactory manner, involve the consumption of only 150 watts of energy.

The activities of the U. S. government in the prosecution of corporations were directed against certain makers of photographic supplies; and in this connection, the Eastman Kodak Company of Rochester, New York, was made the defendant in a suit under the Sherman law, the basis of some of the charges being unjust control exercised over retail dealers in regard to the sale of Eastman goods. Dealers selling these articles were, in some cases, it is alleged, forbidden in their contracts to handle those made by other manufacturers. This applied to films, papers, and certain chemical preparations. While the suit had not been definitely abandoned, it was generally understood that an amicable arrangement had been effected between the representatives of the attorney-general and the officers of the company, whereby the latter agreed to conform to the conditions imposed to the former in adjusting their relations to retail dealers. The importance of the suit in the photographic supply industry was of special note, as it involved questions of restraints of trade and the suppression of competition. The great competition for business and the questionable means for securing the same that had been known to prevail for some time past in this line of manufacture aroused general interest in this matter. In spite of the difficulties alleged, many independent concerns seemed to have been able to exist, and owing to the enormous demand for goods of this sort would probably enter upon an era of great prosperity with the removal of alleged abuses.

In recent years the work of amateurs has been increasingly good. At the 1913 exhibition of the Royal Photographic Society in London, the judges noted a marked improvement over the work of previous years in the pictures shown, both in choice of subject and in composition; and in this connection it is not too much to say that recent improvements in the quality of materials and supplies employed, and advanced methods of manipulation suggested in many cases by manufacturers, have, in part, contributed to this result.

In the domain of moving pictures an ingenious cinematograph hand camera was perfected for special use, such as photographing wild animals in situations where the ordinary moving picture camera would be inconvenient to either transport or operate. This hand camera contained the usual type of apparatus for taking moving pictures, and the motive power for operating the film was furnished by compressed air stored in four cylinders contained in the camera box. Three hundred feet of film may be used in this camera, and the air compressed and stored in the cylinders by means of an ordinary pneumatic tire pump is sufficient to run off two reels each of this length. As the dimensions of the entire outfit are 12 by 8½ by 6½ inches, and its weight only 14 pounds, it is evident that a compact, powerful instrument has been added

to the equipment of naturalists and explorers. See CHEMISTRY, INDUSTRIAL, *Color Photography*; and MOVING PICTURES.

PHYSICS. In a growing science, such as physics, the work of each year can be divided roughly into three or four general divisions. First there are a certain number of investigations which are more or less routine in character. Their purpose is to test some of the details of fairly well established theories or to supply data to fill in certain gaps in our knowledge of this or that class of phenomena. The amount of this work is increasing in volume every year, especially along the lines of radio-activity and discharge through gases. Such work furnishes very valuable material and is very important. At the same time, the results are often such as to seem almost commonplace and uninteresting.

There is a second class of research in which the investigator is working in a rather narrow—sometimes almost unknown—field. From time to time results are published but, since only a few men are working along this line, the results of this work are perhaps not appreciated since they do not seem to have a bearing on the work which is absorbing the attention of the majority of physicists. For example, for a number of years Guthe and several of his students have been studying the elastic properties and behavior of wires. They have contributed very largely to our knowledge of elastic fatigue, elastic hysteresis, etc., but their results have usually attracted much less attention than they deserve.

Somewhat similar to the first class of work mentioned are many of the contributions to theoretical and mathematical physics which appear from time to time. In such subjects as relativity and quantum theory, new methods of attack are constantly being tried and new deductions from the more or less well established theories are constantly being made. Important as some of these contributions are, from their very nature it is almost impossible to give any adequate review of the results which they represent.

Sometimes, though not always, by any means, the year's work is marked by some particularly brilliant discovery or by some exceptional achievement. Often this will open up a new line of investigation which will engage the attention of many investigators, and extremely rapid progress will be made. For a few years before the period now considered this last class of work had seemed to be lacking. Reference to the previous YEAR BOOKS will show this. However, in the review of 1912 passing reference was made to the work on the passage of X-rays through crystals, preliminary reports of which had just appeared when the article was written. It is no exaggeration to say that this work has aroused the most lively interest throughout the scientific world since it promises an insight into both the nature of the X-rays and the structure of crystals. Several groups of investigators have taken up this work and probably there is no other branch of physical research in which so much has been published during the past twelve months. On account of the wide-spread interest in this work, an attempt will be made in this article to give a fairly comprehensive survey of it. This may result in the crowding out of material in other lines which is not less important than the work

on X-rays, though at present hardly as interesting.

X-RAYS AND CRYSTALS. The original work of Laue, Friedrich, and Knipping (1912) consisted in passing a very narrow beam of X-rays through a section of a crystal behind which was placed a photographic plate. After an exposure of several hours, it was found upon developing the plate that the central spot—corresponding to the original beam of rays—was surrounded by a number of dark spots of more or less intensity, arranged in regular order. Laue showed mathematically that the arrangement of these spots corresponded to the interference pattern that would be formed by a diffraction grating of three dimensions. This “grating” was assumed to be formed by the regular arrangement of the molecules or atoms of the crystalline substance.

To explain the regularity of form of crystalline substances, it has long been assumed that the atoms or molecules or groups of molecules are arranged at the vertices of what has been called a “space lattice.” To take a very simple case, consider a substance which crystallizes in the cubic system. The crystal is thought of as built up of elementary cubes. To make this idea concrete, take the kindergarten exercise of making a cube by sticking toothpicks at right angles to each other into peas. If this process is continued by joining one cube to another, each pea forms a corner of *eight* adjacent cubes. This is a rough picture of the space lattice suggested by the writers on crystallography. Atoms, molecules, or groups of molecules correspond to the peas at the corners of the cubes. These are held in position by their mutual actions and reactions on each other. Of course in the case of substances which do not crystallize in the cubic system, the element of the space lattice is assumed to be some other regular geometric solid.

The first work of Laue and his associates was done with a crystal or zinc blende, a substance which crystallizes in the cubic system. As noted above, it was shown that the results obtained photographically could be explained by assuming that the X-rays were electromagnetic waves of very short wave length which were diffracted by the atoms or molecules at the vertices of the space lattice. From the arrangement of these “diffraction” spots, Laue concluded that the energy of the incident beam of X-rays was concentrated chiefly in five definite wave lengths.

For several years Professor W. H. Bragg had advocated a corpuscular theory of the X-rays, which assumed that they were composed of neutral doublets. According to this theory, diffraction would be impossible. Immediately upon the publication of Laue's work, Bragg suggested an explanation of the “diffraction” pattern based upon reflection.

To return to the model of the space lattice outlined in a previous paragraph, if a series of parallel planes are passed through the figure so as to include *all* of the edges of *one side* of a cube, each plane will be separated from the one above or the one below by a distance equal to the edge of the elementary cube. Each of these planes will contain a number of peas arranged in squares. A series of parallel planes can also be passed through the lattice such that each plane cuts diagonally across a series of cubes, taking in, for example, the

nearer edge of the lower face of a given cube and the farther edge of the upper face of the same cube. The adjacent planes of this series would be nearer together than those in the first series of planes, but the peas would be arranged in rectangles instead of in squares, the width of the rectangles being the same as the side of the squares in the first series. In a similar manner other series of parallel planes can be chosen which pass through the lattice at regular intervals and each plane will include a certain number of peas arranged in regular order. The number of peas per unit area for any given plane will depend upon the way in which it cuts the space lattice. The series described first contains the maximum number per unit area; that is, it is the “richest” in peas.

Bragg's explanation of Laue's results was based upon the idea of planes “rich in molecules.” He suggested that such planes would act as reflecting surfaces and he showed theoretically that patterns similar to those observed by Laue could be formed by reflection at such series of planes. Later experimental evidence has led Bragg to give up his theory of “neutral doublets” and to adopt a more or less modified form of the wave theory. However, his suggestion of reflection by series of planes has led to some very important theoretical and experimental work. Some of the best of this has been done by his son, W. L. Bragg.

In order to study the phenomena of reflection, experiments were made in which the beam of X-rays was allowed to fall upon the section of crystal at grazing incidence. Instead of using a photographic plate, the intensities of the reflected rays were studied by the ionizing effect that they produced. The apparatus as arranged was similar to a spectrometer. The incident beam of X-rays was passed through holes in a series of lead plates. This corresponded to the collimator. The reflecting crystal was placed in the position of the prism, and the ionization chamber for detecting the reflected rays was mounted in the place of the telescope. This method has been used chiefly by Bragg and the English investigators, while the men of the Continent have, in the main, used the photographic method.

The interpretations suggested for the various experimental results and some of the conclusions drawn from them are extremely interesting. An outline of these will be given, but the method of arriving at these conclusions often involves very tedious mathematical analysis which is beyond the scope of this review. Bragg has shown that the fact that the reflected (or transmitted) rays are of certain definite wave lengths may be explained without assuming that the energy of the incident rays is concentrated in these wave lengths. The explanation is similar to that given for the “musical echo,” i.e., the production of a definite tone by the reflection of a single sharp noise by a series of equally spaced parallel planes arranged like the risers in a staircase.

The distance between two points at which the reflected (or diffracted) rays reinforce each other depends upon two factors, viz., the wave length of the rays, and the distances between the particles that make up the space lattice. If a value can be assigned to one of these factors, the other can be calculated from the experimental data. By assuming that the particles making up the space lattice are single

atoms of the elements constituting the substance studied, a value can be assigned to the distance between the particles. This calculation is based upon the molecular weight of the substance, its density, and the number of atoms in a cubic centimeter of hydrogen under standard conditions. Of these assumptions, the wave length of the X-rays has been found to be of the order of magnitude of 1×10^{-8} cm., that is about one one-thousandth of the wave length of yellow (sodium) light.

From a study of the patterns formed by crystals of substances of similar composition, W. L. Bragg has drawn some very suggestive inferences concerning the arrangement of the atoms in the crystal and the roles of the heavy and light atoms in the process of reflection at the planes "rich in atoms." It would be natural to expect that the patterns formed by potassium chloride, sodium chloride, potassium bromide, etc., would be similar in character, since it is highly probable that their crystalline structure is similar. Experiment showed, however, that the patterns formed by potassium chloride differ from those formed by potassium iodide or potassium bromide. Bragg showed that the potassium chloride pattern can be explained by the simple cubical space lattice while the patterns for potassium bromide and potassium iodide require that not only shall there be a "diffracting point" at each corner of the cube, but there must also be a "diffracting point" at the centre of each face of the cube. The explanation which Bragg has suggested for this seeming discrepancy is very simple. The experiments made on the absorption of the X-rays by various elements indicate that it is the atomic weight rather than any other specific property that determines the effectiveness of an element as an absorber. To quote from a recent paper of Bragg's (*Proceedings of the Royal Society*, series A, vol. 89, no. A-610, September 22, 1913, pp. 248-276):

"It is reasonable, therefore, to assume provisionally that the weight of an atom in the main defines its effectiveness as a diffracting centre, and that two atoms of equal weight are equally effective. In the case of potassium chloride the atoms of potassium and chlorine, of atomic weight 39 and 35.5 respectively, are sufficiently close in atomic weight to act as identical diffracting centres. . . . In potassium bromide an iodide one atom preponderates so greatly over the other in atomic weight that the diffracting system consists practically of atoms of one kind only, and the pattern can again be assigned to a simple space lattice, but one which is of a different nature to that of potassium chloride. Yet the atoms of alkaline metal and halogen have precisely the same arrangement in all these cases.

"Let us distinguish between two kinds of diffracting points by calling them black and white. Then the points must be arranged in such a way that:

"1. There are equal numbers of black and white.

"2. The arrangement of points black and white taken altogether is that of the first (the simple) cubic space lattice.

"The arrangement of blacks alone or of whites alone is that of the third (the face-centred) cubic space lattice."

A glance at the accompanying figure, which

is adapted from Bragg's article, will help to make this idea clear.

- Metal
- Halide

To quote Bragg again: "The space lattice formed by the whites is the same as that formed by the blacks, being in each case the face-centred cubic. If black and white centres becomes identical, as in potassium chloride, the diffracting lattice becomes the simple cubic one."

Further experiments by Bragg have shown that we must consider that each point in the above figure is a single atom, rather than a group of atoms. This gives us at once a method of estimating the distance between the atoms. For sodium chloride it has been calculated that the distance from one (black) atom to the next (white) atom is 2.8×10^{-8} cm. or approximately one one-hundredth-millionth of an inch. While further work may show that this theory is not correct in all its details, it is very suggestive and its simplicity certainly is in its favor.

Of course in the case of some substances, it is more difficult to analyze the patterns, and the theory is correspondingly more involved. An example of this is given in the following quotation from an article by W. H. and W. L. Bragg on "The Structure of the Diamond" (*Proceedings of Royal Society*, series A, vol. 89, no. A-610, September 22, 1913, pp. 277-91): "The carbon atoms are not arranged on a space lattice, but may be regarded as situated at the points of two interpenetrating face-centred space lattices. These lattices are so situated in relation to each other that, calling them A and B, each point of lattice B is surrounded symmetrically by four points of lattice A, arranged tetrahedron-wise and vice versa."

Patterns similar to those given by hard X-rays have been obtained by Shaw when γ rays fall on mica at grazing incidence. He has estimated that the wave length of the γ rays is between ten and one hundred times smaller than that of the hardest X-rays.

From the amount of investigation at present in progress along these lines, we may expect many important developments in the near future.

CHARACTERISTIC X-RAYS. Previous work by Barkla and Sadler and their associates (see YEAR BOOK for 1910-1912) has shown that when X-rays fall on a metal plate, the plate be-

comes a source of X-rays which are characteristic of the metal. Under certain circumstances, this characteristic radiation has been observed when cathode rays themselves strike an anticathode. Barkla and Sadler had explained this as an indirect effect due to the ordinary production of X-rays at the anticathode and the reaction of these X-rays on the material of the anticathode itself. The results of some recent experiments by Beatty contradict this theory. He showed first that the quantity of this characteristic radiation was about ten times as great as could be accounted for by Barkla and Sadler's theory. By letting cathode rays of several definite velocities fall upon copper and aluminum anticathodes and anticathodes of copper covered with a layer of aluminum of sufficient thickness to cut off the cathode rays, he succeeded in measuring the indirect effect suggested by Barkla and Sadler and also in showing that the characteristic radiation was produced directly. According to his results, the production of both the "indirect" and the "direct" characteristic radiation disappears when the speed of the cathode rays falls below 6.25×10^8 cm. per second. The "direct" effect is apparently much greater than the "indirect" effect but apparently neither effect has any influence on the "regular" or ordinary production of the X-rays at the anticathode. This point is especially interesting as indicating that each class of rays is due to an atomic mechanism which is independent of that which produces the other.

In a paper published in 1913 Whiddington described experiments from which he concludes that in order to excite the fluorescent radiation characteristic of an element of atomic weight A , the cathode rays must be moving with a speed of at least $A \times 10^8$ cm. per second. Since the atomic weight of copper is 63, this result agrees well with that of Beatty.

Gray has shown that the primary γ rays from radium E excite the characteristic X-radiation in several metals such as silver, tin, barium, etc. This point is of interest as further evidence of the similarity in nature of the X-rays and the γ rays.

GENERAL RADIO-ACTIVITY AND DISCHARGE THROUGH GASES. In the 1912 YEAR BOOK some account was given of Rutherford's theory of the structure of the atom. Early in 1913 Bohr published a theoretical paper dealing with the decrease in velocity of α and β particles in passing through matter. According to the theory which he developed, the decrease in velocity of α rays on passing through the material can be estimated from the frequencies of the electrons in the atoms of the absorbing material as calculated from the theory of dispersion. In general his theoretical results are in accord with the experimental data, especially in the case of the lighter elements. His theory also seems to account for the form of the relations between the thickness of the material and the velocity of the β or cathode rays traversing it. Taking the work on α rays in connection with Rutherford's theory of the atom, Beatty concludes that the hydrogen atom contains only one electron outside of the central positive nucleus and that the helium atom contains two such electrons.

Rutherford and Robinson have recently made careful determinations of the heating effects

due to the α , β and γ rays from radium and its disintegration products. Their results are summarized in the table which is taken from their paper.

Substance	Heating effect in gram-calories per hour corresponding to one gram of radium			
	α -rays	β -rays	γ -rays	Total
Radium	25.1	25.1
Emanation	28.6	28.6
Radium A.....	30.5	30.5
Radium B.....	39.4	4.7	6.4	50.5
Radium C.....				
Totals	123.6	4.7	6.4	134.7

To make these results a little more concrete, the results in the table show that in three-quarters of an hour the total heat in all forms of rays given off from one gram of radium in equilibrium with its disintegration products is enough to raise the temperature of one gram of water from freezing temperature to boiling temperature, while in a little less than five and one-half hours, the heat given off is sufficient to convert one gram of ice at the melting point into steam at the boiling point.

The energy necessary to ionize an atom has been discussed theoretically by Beatty. At the same time Franck and Hertz have made direct measurements upon some of the elements. The agreement between the experimental and the theoretical results is not good in all cases, but the general conclusion seems to be warranted that the energy required to ionize an atom decreases as the atomic weight increases. (Mercury seems to be a possible exception to this statement, but the data at present are quite unreliable.) Bergen Davis has suggested that if this is true, it may furnish an explanation of the fact that we have no elements of atomic weight greater than about 240. That is, a heavier atom would require no energy for ionization and hence would disintegrate into an element of lower atomic weight. Since the radio-active elements have the highest atomic weights, this view is certainly very suggestive.

Another paper which presents a rather novel point of view is one by F. C. Brown. In this he argues from geological data that sodium may belong to one of the families of radio-active elements.

THERMIONS. As noted in the last YEAR BOOK, the theories of O. W. Richardson on the emission of positive ions and electrons by hot bodies have been attacked by several investigators. In particular it has been suggested that the emission of electrons is a secondary effect due to the emission of molecules of gas previously absorbed by the heated electrode or to the disintegration of the electrode itself.

In many respects the work of the past year has supported the views of Richardson. In 1904 Owen and Halsall published results seeming to show that at temperatures above 1000° C. at least 5 per cent. of the negative thermionic current from platinum was carried by heavy ions, though below this temperature the current was due almost entirely to the emission of electrons. During the past year they have repeated this work and extended it to palladium and iridium. Their conclusions now are that even above 1000° C. the carriers of the thermionic current are almost entirely electrons. The ratio of heavy ions to electrons

is certainly less than one to two thousand and probably is less than one to ten thousand.

According to Richardson's theory there should be a cooling effect due to the emission of electrons or ions by a hot body. This had been observed by several investigators but their observations indicated a value greater than that given by Richardson's theory. Cooke and Richardson have discussed this point and have called attention to certain corrections which bring these results into agreement with the theoretical values. They have also made direct experiments on osmium, the results of which are in good agreement with theory.

In a more recent paper Richardson has given the details of an investigation of the emission of electrons by heated tungsten. The tungsten filament was heated by the passage of a current. Especial precautions were taken to eliminate the disturbing effects of residual gas, etc. The results showed that the emission of electrons could not be ascribed to the evolution of gas by the filament since the number of electrons emitted was more than six million times as great as the number of molecules of gas given off. It was also shown that the emission of electrons could not be due to "chemical action or some other cause depending upon impacts between gas molecules and the filaments." In one series of experiments the mass of the electrons emitted was approximately three times the loss in mass of the tungsten filament, thus disposing of the argument that the electrons were the result of some process involving the consumption of tungsten. To quote from Richardson's article (*Philosophical Magazine*, August, 1913, pp. 345-350): "It thus follows that the emission of electrons from hot tungsten, which there is no reason for not regarding as exhibiting this phenomenon in typical form, is not a chemical but a physical process. This conclusion does not exclude the possibility that, under other circumstances, electrons may be emitted from metals under the influence of various chemical reagents; . . . but it does involve a denial of the thesis that the emission is invariably caused by processes involving changes of material composition."

The final paragraph of Richardson's article brings out a very interesting point. "The experiments also show that the electrons are not created either out of the tungsten or out of the surrounding gas. It follows that they flow into the tungsten from outside points of the circuit. The experiments therefore furnish a direct experimental proof of the electron theory of conduction in metals."

The December, 1913, number of the *Physical Review* contains two contributions from the Research Laboratory of the General Electric Company which give very strong support to Richardson's theory. In one of these, Langmuir discusses exhaustively the effect of residual gases and of "space-charge," and gives the results of an elaborate series of tests on tungsten filament. His paper also contains a critical discussion of several previous investigations including the work of Pring and Parker. (See 1912 YEAR BOOK.) He brings out both theoretically and experimentally the important point that "the mutual repulsion of electrons (space charge) in a space devoid of positive ions, limits the current that flows from a hot cathode to a cold anode." The presence of

residual gas usually aids in the production of positive ions to such an extent as to greatly reduce the space charge. Besides several other important conclusions, Langmuir states that "the normal thermionic current from tungsten in a 'perfect' vacuum follows Richardson's equation accurately."

The other article to which reference was made is by Coolidge and describes a new form of very powerful X-ray tube. It is mentioned in this connection because "it differs in principle from the ordinary type in that the discharge current is purely thermionic in character." The cathode is heated electrically, thus liberating the negative electrons, while the vacuum is "so high that the ordinary tube would carry no current even on 100,000 volts." Besides its interest as a most unexpected application of the thermionic emission of electrons, the development of this new tube promises much for the future of X-ray work since its performance is much more regular and controllable than that of the ordinary X-ray bulb.

THEORETICAL PHYSICS. Among the more important papers which have appeared, the following are especially worthy of mention: E. B. Wilson and Gilbert N. Lewis have given a comprehensive discussion on the "Space-Time Manifold of Relativity," including an application of non-Euclidean geometry of four dimensions to mechanics and electro-mechanics. (See *American Academy Proceedings*, vol. 48, no. 11, pp. 389-506.) Recent experiments of Michelson have shown that within an error of two per cent., the velocity of light reflected from a moving mirror is independent of the velocity of the mirror. Assuming that the effect is actually zero, he has indicated a method by which differential measurements giving an accuracy of one part in one hundred thousand might be made on the velocity of light coming from the two limbs of the sun. This would furnish a direct experimental test of one of the postulates of the relativity theory. (See *Astrophysical Journal*, vol. 37, pp. 190-193.)

PIEROLA, NICOLAS DE. A Peruvian statesman, died June 24, 1913. He was born at Camana in 1840. While still a youth he entered the army, but resigned his commission in 1862. He then went into politics, and six years later became minister of finance. While in this office he negotiated contracts for the construction of many Peruvian railways, and bonds aggregating \$150,000,000 were floated in Europe. For a time his plans were successful, but financial difficulties followed, and Pierola was impeached. He was acquitted and continued as minister of finance until 1872. Later he led the revolts against the government as represented by President Manuel Cardo, who was assassinated in 1888, and President Mariano Ignacio Prado, who was president during the war between Peru and Chile. Both these attempted revolutions failed. Pierola took an active part in the war against Chile, and on the fall of Lima in 1881 he fled into the interior. On the conclusion of peace between the two countries, he again became prominent in politics, and was elected president.

PITTSBURGH, UNIVERSITY OF. An institution for higher education, founded at Pitts-

burgh in 1787. The total number of students enrolled in the several departments in the autumn of 1913 was 2514. The faculty numbered 295. The university received more than \$500,000 for the Mellen Institute from A. W. and R. B. Mellen of Pittsburgh. The productive funds of the university amount to about \$500,000, and the annual income to about \$360,000, including about \$160,000 appropriated by the State. The library contains about 10,000 volumes.

PITUITARY GLAND. See **EPILEPSY**.

PLAGUE. The advisory committee for plague investigation in India issued its seventh report in 1913. With the exception of a single epidemic in 1905-6 it was stated that plague had never gained a foothold in the city of Madras, although the city had a population of half a million, with crowded native quarters. This was attributed to the fact that for several years Madras had undertaken a campaign against rats, a reward of a half a cent being offered for each rat brought in. The number of rats destroyed since February, 1906, was 1,220,686. Since the commission closed its inquiry the destruction of rats had been continued by the Bombay city health department, and the animals examined for plague. The results showed how the rat epidemic always preceded a human epidemic. See **VITAL STATISTICS**.

PLANT BREEDING. See **BOTANY** and **HORTICULTURE** under heading so entitled.

PLATINUM. The high price of platinum in 1912 encouraged prospecting in the United States, but did not greatly increase the production of crude metal, which amounted to 721 ounces as compared with 628 ounces in 1911. With the exception of a small yield in Wyoming, the entire domestic production came from California and Oregon. The greater part of the California platinum was obtained as a by-product in gold dredging. In Oregon the quantity recovered declined to 39 ounces.

The supply of platinum in the United States comes chiefly from the unmanufactured and manufactured platinum imported indirectly from Russia. In addition, 45,280 ounces of platinum sand were imported into the United States in 1912. By the usual estimate of 80 per cent. fine metal, this would yield 36,224 ounces of fine platinum. Another considerable source of platinum supply comes from the refining of imported and domestic gold and copper bullion. From this source, 1300 ounces were obtained in 1912. In all, the refined platinum produced in domestic refineries amounted to approximately 38,029 fine ounces, valued at \$1,732,221, as compared with 29,140 fine ounces obtained in 1911. The price per troy ounce in 1912 averaged \$45.50.

The world's production of platinum in 1912 was 314,715 troy ounces. Of this, about 300,000 came from Russia; 12,000 from Columbia.

Other platinum metals are paladium and iridium. The average price for paladium in 1912 was \$55 per troy ounce. There were imported 4967 ounces, valued at \$213,397 in 1912. Iridium is the highest-priced metal of the platinum group. In 1912 it averaged \$65 per ounce.

The platinum market in 1913, according to the *Engineering and Mining Journal*, was inclined toward lower prices, owing largely to a

smaller demand by the electric and jewelry trades. The automobile industry uses the paladium and iridium platinum for sparking points, and of this there is a considerable consumption. The average price for platinum in New York was \$44.88 in 1913; paladium about \$45, and iridium \$75.

PLATT, JAMES PERRY. An American jurist, died January 26, 1913. He was born in Towanda, Pa., in 1851; graduated from Yale College in 1873; studied law at the Yale Law School; and began practice at Meriden, Conn., with his father, Senator Orville H. Platt. In 1878 he was elected a member of the State House of Representatives, and from 1879-93 was city attorney of Meriden. He was appointed United States district judge for the district of Connecticut in 1902.

PLATTSBURG, BATTLE OF, CELEBRATION. See **EXPOSITIONS**.

PLAYGROUNDS, PUBLIC. GROWTH OF MOVEMENT. In April, 1906, a group of people, which included some of the most prominent educators and social workers in the country, met at Washington, and formed the nucleus of an organization which has since developed into the Playground and Recreation Society of America. At that time forty-one cities already had public playgrounds in operation. The first, in the form of sand gardens, had been in existence in Boston since 1882. The first out-of-door gymnasium is said to have been equipped at the Round Hill School, Northampton, Mass., in 1885. In 1895 Philadelphia took up the work in a comprehensive way, and was followed by New York and Pittsburgh in 1896, and Chicago in 1898, and other cities were rapidly added to the list, so that the organized effort which began with the formation of the Playground and Recreation Society of America, met a public need, already widely realized.

The first Play Congress was held in Chicago in 1907, and such a meeting has been held each succeeding year, the Play Congress for 1913 being held at Richmond, Va. In 1907, also, *The Playground*, a monthly magazine devoted exclusively to play interests, was established. The same year, 1907, in the State of New Jersey, the first playground legislation was passed.

PRESENT STATUS. The recreation census for the year ending November 1, 1913, completed by the Playground and Recreation Association is summed up in the accompanying table:

Playground and Recreation Centres:	Number of Cities
Under paid supervision.....	342
Under volunteer supervision.....	22
Under no supervision.....	69
School playgrounds	149
	<hr/> 572
Work Started:	
Recreation superintendents appointed.....	3
Playground associations and commissions organized	14
Committees appointed	8
Land secured	26
Money raised	8
Bond issues secured.....	2
Municipal appropriations and bond issues requested	3
	<hr/> 64

In addition, thirty-one cities reported that steps were being taken to arouse interest and that the movement was being agitated. In the

324 cities having paid supervision there were 2402 playgrounds and recreation centres, with 6318 play leaders, and a total expenditure of \$5,700,224 for the year. In addition to the sum just named bonds to the amount of \$2,358,000 were authorized by 20 cities.

OWNERSHIP AND MANAGEMENT. In the early years public playgrounds were operated, if not owned, at private expense, but the work is rapidly being assumed by municipalities and paid for as part of the city budget. In 1913, the work was supported by public funds in 111 cities and partially so in 115 more. In some cities the management is assumed by city departments already in existence, as the park department or school board; in other cities some private organizations, as an improvement association or woman's club, has attempted the administration of the work; in about 32 cities the work has been deemed worthy of the formation of a new department, known as the playground or recreation commission or department. This last-named will doubtless be the practice in an increasing number of cities from year to year.

LEADERSHIP. It has been the universal experience that to be effective the playground or recreation centre must have responsible and competent leadership. In fact those playgrounds that have been maintained—there are at least 300 of them—without it have been so unsuccessful as to form a definite danger of "auto-vaccination against playgrounds," for a playground without a director is as useless as a school without a teacher, and is dangerous. To meet the demand for trained leadership, training classes were maintained in 1913 in 59 cities, 35 of these cities reported 2638 students. Of the 6318 play leaders employed, 3856 were women. This is a profession that is bound to attract young men and women who have a talent for leadership, knowledge of children and of out-of-door sports, and a desire for a very real kind of social service. Social, as well as athletic gifts, are essential for story-telling and folk dances are favorite forms of recreation.

PLURAL VOTING BILL. See GREAT BRITAIN.

POETRY. See FRENCH LITERATURE; GERMAN LITERATURE; ITALIAN LITERATURE; LITERATURE, ENGLISH AND AMERICAN; SCANDINAVIAN LITERATURE; SLAVIC LITERATURE; and SPANISH LITERATURE.

POINCARÉ, RAYMOND. President of the French Republic. Elected January 17, 1913. He was born at Bar-le-Duc, in the department of the Meuse, in 1860, his father an inspector of the bridges and roads department of the public service. He took an interest in politics and was elected deputy at the age of twenty-six. He at once became known as a thorough student of public affairs. At the age of thirty-three he was made minister of instruction, and in 1894 was given the portfolio of finance. Here he made his mark in handling the weighty problems of the budget. It is said that he would without doubt have risen to the premiership had he not shown an indifference in parliamentary reform and a strong preference for the bar. He rose rapidly in the profession of the law, and soon was in the front rank. After his services as minister of finance, he retired from political life, until, in 1912, he was appointed to be reporter to the senate committee

on the Franco-German Accord. He was made premier in 1912. In addition to his political and legal interests M. Poincaré devoted considerable time to literary subjects. (See also FRANCE, *History*.) Among his books are *Idées contemporaines*; *Etudes et figures politiques*; and *Causes littéraires et artistiques*.

POLAND. See RUSSIA.

POLAR EXPLORATION. **ARCTIC.** The most important work in the Arctic during the year was the discovery of new land north of Siberia. Four years ago the Russian government built and commissioned two small ice-breakers, the *Taimyr* and the *Vaigatch*, to make surveys along the north coast of Siberia. While engaged in this work, in the summer of 1913, Captain B. A. Vilkitaky succeeded in pushing the *Taimyr* to the north of the Chelyuskin Peninsula and found a way to the open sea. Thirty miles northeast of Cape Chelyuskin, the expedition, on September 2, discovered an island that was free of ice on its east side. It was seven miles wide at its eastern extremity. After surveying the accessible part of the shore, the expedition skirted the edge of the compact ice and at daybreak on September 3, thirty nautical miles from the eastern edge of the newly discovered island, sighted the towering heights of an unknown land. Seven miles off shore, depths of only 700 feet were found. The land proved to be of volcanic origin containing extensive glaciers. On September 4, a party landed at 80° 4' N. lat., 97° 12' E. long., raised the Russian flag and declared the land annexed to his imperial majesty's dominions. The island was named Nicholas II. Land. Skirting the coast to the northwest, the expedition went on to 81° N. lat., 96° E. long., where the explorers found unbroken ice on all sides and were compelled to put back. They had followed the coast to the northwest for about 200 statute miles.

The party was thus unable to determine how much further to the north the land extended. Its presence seems to account for some hitherto unexplained peculiarities of the Kara Sea. That sea is often found almost choked with ice. This fact together with the condition of its currents and the salinity of its waters has long suggested the theory that some very substantial obstacle stood between it and the Arctic Ocean. The new land, in fact, with Novaya Zemlia and the continental shores, almost encloses the Kara Sea.

An important advance in the exploration of the vast interior of Greenland has been made by three traverses of the inland ice sheet. Knud Rasmussen, with the Dane, Freuchen, and two Eskimos of Smith Sound, started on April 6, 1912, across the inland ice from Inglefield Gulf, West Greenland, to Denmark Fiord and Independence Bay, on the east coast, to look for traces of Einar Mikkelsen. The party made good progress with 53 dogs to haul their four sledges. The highest part of the route was 7300 feet above sea level. The distance across the ice cap, from the starting point to Denmark Fiord was 764 miles. Just to the north of Peary's "Navy Cliff" the party looked in vain for the Peary Channel which was supposed to form the northern boundary of Greenland. Instead of the channel, they found an extensive ice-free upland abounding in game. They returned to Inglefield Gulf on August 8, but news

of their work did not reach civilization till the summer of 1913.

The second party was that of the Swiss savant, Dr. de Quervain, who led a scientific expedition of six men across the ice cap from Disko Bay, on the west coast, to Angmagssalik on the east coast. After crossing the black rocks of the marginal zone, the march over the ice began at an altitude of 1970 feet. At first the water holes and crevasses in the ice caused much trouble, and after reaching the snow the party nearly met disaster on a snow-covered lake on July 13. The highest point was reached at 8200 feet; and four days later a hitherto unknown mountain range was discovered near the east coast where the journey ended on July 20.

Captain Koch of Denmark, crossed Greenland at its widest about midway between the routes of Rasmussen and De Quervain. His expedition spent the winter of 1912-13 near the east coast of the island in the latitude of Koldewey Island. The final start on the 700-mile march to the west coast was made on April 20, 1913. As the center of Greenland was approached the altitude was between 8000 and 9000 feet and the greatest elevation, provisionally estimated at 9500 to 9800 feet, was reached in longitude 43° W., latitude 74° 30' N., or nearer the west than the east coast.

These expeditions, particularly the last two, will supply many new facts on the configuration and meteorological conditions of the ice-filled interior of Greenland. The non-existence of Peary Channel from sea to sea has been proven, for the ill-fated Mylius Erichsen discovered this fact which was later verified by Rasmussen. Dr. Quervain's route supplies much information concerning the ice sheet to the north of Nansen's route in 1888; and Koch throws the first light on the vast central area. Koch found the snow bunting and tracks of foxes at the very centre of the ice sheet. When the full results of these expeditions are published we may expect large additions to our knowledge of the interior of Greenland.

The government of Canada, in February, assumed the entire financial responsibility for the new expedition which Mr. Vilhjalmur Stefansson proposed to lead into the Arctic. His plan was to have two main bases, one on Prince Patrick Island in the north and the other on the North American mainland near Coronation Gulf. He expected to spend three or four years in an intensive study of the archaeology and ethnology of the Eskimos, together with the zoölogy and geology of the whole region from Alaska to Coronation Gulf; also to map the unexplored coasts of Victoria and Prince Patrick Islands and, by off-shore journeys to the north and east, determine by soundings the extent of the continental shelf and discover new lands if they existed in that part of the Arctic. He collected a scientific staff of eleven men besides himself and Dr. R. M. Anderson, the biologist, including four men detailed by the Canadian Geological Survey, George Malloch, stratigrapher, J. J. O'Neill, mining geologist, and Kenneth Chipman and J. R. Cox, topographers, who who were to study and map the copper deposits near the lower Coppermine River and on Victoria Island; James Murray, oceanographer, Fritz Johansen, who was to study Arctic fish, Henri Beauchamp and Dr. G. Jenness, anthropologists, W. L. McKinlay, terrestrial mag-

netism, and Dr. A. Forbes Mackay, surgeon. Most of the crew was selected from the American whaling fleet.

The barkentine steam whaler, *Karluk*, with the main expedition and many of the supplies, sailed early in June from Esquimalt, B. C., under command of Captain Bartlett who gave such efficient service to Peary's enterprises. The three smaller vessels, the steam schooner *Mary Sachs*, the steam whaling bark *Belvidere*, and the gasoline boat *Alaska* followed soon after. The *Belvidere* was with the fleet only to carry supplies to the Alaskan coast.

Unfortunately, the ice conditions, north of Bering Strait, proved to be unprecedented. All the vessels were at the mercy of the ice drift. The *Alaska* and the *Mary Sachs* finally reached Collinson Point, where they were reported to be spending the winter of 1913-14 in safety. The *Belvidere*, also, was safely moored. The *Karluk*, heavily beset in the ice, drifted past Point Barrow on August 8, became free on the same day, but was beset again on August 12, fifteen miles off shore, and drifted slowly back west till September 10. She seemed then to be fast in the ice for the winter, at 150° 7' W. longitude.

Stefansson, believing that her position was assured till spring, went ashore on September 20, with four men, two Eskimos, two sledges, and twelve dogs to hunt for a supply of fresh meat. Two days later, under the impulse of a strong northeast gale, the ice broke up again, the *Karluk* went adrift and as she was hidden by a fog, her direction could not be determined though the explorer thought it probable that she was taken west. Aboard her were twenty-five men, including Captain Bartlett, H. Beauchamp, W. T. McKinlay, Dr. A. F. Mackay, George Malloch, James Murray, and five Eskimos. While the uncertainty as to her fortunes caused great anxiety, it may be said that she was well provisioned for three years. Stefansson decided later to undertake the exploration of the MacKenzie Delta and to make a sledge journey north in February and March to establish the edge of the continental shelf west of the Parry Archipelago. If the *Karluk* does not return he will try to carry out most of his original programme with his two remaining vessels. Dr. Anderson, with the *Alaska* and the *Mary Sachs*, was wintering at Collinson Point.

The Crocker Land expedition sailed on July 2, from Brooklyn for Smith Sound on the steam whaler *Diana*. The members of the scientific staff were Donald B. MacMillan, leader and ethnologist, W. Elmer Ekblaw, geologist and botanist, Ensign Fitzhugh Green, U. S. N., engineer and physicist, Morris C. Tanquary, zoölogist, Dr. H. J. Hunt, surgeon, and Jerome Lee Allen, wireless operator. The expedition was to pass through Smith Sound and establish winter quarters on Flagler Bay, Ellesmere Island. It was to start westward for the supposed Crocker Land in February, 1914. Peary gave this name to an appearance of land which he saw far out to the west when he was completing the survey of the northwest coast of Grant Land in 1906. It was the purpose of MacMillan and his men to explore this land, if it were found to exist, to seek for more lands in the northern part of the Parry Archipelago, to study the geology of the northern parts of Ellesmere Island and, possibly, to cross North Greenland on the inland ice.

Finely equipped in all respects for three years of Arctic work, and with an excellent scientific staff, the prospects of the party were somewhat overcast by misfortunes at the outset. Their steamer grounded on the rocks off Barge Point, Labrador, and as she could not pursue the journey, the services of the *Erik* were procured, and the cargo was transferred. This occasioned so much delay that Smith Sound, when reached, was found to be choked with pack ice, so that the party was compelled to spend the winter of 1913-14 at Etah, on the Greenland coast, some eighty miles from Flagler Bay in Ellesmere Island from which it had been expected to advance supply depots across the island to facilitate the summer work. The achievement during the first year may therefore fall short of the work as planned.

Mr. Harry V. Radford of New York, and his assistant, T. George Street, of Ottawa, are reported to have been killed in a quarrel with Eskimos at Bathurst Inlet, northern Canada, on or about June 5, 1912. He had been engaged for three years in studying the wood bison and other large fauna in Canada and had done some geographical work. He wrote, a little before his death, that he had nearly completed his map of Bathurst Inlet on Canada's Arctic coast.

The Schröder-Stranz expedition (German) which left home in 1912 for pioneer exploration in northeastern Spitzbergen has added another melancholy chapter to Arctic exploration. The two search parties that were sent out for their relief, returned with seven of the fifteen members, eight having perished in Spitzbergen. The expedition had accomplished nothing.

In the fall Captain Amundsen's ship, the *Fram*, started for the Pacific via Cape Horn, to take his party on board at San Francisco for the four or five years' drift in the ice of the Arctic Ocean. The personnel of the expedition will be largely composed of members of Amundsen's Antarctic party.

ANTARCTIC. The tragedy that overtook Captain R. F. Scott's South Pole party was reported in the *YEAR BOOK* for 1912. Scott's records showed that his determination of the position of the South Pole differed but a half mile from that of Amundsen. The scientific work accomplished by the entire expedition, on the mainland to the northwest of winter quarters, in the region of McMurdo Sound and in the south, was of the highest quality. The expedition will rank as among the most fruitful of polar enterprises.

The two detachments of Dr. Mawson's expedition to the eastern coast of the Antarctic continent (Wilkes Land) have produced charts giving a good delineation of over 1000 miles of this part of the mainland coast and have obtained many geological specimens. Along the more southerly part of this coast, where Frank Wild and his party worked, the rock foundations were determined along nearly the whole coast explored, so that earlier errors as to the position of the coast line, due to the mistaking for it of pack ice edges, have been avoided. Wild surveyed all the coast line to the point reached by the German expedition of 1902. An altitude of 4500 feet was reached fifty miles inland, and most of the sledge traveling was at altitudes of 2000 to 3000 feet. On March 14 the Wild party returned to Australia on Mawson's ship the *Aurora*, and Mawson's section will be brought home in the present Antarctic summer. An

interesting feature is that Dr. Mawson has been able to keep in wireless communication with the civilized world by means of his station in Adelie Land and those at Marquarie I. and Tasmania.

It is announced that Dr. Felix König, of Austria, will head an expedition on the German polar steamer *Deutschland*, which will sail in May, 1914, to survey the unknown stretch of coast in North Antarctica between Prince Regent Luitpold Land, discovered by the Filchner expedition of 1912, and Coats Land, discovered by Bruce in 1901. The expedition will also study the relations between the Antarctic continent and South America and carry out other scientific work.

POLIOMYELITIS (INFANTILE SPINAL PARALYSIS). The investigation of this disease during the last year has been in the direction of finding out the method of transmission. The stable fly (*Stomoxys calcitrans*) was for a time thought to be an agent in spreading the disease, possible, by means of laboratory experiment, to convey the disease from animal to animal by means of this fly. Sawyer, Herms, and Frost undertook numerous experiments and investigations which ended negatively, as regards the stable fly. It appeared, according to Flexner, that the human carrier was the principal agent. He and his co-workers cited one instance in which the virus of poliomyelitis was isolated from the mucous membrane of healthy human adults, the parents of a child suffering from an acute attack of epidemic poliomyelitis. Washings from the nasopharynx of these adults were injected into a laboratory animal which in due course exhibited the classical symptoms of paralysis; and body fluids of this animal produced poliomyelitis in a second animal when they were injected into it. Flexner believed that these results show without a doubt that the virus of the disease may be carried in the mucous membrane of the upper respiratory tract of healthy individuals and that the latter act as disseminators. Kling reported extensive researches on the virus and mode of transmission of infantile spinal paralysis. He found that 78 per cent. of the monkeys contracted the disease after inoculation with water in which organs and mucous membranes from poliomyelitis cadavers had been rinsed. All the animals inoculated with spinal cord emulsion died of poliomyelitis. The virus was present constantly in the secretions from the nose and throat and in the intestinal contents of acute poliomyelitis patients, also in those with light, abortive cases of the disease, and further, in numbers of healthy contacts. As a rule, the virus soon loses its virulence, so that isolation need not be kept up for more than two weeks; although the virus was found in the nasopharynx up to seven months in a few of the cases examined, and also in the abortive cases and healthy contacts. He thought it probable that each case and each abortive case is surrounded with a number of carriers, but serious epidemics do not result because the persons exposed are not susceptible. It seemed to be the rule that a region where a disease has once been epidemic, is spared further inroads of the disease later, indicating that a large part of the population has become immunized by having had the disease in an attenuated form. This rule was particularly evident in the large cities where

the people are exposed to so many diseases and contract them in a mild, clinically not appreciable, form, during the course of a mild epidemic. Then, when the disease returns at some later period in a more malignant form, the population is protected. In rural districts there is not the same opportunity to acquire immunity, and when an epidemic occurs it attacks large numbers of non-immunes and is liable to run an exceptionally severe course.

POLITICAL ECONOMY. A considerable number of articles will be found elsewhere in this volume treating various problems and movements of economic interest not covered by this one. A general survey of business conditions during the year is given under FINANCIAL REVIEW. In the article LABOR will be found references to the various topics treating different aspects of the labor problem. The article BANKS AND BANKING includes statistics of all banks in the United States and history for banking and currency reform, and is supplemented by articles on the several kinds of banking institutions, and by that entitled AGRICULTURAL CREDIT. Other articles related to the general subject of economics are: BUREAU OF CORPORATIONS, CARNEGIE INSTITUTION OF WASHINGTON, *Department of Economics and Sociology*; INSURANCE; PARCEL POST; OLD-AGE PENSIONS; PRICES; SOCIAL ECONOMICS, and subjects there referred to, as TARIFF; TAXATION; TRUSTS; and UNITED STATES STEEL CORPORATION.

THE AMERICAN ECONOMIC ASSOCIATION. The twenty-sixth annual meeting of this body was held at Minneapolis, Minn., December 27-30, in connection with the annual meeting of the American Sociological Society. (See SOCIOLOGY.) The first topic on the programme was "The Control of Public Service Corporations," on which a paper was read by Professor John H. Gray of the University of Minnesota, and discussed by a number of other experts. There followed an address of President Small of the American Sociological Society, on "A Vision of Social Efficiency," and that of President David Kinley of the Economic Association, on "The Renewed Extension of Government Control of Economical Life." Much attention was given to the "Theory of the Making of Railway Rates," on which a paper was read by Dr. B. H. Meyer of the Interstate Commerce Commission, and discussed by a number of others, including Professor Josef Schumpeter of the University of Graz, Austria. There were held two round-table discussions on "The Rural Organization Service," led by Professor T. N. Carver of Harvard University, and director of the rural organization service of the United States Department of Agriculture, and on "The Theory of Rent and American Agriculture," led by Professor H. C. Taylor of the University of Wisconsin. At the fifth session Mr. John Graham Brooks of Cambridge, Mass., presented a paper on "Syndicalism," which was discussed by Professor Karl F. Theodor Rathgen of the Kolonialinstitut of Hamburg, Germany, Mr. Roger W. Babson of Wellesley Hills, Mass., and several university professors. At the final session Professor Willard C. Hotchkiss of Northwestern University discussed "Recent Trust Decisions and Business." This same topic was commented upon by numerous distinguished economists.

BIBLIOGRAPHY. Below is a classified list of

some of the principal works of the year. In addition to these, reference lists will be found under SOCIAL ECONOMICS; LABOR; SOCIOLOGY; SYNDICALISM; TAXATION; and WOMEN IN INDUSTRY.

GENERAL AND THEORETICAL WORKS. Henry R. Seager, *Principles of Economics*; G. Moss, *Bibliographie der Socialwissenschaften* (Berlin); G. Schmoller, *Charakterbilder* (Munich); I. H. Penson, *The economics of everyday life: A first book of economic study*; Members of the department of political economy of the University of Chicago, *Material for the study of elementary economics*; J. G. Murdoch, *Economics as the basis of living ethics*; M. Ingan-Baranowsky, *Social Theorie der Verteilung*.

HISTORICAL AND DESCRIPTIVE WORKS. C. A. Beard, *The Economic History of the United States*, vol. 1., and *The Economic Interpretation of the Constitution*; E. Cannan, *The Economic Outlook*; G. Hayes, *British Social Politics*; A. B. Martinez, and M. Lewandowski, *The Argentine in the Twentieth Century*; J. R. H. Moore, *An Industrial History of the American People*; H. Rey, *La vie économique de la Suède*; J. A. Woodburn, *The Life of Thaddeus Stevens; Report of the California conservation commission for 1912*; W. H. Dawson, *Industrial Germany*; O. J. R. Howarth, *Commercial Geography of the World*; A. W. Lauber, *Indian Slavery in Colonial Times within the Present Limits of the United States*; H. Levy, *The Beginning of Economic Liberalism in England*; J. R. Smith, *Industrial and Commercial Geography*; W. Sombart, *The Jews and Modern Capitalism*; S. J. Buck, *The Granger Movement*; J. R. Cahill, *Report of an Enquiry into Agricultural Credit and Agricultural Coöperation in Germany*; C. W. Dahlinger, *The New Agrarianism*; O. J. Dunlop, *The Farm Labourer; the History of a Modern Problem*; F. G. Heath, *British Rural Life and Labour*.

MONEY AND BANKING. C. N. Fowler, *Seventeen Talks on the Banking Question*; F. B. Kirkbridge, and J. E. Sterrett, *The Modern Trust Company: Its Functions and Organization*; Marsel Lenoir, *Etudes sur la Formation et le Mouvement des Prix*; G. K. Holmes, *Cold Storage Prices*; Library of Congress, *Additional reference on the cost of living and prices*; Hartley Withers, *Money-Changing: An Introduction to Foreign Exchange*; J. M. Keynes, *Indian Currency and Finance*; S. W. Levine, *The Business of Pawnbroking; a Guide and a Defense*.

BUSINESS: ITS ORGANIZATION AND METHODS. Hugo Muensterberg, *Psychology and Industrial Efficiency*; H. S. Abbott, *A treatise on the law of public securities*; R. W. Babson, *Business barometers used in the accumulation of money; a textbook on applied economics for merchants, bankers and investors* (sixth edition); H. H. Brace, *The value of organized speculation*; Bureau of Municipal Research, *Handbook of municipal accounts*; W. M. Cole, *Cost of accounting institutions*; C. A. Collins, *Productive sales methods*; C. G. DuBois, *A brief history of telephone accounting*; B. A. Franklin, *Cost reports for executives*; T. Gibson, *The elements of speculation*; C. Gobrecht-Darrach, *Valuation of the properties of public utility corporations*; E. D. Jones, *Business administration: the scientific principles of a new profession*; J. J. Klein, *Elements of accounting, theory and practice*; J. Moody, *Moody's analyses of investments*

(Part I: Steam railroads; fourth annual number); P. T. Cherington, *Advertising as a business force; a compilation of experience and records*; A. H. Church, *The proper distribution of expense burden*; A. J. Liversedge, *Commercial engineering*; W. C. Van Antwerp, *The stock exchange from within; Report on the German Law of 1909 against unfair competition*; F. W. Hirst, *The six panics and other essays*; Samuel S. Wyer, *Regulation, valuation and depreciation of public utilities*; Horatio A. Foster, *Engineering valuation of public utilities and factories*; W. C. Redfield, *Business in the public mind* (Sen. Doc. 37, 63 Cong., 1 Sess.); L. H. Hanley, *Business organization and combination*.

CORPORATIONS. T. L. Greene, *Corporation finance*; R. C. Heisler, *Federal incorporation; constitutional questions involved*; Library of Congress, *List of references on federal control of commerce and corporations* (third edition, with additions by H. B. Meyer); William S. Stevens (Ed.), *Industrial Combinations and Trusts*; S. S. Wyer, *Regulation, valuation and depreciation of public utilities*.

TRADE AND TRANSPORTATION. S. O. Dunn, *The needs of the railways*; C. S. Gleed, *The rehabilitation of the Santa Fé railway system*; E. S. Ketchum, and T. D. Fitzgerald, *The freight classification and traffic territories of the United States*; C. Lasteyrie, *La nationalisation des chemins de fer anglais*; G. De Leener, *La politique des transports en Belgique*; H. C. Lust and R. Merriam, *Digest of the decisions under the interstate commerce act*; Bureau of Railway Economics, *List of references to publications pertaining to the government ownership of railways*; G. Cahen and E. Laurent, *Rapports sur les indices des crises économiques et sur les mesures financières propres à atténuer les chômages résultant de ces crises*; W. J. Cunningham, *The Administration of the State Railways of Prussia-Hesse*; J. P. Curran, *Freight Rates: Studies in Rate Construction*; H. Keller, *American Shipping: Its History and Economic Conditions*.

POLITICAL PARTIES IN 1913. The history of the Democratic party during the year is that of the administration and needs no special treatment. The broken wings of the Republican party which, in 1912, went to form the Progressive and the regular Republican parties both were active in 1913 in the elections which took place in that year.

There was much discussion of the possibility of a reunion of the two parties, and this found more favor among the Republican leaders than among the Progressive. Men prominent in the Progressive party, especially Mr. Roosevelt, declared strongly against any compromise with the aim of reunion. In the elections held in November and in other State elections held during the year, the tendency seemed to be for those who had voted for the Progressive party in 1912 to return to the regular Republican wing. This was shown in elections held in Maine, Massachusetts, New York, and other States. For a discussion of the State elections in 1913 see paragraph *Elections of November, 1913*, in the article *UNITED STATES*, and the historical sections of the State articles. There is given below a brief summary of the more important events in the history of the Republican and Progressive parties in 1913.

REPUBLICAN PARTY. At an address delivered

by President Taft in New York City on January 4, more than 1400 persons prominent in the Republican party were present. In this address Mr. Taft defended the policy of his administration and defined the issues of the election of 1912 as he understood them. After calling to mind several of the most important acts of his administration, he commented on the break in the party which resulted in his defeat as follows: "Let us invite these Republicans who left us under an impulse that calmer consideration shows to have been unwise, to return and stand again shoulder to shoulder with us in this critical time in our country's history. Let us invite from the ranks of our opponents, the Democrats, the many who love the Constitution and the blessings it has conferred on our people to unite with us in its defense. It must be a campaign of education among the common people, against the poison of class hatred, the fantasies of unbalanced enthusiasts, the sophistry of demagogic promises, and the wiles of false friends of humanity." Pleas for reunion with the Progressives were urged in the same month by Chase S. Osborn, Republican, of Michigan, and Frank A. Munsey, one of the most prominent of the Progressive leaders. The plan of Mr. Munsey found no support from Mr. Roosevelt. Early in May the executive committee of the party began to make plans for a reorganization, and an informal convention was held in Chicago. Plans for reorganization considered did not include amalgamation with the Progressive party. Governor Hadley of Missouri, who was one of the supporters of Mr. Roosevelt in the convention in 1912, but refused, on the nomination of Mr. Taft, to leave the Republican party, urged the purging of the party. He advocated a presidential primary and the holding of a reform convention. At the meeting of the executive committee of the national committee plans were made for a meeting of the general committee. Several prominent senators, including Senator Jones of Washington and Senator Cummins of Iowa, urged Mr. Hillea, chairman of the national committee, to hold a convention in 1914. On October 5 the executive committee held a meeting to discuss the advisability of such action. A meeting of the national committee was held in Washington early in December, and after the presentation of many proposals for reform in the method of conducting conventions, the committee adopted certain modifications in the rules of the party governing procedure at national conventions. The most important change related to representation. This was in response to the conditions which placed an undue power in the hands of the delegates from Southern States, in which the party as a party hardly exists. As the Republican party in the South consists almost entirely of Republican office holders, the South in public conventions has been a "solid South" in support of the candidates of the administration. It was this state of affairs which brought about the strongest protests against the renomination of Mr. Taft in 1912. In accordance with the change adopted by the committee, there will probably be 90 fewer delegates in the national Republican convention in 1916 than there were in 1912. Of the losses, 78 will fall upon the South. Alabama will lose 9 delegates; Arkansas 3, Florida 4, Georgia 10, Louisiana 7, Mississippi 8, North Carolina 3, South Carolina 7, Tennessee 3, Texas 15, and Virginia 9. Hawaii will lose 4 of its 6 delegates. Quite as

significant as this change was the committee's action in recognizing the primary laws of the various States and taking away from the committee itself the power to make up the temporary roll of the convention in so far as delegates selected from the primaries held under State law are concerned. The committee decided against a special convention to be held in 1914.

PROGRESSIVE PARTY. As noted above, the plan of union with the Republican party urged by Frank A. Munsey in January, 1913, was opposed by Mr. Roosevelt. On January 24 headquarters were organized in New York and Washington. At a banquet of the National Progressive Club held on February 12, Mr. Roosevelt was named as presidential candidate in 1916. A meeting of members of the party was held in Philadelphia on March 12. Mr. Roosevelt was the chief speaker. He said among other things:

"Our party is not in power; it is not in office; but it is our duty to formulate public opinion and prepare it so that it shall insist on action along the lines we indicate.

"We recognize that party organization and machinery, while imperatively necessary, are of use only if treated as a practical means of securing applied idealism.

"The Progressive party has been founded primarily to render social and industrial service. This means, of course, that there must be clean politics. Rotten politics in the end mean rotten business and rotten conditions generally.

"The most original form of work which we are undertaking is the work of the Progressive Service. The Progressive Service branch of our party activity is devoted to social research in organized, efficient shape, and is endeavoring to correlate it with the acts of law-making bodies and the needs of the public.

"We wish the business man to prosper. We hold that the right type of business man is the man who makes money by serving others, and if the service is great we wish the reward to be great. We draw the line on conduct, not on size. We do not intend to destroy big business where it is useful to the people; we intend to keep it, but we intend so to supervise and control it that we can be sure that it will be useful.

"We wish to see wages go up, if dividends go up. If the man at the top makes a fortune and the man at the bottom only a bare living, we hold that there is something wrong, and we do not intend to rest content until we right that wrong."

At this meeting \$12,000 was collected in money and pledges for the campaign fund of the party. The national committee met in the latter part of May. In a caucus vote a decision against amalgamation with the Republicans was made. Plans were made for the celebration of the first anniversary of the party in Chicago, Ill. The committee endorsed the constitutional amendment providing for the election of senators by direct vote of the people. A convention was held at Newport, R. I., beginning July 2. Addresses were made by Mr. Roosevelt, Oscar S. Straus, Gifford Pinchot, and Herbert Knox Smith. The first anniversary of the founding of the party was celebrated in Chicago on August 30. President Roosevelt and other leaders made addresses. On October 3 President Roosevelt

spoke at a dinner which was held previous to his departure for South America. He received a great ovation and speeches were made by Albert J. Beveridge, Gifford Pinchot, and others. Members of the national, executive, and congressional committees of the party held a joint meeting on November 8. Plans of amalgamating with the Republicans were repudiated by Gifford Pinchot in a statement made on December 6.

POLO. By winning two of the most spectacular polo matches ever played the United States retained possession of the International Challenge Cup. It is noteworthy, too, that the "four" who won the cup at Hurlingham, England, in 1909, were the players who successfully defended the trophy in 1913. These men were Harry Payne Whitney, Lawrence Waterbury, J. M. Waterbury, and Devereux Milburn. The British team composed Captain Leslie St. C. Cheape, Captain A. Noel Edwards, Captain R. Gerald Ritson, Captain Vivian N. Lockett, and F. M. Freake, who took Captain Edwards's place in the second match. The Duke of Westminster was the principal financial backer of the British team, which was better equipped for the matches than ever before. Forty ponies, the pick of the empire, were taken to the United States for use in the contests. In previous games the United States players had had a distinct advantage by reason of the fact that their ponies were speedier and better conditioned. This state of affairs, however, did not exist in 1913. In the practice matches the Americans showed surprisingly poor form and as a result a week before the date set for the first contest those in charge announced that the four to defend the cup would be Louis E. Stoddard, No. 1; Devereux Milburn, No. 2; Foxhall P. Keene, No. 3; and Malcolm Stevenson, back. Greatly to the surprise of polo experts, H. P. Whitney and the two Waterburys were not included in the line-up. An accident to Keene upset the plans made, and four days before the matches Whitney and the rest of the "big four" were named to defend the trophy.

In the first game the Americans started out with an assault that overwhelmed their opponents, quickly running up a score of six goals to Great Britain's one. Then the visitors rallied and met the attack with daring and brilliant play. During the game, J. M. Waterbury had two of the fingers of his right hand broken by a mallet. He was obliged to retire from the game, Louis E. Stoddard taking his place. The match finally ended with the Americans victors by a score of 5½ to 3. An unusual feature of this contest was the fact that the British players escaped any penalties.

F. M. Freake replaced Captain Edwards in the second struggle, while Stoddard again played for the injured Waterbury. The British players gave a masterly exhibition in this game, riding like demons and wielding their mallets with deadly effect. Stoddard was the American star, scoring four goals, while Captain Cheape rolled up the same number for his side. The penalties charged were the deciding factor in the outcome, the British losing ¾ of a goal and the Americans ½ of a goal. The final score was United States 4½, Great Britain 4¼.

Cooperstown won the American open championship for the second successive year, defeating Point Judith in the final match by 7 goals to 2¼. Cooperstown also captured the senior championship title by defeating Meadow

Brook $8\frac{1}{4}$ to $4\frac{1}{4}$, and the junior championship by defeating Great Neck $10\frac{1}{4}$ to 7. In the Westbury challenge cup matches, Great Neck defeated the Meadow Brook Hunters $9\frac{1}{4}$ to $8\frac{1}{4}$. The Newport championships were won by the Cooperstown Leopards, who defeated the Myopia Perroquets $5\frac{1}{2}$ to $1\frac{1}{2}$.

POOL. See BILLIARDS.

POPULATION STATISTICS. See VITAL STATISTICS.

PORTO RICO. POPULATION. The population of Porto Rico in 1910 was 1,118,012, compared with 953,233 in 1900. The largest cities with their populations in 1910 are as follows: San Juan, 48,716; Ponce, 25,005; Mayaguez, 16,563; Caguas, 10,354; Arecibo, 9612; and Aguadilla 6315.

AGRICULTURE. The most important industries of the island are those related to agriculture. Increasing attention has been given within the past two years to the development of agriculture, and for this purpose the insular board of commissioners of agriculture has cooperated with the agencies of the Federal government in private enterprises in distributing information as to the most effective means to be adopted and methods to be followed in working out the various problems of cultivation, preservation, treatment, and marketing of crops under local conditions. Improvements resulted from this are already noticeable throughout the island, both in the increased acreage under tillage and thoroughness in cultivation as well as in the better quality and greater quantity of the resulting products. One of the most important objects sought is the development of intensive farming, in which the rural inhabitants shall generally acquire proprietary interests and thus, participating in the activities, prosperity, and obligations of the country, break away from the condition of peonage in which through ancient system and tradition they have been held for centuries. The board of commissioners has a competent corps of scientists actively engaged in various investigations. Research work for the purpose of discovering methods of combating pests and diseases of cane and other crops has been conducted during 1913 throughout the island.

The most important crop is sugar. While the shipments of sugar during 1913 were 16,000 tons greater than during the preceding year, reaching a total of 333,000 tons, the average price received was \$16 less a ton, reducing the total value of sugar shipments approximately \$5,000,000 from that of 1912. The decreased valuation resulted from the depression in the sugar industry. The tobacco industry has been increasingly important in recent years. The growth of the industry is shown by the fact that the export of cigars in 1913 was 165,524,000, while in 1901 it was less than one-tenth this quantity. The output in 1913 was valued at \$5,800,162. The unmanufactured tobacco produced in 1913 was 6,952,467 pounds, valued at \$3,006,854. Less than one-fourth of the tobacco crop is shipped in the leaf, the remainder being shipped in manufactured form. The growing of coffee continues to be an industry of increasing importance in the island. The coffee exported to foreign countries in 1913 amounted to 49,571 pounds valued at \$8,378,346. The export of coffee to the United States amounted to 773,826 pounds, valued at \$132,970. The growing of coffee is being extended

throughout the works of the island, the soil and climate of which are successfully adapted to the production of the highest grades of coffee to be found in the world. The figures above indicate that Porto Rican coffee has found a much wider market outside the United States than within it. Great progress has been made in the growing of fruits of various kinds. The most important of these are oranges, pineapples, and grape fruit. In 1913 353,633 boxes of oranges, 360,232 crates of pineapples, and 216,216 boxes of grape fruit were exported to the United States. Much attention is also given to the raising of coconuts. The industries mentioned comprise the leading agricultural activities of the island.

COMMERCE. The value of exports and imports for the fiscal year 1912-13 aggregated \$86,003,627, or a decrease of \$6,628,259 from the corresponding total of 1911-12. Imports were valued at \$36,900,062 and exports at \$49,103,565, a decrease in the value of the former of \$6,026,411, and of the latter, \$601,848. A decrease in the value of exports to the United States is partially offset by an increase of \$1,732,930 in exports to other countries. The drop in the price of sugar was chiefly responsible for the decrease in the total value of shipments to the United States. In addition to the products noted above, the most important exports were hides, leather, and tallow. The most important articles brought into Porto Rico from the United States and foreign countries during the fiscal year were rice, valued at \$5,069,527, manufactures of cotton, \$2,012,640, cloths, \$1,808,895, manufactures of iron and steel, \$2,039,442, wheat flour, \$1,786,589, and pork, \$1,253,711.

ROADS. At the end of the fiscal year 1913, macadamized highways had been constructed to a total length of 1070 kilometers, of which 7.7 kilometers were completed during the year. Of the total, 657 kilometers had been constructed since the establishment of the civil government in 1901. At the end of the year there were 960 passenger and 67 freight automobiles using these highways. In recent years a considerable portion of road construction has been done by convict labor. Work on improvements of harbors at San Juan and Ponce were continued during 1913. These harbors when completed will make it much better adapted to receive shipping than before. A railroad pier at San Juan was nearing completion at the end of the year. A survey and estimate for the further dredging of San Juan harbor has been completed by the United States engineers, and is to be used as a basis for recommendation as to appropriation for that purpose.

IRRIGATION. One of the most important undertakings for the benefit of the island is the irrigation system which has been under way for several years and now approaches completion. The position, extent, and direction of the mountain ranges and the influence of prevailing winds in Porto Rico cause a precipitation of the atmosphere moisture upon the northern and eastern portions of the island, depriving large areas of otherwise fertile and productive lands to the south and west of the main divide of the rainfall essential to their use for agriculture. The owners of these lands for many years made use of primitive methods of irrigation which were too uncertain in their operation and efficiency to insure the satisfac-

tory and uninterrupted service necessary to success in the extensive agricultural enterprises in which the land owners were engaged. The principal crop of the region is sugar-cane, which requires a large and uninterrupted supply of moisture. Investigations which led up to the system now nearing completion were made in 1908, and an appropriation of \$3,000,000 was enacted into a law at the special session of the legislature held in September of that year. The system consists of three distinct but complementary projects: The Patillas reservoir, dam, and distributing system in the east; the Carite reservoir, dam, tunnel, and distributing system; and the Guayabal reservoir, dam, and distributing system with their subsidiary structures. In three years two-thirds of the work was completed, and the entire system will be effective early in 1914. The irrigation district is about 40 miles long, and averages two miles in width. The final legislation necessary for the completion of the work was enacted at a special session of the Assembly convened in June, 1913. The act passed at this session constitutes the general revision of the previous irrigation legislation to adapt it to the needs of the property owners and to properly protect the interests of the people of Porto Rico. It provides for the financing of a project in such a manner as to best serve the interests of the land owners by extending the payment required of them to meet the entire cost of the project over an estimated period of 43 years. The total cost of constructing the system will be about \$4,000,000.

EDUCATION. The daily attendance in the public schools of the island during the year averaged 117,360, a slight increase over the average of the previous school year. The total enrollment was 166,785. The legislative assembly of 1913 passed new laws providing for increased revenues for educational purposes. Appropriations for these purposes were increased by over \$1,000,000, and an increase of nearly 800 in the number of teachers was also authorized. Accommodations will be provided for at least 30,000 more pupils. The Assembly also appropriated \$150,000 for the construction of four high-school buildings in addition to the four now in use. Four of the high schools maintained by the department of education during the past year have offered a four-year course, while during 1913-14 four-year studies will be added to the course given by one of the other high schools. Certificates from the high schools of Porto Rico have been recognized by many of the leading colleges and universities on the mainland, in which graduates are pursuing courses. A commercial course has been added to the other studies given in the high schools, two years being required for its completion. The domestic science department of the Central High School at San Juan has awakened much interest. Special attention is being devoted throughout the educational system to practice courses such as manual training, household economy, and agricultural and commercial studies. Instruction in night schools throughout the island, numbering 299 up to 1913, had been confined to academic courses. In that year a night trade school was opened at San Juan, with classes in carpentry, brick-laying, plumbing, and automobile economics. The total enrollment in this school was 206. The interest in agricultural instruction

has been maintained throughout the islands to such an extent that in many places property owners have placed land at the disposition of the school boards for use in giving practical instruction. Military instruction in the schools meets with enthusiastic interest. The University of Porto Rico is the highest institution in the educational system. The board of trustees in 1913 completed plans to open a college of law, a college of pharmacy, and a university high school. Special evening classes in industrial work were begun in January, 1913. A college of agriculture and mechanic arts is being developed at Mayaguez, near the United States agricultural experiment station. This was started with an enrollment of 126 students.

HEALTH AND SANITATION. The sanitation service of the island was reorganized in accordance with the provisions of a law passed in 1912. The new methods of administration proved successful, though they at first met with some opposition. Results were accomplished in the eradication of bubonic plague, and several epidemics of typhoid fever. The first suspended case of bubonic plague was found on January 14, 1912, and by February 15, 1913, all evidences of plague infection were absent for a sufficient length of time to indicate its eradication. During this period, 36 persons died of the plague and \$227,000 was expended for emergency measures. At the time of the organization of the sanitation service few of the towns of the island had proper water supply and sewerage systems. As a result of the work of the service, a number of water systems had been installed and others are being projected, while sewerage systems are being planned and installed as rapidly as funds are available. The legislature of 1913 provided for the establishment of an institute for the study of tropical diseases. Aside from the work indicated, this institute furnishes a valuable course of instruction to medical officers and inspectors of the sanitation service as well as other persons interested in tropical diseases and sanitation work. The work of eradicating hook-worm, although far from complete, continues to progress as rapidly as funds available permit. During 1913, 29,816 cases were treated. These resulted in complete cure of 10,583. The most difficult problem confronting the health authorities at the present time is the prevalence of tuberculosis. The death rate from this disease in Porto Rico is approximately 100 per cent. The legislature of 1913 made a small appropriation to assist in the eradication of this disease. An important feature of the health work in Porto Rico has been the mosquito-eradication service, inaugurated in 1911 under the direction of Major Robert E. Noble, United States army. This work has resulted in a marked decrease in the number of mosquitoes in 85 per cent. of the towns of the island and a material decrease in the number of cases of malaria in districts where formerly its prevalence was serious. In Porto Rico mosquitoes that transmit malaria, elephantiasis, and yellow fever are found in nearly all parts of the island, and their eradication is of great importance in preventing the spread of the first two diseases and in preventing an epidemic of yellow fever.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the island in-

clude an insane asylum, and asylum for the blind, girls' charity school, and boys' charity school. These, with the exception of the blind asylum, are in San Juan. The latter is in Ponce. Penal institutions include the jails and penitentiary and reform school. On January 30, 1913, there were 1567 persons serving sentences in the penal institutions.

LEGISLATION. The first session of the seventh legislative assembly convened on January 13, 1913. During its sixty days of session, 118 laws and 24 joint resolutions were passed. Special attention was devoted to revenue measures for the purpose of increasing the amount of funds available for education and public works. Provision was made for the erection of seven district hospitals and several other laws were enacted in the interest of health and sanitation. In addition to these acts, there were others to promote commerce and agriculture, and other interests of the people of the island, and the legislature completed its work by passing the necessary bills to appropriate funds for the conduct of the government during the fiscal year 1914. On June 20, 1913, the legislature was convened in special session for the purpose of modifying and completing the legislation necessary for financing, completion, and operation of the irrigation project referred to above, and the creation of an agricultural and industrial bank.

Other important measures passed at the legislative session of 1913 included amendments to the employers' liability law and the creation of a commission to make a study of the employers' liability. Measures were passed regulating the employment of women and children for an eight-hour day under certain conditions. A law was enacted to aid in the suppression of tuberculosis, and provisions were made for the registration of foreign corporations. As a whole, the laws passed during the regular and special sessions give to the work accomplished a progressive character, highly creditable to the legislature of Porto Rico.

The island was free from political agitation in 1913. In October President Wilson appointed Arthur Yager governor to succeed George R. Colton.

PORTUGAL. A European republic (since 1910) occupying the western coast of the Iberian Peninsula. The capital is Lisbon.

tracts and the results of the census of December 1, 1911, compared with that of 1910, with density per square kilometer in 1911, are shown in the foregoing table.

Of the total population in 1911, 2,828,691 were males and 3,131,365 females. Foreigners in the country numbered 41,197, of whom 20,517 were Spaniards and 12,143 Brazilians. Lisbon had (1911) 435,359; Porto, 194,009; Braga, 30,436; Setúbal, 24,687; Funchal, (Madeira), 20,844; Coimbra, 20,581; Evora, 17,901; Coyilba, 15,745; Faro, 12,680; Tavira, 11,665; Portalegre, 11,603; Aveiro, 11,523; Elyas 10,645; Vianna do Castelo, 10,486; Beja, 10,113; Angra (Azores), 10,067. There were (1909) 34,150 marriages, 176,707 births, 111,395 deaths. Emigrants, 1910, 39,515; 1911, 59,661 (of whom 48,202 went to Brazil); 1912, 88,929. Alarm is felt in Portugal over the excessive emigration and efforts are being made to restrict it.

EDUCATION. Although primary instruction is nominally compulsory, more than 70 per cent. of the people over six years of age remain illiterate. A decree of March 29, 1911, was designed to combat old methods and provided for strict enforcement of laws regarding elementary education. There were then reported to be 7120 primary and 32 secondary schools. There are special schools, but they are ill attended. Higher education is provided in the universities—Coimbra, Lisbon, and Porto (Oporto).

The law (1911) separating church and state has been enforced; no appropriation is made for worship; all creeds are tolerated.

PRODUCTION. Agriculture engages three-fifths of the population. Crops and pasture occupy 26.2 per cent. of the total area; vineyards, 3.5; orchards, 3.9; forest, 17.3; 43.1 per cent. is barren or uncultivable. The production of wheat in 1912 was 3,225,000 quintals. Complete production figures are unavailable. In the highlands cereals, flax, hemp, and vines are grown; the products of the lowlands are rice, olives, almonds, figs, and citrous fruits. Livestock is raised. The mineral output is important. Output of sulphur in 1911, 272,052 metric tons; copper, 811 tons; copper precipitate, 3963; cupreous pyrites, 10,427; iron, 19,541; arsenic, 887; anthracite, 10,610; silver ore, 3667; uranium, 814; wolfram, 902. Salt, marble, gypsum, and lime are worked. The manufactured products are gloves, silks, woollens, linens, cottons, metal and metal wares, tobacco, cigars, etc. The value of the fisheries products in 1910 was 5,919,842 milreis (sardines, 2,943,778 milreis; tunny fish, 322,696; cod, 440,018; whale, 22,790).

COMMERCE AND COMMUNICATIONS. The special trade is shown in the table below in contos (1 conto=1000 milreis) for three years: A=raw materials, B=foodstuffs, C=yarns and textiles, D=machinery, implements, etc., E=miscellaneous manufactures, F=live animals, G=tare, C. and B.=coin and bullion, and includes all precious metals.

The principal articles of export in 1911, with values in thousands of milreis, were wine, 11,933; cork, 4378; animals, 3943; fish, 3104; tropical fruits, 1635; cotton textiles, 1185; timber, 905; copper, 869; olive oil, 544. The principal countries of origin and destination (values in thousands of milreis) were the United Kingdom with imports, 10,398, and exports, 6935; Germany, 12,128 and 3300; United States, 5835 and 842; Belgium, 5267 and 1070; France, 5238 and 1359; Spain, 5106 and 5764; Portuguese colonies, 2574 and 2233; Brazil, 1854 and 6316; Netherlands, 1816 and 755; Italy, 1714 and 629; Norway, 1320 and 190. Vessels entered in the 1911 trade, 10,370, of 19,154,239 tons. Merchant marine (1911), 66 steamers, of 70,193 tons, and 259 sail, of 43,844.

Railway lines in operation January 1, 1913, 2993 kilometers, of which 1148 kms. state-owned. Telegraph lines (1912), 7089 kms.; wires, 19,658 kms.; stations, 580; wireless stations, 6, with 8 on board vessels. Urban telephone lines, 410 kms., wires, 1891; interurban lines, 388, wires, 779. Post offices, 4081.

FINANCE. By a recent decree the name of the monetary unit has been altered from milreis to escudo, with no change in value. The escudo is divided into 100 centavos (1 centavo = 10 reis) and the milreis into 1000 reis. The budget details below for 1913-14 are given in thousands of escudos.

Revenue	1000 es.	Expenditure	1000 es.

Total	75,894		74,915

The foreign debt stood December 31, 1912, at 176,376,650 escudos, the internal debt at 708,131,002.

ARMY. Military service is obligatory between the ages of 20 and 25 and the army law in force provides for active reserve and territorial forces organized on a militia basis. In his 21st year the recruit is called out for 15 weeks' service in the infantry, 20 in the artillery and 30 in the cavalry, and every year thereafter until the end of his 30th year. There is an annual training of two weeks. Subsequently he is enrolled for ten years in the reserve and for five years in the national army. The permanent force is maintained during the non-training season by voluntary enlistment. The army is organized in eight divisions, each division corresponding to a military district, and one cavalry brigade, while a permanent

force of between 7000 and 12,000 is recruited by voluntary enlistment for garrison service in the Azores and Madeira. Each divisional area furnishes, in addition to the first line, two reserve infantry brigades and certain territorial formation. The peace strength of Portugal, exclusive of colonial garrisons, is estimated at about 30,000, which could be increased to a war footing of about 120,000 with ultimately 140,000 more trained men available.

The state patronizes and subsidizes volunteer societies with military instruction for young men between the ages of 17 and 20, especially those interested in rifle practice. The fundamental unit for battle is the division, each division consisting of four infantry regiments, one cavalry regiment, one artillery regiment, one company of army service corps, one company of train, one sanitary company, one company of sappers, one section of pontoniers, one searchlight section, one section of field telegraphists, one section of wireless telegraphists. The metropolitan army embraces eight divisions on the continent and three independent commands in the Azores and Madeira.

There is also a reserve and territorial army, the former being organized on somewhat the same basis as the army, while the territorial army consists of those subject to service between the ages of 17 and 20, and 40 and 45, the staffs being composed of senior officers of reserves and retired veteran officers. There is also a republican guard which acts as police, formed of 146 officers and 5000 men and a fiscal guard for customs duty with 92 officers, 5100 men and 300 horses, being organized as 20 companies of infantry and two squadrons of cavalry. The colonial army of Portugal is officered by volunteer officers and the natives in the ranks are paid by conscription. There is a total of 649 officers, 9759 men, of which 2532 are Europeans, 7227 natives with 300 horses. In Angola and Mozambique there are various companies of second-line troops.

NAVY. The fleet includes 27 vessels of 22,100 aggregate tons (excluding training ships, yachts, etc), detailed as follows: 1 armored coast-defense vessel (3030 tons), 4 cruisers (9410), 6 gunboats (2573) of date 1895-1909, 11 gunboats (4300) of date 1874-90, 1 torpedo gunboat (535), 4 torpedo boats (252). Under construction, 2 torpedo-boat destroyers and 3 torpedo boats.

In May, 1913, the government issued orders with a naval construction syndicate of British firms for the development of a new squadron to consist of 2 cruisers of 2500 tons and 20 knots speed, 6 destroyers of 900 tons and 32 knots speed, 3 submarines (350 tons and 14 knots), and a submarine depot ship (850 tons and 15 knots), to be provided in two years.

GOVERNMENT. The republic was proclaimed October 5, 1910, and sanctioned by the National Assembly August 21, 1911. The constitution of August 21, 1911, provides for a president, to be elected every four years by Congress. He is not eligible for reelection. He appoints his ministers, who are responsible to the Parliament. This body is composed of a senate of 71 members elected for six years, and a chamber of 164 deputies directly elected for three years.

The dethroned monarch was Manoel II., born 1889, who came to the throne in 1908 upon the assassination of his father and elder brother.

He married, September 4, 1913, Princess Augusta of Hohenzollern.

The president of the republic in 1913 was Dr. Manoel de Arriaga (1911-15). The ministry as constituted January 9, 1912, was as follows: Alfonso Costa, premier and minister of finance; R. Rodriguez, interior; Alvaro de Castro, justice; Pereira Bastos, war; J. Freitas Ribeiro, marine; A. Macieira, foreign affairs; M. da Silva, public works; Almeida Ribeiro, colonies.

HISTORY

THE CABINET CRISIS. Late in December, 1912, the dissensions within the coalition ministry of Dr. Duarte Leite became so strong that the cabinet resigned. During the first week in January Antonio José de Almeida, chief of the Republican Evolutionist group, attempted to form a new ministry with a programme of amnesty for political offenders, economy, and revision of the separation and education laws. Senhor de Almeida failed to obtain the necessary support from the Independents, however, and was therefore unable to form a government. Senhor Alfonso Costa, who was minister of justice under the provisional government, then established a Democratic ministry constituted as follows: President of the council, Alfonso Costa; justice, Alvaro Castro; war, Pereira Bastos; public works, Antonio Maria da Silva; colonies, Almeida Ribeiro; finance, Mar-noco Souza; marine, Freitas Ribeiro; foreign affairs, Antonio Macieira; interior, Rodrigo Rodriguez. The Costa cabinet gained the allegiance of the Democratic, Unionist, and Independent groups; while Senhor Almeida led the Republican Evolutionist opposition. The ministerial declaration of January 11 insisted upon the scrupulous observance of the separation law, and the erection of a ministry of public instruction; it promised to improve public service, to maintain friendship with Great Britain, and cultivate closer relations with Brazil, to achieve financial equilibrium in the budget of 1914, to establish an administrative code, to revise the electoral law, to reform the Lisbon police, to give the colonies greater financial and administrative autonomy, to develop railways, and to reduce the cost of living.

INSURRECTIONS. The government was repeatedly disturbed, but at no time seriously menaced by Syndicalist and Monarchist plots. On the night of April 26 the Radical Republican and Syndicalist federations organized an uprising; bombs were thrown and revolvers discharged, but no casualties were reported. The most serious result of the incident was the arrest of 150 additional political suspects. In June the Camoens anniversary celebration was interrupted by Syndicalist bomb-throwers, and an indignant crowd burnt the Syndicalist meeting place. Again on July 20-21 bomb outrages were perpetrated. On September 25 a plot to assassinate the premier was discovered and thwarted. On October 21 a plot of more serious dimensions, this time organized by the Monarchists, resulted in disturbances in Lisbon. Wires were cut, railways damaged, and a bridge dynamited, but the rioters were arrested, and order was restored. Among the Monarchists arrested was Senhor Carvalho Monteiro, a well-known millionaire. The frequency of insurrections in Portugal, the numerous arrests, and the unmistakable prevalence

of discontent among many classes of the population, were interpreted by observers (and notably by Mr. McCullagh writing for the *Nineteenth Century and After*) as indications that the Republican anti-clerical régime was not proving itself an unqualified success. Furthermore, the alleged cruel and arbitrary treatment of political prisoners was vehemently censured, and the government was obliged to promise mitigatory measures.

PARLIAMENT. On June 13 Dr. Costa informed Parliament that the budget expenditures for the coming year would leave a surplus of over \$1,000,000, of which about one-half would be expended on the navy. In the supplementary parliamentary elections of November, the Democrats won 34 out of 37 contested seats, thus giving Senhor Costa a considerable majority. Parliament was opened on December 3. Victor Hugo Azevedo Continho was elected president of the Chamber of Deputies, and M. Braamcamp of the Senate.

The sternly anti-clerical policy of the Costa government was well illustrated by the haling of the bishop of Oporto to a police court for administering confirmation in his diocese, from which he had been expelled. About the first of June the Portuguese legation at the Vatican was abolished.

PORTUGUESE EAST AFRICA (or **MOZAMBIQUE**). A Portuguese African colony. Area, 293,860 square miles; population, about 3,120,000. Capital, Lourenço Marques, with 10,000 inhabitants. The trade is divided among the state territories, the Mozambique Company, and the Nyassa Company. Railway lines, about 365 miles. The 1910-11 budget showed revenue, 5,418,332 milreis; expenditure, 5,118,832. The governorship in 1913 was vacant.

PORTUGUESE GUINEA. A Portuguese West African colony, covering 13,940 square miles and having about 820,000 inhabitants. Capital, Bolama. The imports in 1908 were valued at 875,155 milreis and the exports at 492,238. The 1910-11 budget balanced at 309,900 milreis. The colony includes the islands of Bolama and Bijagoz. In 1913 the governor was Lieut. C. A. Pereira.

POST, GEORGE BROWNE. An American architect, died November 28, 1913. He was born in New York City in 1837; graduated from the civil engineering course in New York University in 1858; studied architecture with Richard Morris Hunt, but at the outbreak of the Civil War discontinued his studies and went to the front as a captain in the Twenty-second New York Volunteers. He rose through the ranks of major and lieutenant-colonel to that of colonel. After the war he returned to New York and opened an office in partnership with Charles D. Gambol. One of his earliest commissions was the old Equitable Life Assurance building which was burned in 1912. Among other buildings in New York City which he designed are the Stock Exchange, the Produce Exchange, and the Cotton Exchange, the Pulitzer building, the Western Union building, and many other business structures. He was also the designer of the residence of Cornelius Vanderbilt at 57th Street and Fifth Avenue. Among the best-known of his structures outside of New York City is the Wisconsin State Capitol. He was a member of the national advisory board on fuels and structural materials from 1906 until his death, and from 1909 until

his death was a member of the National Bureau of Fine Arts. In 1904 he was a member of the board of commissioners of the St. Louis Exposition. In 1911 he was awarded a gold medal by the American Institute of Architects.

POST-IMPRESSIONISTS. See PAINTING AND SCULPTURE.

POSTAL SAVINGS BANKS. During the past decade there has been a phenomenal growth of postal savings banks throughout the world. From data compiled by the Department of Commerce it appeared that the number of depositors in such banks had increased from 28,931,000 in 1901-03 to 52,176,000 in 1911-13. The deposits had increased from a total of \$1,588,908,000 in 1901-03 to \$2,691,860,000 in 1911-13. During this decade the greatest increases occurred in the following countries: Belgium, France, Italy, Russia, United Kingdom, Japan, Egypt, and New Zealand. The accompanying table gives a complete summary for the period 1911-13. See also BANKS AND BANKING; and FINANCIAL REVIEW.

POTASH. See FERTILIZERS.

POTATOES. The world's potato crop in 1913 was about normal or up to the average production, which is approximately 5,000,000,000 bushels. The North American yield was quite low but elsewhere the yields were sufficiently large to offset the shortage. Germany produced the largest crop in her history, the total production amounting to 1,986,246,000 bushels, with an average yield of over 235 bushels per acre or 12 bushels per acre more than in 1912. The crop of 1913 exceeded the one of 1912, which was also a record crop, by 143,559,000 bushels. Of the tubers harvested in 1913, 84,032,000 bushels, or 4.2 per cent., were diseased. Statistics for 10 years showed that low production was coincident with a low percentage of disease injury. The 1913 large crop was not considered as having been badly attacked by disease. During the year more than 300 factories were engaged in Germany in drying potatoes and in the manufacture of potato chips and potato meal, over 15,000,000 bushels

being used for this purpose. The production of potatoes in the United Kingdom in 1913 was also high, amounting to about 350,000,000 bushels and exceeding the previous year's yield, the excess being about 45,000,000 bushels in Ireland and 30,000,000 bushels in England and Wales. The Canadian crop was approximately 80,000,000 bushels, or about the same as in 1912, but 20,000,000 bushels less than the heavy crop of 1909. This production just about satisfies the Canadian demand.

According to estimates by the Department of Agriculture the United States produced 331,525,000 bushels on 3,688,000 acres, as compared with 420,647,000 bushels on 3,711,000 acres in 1912, a decrease of 89,122,000 bushels and of 43,000 acres. The average yield per acre was only 90.4 bushels, being 23 bushels less than in the previous year. The average farm price on December 1 was 68.7 cents per bushel and the total crop value on that date was \$227,903,000, while in 1912 the price on the corresponding date was 50.5 cents, making the value of the much larger crop \$212,550,000. The leading States were Michigan with 33,600,000 bushels; Wisconsin with 32,155,000; and Minnesota with 30,250,000 bushels. These yields were only about from 2 to 3 million bushels smaller than the year before, but in many of the States stricken by the severe drouth of the season, the crop was only half of normal. The States following in production those mentioned were Maine with 28,160,000 bushels; New York with 26,640,000 bushels; and Pennsylvania with 23,320,000 bushels. New York produced 11,520,000 bushels and Pennsylvania 5,565,000 bushels less than in 1912, while Maine yielded 4,994,000 bushels more. In Ohio, Indiana, Illinois, Iowa, Missouri, and Kentucky the crop was less than half the previous crop. The lowest average yield per acre, 38 bushels, was secured in Missouri. In addition to Maine the States reporting larger crops than in 1912 were Rhode Island, Virginia, Georgia, Alabama, Mississippi, Louisiana, Oklahoma, Arkansas, Wyoming, Colorado, and Utah. In Colorado the increase amounted to 1,125,000 bushels, but in all the other States it was small. Maine with its increased acreage and an average yield of 220 bushels per acre, produced a large quantity of seed stock for shipment beyond its borders. See HORTICULTURE, paragraph on Quarantine.

POTTERY. See CLAY-WORKING INDUSTRIES.

POWELL, LYMAN PIERSON. An American clergyman and educator, appointed in 1913 president of Hobart College. He was born in Farmington, Del., in 1866. He graduated from Johns Hopkins University in 1890. For two years following he was a graduate student at that university, and in 1902-3 took post graduate studies at the University of Wisconsin. From 1893-95 he was a fellow of the University of Pennsylvania, and during the same period was university extension lecturer. In 1897 he graduated from the Philadelphia Divinity School. He was ordained a priest of the Protestant Episcopal Church in 1898. Following a year's pastorate in Ambler, Pa., he became rector of Saint John's Episcopal Church at Lansdowne, Pa., and in 1903 of the Protestant Episcopal parish at Northampton, Mass. He has written much, and among other works: *The History of Education in Delaware* (1893); *Christian Science—The Faith and its Founder* (1907); *The Art of Natural Sleep* (1908); *The*

Emmanuel Movement in a New England Town (1909); and *Heavenly Heretics* (1910). He was also the editor of several series of books, including *American Historic Towns*, *Current Religious Literature*, and a *Devotional Series*.

POWER, ELECTRIC, TRANSMISSION OF. See TRANSMISSION OF ELECTRIC POWER.

POWERS, HORACE. An American jurist and public official, died December 9, 1913. Born at Morristown, Vt., in 1835, he graduated from the University of Vermont in 1855; studied law, and in 1858 was admitted to the bar. In the same year he was elected a member of the State House of Representatives. In 1872-3 he was a member of the Senate; in 1874 was again elected to the House, serving as speaker; from 1875 to 1890 was judge of the Supreme Court of the State; and from 1891 to 1901 representative in Congress.

PRECIOUS STONES. See GEMS AND PRECIOUS STONES.

PREECE, SIR WILLIAM HENRY. An English engineer and inventor, died November 6, 1913. Born in 1844, he received his education in science and engineering in France and Germany; from 1872-78 was engaged in railway and electrical undertakings, especially in Saxony; and he built electric railways in the years following in Italy and Switzerland. He first introduced the talking machine and telephone into England, and held many patents connected with the telegraphs and telephones. For several years he was engineer-in-chief and electrician of the British Post Office. In 1898 he delivered several lectures in the United States, in the course of which he contended that American technical education was far ahead of that given in the British schools. He wrote many scientific papers for engineering journals.

PRENDERGAST, SIR HARRY NORTH DALRYMPLE. A British soldier, died July 25, 1913. He was born in India in 1834 and was educated at Brighton College and at Addiscombe. In 1854 he entered the army. He served in the Persian War in 1857; in the Abyssinian War in 1867-68; and in the latter year was in command of the sappers with the Indian Expedition to the Mediterranean. In 1885-86 he commanded the expedition which resulted in the annexation of Upper Burma. He was afterwards in command of several important districts in India and Burma. The Burmese War brought his active military career to a close, but he afterwards held many important positions in the city government of Burma. He wrote many articles for reviews and magazines.

PRESBYTERIAN CHURCH. The total number of Presbyterians in the United States in 1913 was 2,027,598, with 16,286 churches, and 13,740 ministers. There are four large and several smaller denominations under the Presbyterian system. The largest is the Presbyterian Church of the United States of America, known as the Northern Presbyterians, with 1,402,533 communicants, 9987 churches, and 9286 ministers, in 1913. The Presbyterian Church of the United States known as the Southern Presbyterians had, in 1913, 300,771 communicants, 3049 churches, and 1781 ministers. Other bodies which are treated under their own titles are the Cumberland Presbyterian Church, the United Presbyterian Church, and the Reform Presbyterian Church. A very small body is the Associate Presbyterian de-

nomination, which numbered in 1913, 786 communicants, 22 churches, and 12 ministers.

The Northern Presbyterian Church or the Presbyterian Church in the United States of America is divided into 40 synods, with 295 Presbyteries. The Sunday School members in 1913 numbered 1,281,961. The total contributions received for all purposes amounted to \$22,293,808. Of this amount, \$18,835,643 was for congregational purposes; \$1,928,363 for home missions; \$1,530,795 for foreign missions; and \$369,730 for colleges. The chief administrative body is the General Assembly, which has general charge of its work. The missionary work of the denomination is under the control of the board of foreign missions and the board of home missions. There were in 1913 27 foreign missions; 162 stations; 1155 missionaries; and 129,009 communicants. There were distributed 155,773,673 pages of *Christian Truth* in 20 languages. Educational work of the denomination is in charge of the board of education. Other important boards are the board of publication and Sunday school work, the board of church erection, and the board of ministerial relief and sustentation. The denomination supports 11 theological seminaries and many colleges and universities. In the latter there were, in 1913, 22,776 students.

The General Assembly of 1913 met, beginning its sessions on May 15, with John Timothy Stone, D.D., as moderator. Among the important acts of the assembly were the following: The proposed world conference of all Christian churches was approved; a resolution was adopted permitting the board of home missions to present to college and seminary students a declaration pledging three years in some form of Christian mission service under the American flag; approval of schools for lay workers. Resolutions on marriage and divorce to be accepted by Presbyterians were adopted. Social service was declared to be secondary to evangelism as a mission of the church. A board of temperance was constituted. Church members were forbidden in any way to aid or abet the evil of intemperance. A committee on the white slave traffic was appointed. See also RELIGIOUS DENOMINATIONS AND MOVEMENTS.

PRESBYTERIAN CHURCH, CUMBERLAND. See PRESBYTERIAN CHURCH.

PRICES. The increased cost of living has been a subject of general discussion throughout the world for a number of years. Since 1895 or 1896 with only temporary recessions there has been a continuous rise of prices. Thus *Bradstreet's* index number, being the sum of wholesale prices of 96 commodities, rose from an average of 5.9124 for the year 1896 to 9.2290 for November, 1913. *Bradstreet's* index for some other years was as follows: 1900, 7.8839; 1905, 8.0987; 1906, 8.4176; 1907, 8.9045; 1908, 8.0094; 1909, 8.5153; 1910, 8.9881; 1911, 8.7132; 1912, 9.1867. In 1913 there was a continuous decline in the general price level from 9.4592 for January to 8.9521 for June. Thereafter the level rose gradually and continuously. The indexes of the *London Economist* and the *Statist* (Sauerbeck's) indicated a perceptible decline of prices from August to the close of the year. Thus the *Statist* index was 86.4 for January and only 83.3 for November. This index takes the average for the eleven years 1867-1877 as its base,

or 100. It reached a minimum of 61 for 1896; rose to 68 for 1899; to 72 for 1905; to 80 for 1907; fell to 73 for 1908; but rose steadily again to 80 for 1911, and 85 for 1912. For the first ten months of 1913 it averaged 85.4. In Canada the level of prices, as shown by the Department of Labor index, rose almost steadily through the year. In January it was 136.2 and in November 138.4. This rise in Canada contrasted sharply with the fall in Great Britain.

From Australia also came reports of a very great rise of prices. A New Zealand commission reported a rise of 20 per cent. in the prices of bread stuffs from 1895 to 1911. The statistician of the Australian commonwealth reported an increase of staple commodity prices of 25.1 per cent. from 1901 to 1913. During the same period wages had risen 23.9 per cent.

The bureau of labor statistics of the Department of Labor published among its *Bulletins* a series on *Retail Prices and Cost of Living*. This showed the relative level of prices for the following fifteen articles at various dates since 1890: Sirloin steak, round steak, rib roast, pork chops, bacon, ham, lard, hens, wheat flour, corn meal, strictly fresh eggs, creamery butter, potatoes, granulated sugar, and fresh milk. The index number for these articles for the ten years 1890-99 was taken as 100. When weighted according to their average consumption in workingmen's families, their index number fell to the minimum of 95.2 for the year 1896. It rose to 103 for 1900; to 116.4 for 1905; to 144 for 1910; to 143 for 1911; to 154.2 for 1912; and to 158.1 for December, 1912. For the months of 1913 it varied as follows: January, 157.9; February, 155.8; March, 156.7; April, 158.9; May, 157.2; June, 159.2; July, 163.6; and August, 166.1. There was thus an indicated increase in prices of 74.4 per cent. over 1896; and of 61.2 per cent. over 1900. When the prices of these articles were not weighted according to consumption their average showed a rise from 94.9 in 1896 to 102.9 in 1900; 148.5 in 1910; 157.9 in 1912; and 171.3 in August, 1913. The increase from August, 1912, to August, 1913, was 8.6 per cent.; while the entire increase of August, 1913, over the average for 1896 was 8 per cent.

AMERICAN ACADEMY OF POLITICAL AND SOCIAL SCIENCE. This body devoted its annual meeting at Philadelphia in April to considerations on the cost of living. Family standards were discussed by Professor S. N. Patten and Martha Bensley Bruère, the latter contending that \$1200 was the minimum for decent family living. Other papers discussed the difficulties of putting the farmer in closer contact with the consumer; the possibilities of the new scientific home management; the effects of cold storage; the advantages of municipal control of terminal markets; the control and distribution of immigration; the effect of the changing value of money; the relation of advertising and false capitalization to prices. Mrs. Charlotte P. Gilman, in a paper on "Waste of Private House-keeping," contended that housework should be more specialized. She put the present waste of labor at "over 40 per cent. of the world's full output," i.e. fifty women do the work of fifty men when ten could do it as well; the waste of plant she put at 90 per cent. and the waste in purchasing at 60 per cent. All these

wastes and many other advantages she thought would follow a more wholesale plan of providing food and shelter. Wages in the United States and the need of minimum wage laws were discussed by Professor Henry R. Seager and Professor Scott Neering. Dr. Albert Shaw found in the cooperative movement a means of reducing living costs. See **FINANCIAL REVIEW** and **PARCEL POST**.

PRINCE EDWARD ISLAND. A province of the Dominion of Canada. Area, 2184 square miles; population (census of June 1, 1911), 93,728 (103,259 in 1901). Charlottetown is the provincial capital, with 11,198 inhabitants in 1911. A lieutenant-governor administers the province—Benjamin Rogers in 1913 (appointed June 1, 1910). Premier in 1913, John A. Mathieson. See section so entitled under **CANADA, DOMINION OF**.

PRINCETON UNIVERSITY. The total enrollment in all departments of the university in the collegiate year 1913-14 was 1599, divided as follows: Graduate school, 176; school of electrical engineering, 13; undergraduates, 1355; students qualified for regular standing, 47; special students, 4; students pursuing partial courses 4. The faculty and instructors numbered 202, and the officers of administration 15. Among the changes in the faculty made since the collegiate year 1912-13 are the following: Dr. Pierre Léon Boutez was elected professor of mathematics; Dr. Charles Grosvenor Osgood was elected professor of English; Dr. George Dobbin Brown was appointed reference librarian of the university; Philip Marshall Brown was appointed assistant professor of international law for 1913-14; Dr. Herbert Spencer Murch was elected assistant in English; Dr. William Ezra Lingelbach was appointed lecturer on modern history for the year 1913-14; and Dr. William Ernest Hocking, assistant professor of philosophy at Yale University, was appointed lecturer on philosophy. Dr. Charles Green Rockwood, Jr., professor of mathematics, emeritus, died on July 2, 1913. Francis Landey Patton, former president of the university, and Stuart professor of ethics and the philosophy of religion, resigned from active service during the year. He was elected professor emeritus. Professor Alexander Thomas Ormond, the McCosh professor of philosophy, resigned to become president of Grove City College, Grove City, Pa. Professor Henry Van Dyke, Murray professor of English literature, resigned to become minister to the Netherlands. New buildings for the graduate college were ready for occupancy in September, 1913, and were dedicated on October 22. The buildings consist of Thomson College, gift of the late Mrs. J. R. Thomson Swann; Proctor Hall, the gift of William Cooper Proctor of the class of 1883, in memory of his parents; Pyne Tower, the gift of M. Taylor Pyne of the class of 1877; Wyman House, contributed by the estate of Isaac C. Wyman; and the Cleveland Memorial Tower, in memory of former President Grover Cleveland, erected out of popular contributions collected by the Cleveland Monument Association. The disbursements for the work of the university in 1912-13 amounted to \$812,823, and the receipts to \$734,260. The total assets were, up to the end of

the year, \$5,535,037. The library contained at the end of the year 306,218 volumes and 76,383 unbound periodicals and pamphlets. The president is John Grier Hibben, Ph.D., D.D. For additional notes relating to the history of the university during 1913, see **UNIVERSITIES AND COLLEGES**.

PROFESSIONAL SCHOOLS. See **UNIVERSITIES AND COLLEGES**.

PROHIBITION. See **LIQUOR REGULATION**.

PROSTITUTION. In no previous year has there been such an extensive and determined movement against the so-called social evil. There was a sincere and effective enforcement of the white-slave law, the constitutionality of which was upheld by the United States Supreme Court; there were investigations and repressive activities in many cities; the education of public opinion was carried on through the press, the pulpit, platform, and theatre; and there was formed in New York City a voluntary bureau of social hygiene for scientific investigation. See the special article on this bureau for its study of conditions in New York City. Data were presented to the public showing that 50,000 girls are drawn annually into a life of vice; that of the 300,000 professional prostitutes in the country, about one-sixth die each year; and that the annual cost of sexual immorality and venereal diseases in this country is three billions of dollars. Ex-Secretary of War Stimson declared that the extent of venereal infection among American soldiers was "shameful beyond that of the army of any other civilized nation." Army and naval records showed that as a rule ten per cent. of the soldiers and sailors were disabled through venereal contagion. The marked public interest expressed itself in Massachusetts by the passage of an act providing for a commission of five with extensive powers to conduct a State-wide investigation of commercialized vice.

In Chicago, where the vice commission had made a thorough and comprehensive investigation in 1911, the board of aldermen began another inquiry through a committee created by it. The charge was made that this was largely a political move to ward off immediate action in the expectation that the reform movement would soon spend its force. Investigations were made and reports issued in Portland (Ore.), Atlanta, Syracuse, and Rochester, in addition to those of New York and Philadelphia noted below. All reports revealed essentially the same conditions. They also established the national character of the problem through the fact that those thriving upon the vice move from city to city, taking their women with them; they thus avoid the local points of greatest repression.

CALIFORNIA. In California the most notable legislation of the year was passed in the red-light injunction and abatement bill. This law was the result of the persistent activities of the women of the State, who carried on a campaign of publicity in all cities and towns and exerted an insistent and direct political pressure upon the legislature. The law was aimed at the segregated districts which were found in every city of the State. It declared houses of prostitution public nuisances; held both proprietor and owner responsible; enabled any citizen, whether damaged or not, to bring action; and provided for a fine against the property itself. The women's or-

ganizations in the different cities provided for the care of any prostitutes set free by the enforcement of this law. Another law, passed following the Diggs-Caminetti case, prohibited the transportation of women from one county to another for immoral purposes.

IOWA. In Iowa had originated in 1909 the principles embodied in the above injunction and abatement law. Following Iowa five other States enacted a similar measure; but in September, 1913, the Iowa law was declared void owing to the discovery that a formal step in the legislative processes of enactment had been omitted. Meanwhile the law had showed that it was an effective measure of repression, since it placed in jeopardy the owner of the house where prostitution was carried on.

WHITE SLAVE ACT. The Mann act forbidding the transportation between States of women for immoral purposes was attacked on the ground that by it the national government usurped the police powers of the States and interfered with the right of individuals to travel freely from State to State regardless of motive. The Supreme Court of the country on February 24, in a decision written by Justice McKenna, upheld the act against both charges. It admitted the power of the States to control the morals of citizens, but, since there is a domain to which the jurisdiction of the States does not reach, this act "does not encroach upon the jurisdiction of the States." By the Constitution Congress is given power over transportation between the States, and this act was declared by the court to be an expression of that power just as was the pure food and drug act. As to the right above mentioned the decision declared that a right exercised in morality cannot be made to sustain a right to be exercised in immorality. In this respect the white slave act differs not at all from the laws prohibiting the sending of obscene literature through the mails or articles for immoral use, or prohibiting lotteries.

Up to about March, 1913, there had been 337 convictions under the Mann act, with total sentences of 607 years and \$66,600 fines. There were 106 cases then pending; and there had been 35 acquittals. An analysis of the sentences showed that the judges as a rule gave much weight to the degree of coercion involved. They thus distinguished those cases in which the defendant persuaded a girl or woman of previous good character from those where defendant habitually associated with prostitutes and lived off their earnings, and from those where defendant, earning a legitimate livelihood, occasionally associated with immoral women. Thus, a Pittsburgh man convicted under the law was sentenced to imprisonment for one day and a fine of \$200; but in other cases the maximum penalty of five years in prison and a fine of \$5000 has been imposed.

Diggs-Caminetti Case. The most notable case of the year under this law was the trial of two San Francisco business men, Diggs and Caminetti, both married, for transporting two girls to Nevada. The notoriety given the case was due to the local prominence of the persons involved and an alleged attempt through political influence to have their prosecution discontinued.

NEW YORK. Following the sensational revelations connected with the Rosenthal murder in

Copyright, 1913, by Wurts Bros., N.Y.

PRINCETON UNIVERSITY
THE GRADUATE COLLEGE AND CLEVELAND MEMORIAL TOWER

1912, an inquiry into the relations of the police force to commercial vice was undertaken by the Curran committee of the board of aldermen. Numerous witnesses were heard and every phase of prostitution and its relation to police corruption was exposed. Witnesses told how prostitutes were recruited; how the business of prostitution was organized and controlled; how representatives of the police collected money for protection with great regularity; how the avarice of graft collectors knew almost no bounds; how there appeared to be a fairly well defined system of dividing the spoils among police officials of various grades.

With a view to police reform a citizens' committee issued a report early in March recommending the extension of the term of the police commissioner to ten years, the removal of all control of vices from the police, and the creation of a board of social welfare to deal with the social evil, the saloons, gambling, and amusements. According to the report this board would be under a director with rank of commissioner. It would have independent control over certain policemen and detectives. About the same time the Bureau of Social Hygiene (q.v.) began a study of European police systems.

Tribelhorn Case. The first conviction in many years of a real estate agent having charge of a disorderly house occurred in December, when Ernest Tribelhorn, agent of a New York apartment house, was convicted in the Court of Special Sessions. He was sentenced to twenty-five days' imprisonment and a fine of \$500. The court held that a fine in such a case would be insufficient; and that the publicity and the disgrace attending actual imprisonment was needed to effect reform. An appeal was made to the Appellate Division.

ILLINOIS. A State-wide inquiry was carried out by a special committee of the Illinois senate headed by Lieutenant-Governor O'Hara. In the principal cities were held hearings to which the employers of girls and women were subpoenaed and testified regarding wages, working conditions, and the cost of living of employees. Inmates and keepers of brothel houses were also subpoenaed. The employers differed sharply as to the relation of low wages to prostitution; most of them thought there was little connection, while the fallen women thought there was much. Some of the largest employers thought wages could be raised to cover the minimum cost of living without affecting the profits of the business. The secretary of the Illinois Manufacturers' Association expressed almost the only public opposition to the investigation. The commission communicated with governors and legislatures, and interviewed President Wilson with reference to the calling of a national conference on the subject. One immediate result of the agitation was the announcement of new and higher minimum wages by department stores in Chicago and by the International Harvester Company. Lieutenant-Governor O'Hara declared that in Chicago a division of the Municipal Court, called the Morals Court, was opened on April 1.

PHILADELPHIA. A commission appointed by Mayor Blankenburg to investigate the social evil in Philadelphia issued a report covering 372 resorts and 3311 prostitutes. The report laid special stress on the familiarity of children

in certain districts with the life of vice owing to the commingling of inmates and frequenters of houses of prostitution with the population. In fifteen blocks of the more notorious streets were 1542 children of ages six to sixteen. The report said: "This condition has no parallel in any other city, so far as we know." The field work was directed by Mr. Kneeland, above mentioned, as conducting inquiries in Chicago and New York; yet his investigators "were astonished at the open association of the worst forms of vice and of innocence." It was estimated that more than \$6,000,000 is spent directly for prostitution yearly in Philadelphia.

SUGGESTED REFORMS. Among the plans for fighting the evil which have been suggested or recently enacted are the following: The "little tin-plate" ordinance whereby every building in the city must have on its front a metal plate setting forth the name of the owner; a law making it impossible for the owner of a house of prostitution to collect insurance thereon; a law providing that the property in a house of prostitution may be confiscated; a law empowering the board of health to close a house of ill-fame on the ground that it spreads contagious disease; a law such as that passed in California and noted above; provision at public expense of forms of amusement to supplant those places which profit by feeding the social evil; minimum-wage laws.

MASSACHUSETTS. This was the first State to institute by legislative enactment a State-wide investigation by commission of prostitution in all its phases. In April a law was enacted creating for this purpose a commission of five of whom one must be a woman.

INTERNATIONAL CONGRESS. The fifth International Congress for the Suppression of the White Slave Traffic was opened in London, June 30. A message from King George congratulated the National Vigilance Association and the International Bureau on their success. Among the subjects discussed was the extension of laws protecting children employed at theatres, circuses, and concerts. Great attention was also given to the problem of moral education, particularly as it relates to the relation of the sexes and the dangers confronting youth in modern society. The delegates from Germany, Denmark, Holland, and Spain unanimously favored the abolition of the state regulation of the social evil, but M. Hennequin of France, doubted the practicability of immediate abolition owing to social and economic conditions. Reports showed that there had been established in each country adopting the convention of the congress a bureau for the collection of information and the communication of it to all countries concerned. Moreover the supporting nations had agreed to frame domestic legislation with a view to providing more speedy methods for suppressing the evil. See also MINIMUM WAGE.

PROTESTANT EPISCOPAL CHURCH. The total number of communicants in this denomination in the United States in 1913 was 986,607, an increase of 16,156 over 1912. The total number in the church throughout the world was 1,004,217, an increase of 17,533. In the Sunday schools in the United States, were enrolled 442,234 scholars and 50,493 teachers. The total contributions made for all purposes during the year amounted to \$19,386,209. The

denomination is divided into 91 dioceses in the United States, each of which is presided over by a bishop. In addition there are 13 dioceses in foreign countries. The missions of the denomination are in the charge of the Domestic and Foreign Mission Society. The net appropriations made for missions during the year was \$1,133,377. The expenditures exceeded this by \$197,633,000. The church lost during the year two of its bishops: Bishop Doane of Albany (q.v.), and Bishop Jaggard, who was sometime bishop of Southern Ohio. From 1908 to the time of his death he had charge of the American churches in Europe. The bishops consecrated during the year were Samuel Gavitt Babcock, suffragan bishop of Massachusetts; F. C. McIlwain, suffragan bishop of Minnesota; Theodore Irving Reese, bishop coadjutor of Southern Ohio; William Farrer Weeks, bishop coadjutor of Vermont. The denomination has been active in recent years in efforts to bring about a closer unity between the Protestant denominations. Among the organizations to effect this was the Christian Unity Foundation, which during 1913 continued its work of conference and research. It had conferences with the Disciples of Christ, Baptists, Congregationalists, and Methodists. Another movement in which the denomination has been active is the world conference on faith and order, which has enlisted coöperation of both Catholic and Protestant bodies for a closer understanding. The educational interests of the denomination are in charge of the general board of religious education. During this year this board promoted the organization of diocesan boards of education. It formulated and published a standard curriculum for the help of the schools of the church. The church sustains missions in nearly all foreign countries.

The forty-third triennial general convention of the church was held in New York City beginning October 10. The presiding bishop was Rev. Daniel S. Tuttle, bishop of Missouri. The convention met in the cathedral of St. John the Divine. At the first session was held a preliminary meeting of the missionary bishops, who are confined to the field of home missions. This was followed by a formal opening of the convention by a great procession of the delegates. The opening session was followed by business meetings at which matters of great importance were taken up. Among the most notable of these was the election of Rev. Dr. Alexander Mann of Trinity Church, Boston, as president of the house of deputies, a body of representatives from all parts of the country. Dr. Mann is identified with the low church element of the denomination. Dr. W. T. Manning, rector of Trinity Church, New York City, and the representative of the high church element, was defeated. One of the most impressive ceremonies of the convention was the united offering service of the woman's auxiliary. During this service, an offertory of \$307,500 was made. Among the other important matters which came before the convention were the question of a change of name, and a memorial regarding the marriage canon. The latter required, "first, the publication of the banns of marriage in the church or the publication of civil license in some newspaper, and second, the presentation on behalf of each of the parties desiring to be married, of a certificate of a

legally practicing physician that he or she is normal and not afflicted with a disease rendering marriage inadvisable." The discussion over the change of name was spirited. Precautions had been taken to prevent this controversy, but it came up accidentally through the question of the revision of the prayer book, and it was precipitated when a memorial was presented providing for a committee to revise the Book of Common Prayer—a move which the low church supporters thought involved changes in the title page, and therefore a change of the name of the denomination. Dr. Leighton Parks, rector of St. Bartholomew's Church, in New York City, spoke of the proposed change of name as an act of "robbery." No action was taken by the convention on this matter. On the same day a resolution was presented expressing sympathy with the international committee on marriage and divorce. Other matters discussed were the various missionary movements, theories of religious education, the idea of a world conference, a measure providing for the organization of church provinces which shall correspond to that of the general body of the church—i.e. with houses of bishops and deputies in each province—and preparations for the next convention. It was voted to hold this, which will be the fiftieth, in St. Louis. Perhaps the most important single matter of business transacted in the convention was the passage of an amendment to the constitution which makes impossible any change in name or system of representation in general convention without a two-thirds' favorable majority in the house of bishops and the house of deputies. PSYCHIATRY. See INSANITY.

PSYCHIC RESEARCH. Among the many honors conferred upon Professor Henri Bergson has been the appointment to the presidency of the British Society for Psychical Research. Before this society he delivered the presidential address on May 28. In it he expressed the opinion (*Proceedings*, xxvi, 462) that the experimental methods of the society should be kept free from the mechanistic and vitalistic principles of the older sciences, and also he thought that there was still a vast region of unexplored territory within which the society could advantageously work. He did not, however, take the extreme position assumed by C. E. Ozanne (*Hibbert Journal*, xii, 72), "that not only the evidential matter dealing with data of personal reminiscence . . . but the so-called non-evidential matter also, has gone far to prove the reality of spirit communication." One of the main contentions of this writer is that the remarks made by mediums while in the trance state are much more typical of the intelligence and disposition of the communicating "spirit" than of the mental equipment of the medium. A topic which still occupies a large place of interest in the field of psychic research is that of "automatic script," or the coincidental writings of two persons on the same subject—often in like phrases—without any of the usual means of communication. This phenomenon of "cross-correspondence" is generally classed as a form of telepathy. J. Maxwell's criticism of a num-

ber of these scripts has called forth a storm of replies filling almost one-half of the literary contents in the 67th part of the *Proceedings* (pp. 375-418). In defense, cryptomnesia is generally admitted as an explanation even to the extent of supposing a subliminal "self." Most of the writers of the year allow their critics no definite place of attack inasmuch as most of the statements made are outlines of hypothesis and belief. An example is an extract from the reply of Mrs. Sidgwick to Dr. Maxwell (*Proceedings*, xxvi., 400), "In the meanwhile I should like to conclude by saying that though we are not yet justified in feeling any certainty, I myself think the evidence is pointing towards the conclusion that our former fellow-workers are still working with us." A similar controversy is waging in *Bedrock* (ii., 57 and 194) concerning proofs of telepathy. It appears that a number of business men have pledged sums ranging from £1000 to £5000 for evidence of thought-transference. William Crookes, Oliver Lodge, and W. F. Barrett have refused to consider the offers. Lankester's view of the situation is expressed in the sentence, "I say that Sir Oliver Lodge and his associates have not given any demonstration of its existence nor even any evidence which makes its existence probable." The phenomena of dreams appears to open a comparatively new field for psychic investigations. According to F. V. Eeden (*Proceedings*, xxvi., 431), "for the exploration of this mysterious world of dreams we want not only the purely scientific, but also the poetical function." Later, again, "no theory has as yet explained all about dreams; no! not even more than the tiniest part. We have not yet crossed the threshold of that world, which for us is still 'occult.'" A great deal of the invective hurled against modern science by critics of this type savors very much of the criticism which Clifford's thesis on "automatism" received a quarter of a century ago. G. W. Balfour, a member of the British Society, makes a consistent attempt to erect a form of "psychophysical idealism" on the foundation of telepathy (*Hibbert Journal*, ix., 544). The universe consists of conscious entities, like the Leibnizian monads, in the sense that these entities "reflect all the rest in different degrees of perfection." They differ from the monads, however, in that the "relation between them is not one of pre-established harmony; it is a relation of real reciprocity."

PSYCHOLOGICAL ASSOCIATION, AMERICAN. See **PSYCHOLOGY**.

PSYCHOLOGY. The immediate estimation of current tendencies and trends within a fluent body of knowledge is very likely to be gross and subjective. Time is necessary to a seasoned judgment. From year to year emphasis changes, accent shifts, purposes are modified, the coloring of the scientific background brightens or fades, new terms creep in and old terms acquire new meanings. The precise significance to the science of all these modifications only subsequent events will fully reveal. When taken individually, they may indicate progress or development; or they may, on the other hand, stand simply for caprice, or idiosyncrasy, or want of historical perspective, or desire for novelty, or lack of scientific training. The historian of the year can do little more than record a few of the more important

books and articles and researches and addresses, and leave the rest to the deliberate reviewer of decades and generations and systems and schools. As regards the present case, psychology, pure and applied, is suffering wider and wider extension. Its present ramifications, when measured in terms of literary product, cover an exceedingly broad territory. This review must, then, limit itself to instances and examples, and also, for the greater part, it must be confined to the pure psychology of the human individual—the basis of all psychology. As to noting general drift, it will limit itself to the impression that discussion and investigation have taken the direction (1) of a criticism, more or less self-conscious, of methods and means; and (2) of a searching and analytical examination of the elementary processes and the simpler, perceptual, formations. Reference to the reviews of previous years (see *YEAR BOOK*, 1907, 661; 1910, 613; 1911, 590 and 592) will suggest that the reconstruction, since 1900, of the psychology of thought and of voluntary action has furnished a strong motive to this current examination and criticism.

MEETINGS AND GENERAL NEWS. At the meeting of the American Psychological Association, held in conjunction with the American Philosophical Association, at New Haven, Conn., on December 29-31, under the presidency of H. C. Warren, the question of the general methods of psychology was discussed, with particular emphasis laid on the nature of consciousness. This joint meeting forms a unique contrast to a set of resolutions recently passed by a group of six German philosophers to the effect that no experimental psychologists should be appointed to the existing chairs of philosophy in the German higher institutions of learning, but that provision should be made for the creation of new chairs specifically designated for empirical psychology. Among a number of eminent psychologists who have taken a stand against the spirit of the document is W. Wundt (see his *Die Psychologie im Kampf ums Dasein*). At the meeting of the Experimental Psychologists, held at Wesleyan University, Middletown, Conn., on April 10-12, the discussion of method took a decided turn against sanctioning the "behavior-psychology," particularly as outlined by J. B. Watson (*infra* on "method").

Several academic changes and appointments occurred during the year. At Munich, O. Külpe has succeeded T. Lipps, who has been unable for a number of years to discharge his duties on account of illness. In England, Prof. James Ward recently passed his 70th birthday. In recognition of his services to philosophy and psychology, and in manifestation of the esteem in which his friends and colleagues hold him, a fund has been subscribed for the purpose of painting a portrait of the distinguished philosopher. H. Piéron was appointed director of the Sorbonne laboratory at Paris, founded, and for a long term of years directed, by the late A. Binet. Piéron was also called to succeed Binet as editor of *L'année psychologique*. P. Janet, professor of experimental psychology at the Collège de France, was appointed to the chair, left vacant by the death of A. Fouillée, at the French Academy of Moral and Political Science. The list of psychological periodicals is this.

year increased by the new quarterly, *Revue des sciences psychologique*, published under the editorship of J. Tastevin and P.-L. Couchaud.

GENERAL BOOKS AND TREATISES. The number of general texts has been unusually small. D. R. Major's *The Elements of Psychology* has not been out long enough to have elicited a definite critical response. It represents no emphatically new point of view, but it gives, rather, a large number of excerpts from the works of other psychologists. R. M. Yerkes and D. W. La Rue have coöperated on an *Outline of a Study of the Self*. C. L. Morgan's *Instinct and Experience*, published last year, has passed into a German translation (by R. Theising). In J. Ward's Henry Sidgwick Memorial Lecture on *Heredity and Memory*, now published in book form, heredity in racial experience is compared with the formation of habit within the individual. *L'année psychologique* continues, under the new directorship, to take a catholic view of the march of psychological progress. Last year the annual volume contained articles on memory, on the scope of psychology, the laws of mental activity, and the personal equation. More than two hundred pages were devoted to a useful review of the preceding year in which French and American works fared better than German. In a readable book entitled *The Psychology of Laughter*, B. Sidis places laughter with the religious and the artistic activities; like them laughter arises from the instinct of play. A similar view is held by C. E. Seashore in his *Psychology in Daily Life*—a book which includes many wholesome maxims with regard to play, work, memory, mental health, and musical training. The maxims are sanctioned, as the author demonstrates in a simple and popular manner, by the facts and principles of psychology. E. L. Thorndike's *The Original Nature of Man* describes "the inherited foundation of intellect, morals, and skill," and then turns them to account in education. The volume summarizes and criticizes a good deal that has been written about instincts and capacities. Münsterberg discusses the application of psychology to the problems of business in his book on *Psychology and Industrial Efficiency*. The volume outlines a programme for the coöperation of psychology with economic interests to the end that "the best possible man" shall be selected for "the best possible work" to "the best possible effect." While most of the experimental suggestions given savor too strongly of reaction-time and crude tests of mental capacity, nevertheless many valuable suggestions are offered for the guidance of future steps taken in this direction. The book will, doubtless, indicate to the lay mind the value of empirical psychology in the "scientific management" of business and industry.

Freud's treatise on *The Interpretation of Dreams*, originally published in 1899, has been done into English from the third edition in the German by A. A. Brill, an ardent follower of the Freudian school. This translation makes available to the American public a clear and readable explanation of dreams on the basis of "sex-repressions" (see YEAR BOOK, 1911, p. 593; and 1912, p. 598). A good summary of the literature, sample interpretations, personal experiences of the author, all help to make the presentation clear. Although many psycholo-

gists agree that it is possible at times to trace dreams to "repressions" of one sort or another, only a few follow the Freudian school to the extent of interpreting dreams in the light of social sex-restrictions.

The wide current use of the term "behavior" as designative of the objectively visible movements of organisms is well illustrated by M. Parmelee's book, *The Science of Human Behavior*, in which the phenomena attributed to behavior are described in semi-popular fashion with a background supplied from the "results of recent work in biology in general and in zoölogy and neurology in particular, in genetic and comparative psychology, and in anthropology." It traces the thread of "behavior" upward through its physical and chemical foundations to its physiological function and anatomical and morphological structure throughout the entire evolutionary series, and, finally, to its highest level in the organized superstructure of social custom.

SENSATION AND PERCEPTION. *Vision*. Attempts have been made to remove some of the shortcomings of the Hering theory of vision. One of the difficulties lies in the phenomenon of contrast. S. Blachowski has investigated the effects of "reciprocal contrast" (*Zeitschr. f. Sinnesphysiol.*, xlvii., 291). His results show a lower intensive sensitivity at the centre of the retina than at the periphery, and, in consequence, a proportionately greater degree of excitation in the periphery than at the centre under the influence of a given photic stimulus. L. Hermann has made a study of the effect of compensating a given color for the amount of contrast induced from a gray background, and has found a distinct weakening of the chroma of the color after it has been compensated in light-value (*ibid.*, xlvii., 97). A painstaking piece of investigation has been published by G. Rand (*The Factors that Influence the Sensitivity of the Retina to Color: A Quantitative Study and Methods of Standardization*, *Psychol. Rev.*, Mon. Supp., 15, No. 1). Almost one-half of the work comprises an historical and critical survey of the literature. On the whole, the investigation shows "how strongly the changes in the illumination of the visual field influence the color sensitivity of the peripheral retina." That there is a difference in the discrimination of brightness in uniocular and binocular vision has been shown by S. Dawson (*Brit. J. of Psychol.*, vi., 78). "Small differences of intensity are detected more frequently when both eyes are used, judgments are given with more certainty and consistency, and their reaction-times are shorter." Explanation of these facts is given in terms of the increased steadiness in the impression. There are a number of studies in reversible perspective (J. C. Flügel *ibid.*, v. 357; vi., 60; A. Zimmer, *Zeitschr. f. Sinnesphysiol.*, xlvii., 106) which seem to contradict the well-known theory, originally attributed to Necker, that makes reversion dependent upon change of fixation. It is now claimed that change or shift of attention, without change of ocular fixation, may explain many instances of this phenomenon. The results should be considered, however, in connection with Wundt's doctrine of assimilation. Of interest under the heading of vision are the studies in the visual perception of movement by T. Takei (*Zeitschr. f. Sinnesphysiol.*, xlvii.,

377), H. J. Watt (*Brit. J. of Psychol.*, vi., 26), and S. Meyer (*Zeitschr. f. Psych.*, lxx., 40). P. Homuth went over again (*Arch. f. d. ges. Psych.*, xxvi., 181 and 239) the effects of short and of continued stimulation of the visual organ. His results seem to him to indicate that blue, yellow, and purple are the psychophysical primaries, and hence that visual theory is to be built upon them. Continuing his work upon visual adaptation, C. E. Ferree seeks experimentally to demonstrate (*Amer. Jour. of Psych.*, xxiv., 378) that the periodic disappearance of small stimulus-areas, long referred to fluctuations of attention, falls, just as well as large areas, under the laws of sensory adaptation.

Audition. Much work has been done of late in the psychology of hearing. E. R. Jaensch proved, by means of an ingenious apparatus, that (1) sinusoid variations in air-waves produce tones, when the waves are equal in length, (2) sinusoid variations produce noises, when the waves are greatly unequal in length, and (3) when these variations are only slight, a vowel-quality results. He substantiates the approximate optimal pitch of the vowel sounds as recently established by W. Köhler: 250 vd. for U, 500 vd. for O, 1000 vd. for A, 2000 vd. for E, and 4000 vd. for I (*Zeitschr. f. Sinnesphysiol.*, xlvii., 219). The results of Hermann and Jaensch upon the formants of vowel-sounds (see YEAR BOOK, 1907, 659) were also confirmed last year by L. J. Wittmann (*Arch. f. d. ges. Psych.*, xxix, 389), who worked by the Marbe method of smoke-rings. The region which Bezold claimed to be essential to the hearing of speech (b'-g'') has been shown to be wanting in a number of observers who could nevertheless hear spoken words (see *Zeitschr. f. Sinnesphysiol.*, xlvii., 192). Sound localization is claiming a renewed interest. G. F. Arps and O. Klemm have reported work done on the influence of intensity on the localization of sounds with reference to distance from the observer. Some of the factors which account for this influence are those of variations in the absolute intensity, variations in the relative intensity for both ears, and, finally, the angle of incidence at each ear. But in addition to these three, there is still another factor which is unknown (*Psychol. Studien*, viii., 226). A later study of O. Klemm (*ibid.*, viii., 497) in monaural hearing points out that while localization in distance is possible, yet it is more difficult under these conditions than under those of binaural hearing. J. Peterson writes in defense of the Helmholtzian theory of audition (*Psychol. Rev.*, xx., 312) as representing the explanation which is most nearly adequate to the facts. F. Densmore has added another volume to her work on Indian music (*Chippewa Music*) and with it a collection of phonograms, bringing the total up to something like 350 separate records, a beginning which ought to compare favorably—at least in number—with C. Stumpf's archives of phonograms at Berlin.

TACTUAL AND KINÆSTHETIC. Since Goldscheider's classical work, the sense-organs in and near the surface of the joints have generally been held responsible (with occasional protest from other investigators) for the perception of movement of the bodily members. T. Erisman has now brought a good deal of evidence (*Arch. f. d. ges. Psych.*, xxviii., 1) to show the

participation in this perception of qualities from muscle and tendon. Erisman also makes it appear probable that these senses suffer in intensity (as do also auditory and tactual sensations) through the deflection of attention. In the same laboratory (Strassburg) the repetition of the psychological experiment of lifted weights gave a value (*ibid.*, xxviii., 183) for differential sensitivity of 1-50, when the basis of weight was the tendinous sensation and not any secondary criterion (as, e.g. Müller's "rate of lift").

MEMORY, LEARNING, ASSOCIATION AND ATTENTION. Two well-known German works on memory and learning have been made available to the English-reading public during the year. H. Ebbinghaus's pioneer work, done in the early eighties (*Ueber das Gedächtnis*, 1885), has been translated by H. A. Ruger and C. E. Bussenius; but a more felicitous rendition is to be found in J. W. Baird's transcription of E. Meumann's book on memory under the title, *The Psychology of Learning*. The monumental work of the year is the third part of G. E. Müller's *Zur Analyse der Gedächtnistätigkeit und des Vorstellungsverlaufes* (*Zeitschr. f. Psych.*, *Ergänzungsband*, viii., 1-567), which precedes the second part. It discusses the secondary aids to learning, shows their advantages and disadvantages, the rôle of diagrams and colored presentations, the consciousness of recognition, affective coloring, the intent of recall, determining tendencies, and reciprocal effects in the memory content. A. Aall proposes (*Zeitschr. f. Psych.*, lxvi., 1) a new law of memory, to which, however, G. E. Müller gives attention in his work. Aall's results indicate that there is a difference in the efficiency of learning when the instruction assumed is to the effect that the material must be available either (a) for a long or an indefinitely great time, or (b) for a specific occasion. A. Wohlgemuth points out (*Brit. J. of Psych.*, v., 447) that "the prevailing method of studying memory merely by means of syllables is inadequate" because "in learning the syllables, visual memory, auditory memory, and motor memory" are involved, while in learning colors and diagrams "only visual imagery and, . . . in some subjects imageless reproduction" are present. With the exception of the final qualification, this statement also agrees with G. E. Müller's work. L. W. Kline and W. A. Owens studied the learning process by requiring their observers to place a series of cards in their proper pigeon-holes (*Psychol. Rev.*, xx., 206) verifying in general a number of the laws of learning and in particular the part played by affection and emotion. P. Ranschburg (*Zeitschr. f. Psych.*, lxvi., 161; lxvii., 22) verified the following laws in an investigation of simultaneously and successively presented letters, numbers, colored objects and diagrams: (1) Simultaneous and similar stimuli seem to inhibit one another in the tendency to coalesce, but there are stages in the degree of coalescence and separation; (2) the attentional clearness of an incorporation depends upon the degree to which less-favored factors are suppressed on account of their similarity. It has been known for some time that the learning by heart of sense or nonsense materials proceeds more rapidly, under experimental conditions, when the repetitions are distributed throughout the period of learning than

it does when one repetition follows immediately upon another. Work sent out last year from the Vassar laboratory (*Amer. Jour. of Psych.*, xxiv., 580) suggests that the advantage of distribution may rest, not at all upon a law of verbal association—as is usually supposed—but upon a law of motor connections. K. M. Dallenbach extended (*ibid.*, xxiv., 465) the research of Geissler upon the measurement of attention, and he found a close parallelism to exist between degree of attention, on the one hand—as measured directly in terms of clearness—and amount and precision of work performed, on the other. He believes that the distinction between the “dual-level” and the “multi-level” consciousness indicates a true difference of individual type. The common conviction that a person, A, can, by staring at the back of another person, B, cause B to look round has been put to experimental test at Leland Stanford University (J. S. Coover: *ibid.*, xxiv., 570), with the result that the observers who thought that they were being stared at were as often wrong as right.

THOUGHT, ACTION, AND EMOTION. T. Lipps's monograph on empathy (*Psychol. Untersuch.*, ii., 111) commands first place under this rubric. It treats of a variety of subjects; errors in judgment, geometrical illusions, deceptions in the estimation of visual magnitudes, and many others. It is written in terms of the Herbartian psychology, in which references to the bridge formed by the “impression” between the “ego” and the “objective world” largely figure. In G. E. Müller's work on memory (*op. cit.*) we find contributions to this subject in his discussion of the “conscious attitude” and the “determining tendency.” A warning is repeatedly sounded to the effect that unclear elementary processes should not be clothed with a new terminology: When a process is hard to differentiate from other processes, when it is marginal, or when it cannot readily be recognized, a new name for it should not forthwith be coined. In N. Ach's historical experiments on the thought-processes, what was called an “attitude” was very often, as Müller maintains, a misapprehension of details. “The doctrine of ‘conscious attitude,’ like that of the determining tendency can be characterized by the statement: It is likewise unsuited to psychological analysis.” From the Leipzig laboratory a number of studies in reaction are reported. G. Deuchler (*Psychol. Studien*, viii., 117) concludes that the effect of concentrating attention upon one element in a group of complex stimuli tends to inhibit the processes corresponding to the other components. P. Salow (*ibid.*, viii., 506) had left material on the reaction-times for right-hand, left-hand, and both-hand, responses. This material is now brought together to show, among other things, that the interval between instruction and stimulus has a direct and proportionate effect upon the time of reaction.

An article indicative of the trend in the psychology of thought contains a formulation by O. Selz of the laws of productive activity (*Arch. f. d. ges. Psych.*, xxvii., 367). Selz insists that the essence of mental “production” is organization. Laws of association are insufficient to the explanation of mind; they do not show how conscious processes are integrated. To the process of reproduction must be

added “operations”—operations of abstraction and of combination. Thought is purposive: It works toward ends, and the operations serve to unite end and means and so to create new combinations. The dangers which lurk in this sort of treatment are (1) a lapse to formal and hypothetical powers, and (2) the translation of the thought processes into logical terms. Like Selz, R. Müller-Freienfels believes in non-ideational factors in thought (*ibid.*, xxvii., 381). He calls them, after the practice of Münsterberg and others, *Stellungnahmen*. They are volitional factors, and they display the relation of the ego to sensation. Every feeling (*gefühl*) includes a motor tendency, a preparation for action. The more active and purposive the thought, the more obvious the motor tendency in the *Stellungnahme*, or motor attitude. Thought may be said to be constituted by these “attitudes,” not by ideas. In a general appraisal of the method of question-and-answer or of examination (*Ausfragemethode*), E. B. Titchener inclines to the belief (*Amer. Jour. of Psych.*, xxiv., 429) that the method will never “avail, of itself, to settle disputed questions of a systematic kind.” Its results must be gross and loose, capable of a variety of interpretations. But the chief use of the method is—as this psychologist thinks—“to make a first survey.” It has already served to define the problems of thought, and these problems may now be put into commission for solution by a method of the type of Ach's “systematic experimental introspection.” The most notable application of the method of examination made during the year came from Külpe's laboratory at Bonn (T. Haering, *Arch. f. d. ges. Psych.*, xxvii., 269; xxvii., 63, 285). Haering applied it to the doctrine of values (*Werttheorie*). He is led to the conclusion that “value” is not describable in terms of consciousness. It is no more to be found in mind than, say, the survival value of an animal's horn is to be found, by anatomical dissection, within the horn. The description of the “valuing consciousness” shows only that a given object is referred to a preëxistent and extra-psychological value—moral, æsthetical, logical, or what not. Valuation, then (*Wertung*), is the subsumption of an experience under a presupposed “absolute” value or sphere of values. In consciousness, values are never established; they are only applied. This result disposes—so the author thinks—of all those psychological theories of value which are based upon psychological factors, e.g., effort or feeling. The whole study is laid out in the realm of “intention,” tendency, and *Einstellung*. In a study of embarrassment (*ibid.*, xxvii., 1), W. Hellpach finds the emotion to be determined, in the main, by social factors; namely, by the apprehensive fear of the judgments and opinions of a second person. He connects the expressions of embarrassment (blushing, retreating, automatic movements of hands and feet) with sexual display and allurements.

METHODS. The presidential address delivered by E. L. Thorndike before the 1912 session of the American Psychological Association together with a paper read by J. R. Angell at the same session (*Psychol. Rev.*, xx., 91 and 255) sounds the keynote of a discussion of psychological methods begun last year. Both of these papers emphasize the inadequacy of the

interpretation of movements or "behavior" as an index to mental processes: The former, by attempting to dispel the illusion that all ideas tend to develop into movement, the latter by outlining problems which could not be solved by "behavior" methods. Since the meetings, J. B. Watson has set forth his articles of faith in the "behavior" methods, and he has expressed his belief that the introspective methods are inferior (*Psychol. Rev.*, xx., 158). M. W. Calkins has more recently joined forces against this proposal (*Psychol. Bull.*, x., 288), but emphasizes the fact that, in her opinion, the methods of introspective psychology have disregarded the organic structure of the conscious "self." Certain difficulties met with in the methods of comparative psychology are outlined by C. Read (*Brit. J. of Psych.*, vi., 44).

METHODS OF EXPRESSION. The YEAR BOOK of 1908 (p. 603) explained the meaning of the psycho-galvanic reflex and the attempts made to include it among the expressive methods of psychology. The researches of the last five years seem to have warranted the editor's reluctance to grant the psychophysical importance commonly attached to the "reflex." During the past year, A. Gregor, working in Flechsig's laboratory in Leipzig, came to the following conclusions (*Arch. f. d. ges. Psych.*, xxvii., 241): (1) That the deflection of the galvanometer does not rest—at least not wholly—upon feelings or emotions; (2) that intensity of stimulus has an effect upon the amount of the deflection; (3) that the observer has no voluntary control of the reaction; and (4) that, in some cases at least, sweat-secretion plays a part. This fairly elaborate research gives the impression that we are still far from an exact knowledge of the physical and mental conditions of the "psycho-galvanic reaction." One further step, however, toward this knowledge, is indicated by V. J. Müller's demonstration (*Monatsschr. f. Psychiat. u. Neurol.*, xxxiii., 235) that the centrifugal vehicle of the "reflex" is the sensory nerve. The expressive methods underwent a further extension when G. Katzsch observed (*Zeitschr. f. exper. Pathol. u. Therapie*, xi) intestinal movements through a celluloid window set into the abdomen. Unpleasant feelings decreased and pleasant feelings increased the movements. H. Rose confirmed (*Arch. f. d. ges. Psych.*, xxviii., 94) Störing's contention that unpleasantness increases voluntary strength. His observers pressed harder upon the dynamograph when unpleasantly affected than when they were affectively indifferent. The result contradicts the traditional belief that unpleasantness tends to inhibit voluntary action.

PSYCHOTHERAPY. Interest in this field of investigation has grown during the year out of all proportion to the number of books issued. Together with psychopathology, psychiatry, and psychoanalysis, the subject is claiming the attention of the medical profession on both continents. A committee of the American Psychological Association has drawn up a set of six conclusions based upon a canvas of 116 medical schools. These conclusions (see *Science*, n. s., xxviii., 555) express, among other things, the opinion that a course of instruction in elementary psychology, modified to suit the practical facts of medical experience, should be given to all candidates for the medical degree,

preferably before admission to the medical school. The International Association of Medical Psychology and Psychotherapy met in Vienna on September 18 and 19. Among the questions discussed at the second convention of the Società Italiana di Psicologia, held in Rome during the last week in March, was the subject of "the psychological problems of psychotherapy." The first volume of the *Psychoanalytic Review* has made its appearance under the editorship of W. A. White and S. E. Jelliffe. The editorial announcement promises that the periodical "with its object distinctly to contribute to the problems of psychopathology . . . will endeavor to throw light upon the problems of human conduct, by the study not only of the minds of any particular individuals, but by a research of the human mind in the large, throughout the ages, with a view to reaching thereby certain general laws and principles which may be applied to an understanding of the individual." A large treatise in two volumes on *Modern Treatment of Nervous and Mental Diseases* has also just appeared under the editorship of these two authors. Its scope is somewhat broader than its title. It furnishes a compendious summary of facts and theories, including eugenics, education, general matters concerning mental deficiency and pathology, and sexual problems. Publications connected more intimately with the Freudian school (see YEAR BOOK, 1911, p. 593), are E. Hitschmann's monograph, *Freud's Theories of the Neuroses* (translated by C. R. Payne), and A. A. Brill's volume, *Psychoanalysis, its Theory and Practical Application*. Both of these works are attempts to summarize, one fairly completely and on a technical level, the other somewhat more briefly and in terms of the phraseology of the layman, the main discussions and results of the school. The former gives a complete bibliography of S. Freud's works. It makes a strong, sympathetic plea for confidence in the methods of psychoanalysis. Apparently in order to reach satisfactory results, *rapprochement* has to be established between patient and physician. It is here that the "doubting Thomases" fail. As A. A. Brill says in his preface, "Nothing can be done without it, and unless this is properly managed, little can be done for the patient. One may get excellent results in surgery or in any other specialty without seeing the patient's face, but psychoanalysis presupposes an intimate acquaintanceship." This latter work brings the subject of dreams, obsessions, hysteria, sexual perversions, wit, and various neuroses within the compass of a single readable volume. Considerable work has this year been done on the subject of dreams and of myths. In addition to the translation of S. Freud's *Interpretation of Dreams*, K. Abraham's *Dreams and Myths* has appeared in the series of *Nervous and Mental Disease Monographs*, and O. Rank's *Myth of the Birth of the Hero*, done into English by F. Robbins and S. E. Jelliffe, has been printed serially in the *Journal of Nervous and Mental Disease* (vol. xl.). For a further discussion of the connection between dreams and the sexual life the reader is referred to the positive presentation of the subject by H. Ellis in the *Journal of Abnormal Psychology* (viii., 1374), and to the negative instances cited by M. Solomon (*ibid.*,

viii., 73) in support of the interpretation of dreams, and psychoneuroses as well, "on the motive of self-preservation." E. E. Weaver's *Mind and Health* treats the entire subject of "mental healing" on the side of the great religious movements with introductory chapters on the historical concepts of mind and of the principles of psychotherapy. A full bibliography completes the work. To those readers who care to see the facts of psychotherapeutics considered from an ethical and a religious point of view, this book will render valuable service.

PUGH, CHARLES EDMUND. An American railway official, died April 8, 1913. He was born in Unionville, Chester County, Pa., in 1841, and was educated at the Millersville Normal School. In 1859 he entered the service of the Pennsylvania Railroad as a station agent, rose through various grades in the service until, in 1882, he became general manager of the Pennsylvania system east of Erie and Pittsburgh. He was elected first vice-president in 1909, and held this office at the time of his death. He also held positions in the directorates of several other railroads.

PUMPS. See INTERNAL COMBUSTION ENGINES, and PUMPING MACHINERY.

PUMPING MACHINERY. During the year 1913 arrangements were made for the construction of the Humphrey internal combustion pump in the United States. This pump, which has been described in previous issues of the YEAR BOOK, consists of a cylinder in which the combustion of an explosive mixture of air and gas takes place directly above the surface of a liquid and produces motion in a tower and play pipe. The succession of explosions produces regular motion in the liquid and gradually the level is depressed against the head at which it can be discharged. The type of pump which it was proposed to manufacture in the United States was limited to a delivery head of 35 ft., but this limit has been exceeded in England, where a number of pumps have been under test and in service for several years. At Chingford, Essex, England, at a large reservoir under control of the Metropolitan Water Board, five Humphrey internal combustion pumps, working on producer gas, were installed, having an aggregate capacity of 180,000,000 gallons per day of 24 hours raised to a height of from 25 to 30 ft. in connection with the raising of water from the River Lea into the Chingford storage reservoir. It was stated in the official report that the average fuel consumption of the four large pumps was .931 pounds of anthracite coal per water horse power, while the small pump, which was rated at 20,000,000 gallons a day capacity gave the remarkable average figure of .8 pounds of anthracite. All the pumps showed an actual average discharge in excess of the contract re-

quirements and the endurance, as well as the efficiency tests, were satisfactorily met.

What was reported to be the largest steam turbine driven pump ever built in the United States was ordered for the Ross pumping station of the city of Pittsburgh. This was a De Laval centrifugal pump with a rated capacity of 100 million gallons for 24 hours against a total head of 56 ft. The Bethlehem Steel Company constructed for service at the New Mission Street station of the same city two vertical triple expansion high-duty pumping engines, each having a capacity of seven million gallons for 24 hours against a head of 495 ft.

PURDUE UNIVERSITY. A State institution of higher education, founded at Lafayette, Ind., in 1869. The total enrollment in all departments in the autumn of 1913 was about 1900. The faculty numbered 180. There were no noteworthy changes during the year, and the only notable benefaction was a gift of about \$100,000 to the Agricultural School. The annual income of the university is about \$850,000, chiefly derived from Federal and State appropriations. The productive funds amount to about \$250,000. The library contains about 50,000 volumes. The president is W. E. Stone.

QUAKERS. See FRIENDS.

QUARITCH, BERNARD. An English publisher and bookseller, died August 27, 1913. He was the son of Bernard Quaritch, the famous bookseller and collector, who died in 1899. In the same year he succeeded his father in the business. He became one of the best known buyers and collectors of rare books in England and the United States. He was a bidder at sales of many famous collections. A famous acquisition of his was a Gutenberg Bible, known as the Mazarin Bible, because a copy had been in the library of Cardinal Mazarin. This purchase was made for J. Pierpont Morgan. He frequently acted as buying agent for the British Museum and the Society of Antiquaries.

QUEBEC. A province of the Dominion of Canada; area, 351,873 sq. miles; population (census of June 1, 1911), 2,003,232 (1,648,898 in 1901). Including that portion of the Northwest Territories annexed to Quebec in 1912, the area is 706,834 sq. miles and the population 2,005,779. Quebec is the provincial capital, with 78,710 inhabitants in 1911. A lieutenant-governor administers the province—Sir François Langelier in 1913 (appointed May 5, 1911). Premier in 1913, Sir Lomer Gouin. See CANADA.

QUEENSLAND. A state of the Commonwealth of Australia. Area, 670,500 sq. miles. Population (census of April 3, 1911), 605,813, exclusive of full-blooded aborigines. Brisbane is the capital, with a population (1911) of 11,096; population of the local government area, 35,491; with suburbs, 139,480. The railways of Queensland included three principal lines running west and southwest from the coast as follows: From Brisbane on the south to Cunnamulle (2184 miles); from Rockhampton in the centre to Longreach (912 miles); and from Townsville in the north to Winton and Cloncurry (792 miles). Five other lines open up the

interior from the ports of Bowen, Cooktown, Cairns, Mackay, and Normanton. Two other important lines were under construction in 1913. During the last official year there were opened in this state eleven extensions to the railway system which, when completed, will be of gridiron form with the various lines intersecting the country. The east and west lines had incomplete connections in several cases at their coast ends and 67 miles were under construction for this purpose. At the inland extremities 26-mile lengths for joining up the inland ends were under construction and 11 light feeders, aggregating 244 miles, were also being built. Governor in 1913, Sir William MacGregor (appointed 1909). Premier, Digby Frank Denham. See AUSTRALIA.

QUICKSILVER. The domestic production of quicksilver in 1913, according to preliminary estimates of the United States Geological Survey, was 19,681 flasks of 75 pounds each, valued at \$774,054. This is the lowest recorded output since 1860. The output in California, which comprises nearly all the quicksilver produced, was 15,396 flasks, valued at \$605,525, a decline of 5128 in quantity, and \$257,509 in value, from the quantity and value of 1912. The decrease was due mainly to the falling off in yield from the important mines in Santa Clara County. There was a small output in 1913 in Arizona, Nevada, and Texas. The mined output of these States was 4285 flasks, valued at \$168,529.

QUININE. See RABIES.

RABIES. As is well known, patients having rabies in its completely developed form never recover, no remedies having been discovered which will influence the course after the attack has begun. Injection of anti-rabic serum between the receipt of a bite and the onset of the disease has been the only means of warding off death. One case, however, was reported in 1913, in which injection of quinine and urea hydrochloride administered intravenously, cured a well developed case. Moon succeeded in curing animals infected with rabies by means of quinine sulphate, given by mouth. It seems likely that further trial of this drug will prove it a reliable remedy for rabies.

RABINDRA NATH TAGORE. See TAGORE, RABINDRA NATH; and NOBEL PRIZES.

RACING. The 1913 racing season in the United States was noteworthy for the revival of the sport in New York State, the principal meetings being held on the tracks at Belmont Park, Saratoga, Sheepshead Bay, and Gravesend. The winners of the more important events were: Metropolitan Handicap, 1 mile, H. P. Whitney's Whisk Broom II; Saratoga Handicap, 1¼ miles, F. Johnson's Cock o' the Walk; Suburban Handicap, 1¼ miles, H. P. Whitney's Whisk Broom II; Futurity, 6 furlongs, H. P. Whitney's Pennant; Brooklyn Handicap, H. P. Whitney's Whisk Broom II. The English Derby was captured by A. P. Cunliffe's Aboyeur and the French Derby by Dagor. The leading winners among the American owners in 1913 were: H. P. Whitney, \$42,860; R. T. Wilson, \$19,555; R. F. Carman, \$18,330; August Belmont, \$17,790; F. Johnson, \$14,015; J. L. Holland, \$13,075; J. O. Talbot, \$11,245.

There were several notable performances on the running turf in 1913. Bringhurst a 2-year-old carrying 109 pounds, went 5½ furlongs at Louisville, Ky., in 1 minute 4¾ seconds; Iron Mask, also a 2-year-old, while carrying 112

pounds, made the fast time of 1 minute 10¾ seconds for 6 furlongs at Louisville; Froglegs, a 4-year-old, with 107 pounds, covered 1 mile 20 yards at Louisville in 1 minute 39 seconds and Whisk Broom II, a 5-year-old carrying 139 pounds, ran 1¼ miles at Belmont Park in 2 minutes.

Uhlan for the second successive year carried off the laurels in light harness racing by trotting a mile against time in 1 minute 54½ seconds. Other trotters to distinguish themselves in 1913 were Peter Volo, who covered the mile in 2 minutes 4½ seconds, and Dudie Archdale, whose time for the mile in each of three heats was respectively 2:04¼, 2:04¼, and 2:04½. Two hundred and eighty-three trotters took part in the grand circuit meets, the horses to make the best showings being Cheeney, Lord Dewey, Marigold, Anvil, Dr. Thorne, Tenara, and Etawah. The last two named won for their owners \$24,140 and \$21,375 respectively. In the pacing events Frank Bogash, Jr., Margot Hal, Branden Direct, and Directum I captured the largest number of firsts. Frank Bogash, Jr., was the biggest winner, \$20,341, with Leeta T, \$11,625, ranking second.

RACQUETS AND COURT TENNIS. The highest honors in racquets in 1913 went to Jack Soutar of Philadelphia, who defeated Charles Williams of London for the world's professional championship by 6 games to 4. Williams won four of the six games played in London but lost four straight games at Philadelphia. The scores of the games, Soutar's total being given first were: 15-6, 12-15, 11-15, 10-15, 15-9, 6-15, 15-2, 15-8, 15-4, 15-3.

Q. A. Shaw and G. R. Fearing lost the United States doubles title to P. D. Haughton and H. D. Scott, the scores being 15-11, 8-15, 9-15, 18-13, 15-12. H. F. McCormick won the gold racquet trophy by defeating E. Greenshield, 12-15, 15-2, 15-6. The English amateur doubles championship went to B. S. Foster and H. Brougham by default. The English amateur singles title was retained by Foster, who defeated H. W. Latham.

In court tennis Jay Gould successfully defended his singles championship by vanquishing Joshua Crane 6-4, 6-0, 6-2. The world's covered court singles championship was won by A. F. Wilding, Australia, who defeated M. Germot, France 5-7, 6-2, 6-3, 6-1. The doubles event was captured by Max Decugis and Germot, who defeated H. Kleinschroth and C. Bergmann of Germany 7-5, 2-6, 7-9, 6-3, 6-1. The women's singles championship was won by Miss H. Aitchison, who defeated Miss Fenwick 6-4, 6-2.

RADIOTHERAPY. Zimmern, Cottenot, and Dariaux reported remarkable results in the treatment of neuralgia and neuritis with the X-ray. They applied the rays directly over the nerve roots along the spine when the neuralgia was due to disease of the spinal nerves. They found exposure to the X-ray remarkably effec-

tual in curing sciatica, neuralgia, and neuritis of the brachial plexus and in neuralgias of the fifth nerve. In the latter case exposures were made over the region above the zygomatic process at the point of surgical access to the gasserian ganglion. In thirty-one cases treated in this way, many of them severe and rebellious to other forms of therapy, prompt relief and cure were the rule.

RADIUM. The London Radium Institute reported important discoveries in radium-therapy during 1913. The institute owned 4 gm. of this substance, valued at \$400,000. A discovery of the highest importance was that radium emanation has exactly the same properties as pure radium and it is thus possible to furnish outside physicians with definite therapeutic quantities, whereas hitherto patients required treatment at the institute. Thus, if a physician needed 20 gm. of radium for use on a patient, its cost would be prohibitive. But for a comparatively trifling sum the institute could supply a plate or tube containing radium emanation which would have the same effect. This plan had the disadvantage, however, that the activity of the emanation falls rapidly, a few days being sufficient to reduce its strength one-half. Water impregnated with radium emanation was also distributed. Over 7000 treatments were given in the institute during the past year. The assistants and nurses have suffered severely from radium burns. The nurses who do most of the actual handling suffer most. During the month of August the institute was closed in order that members of the staff might have a holiday and rest, which was the only cure for these burns.

According to the report of experts of the Bureau of Mines, of the United States Department of the Interior, presented before the American Chemical Society in 1913, by Professor C. L. Parsons, the greater part of the radium produced in Europe originated in America.

Carnotite and pitchblende are the uranium minerals in which radium occurs. Practically the total American output of pitchblende, the richest radium bearing ore, comes from mines in Colorado; at least 20 to 25 tons of high-grade pitchblende had already been exported. The same situation existed with regard to carnotite, nearly all of which was sent abroad. Parsons said that while practically all radium-yielding ore mined in the United States in 1912 was exported, the American deposits were far from inexhaustible, and the United States was depleting its reserve and shipping away material of great value which could not be replaced. Americans were dependent on foreign sources for the refined product, which had become almost prohibitive in price. He urged that the extraction and refining of radium should be undertaken in this country, where many carnotite ores that cannot find a market in Europe were being thrown away and wasted. The industrial journals reported a marked reduction in the price of radium preparations of late. The total production of radium per year was between 2 and 3 gm. In 1911 the radium preparations produced by the Austrian radium praeparatefabrik amounted to 14.1 gm. containing 2.647 gm. of pure radium chloride, valued at \$214,900. Early in 1913 radium bromide sold at \$105 per milligram in Germany. In July, however, sales were made in Vienna at about half that price. As a reason for this decrease the fact was advanced that

mesothorium, as well as radiothorium, had begun to be employed in place of radium, especially in medicine. Mesothorium more active than radium could be obtained at a cost of only \$32 per milligram. Although the life of mesothorium is short, by mixing it with radium salts a long-lived preparation is said to be obtained. Moore and Whittemore of the United States Bureau of Mines reported that all of the 12 Saratoga spring waters examined by them show radio-activity due to dissolved radium salts principally, and slightly to emanations, which is also true of the residue on evaporation. This is exceptional. See SARATOGA SPRINGS.

The employment of radium and mesothorium in uterine cancer received no little impetus from the announcement of remarkable cures by certain clinicians at the German Gynecological Congress held at Halle in May. Wicham and Degrais found that the present dosage was far too small; also that certain rays must be eliminated to attain the best results. The rays emitted by radium and mesothorium vary as to "hardness" or "softness" or penetrating qualities. These various rays, designated alpha, beta, or gamma rays, could be separated by certain filtering substances. The alpha rays, which are soft, are very destructive to tissue; the beta rays, which are hard, penetrate deeply and effect cellular changes without causing necrosis. The alpha rays, therefore, may be advantageously used in superficial cancer, where necrosis is not harmful; while in deep tumors, where necrosis is to be avoided, the beta rays are indicated. The radiations are controlled by enclosing the radium or mesothorium in filters of various substances, such as gold, silver, platinum, aluminum, or rubber.

Dr. H. A. Kelly, of Johns Hopkins University, and Dr. Robert Abbe, of St. Luke's Hospital, New York City, in a lecture before the College of Physicians, Philadelphia, December 15, reported many cures of epithelial cancer made by the use of radium, and representing ten years of work. Dr. Abbe, who had worked with Madame Curie, was the pioneer in the application of radium to disease in this country. Following their startling presentation, it was announced that A. I. Du Pont, of the Du Pont Powder Co. of Wilmington, Del., would cooperate with Dr. Kelly in an attempt to turn over to the United States government for the alleviation of humanity, the pitchblende and carnotite deposits owned by Mr. Du Pont, in Gilpin County, Col. The plan included a central institution where radium should be prepared and whence it should be distributed to clinics and to physicians for use in an attempt to lessen the number of deaths from cancer—75,000 annually.

See also RADIUM and CHEMISTRY.

RADIO-THORIUM. See RADIUM.

RADIUM, URANIUM, AND VANADIUM ORES. It is probable that no other minerals mined at the present time have so large a hold on public attention and at the same time so small a total monetary value as the so-called uranium minerals. This interest is, of course, due not to the minerals as such, nor to the uranium they contain, but to the accompanying radium which is found only with uranium. Up to the latter part of 1913, the interest in radium had been largely academic, on account of the marvelous qualities which it displays when compared with the better known elements. Owing

to the apparent cures of cancer abroad by the application of the gamma rays given out by radium, public interest in its production became thoroughly aroused toward the latter part of 1913.

According to the United States Geological Survey, the uranium minerals were produced in commercial quantity in the United States in 1913 only in Colorado and Utah. Although during the year some pitchblende was mined in Colorado, only a few pounds were sold, although 50 dry tons of low-grade material carrying 1.49 per cent. of uranium oxide was shipped to France. The carnotite, a yellow powdery or waxy material found in the sandstones of the high plateau between the Rocky Mountains of Colorado and the San Rafael Swell of Utah, south of the Book Cliffs, furnished the whole production.

Carnotite, as the word is ordinarily used, is a potash or lime uranium vanadate. Several vanadium minerals occur with the carnotite, so that in mining for uranium, a great deal of vanadium is also obtained.

The total mine shipments of uranium and vanadium in 1913, were, equally, about 2140 tons of dry ore, carrying an equivalent of 38 tons of uranium oxide. The vanadium in carnotite ores shipped is equivalent to 914 tons of vanadium oxide.

The Bureau of Mines determined that carnotite carries about 90 per cent., or even a little more, of the theoretical quantity of radium in equilibrium with uranium, which is equal to about one gram in 3000 kilograms of uranium. Assuming that 90 per cent. of the radium is recoverable, this would give the output of 1913 an equivalent of about 8.79 grams of metallic radium, or 16.40 grams of hydrous radium bromide, worth, at \$120 a milligram of metallic radium, about \$1,055,000. The total value of carnotite ores sold was about \$142,000, which represents the uranium value only, as little was paid for the vanadium content. This production was the largest ever made. Over half the quantity of uranium oxide produced was shipped to Europe.

The demand for carnotite at increasing prices induced a large amount of prospecting during the year, and the carnotite bearing area was shown to extend from the Paradox County, westward into the Dry Valley Region of Utah. Farther west and south, deposits of carnotite were found at Crescent and Trachyte creeks, in the Henry Mountains, and also southwest of the mountains.

The Standard Chemical Company actively produced radium at its plants at Cannonsburg, Pa., and the Radium Company of America established a plant and did preliminary work at Sellersville, Pa., during 1913.

See also CHEMISTRY, INDUSTRIAL; MINERALOGY; and RADIOTHERAPY, *Radium*.

RAILWAY ACCIDENTS. During the year 1913 there were a number of serious railway accidents in Europe and the United States so that the general discussion of means for their prevention was even more active than in preceding years. The complexity of the problem was generally recognized and while radical schemes for regulation and legislation were proposed, the futility of many of these was evident and the impossibility of carrying out any but the best considered reforms was apparent. The problem, while almost universal, seemed to be

different in different countries and in different sections of the same country, and accidents occurred under conditions where the best equipment and discipline prevailed as well as on poorly constructed and inadequately maintained lines.

In the United States speed and heavy equipment were responsible, in part, for accidents, yet, at the same time, the human element was prominent to a marked degree. Disregard of signals, disobedience of orders, and improper flagging were responsible for serious catastrophes, and the agitation for automatic train stops and other devices continued. There was, of course, the usual discussion as to the comparative frequency of railway accidents in Europe and the United States, and despite the uselessness of attempting comparisons where the data were plainly incommensurable, considerable was written on this subject in the popular press, and, naturally, comparisons were drawn between conditions of operation in Great Britain and in the United States, with inferences that the hazards attending railroad travel in the latter country were infinitely greater than in Great Britain, and in Europe generally. It was stated that in the ten-year period ending with 1909 in Great Britain and Ireland the average record would be one passenger killed to every 72,000,000 carried, while, taking the figures for the United States for 1910, it would appear that one passenger was killed for each 4,900,000 carried. Of course, there must be considered the average length of journey in the two countries, which was not susceptible to accurate analysis, and the fact that in Great Britain the passenger traffic was much denser than in the United States; yet, on the other hand, density of traffic can be attained with safety, as was clearly shown in the operation of the New York subway.

The chief element of safety for British railways was considered to be the block system, which is practically universal, and to which engineers have become accustomed their entire lives. In that country there is usually one system in force, whereas in the United States there may be several systems prevalent on perhaps the same run. Furthermore, while block signaling is universal in England, on December 31, 1913, statistics published showed that in the United States 26,123 miles of road were protected by automatic block signals and 61,062 by manual block signals, a total of about 9000 miles more than December 31, 1912. When this is compared with a total mileage for the United States of over 250,000 miles in operation in 1913, it will be apparent how much remains to be done in this important particular, although block signals do not necessarily insure safety, as was shown by the disastrous collisions described below that occurred in England and France, and also on well equipped lines in the United States.

The Interstate Commerce Commission in the United States during the twelve months ended June 30, 1913, through its inspectors investigated 51 collisions and 25 derailments which caused the death of 283 persons and the injury of 1880. The commission realized that the causes of these accidents were the same as had figured in previous reports, and the similarity of many accidents was striking. The commission observed that either a great majority of

these accidents were unavoidable, or that there was a widespread lack of intelligent and well-directed effort to minimize the mistakes of employees in the operation of trains. Simple rules were habitually violated, and operating officers

in many cases were cognizant of the habitual disregard, or violation of regulations. The commission believed that there was lack of discipline, or supervision of the work of train service employees, and that as a substitute for man

failure some system of automatic control should be developed. The commission believed that the maximum of allowable speed of trains of all roads should be established at a safe limit, and that legislation should be enacted prohibiting the use of wooden cars in high-speed through trains after a certain date, with reasonable time given to the carriers to comply with the provisions of any such law. The commission further believed that it should be authorized to make independent investigations, with respect to all matters affecting the safety of railway travel, so as to enforce recommendations before, rather than conduct investigations after, the occurrence of accidents. It believed, in particular, that there was a need for the most careful investigation and study of steel rails and steel car wheels before being put in service, since a number of accidents had been due to failures of rails in the roadbed, or to the breaking of wheels. Many of the rail failures unquestionably were due to lack of care in the fabrication of rails laid in the track at a time when construction and replacement were very active and suitable tests and records of the materials were not made. This condition, in part, was being remedied by the railways, which for several years had been very active in testing and recording the behavior of new rails, and, while the condition was not entirely satisfactory, still improvement was to be noted.

The "Safety First" campaign was prosecuted vigorously during the year with desired results so, as far as the employees were concerned, a beginning was made in arousing the interest of the public. A large number of fatalities, which apparently showed no decrease, were due to the number of trespassers using the railway right of way as a highway, and lack of observation of due precaution at grade crossings.

In the year ending June 30, 1913, there were 4366 derailments on steam railways, in which 49 persons were killed and 1245 injured, while damage to the road and equipment and the cost of clearing the wrecks amounted to \$3,421,037. This record may be compared with that of the previous year, when there were 3847 derailments, in which 68 persons were killed and 1197 were injured. The damage to the road and equipment, and the cost of clearing the wrecks amounting to \$3,165,033. In the year 1913 there were 1959 derailments due to defects of roadway, in which 70 persons were killed and 2230 injured, the damage aggregating \$1,839,929. In the year 1912, in 1877 derailments, 102 persons were killed and 2766 injured, the damage to road and equipment and the cost of clearing the wrecks amounting to \$1,541,460.

Summary of accidents resulting from collisions and derailments for the five years ended June 30, 1913:

Year	Number	Killed	Injured	Damage to road and equipment, and cost of clearing wrecks
1909.....	9,670	606	9,560	7,480,203
1910.....	11,779	773	12,579	9,823,958
1911.....	11,865	785	11,793	9,851,780
1912.....	13,698	772	15,096	11,527,458
1913.....	15,526	791	14,565	13,049,214

Figures for number of persons killed and injured for years prior to 1911 are restricted to passengers and employes on duty.

Among the notable accidents of the year, two stand out with marked prominence, both being rear collisions. On June 12, at Stamford, Connecticut, a heavy passenger train on the New York, New Haven, and Hartford Railroad, crashed into the first section of the west-bound express which had stopped to change engines. Six passengers were killed and 18 were injured. The accident was due to the failure of the engineer to bring his train under control after passing the distance signal, and not being able to stop the train on account of the brakes failing to hold when the home signal was set against him. It was found that the air brake equipment of the following train was not in proper condition, and that the engineer was inexperienced in handling a heavy train with a new and powerful locomotive.

The most serious accident of the year was a rear-end collision of passenger trains which took place also on the New York, New Haven, and Hartford Railroad at North Haven, Conn., on September 2, in which three sleeping cars were wrecked, 21 passengers killed and about 30 injured. The leading train ran past the stop signal before it came to a stop. The following train, which was proceeding in the dense fog then prevalent, came in sight of the flagman, the fixed signal, and the rear of the preceding train all at the same moment. The engineer was unable to stop his engine in time and it crashed into the train ahead, with the result that the three sleeping cars were wrecked. On this section of the line there was no distance signal and, while the signaling conditions were not of the best, and were being supplanted by a more modern system, yet they were far from inadequate. Both of these collisions seem to indicate demoralization in the operating departments of the railroad, but, at the same time, they were typical of conditions on other lines.

EUROPEAN ACCIDENTS. That the year 1913 was disastrous as regards railway accidents in Europe is shown by several accidents where great loss of life ensued. On November 4, 1913, on the Paris, Lyons, and Mediterranean Railway at Melun, France, 27 miles south of Paris, a south-bound train consisting wholly of mail cars was crossing a north-bound track to enter a loop line when it was struck by a north-bound express passenger train. The latter was proceeding at a rate of about 50 miles an hour and had passed two signals set against it located 3773 feet and 3182 feet respectively behind the point where the collision occurred, as well as a home signal 502 feet behind the crossing. The result of this accident was the killing of 39 passengers and a large number of injured. The cause of the accident was an unexplained overrunning of signals and it took place at a time when the company had decided to equip the line between Paris and Dijon, about 150 miles, with audible cab signals.

This accident naturally aroused considerable discussion in European railway circles, and British authorities claimed that the block signal rules, enforced in Great Britain, would have required the switches to be set so as to divert the mail train to another track, or have pro-

tected the passenger train by preventing its passing the last block station.

The record for safe railway transportation in Great Britain was seriously marred during the year 1913 by three disastrous accidents. On September 2, at Aisgill, a desolate spot not far from Hawes Junction on the Midland Railway in the north of the West Riding of Yorkshire, and within a mile of the spot where a Scottish express was wrecked with a loss of twelve lives on December 24, 1910, a collision took place between a London express and another express owing to the disregard of signals, and a standing train was run into by a following train that had passed into a block. Twelve passengers were killed outright and many injured, of whom four subsequently died. Fire broke out at once, but was subdued by the extinguishers, but ten minutes later another fire, which could not be extinguished, seized the wreckage and consumed all combustible material. This fire, it was proved on the official investigation, was due, not to the illuminating gas for lighting the train, but to the ashes in the furnace. The responsibility for the accident rested on the driver of the following train, who disregarded signals while he was oiling his engine and attending to a troublesome injector. The driver, after being acquitted on two inquests, was found guilty of manslaughter on trial and sentenced to two months' imprisonment, but received a royal pardon on October 31. This accident and subsequent proceedings brought the question of the responsibility for the proper discipline of railway servants very prominently into discussion, as an attempt was made by labor unions and other people to lift the blame from the engineer, who had disregarded the signals, to the railway for supplying bad coal for the stalled train.

A second important accident took place on October 15 at St. James Station, Liverpool, where five passengers and the guard were killed and many injured. A train, which had been stopped by the unexplained pulling of the communication cord, was run into by another train and the two rear coaches were telescoped. This accident was due to the failure of the signal man to protect the halted train.

A third accident occurred at the Waterloo Junction Station of the South Eastern and Chatham Railway on October 25, in which three passengers were killed and several injured. This collision, which took place in a fog, was due to an error in signaling.

The record of passengers killed in railway accidents in Great Britain in 1913 was 33, of which the Aisgill accident was responsible for 16. While this is not a favorable record compared with the years immediately preceding, yet in 1906 the total number of passengers killed in train accidents was 59. As in the United States, all of the important accidents in Great Britain were due to errors of judgment, or want of care on the part of employees, or the failure to use, or improper use of, several guards provided by the railways themselves.

These accidents, and others of minor character on English railways, like many in the United States, were due to failures of the human element and there was a demand that mechanical automatic stop devices be introduced. Several English lines, notably the Great Western and the North Eastern, have such cab sig-

nals in operation, while the London and South Western and the Midland were testing electrical devices. In France it was decided definitely, largely as a result of the Melun accident, that all companies must employ cab signals in case of overrunning danger signals set against them.

A collision at the railway station at Dvinak, Russia, on October 6, resulted in the killing of 14 persons and the injury of 28. An express train from Kieff to St. Petersburg ran into an engine standing on the main tracks near the station. Another disastrous European accident occurred at Groningen in the Netherlands on the night of December 24, when an express train for Amsterdam was derailed and eight persons were killed and twelve injured.

RAILWAYS. In the opinion of many students of railway operation and economics, it was a question whether the daily press in 1913 was leading a change in public opinion in regard to railways or simply recording it; but in either case, there were ample evidences of this change. The editorials that appeared during the year in all classes of daily papers—and the sensational papers and yellow journals contributed their full share—bespeaking fair treatment for the railways, would fill a number of large volumes; and this change in sentiment was, of course, most marked where sentiment had previously been most hostile. Thus, in Texas and in Kansas there had been a change that amounted almost to complete reversal of public opinion. But whether or not this change in sentiment would be drastic enough over the whole country, or, even if drastic, would in itself be sufficient to offset other tendencies which were making toward government ownership, was a matter of pure speculation. Chief of these tendencies was a growing feeling among bankers and investors that the courts will no longer stand between the railways and legislative assumption of managerial powers.

It was once the fashion, not many years before 1913, for railway directors to express the belief that if the case was put in the proper way, and was put squarely up to the United States Supreme Court, the combination of legislative, judicial, and administrative powers with which the Interstate Commerce Commission claimed to be clothed would be held to be unconstitutional. It was thought doubtful in 1913, if, after the decision of the Supreme Court in the Minnesota rate case, in the Missouri rate case, and in the Kansas City Southern accounting case, there would be found any lawyer of reputation who would subscribe for an instant to the belief that the Interstate Commerce Commission law would, on any grounds whatsoever, be attacked as unconstitutional.

While it is perfectly true that the higher courts of both the United States and England act as a restraint on the fluctuations of public opinion, their decisions are fundamentally influenced by the general trend of what might be called the second thoughts of public opinion. In the successive waves of legislation hostile to the railways which have swept over the United States, the railway directors have relied on the courts to protect their property and to continue

them in what they consider their inherent rights. One string after another has been followed from the lower court to the higher, from the higher court to the Court of Appeals, and from the Court of Appeals to the Supreme Court of the United States, and, almost without exception, in this court of last resort the theories of the old school of railroad men have met defeat.

THE MINNESOTA RATE CASE was, of course, far the most important of the railroad companies' defeats in the courts. This case, which had been fought from the lowest Federal court and which had been decided in favor of the railroad companies in the highest court, short of the Supreme Court, was decided on June 6, 1913. The State of Minnesota had passed laws reducing both passenger and freight rates within the State. The railway companies operating within Minnesota had obtained injunctions against the enforcement of the reduced passenger rates and had contended that these State-made rates were actually an interference with interstate commerce and were of themselves confiscatory. The main contention, and the one on which the roads relied to protect them from hostile State legislation, was that the fixing of intrastate rates so affected interstate rates that such exercise of power by State legislatures was an invasion of the rights of the federal government. The Supreme Court held unequivocally that "under the established principles governing State action, Minnesota did not transcend the limits of its authority for transcribing the rates here involved, assuming them to be reasonable intrastate rates. It exercised an authority appropriate to its territorial jurisdiction and not opposed to any action thus far taken by Congress." The point about the case, however, which most shook the confidence of railway directors in their belief that the courts of last resort would sustain their doctrine of "to have is to hold," was the court's brushing aside of the argument that *indirectly* the Minnesota rates deprived them of property without due process of law. The court refused to go into the question of indirect effects.

While this decision upheld States' rights to fix interstate rates and was followed by a reduction in various other States of passenger fares to conform with fares ordered either by State commissions or by acts of State legislatures, the Supreme Court decision in the Kansas City Southern case affirmed in sweeping language the power of the Interstate Commerce Commission to regulate not only railway rates, but the actual internal management of railway companies.

THE KANSAS CITY SOUTHERN CASE dealt with an appeal by the railway company from a ruling of the Interstate Commerce Commission, which provided that when a piece of railroad line was abandoned and replaced by another piece of line in a different location, the estimated original cost of the old line should be charged to operating expenses. The railways had claimed the right to either make no charge to its accounts for such abandoned property, or to make the charge to profit and loss account. The case involved far more than the somewhat technical nature of the question would appear to indicate. The Kansas City Southern case was an extreme one, although not more extreme than that of a number of

other roads. If it was compelled to charge the cost of the abandoned property to its expenses it could not show its preferred dividend as having been earned, and as a result could not issue and sell certain new securities which it was at the time the suit was brought negotiating for the sale of. In its appeal to the court, the Kansas City squarely raised the question of the power of the commission to extend its regulation so far over the management of corporate affairs as to amount to what was claimed to be confiscation of the right of railroad directors to manage their own business, and the court ruled squarely in favor of the commission.

A POSSIBLE RAILWAY CRISIS. W. M. Acworth, the English economist, made an extended visit to the United States in the fall of 1913, and after some weeks of study of conditions of railway operation in widely separated localities, expressed the belief that this country was drifting directly towards a crisis, in which government ownership would become imperative.

Certain roads, the rich ones, had been able to keep their plant fully abreast of the progress of the art of manufacturing transportation; but, on the other hand, it was not too much to say that the majority of the great railways of the United States were living a hand-to-mouth existence, and if in the fall of 1914 there should be a great increase in the prosperity of the country and in manufacturing output, coincident with very heavy crops, the country would stand in danger of facing a congestion of its railway facilities more severe than it had ever experienced, even in the year 1906. Herein, said critics, lay the possibility and danger that, with the sudden breakdown of transportation machinery at a time when it would mean most to manufacturers and farmers to have their products move promptly, there would come an overwhelming popular demand for the government to take over the railways. (But see *infra*.)

RATE ADVANCE CASE. After months of careful study of conditions, representatives of the railways in official classification territory, (all of the United States east of the Mississippi and north of the Ohio and Potomac) made an application to the Interstate Commerce Commission to have the 1910 rate advance case, in which the roads had been denied the right to a general increase of 10 per cent. in freight, reopened, but were met with refusal. The railways, therefore, formally filed new tariffs showing increases in rates approximating 5 per cent. These new rates were suspended by the commission and the roads ordered to present their evidence to justify the proposed increases. They opened their case before the commission on November 23, 1913, by presenting through Daniel Willard, president of the Baltimore and Ohio, and F. A. Delano, receiver of the Wabash, an outline of what they proposed to show. So clearly was the case presented that after the first two days' hearings, at which he was a deeply interested listener, Mr. Acworth, was ready to admit that possibly he had misread the signs of the times; that, after all, the United States was not drifting into government ownership of the railways.

Even before the important Supreme Court decisions of 1913, the more thoughtful of the leaders among railway executives had recognized the fact that their best hope of more

liberal treatment lay, rather in appealing to the court of public opinion than to the law courts. An attempt was being made to work with and not against the Interstate Commerce Commission and such State commissions as are not wholly influenced by political considerations, to the end that the commissions should see and understand not only that certain problems had failed of a satisfactory solution, but that of the vast number of the railroad men's problems, by far the majority, were being successfully worked out. At the annual dinner of the Railway Business Association, in December, 1912, James J. Hill struck the keynote for this campaign of education, and during 1913, the work which Mr. Hill began had been carried on by railway men throughout the country.

THE MANN-ELKINS AMENDMENT to the act to regulate commerce made it incumbent on railways desiring to increase freight rates to convince the Interstate Commerce Commission that such increases are reasonable. The refusal of the commission to permit an increase of freight rates in 1900 was ostensibly based on the fact that the railways were earning net, after the payment of expenses, sufficient to make investment in railway securities attractive, and that higher costs of labor and material were being more than offset through the growth of traffic and the consequent reduction of cost of handling each unit of traffic. Back of this reasoning there was pretty surely a feeling that Mr. Brandeis, in accusing the roads of insufficient utilization of their resources and extravagance in spending of their earnings, was right. Facts have not apparently borne out the economic assumption that an increase in gross business, though accompanied by higher wage rates, would reduce the unit cost of handling business. Prof. W. Z. Ripley, of Harvard University, pointed out that there was a point in the growth and development of a transportation system at which the law of increasing returns suddenly ceased to follow the growth in traffic, and that beyond this point increased traffic meant increased cost in handling each unit of traffic. As long as a single track line is not being worked to its full capacity, each additional ton of freight shipped over this line under ordinary circumstances reduces the unit cost of handling all the traffic, but just as soon as the single track line is worked to its full capacity, then either a double track line has to be built, in which case interest charges and maintenance charges are almost doubled, or else congestion follows. If interest and maintenance charges are suddenly doubled, the unit cost of handling traffic is very greatly increased; if congestion takes place, of course transportation costs per unit are largely increased.

Briefly stated, the roads in the 1913 rate advance case undertook to show that since 1910 there had been a considerable increase in the rates of wages paid, an increase in nearly all other expenses of railway operation, an increase in the interest rates, which a corporation has to pay to secure new capital, and a decrease in the purchasing power of each dollar received in revenue, and that these tendencies had not been offset by the lower unit cost of handling business, due to a greater traffic handled, despite the fact that there had been large gains in efficiency in the use of the transportation plant.

The Interstate Commerce Commission appointed Louis D. Brandeis as its attorney, and while there had not developed up to the end of the year any general opposition on the part of the shippers to the rate advance, certain large shippers were represented by counsel before the commission. It was not until December 29 that any definite indication was given of what line the commission's attorney would pursue in opposing the railway's petition. On almost the last day of December, a list of 73 questions was sent to the railways involved in the rate advance application, and so keen and searching are these questions that it is doubtful if a single railway company can or will answer them in full.

The information required deals with seven classes of questions—those relating to preliminary information; information as to revenues and the conservation thereof; information as to economy; information as to financial history and present standing; information as to the other interests of directors, officers, and employees; information as to sleeping car operations; and general information.

The three following questions are typical:

Question 43 asks what investigation has been made by the respondent to determine the relative cost of maintaining heavier locomotives and larger capacity cars and the comparative cost of maintaining steel or steel underframe cars with that of maintaining wooden cars, and calls for the result of such investigations.

Question 63 calls for the following information in regard to contracts and interests of officers or directors in transactions of the company during the year ended June 30, 1913: Description of the transaction; date contracted or performed; parties other than respondent; names of respondent's directors or officers interested; nature of interest, and remarks. With this is to be included a statement in writing from each officer whose name and address is listed under Question 5, as to whether or not he is financially interested in any concern with which the respondent has had transactions during the year ended June 30, 1913.

Question 66 calls for the following detailed information in regard to sleeping car operations borne by the respondent or its subsidiaries during the first and the last year of the life of each contract: Cost of cleaning and washing outside of cars, inside of cars; cost of furnishing and applying lubricating material, ice, heating, lighting, etc.; cost of replacing bell cords, couplers, air brake hose, etc.; payment of amounts determined on a mileage or other basis to cover the use and maintenance of cars; cost of all damages to sleeping cars resulting from accident, except those due to acts of employees of the sleeping car company.

In other words, the railways are asked to show that they come into court with clean hands not only as to efficiency, but also as to freedom from "graft." The answers to these questions will be part of the history of 1914; but some of the happenings in 1913 throw a rather unfortunate light on what may be brought out in specific instances.

RECEIVERSHIPS AND FORECLOSURES. Although there was no panic in 1913, there was for a time a stringency in the money markets, not only of the United States, but of the world, that bordered closely on financial panic. Railroad credit suffered less than commercial credit,

but almost throughout the entire year 1913, most railway companies had a hard time refunding maturing securities. The only large railway to go into the hands of a receiver in 1913 was the St. Louis and San Francisco, and its leased line, the Chicago and Eastern Illinois. The receivership of the Frisco, however, cannot be fairly attributed to bad money market conditions, although, of course, this was the immediate cause of the appointment of a receiver. B. F. Yoakum, who is chairman of the board of directors, was engaged in working out a rather ambitious scheme of railway extension into the Southwest. The Frisco, years ago, leased the Chicago and Eastern Illinois, guaranteeing as one of the conditions of the lease 10 per cent. on the C. & E. I. stock. Valuable as was the C. & E. I., both as a coal line and as a connection for the Frisco to Chicago, it did not, largely because of competitive conditions, succeed in paying its own cost each year to the Frisco, and thus there was a drain on Frisco credit from both ends, the Texas and the Chicago end. In addition to this, the laws of Texas were such that it was almost impossible for a foreign corporation to build new lines in that State. The new lines, therefore, were built by private individuals and were sold to the Frisco at a considerable profit. Mr. Yoakum himself acknowledged that he profited in such sales, and whether or not the profit to the promoters was excessive, the drain on the St. Louis and San Francisco credit was excessive. In his efforts to carry out his plans, Mr. Yoakum had "shopped" around among New York, Boston, and foreign bankers selling blocks of securities wherever he could get the best price. The result was, that when the Frisco happened to have a considerable block of obligations falling due at a time when money was tight, no single banking house felt under moral or any other obligations to take care of the property, or if they were willing to take care of it it was on terms which Mr. Yoakum refused to accept.

Including the St. Louis and San Francisco and the Chicago and Eastern Illinois, and their subsidiaries (the subsidiaries not counted separately), there were 17 steam railways placed in the hands of receivers, with a total mileage of 9020, and a total capitalization of \$477,780,820; and the *Railway Age Gazette*, from which the above figures were taken, showed that 6 roads with 1159 miles were sold under foreclosure, with a total capitalization of \$86,163,850.

THE NEW ENGLAND SITUATION. The New Haven affairs had been slowly coming to a crisis for about three years. The New York, New Haven, and Hartford Railroad Company had been using its very large credit to buy potentially competing trolley lines all through New England, and to buy boat lines which parallel its rail lines from New York into New England and Canada, and to strengthen its entrance into New York City. The New Haven was not only financed by the banking firm of J. P. Morgan & Company, but was very largely controlled by members of that firm and their associates, who were the guiding force on the board of directors. Charles S. Mellen was president, and it is problematical as to how far the New England situation as it developed was the result of Mr. Mellen's own ambitions and how far it was the result of the unskillful car-

rying out of what Mr. Mellen conceived to be the Morgan idea of the development of the New England transportation system. The point was, that the working out of these plans was not only against public opinion, but apparently was unskillfully done. Too much was paid for trolley properties. The New York, Westchester, and Boston, the double-track electric road into New York, which the New Haven financed, valuable as it would undoubtedly be some time, was too great a strain on New Haven credit. The economical and effective operation of the New Haven as a railroad property was neglected; labor unionism was permitted to interfere with the best efforts of the operating officers directly in charge; and to cap all this, Mr. Mellen had an unfortunate personality which militated strongly against the success of his own plans in antagonizing the press and the public of the territory which the New Haven serves. Combined with this, there was also a series of fatal accidents which the public generally attributed to bad management and which were pretty surely, at least in part, due to lack of discipline. The result was the retirement of Mr. Mellen as president, the election of Mr. Elliott, who had been chairman of the Northern Pacific, as chairman of the board of the New York, New Haven, and Hartford system, and the election of James H. Hustis as president of the New York, New Haven, and Hartford Railroad without jurisdiction over steamship or trolley lines. Mr. Hustis had been chief executive officer of the Boston and Albany, and was not only liked, but deeply respected and admired quite universally throughout New England. As president of the New York, New Haven, and Hartford, Mr. Hustis will devote himself exclusively to the management and operation of the railroad property.

This was followed by the cutting of the New Haven dividend from 8 per cent. to 6 per cent., and in December the passing of a quarterly dividend entirely. The New Haven had 23,968 stockholders at the end of 1913.

As the situation stood at the end of 1913, the Boston and Maine, controlled by the New Haven, was on the verge of bankruptcy; the New Haven was showing a deficit, after the payment of interest charges even without any dividend charges, and New Haven credit was in danger of very serious hurt if the company's bonds should no longer be legal investments for Massachusetts savings banks because the company had failed for a year to pay dividends.

CHANGES IN OWNERSHIP AND CONTROL. At about the time of Mr. Mellen's resignation, it became necessary to provide for refunding New Haven notes falling due early in 1914. The directors, therefore, voted to issue and offer at par to stockholders through the company's bankers, J. P. Morgan & Company, \$67,522,000 convertible debenture 6 per cent. bonds. The bankers' commission was fixed at 2½ per cent. There was considerable bitter criticism of the bankers acting both as directors and as underwriters. J. P. Morgan & Company apparently were somewhat sensitive to this criticism, and while not changing the underwriting agreement, served notice that they would terminate the agreement under which they acted as sole bankers for the New Haven. This was followed, late in December, by the announcement that all members of the firm had

resigned as directors of the New York, New Haven, and Hartford and the New York Central and Hudson River and of the American Telephone & Telegraph Company.

Ranking in importance with the withdrawal of Morgan & Company from the boards of two of the railways most closely connected with their interest was the working out of the Harriman roads' dissolution. The decree of the Supreme Court ordering the Union Pacific to sell its \$126,650,000 of Southern Pacific stock was handed down in 1912, but the actual working out of the decree took place in 1913. The first plan provided for an outright sale at par of the entire \$126,650,000 Southern Pacific stock, the Southern Pacific agreeing to sell to the Union Pacific the Central Pacific, which runs from Salt Lake City to San Francisco, and to gain possession of which was one of the chief reasons that is supposed to have actuated E. H. Harriman in his purchase for the Union Pacific of control of the Southern Pacific. The sale of this great block of stock at par was underwritten by an international syndicate of bankers. There was, however, a provision by which the Union Pacific and Southern Pacific were to continue to use a part of the Central Pacific lying wholly within the State of California to the exclusion of any other railway. The California railway commission refused to sanction this agreement and the entire deal fell through. The interesting point about this was that when the underwriting was done in February, the syndicate was eagerly subscribed to and it was generally considered a great privilege among bankers to have been asked to participate. By the time, April, that final action by the California commission made the consummation of the plan impossible, there was probably not a single participant who did not have a feeling of relief.

The final plan, which was adopted, provided for the sale of \$38,292,400 of the Southern Pacific stock to the Pennsylvania Railroad in exchange for \$21,273,000 preferred stock and an equal amount of common stock of the Baltimore and Ohio and the sale of the remaining \$88,357,600 Southern Pacific stock to the Union Pacific stockholders at a price which was equivalent to 88. The Union Pacific stockholders, however, were not permitted to come into possession of the stock certificates of the Southern Pacific nor did they have any voting rights. The stock was held by a New York trust company under direction of the board and Union Pacific stockholders received what were called certificates of ownership. These they were at liberty to sell, and if bought by some one who was not a stockholder in Union Pacific could be exchanged by presentation at the trust company for the stock of the Southern Pacific itself. In this way the court went further than it had in the dissolution of either the Standard Oil Company or the American Tobacco Company, and tried to provide a means by which not only should one corporation be prevented from controlling another, but the same individuals should not control two competing corporations. This plan was worked out satisfactorily, and by the end of the year the greater part of the Southern Pacific stock had been taken by people or corporations who were not stockholders of the Union Pacific; but it was significant that what was generally spoken of as the success of this plan was the sale at 88

of stock paying 6 per cent. on par and earning about 10 per cent.

WAGE DISPUTES. There were two important labor arbitration proceedings in 1913, one, that of the firemen under the old Erdman act, and the other, that of the trainmen under the amendment to this act known as the Newlands act. In the case of the firemen, the award was made by three arbitrators, who represented respectively the employees, the railroad managements, and the public. The result of this arbitration was a compromise by which the firemen received on most of the eastern roads fairly substantial increases in rates of pay, and following this award the unions representing the trainmen at once presented their demands. The trainmen had received increases in pay in 1910, and railway managers generally felt that if the progressive increases to organized labor at the expense of the railway stockholder and of the unorganized employees was to ever be brought to an end, the settlement of the trainmen's demands was an auspicious time to do it. The Erdman act had proved unsatisfactory both to the labor leaders and to the managers, it having placed too great a responsibility on a single man and made the award in any arbitration proceeding almost inevitably a compromise. Labor leaders, railway men, and the National Civic Federation, working together, drafted a new bill providing for a permanent board of conciliation and mediation, which board consisted of a chairman and two members, the president appointing the chairman and members of the board which should endeavor to bring about an agreement between managers and employees without a formal arbitration proceeding. Failing in this, however, they were empowered to appoint a board of arbitration to consist of a chairman and five members, which was to hear both sides of a controversy and the finding of which was to be compulsory. The agreement, however, to arbitrate at all is not made compulsory by the law. This bill was hurried through Congress and signed, and immediately thereafter the demands of the trainmen were brought before the board, of which Judge Chambers was appointed chairman and Judge Knapp, formerly chairman of the Interstate Commerce Commission, one member and the other membership left vacant. The committee, failing to bring about any agreement, selected an arbitration board, of which Seth Low, president of the National Civic Federation, was chairman, the other members being J. H. Finley, State commissioner of education of New York; W. W. Atterbury, of the Pennsylvania; A. H. Smith, then vice-president of the New York Central; D. L. Cease and L. C. Sheppard. The arbitration board confined its consideration of the demands of the trainmen to the question of whether or not the cost of living of employees had increased, and, if so, to what extent since 1910? They found that in general the cost of living had increased by about 7 per cent. and they therefore awarded an increase in wages on this basis.

CONSTRUCTION. The total mileage of new first track built in the United States in 1913, as shown by the annual compilation made by the *Railway Age Gazette*, was 3071.12 miles.

In addition there was 1263.88 miles of second track, 88.37 miles of third track, and 43.26 miles of fourth and other tracks. This compares with 2997.08 miles of first track built in 1912, 1072.94 miles of second track, 67.43 miles of third track, and 74.38 miles of fourth and other tracks. Almost the entire amount of the new mileage built was short extensions of existing lines, the longest continuous line built being the extension of the Chicago, Milwaukee, and St. Paul from Great Falls, Mont., to Lewistown, 135 miles. The rather interesting fact about this new construction in 1913 is that whereas in the United States the first track mileage built was only very slightly more in 1913 than in 1912, in Canada there was 3012.96 miles of first track built in 1913, as against 2232.10 miles in 1912. It is not surprising that the United States should show such a small amount of first track mileage built, nor that Canada should be making such rapid gains, although it is interesting to note that for the first time in the history of railroad building new first track mileage built in a country other than the United States almost equalled the building in the United States. It is, however, notable, that while Canada is about to take the leading place for new first track built, the United States is not making a proportionate gain over corresponding years in second track built. It is second, third, and fourth track rather than new railways that the eastern part of the United States needs, and even many parts of the West and South, for the proper development of the country's new business.

The following table, compiled from reports of State commissions, shows road mileage (first track mileage) in operation at the date of the last report, either December 31, 1912, or June 30, 1913, for each State in the Union having a railroad commission:

Alabama	Nebraska	6,204
Arizona	Nevada	2,314
Arkansas	New Hampshire	1,217
California	New Jersey	2,431
Colorado	New Mexico. No report	
Connecticut	New York	8,384
Delaware	North Carolina	4,657
Florida	North Dakota	5,925
Georgia	Ohio	9,233
Idaho	Oklahoma	6,324
Illinois	Oregon	
Indiana	Pennsylvania	11,881
Iowa	Rhode Island	2,098
Kansas	South Carolina	3,502
Kentucky	Tennessee	4,016
Louisiana	Texas	15,284
Maine	Utah	No report
Maryland	Vermont	1,106
Massachusetts	Virginia	4,517
Michigan	Washington	5,934
Minnesota	West Virginia	3,606
Mississippi	Wisconsin	7,583
Missouri	Wyoming	1,750
Montana		4,377

CARS AND LOCOMOTIVES ORDERED. The total number of locomotives ordered in 1913 was 3467, passenger cars, 3179, and freight cars, 146,732. This compares with 4515 locomotives ordered in 1912, 3642 passenger cars, and 234,758 freight cars.

See also RAILWAY ACCIDENTS.

RAINER, ARCHDUKE. An Austrian nobleman and soldier, died January 27, 1913. He was born at Milan in 1827, his father being a brother of the grandfather of Emperor Francis

Joseph. He was also related to the reigning house of Italy, his mother, Elizabeth, having been a princess of the House of Savoy. His sister, Archduchess Adelaide, was the wife of King Victor Emmanuel of Italy. He was married in 1852 to Princess Marie Caroline of Austria. The Archduke Rainer was one of the best known of Austrian soldiers, and in 1861 he became field marshal. He rendered great service by reorganizing the militia, which he commanded for many years. As a patron of the arts and sciences, he was largely responsible for the great museum of science and art at Vienna. In 1899 he presented 100,000 valuable manuscripts to the Royal Library. He had no children, but adopted his niece and godchild, Maria Raineria, Countess Waldeck, the daughter of Archduke Henri and of hismorganatic wife, Leopoldine.

RALPH, ELSIE (REASONER). An American sculptor and journalist, died May 10, 1913. She was born in 1883. During part of the Cuban Rebellion and the Spanish-American War she was the correspondent of the Associated Press in Cuba, and later she went to Europe and reported the coronation of Queen Wilhelmina at The Hague. For two years she was art critic in London for the New York Sun. She married Lester Ralph, an artist, and as a pastime took up modeling. Moving to London, in a little more than a year she had become well-known as a sculptor, not only there but in other capitals of Europe. In 1911 she exhibited "The Dance of Life," which had the place of honor in the sculpture division at the exhibition in the Royal Academy.

RAMPOLLA, MARIANO. A Roman Catholic cardinal, died December 16, 1913. He was born at Polizzi, Sicily, in 1843. After completing his studies at Capranica College at Rome and taking holy orders, he studied diplomacy in the College of Ecclesiastical Nobles and was later appointed counselor to the papal nunciature at Madrid. In 1865 he was created titular archbishop of Heracles and returned to Madrid as nuncio, but he was soon made a cardinal and appointed papal secretary of state under Leo XIII. In this position he became one of the most important political figures in Europe. He was held personally responsible for the friendly agreement between France and Russia, and for the opposition to the powers of the Triple Alliance. This is said to have been the cause of Austria's veto, when, at the death of Leo XIII, he was the favorite choice for Pope. This action of Austria resulted in the election of Cardinal Sato, who became Pope Pius X. on August 4, 1903. Cardinal Rampolla resigned as secretary of state and was succeeded by Cardinal Merry del Val. After the election of Pius X., Cardinal Rampolla lived in retirement near the Vatican. He is said to have taken his defeat most to heart and for many months to have kept himself hidden from public eyes, except for infrequent appearances to officiate at St. Peter's, of which he was the archpriest. He gave himself over to the study of sacred history and archæology, and wrote the life of St. Melania. He also wrote a large number of circular letters upholding the temporal power of the Pope, and endeavored to convince other countries that the church was oppressed by the Italian government.

RANSDELL, JOSEPH EUGENE, United States senator (Democrat) from Louisiana. He was born in Alexandria, La., in 1858, and was educated in the public schools of that city and at Union College, where he graduated in 1882. The following year he was admitted to the bar. Elected district attorney for the eighth judicial district of Louisiana in 1884, he held this office for twelve years. A member of the State constitutional convention in 1898, the following year he was elected to the Fifty-sixth Congress, and served continuously in the House of Representatives until the close of the Sixty-second Congress. He received the nomination for United States senator in a Democratic primary election held June 23, 1912, and was elected by the legislature to succeed Senator Foster, on May 21, 1912. He took his seat in the Senate on March 4, 1913. His term of office expires 1919.

RAPID TRANSIT. The providing of increased facilities for urban and suburban transportation continued a leading question in practically all the great capitals of the world and especially in the large cities of America. The concentration of population and industries in cities had produced congestion which, in the great majority of cases, was far in excess of the facilities available. In certain cases construction was actually under way, as in New York and Boston, while in others the question, which was one of vast importance and intimately connected with municipal economy and finance, was under careful consideration.

THE NEW YORK DUAL SUBWAY SYSTEM. On March 19, 1913, the City of New York, by the public service commission for the first district, entered into separate contracts with the Interborough Rapid Transit Company, and the New York Municipal Railway Company, a corporation formed for this purpose by the Brooklyn Rapid Transit Company, which controlled the existing system of elevated railroads in Brooklyn, for the construction, equipment, and operation of the dual system which had been laid out and arranged, and had met with the approval of the city authorities. At the date when the contracts were signed, the existing trackage of subway and elevated was 296 miles. Of this, the Interborough Company in Manhattan operated 191 miles, and the Brooklyn Company 105 miles. The new lines provided for under the dual system were to add 324.9 miles of track, making a total of 620.9 miles, affording a carrying capacity of 3,000,000,000 passengers per annum. This new system was to cost \$366,000,000, of which the city of New York was to supply \$200,000,000, all of which would be devoted to construction work upon lines owned by the city, while the Interborough Company would contribute to the cost of these lines, \$58,000,000 and the New York Municipal Railway Corporation, about \$14,000,000. The companies were to bear the expense of new equipment for both subway and elevated lines, but the equipment for the city-owned lines was to be owned by the city. This would make an extra expense of about \$47,000,000 for the construction and equipment of the city-owned lines, while the Brooklyn Company was to expend practically the same amount for new elevated construction and equipment. This all was in addition to the investment of between \$55,000,000 and \$56,000,-

000, which the city of New York had in the existing subway, and \$48,000,000 which the Interborough Rapid Transit Company had invested in its equipment.

The dual system provided for the enlargement and development of both of the present systems controlled by these two companies. In the Interborough's territory the existing subway was to be extended on the east side from Park Avenue and Forty-second Street north through Lexington Avenue to the Bronx, and on the west side from Forty-second Street and Broadway south through Seventh Avenue and other streets to the lower part of Manhattan to a new tunnel connection with the subway line in Brooklyn. The present subway was to be extended in Brooklyn to New Lots Avenue, with a branch from Eastern Parkway to Flatbush Avenue. The Lexington Avenue subway was to have two branches in the Bronx, one running up Jerome Avenue to Woodlawn Road and the other to Pelham Bay Park, both being elevated railroads in the outlying districts. The existing subway terminating at Bronx Park was to be extended to Two Hundred and Forty-first Street. The present system of elevated railroads was to be extended in the Bronx and connections developed between the subways. The Steinway tunnel under the East River at Forty-second Street was to be extended across Forty-second Street to Times Square and connect in Queensborough with the Astoria and Corona lines.

The other party to the contract with the city, the Brooklyn Rapid Transit Company, was to receive a system of subways in Manhattan so that it could distribute its passengers through the territory south of Fifty-ninth Street, and relieve the congestion at the Manhattan terminals of the bridges.

The most important subway to be constructed under this plan was to begin at the Queensborough bridge and run westerly through Fifty-ninth and Sixtieth streets to Seventh Avenue, and south through Seventh Avenue to Forty-second Street, whence it would run down Broadway to Vesey Street, and thence under private property and through Church Street and Trinity Place to a tunnel under the East River from Whitehall Street, Manhattan, to Montague Street, Brooklyn, whence it would be extended to connect with the Fourth Avenue subway. This tunnel was to be connected also with the Centre Street line, which runs between the Williamsburg and Brooklyn bridges, by a tunnel down Nassau Street to Broad Street.

In Brooklyn an extensive system of new elevated railroads was to be constructed and the Fourth Avenue subway extended from the Manhattan bridge to Eighty-sixth Street and Fourth Avenue. Other subways were to be constructed to connect with existing lines and the present elevated lines were to be extended and amplified.

A subway was to be constructed under the East River from Fourteenth Street, Manhattan, to Greenpoint in East New York, connecting with the Broadway and Cypress Hill lines of the existing elevated system. A five-cent fare was to be charged for a continuous passage on each system with the right of transfer on the system, but not from one system to another, and the longest ride possible for one fare and with-

out change of cars would be a distance of about twenty-six miles.

The contract signed contemplated that the entire system would be in operation in the year 1917, but as each part was furnished it would be used immediately where feasible.

The first part of the new system placed in operation was the Centre Street loop, which was put in service on August 4, 1913, by the New York Municipal Railway Corporation under a contract with that company, whereby the Broadway and Myrtle Avenue elevated lines in Brooklyn coming to Manhattan by the Williamsburg bridge, now come down town through the loop instead of stopping at the Manhattan end of the bridge.

At the time the dual system contract was signed on March 19, the city of New York had expended, or obligated itself to expend upon the additional subways decided upon by the city before the planning of the dual system, \$75,637,628.84, and of this amount, \$40,501,991 applied to lines for operation by the New York Municipal Railway Corporation and \$35,135,637.84 to lines for operation by the Interborough Rapid Transit Company. On December 9, 1913, the total amount of contracts on the dual system awarded, was \$88,511,928.42, divided between contracts on lines for operation by the New York Municipal Railway Corporation to the amount of \$46,691,797.08, and on lines for operation by the Interborough Rapid Transit Company, to the amount of \$41,815,272.34. The Fourth Avenue subway in Brooklyn and the Centre Street loop subway in Manhattan were about completed at the end of the year, and work on the Broadway line in lower Manhattan was in progress. The Lexington Avenue line north of Forty-second Street was well under way, especially the sections north of Fifty-third Street. The contracts for the Seventh Avenue subway in Manhattan were awarded in November, 1913, as were also the contracts for elevated lines in Queens and in the Bronx and Brooklyn, in addition to the reconstruction of the various elevated lines in Brooklyn. The engineers of the public service commission were at work on plans for the two proposed tunnels, which were designed to run under the East River.

In the construction of the new subways, both engineers and contractors benefited by the experiences in the older subways, and many modifications that have been necessary, or desirable, were incorporated. The double-deck construction of subways adopted for certain lines proceeded without difficulty, while the open cut and rock excavation presented little difficulty, and was being accomplished with a minimum of inconvenience to the users of the streets and owners of adjoining property. The tunnels under the Harlem River were being built during the year by excavation and sinking the tubes in the river bed, and this work was being accomplished satisfactorily, and without serious or unforeseen obstacles.

The contracts finally signed, without doubt, represented probably more study and discussion than ever had been expended on a municipal project. Much bitterness was exhibited in the preliminary arguments and the final outcome was in doubt until almost the time of the signing of the contracts. On February 3, 1913, Governor Sulzer appointed Edward E. McCall, then a Supreme Court justice, as chair-

man of the public service commission for the first district to succeed William R. Willcox, whose term had expired on February 1, and the new chairman joined with two other commissioners in voting affirmatively for the dual system contract as modified by more recent developments. Of the other two commissioners, one was present at the time of the vote and the other voted in the negative. The new contract was approved by the board of estimate on March 18, and on the following day was formally executed so that an important chapter in planning this huge urban transportation project was closed. Subsequent developments naturally were concerned with actual problems of construction and the linking in with the existing systems of the various elements as they were constructed.

An innovation in the method of providing for the construction of the New York City subway system worthy of mention was introduced by the Public Service Commission. Instead of letting contracts for the work and allowing the contractor to purchase the materials, as have been the rules hitherto, the commission itself will advertise for bids for the supply of such materials and after awarding the contract will make another contract with contractors experienced in building railroads to do the work of track laying, etc. In the new dual system there was involved 324 miles of single-track construction and the work on city owned lines involved 260 miles, so that as 100-pound rails were specified, the commission intended to purchase at least 45,760 tons.

BOSTON SUBWAY SYSTEM. During the year there was under construction the Boylston Street subway through the filled lands of the Back Bay district in the city of Boston. This subway extends from a point near the junction of Commonwealth Avenue and Beacon Street to the corner of Park and Tremont streets, a distance of nearly two miles, with stations at Massachusetts Avenue, at Copley Square, at, or near, the corner of Boylston and Tremont streets, and at Park Street. It was proposed to change the terminus from Park Street to Post Office Square, but this had not been decided up to the end of the year, and a temporary connection with Tremont Street subway at Park Square was under construction. The portion under contract during the year consisted of a reinforced concrete two-track structure, 8000 feet in length, with stations at Massachusetts Avenue and at Copley Square in accordance with the terms of the act of January 30, 1911, ground being broken for the first of the five contract sections in March, 1912. At the end of the year the project was about 80 per cent. completed, and its operation early in the summer of 1914 was anticipated. The construction through made lands, much of which, together with its buildings, had settled in the course of time, presented unusual problems, and on account of the depth of cover over the tubes and the unstable character of the earth beneath, a continuous centre wall was used for a large portion of the road.

Work was also in progress on the East Boston tunnel extension whose Boston terminal was located at Court and Tremont streets. The extension under construction involved lowering part of the existing tunnel between Washington

Street and Scollay Square, and extending it under the present Tremont Street subway along Court and Cambridge streets, coming to the surface at an incline on Cambridge Street near North Russell Street, so as to permit a track connection between the Cambridge Street surface cars through the tunnel to East Boston. A loop was also to be built at Bowdoin Square so that some of the cars could turn there and go back to East Boston through the tunnel. This line involves about 2300 feet of construction and about half was under way during the year,—the Washington Street part, including the change of grade in the old tunnel, and the loop. This work was undertaken on the basis of cost, plus 10 per cent.

Another tunnel in the Boston rapid transit system was to extend the Cambridge subway at Tremont and Winter streets to South Boston and Dorchester, forming a through line from Harvard Square, Cambridge, to Andrew Square, at South Boston, extending from the Park Street station of the subway along Winter and Summer streets by the South Station, and thence under the Fort Point Channel to Dorchester Avenue, along which it will continue to Andrew Square, South Boston. At the end of the year the easterly end was under construction and the portion between the Park Street station and the Summer Street station was completed, while plans were under way for that part extending from the Summer Station to the station at Dewey Square. The tunnel under the Fort Point Channel would have to be excavated by the shield method, but the remainder of the work was of the regular cut-and-cover type.

BUENOS AIRES SUBWAY SYSTEM. During the year there was under construction in Buenos Aires by the Anglo-Argentine Tramways Company, a corporation owned and managed principally by Germans, a double-track subway in two sections, having a combined length of nearly five miles. Most of the construction was in open cut and steam shovels were used, the material penetrated consisting of a hard, indurated clay line below a top surface of loam and earth. On December 1 about three miles of line was officially opened. It represented a

cost including rolling stock of about \$17,000,000. Other subways were being planned for this South American metropolis and, at the same time, improvements of the railways systems which involve the elimination of grade crossings and the electrification of the suburban zones.

RAYMOND, CHARLES WALKER. An American soldier, died May 3, 1913. Born in Hartford, Conn., in 1842, he graduated from the Brooklyn Polytechnic Institute in 1861, and from the United States Military Academy in 1865. In the last-named year he was appointed first lieutenant in the Engineers Corps; rose to be colonel in 1904; and was retired with the rank of brigadier general in that year. In the course of his service in the army he was engaged in the exploration of the Yukon River; was assistant professor of natural and experimental philosophy at the United States Military Academy; commanded the United States expedition to Northern Tasmania to observe the transit of Venus in 1874; and was instructor in military engineering, military signaling, and telegraphing at the United States Military Academy in 1878. After his retirement from the army he was chairman of the board of engineers in charge of the construction of the tunnels for the Pennsylvania Railroad in New York City.

RECALL, THE. See ELECTORAL REFORM.

RECLAMATION OF LAND. By the act of Congress approved June 17, 1902, and known as the "Reclamation act," a fund for the reclamation of arid lands was created from the moneys received from the sale of public lands in certain Western States and Territories. The actual receipts from this source to June 30, 1913, were \$81,819,614, and the net investment of this fund in reclamation works on the same date amounted to \$76,233,056. No new reclamation projects under this law have been undertaken since 1906, but prior to that date 25 primary projects had been undertaken, the net investment in which on June 30, 1913, amounted to \$5,174,283. The names of these projects and the amount invested are shown in the following table:

State	Project	Net investment
Arizona	Salt River	\$ 9,883,321.41
Arizona-California	Yuma	6,210,894.01
California	Orland	570,653.44
Colorado	Grand Valley	451,931.11
Do	Uncompahgre	5,050,987.38
Idaho	Boisé	8,155,463.02
Do	Minidoka	4,296,711.67
Kansas	Garden City	380,954.77
Montana	Huntley	962,344.23
Do	Milk River	1,631,076.89
Do	Sun River	1,013,072.87
Montana-North Dakota	Lower Yellowstone	3,070,947.86
Nebraska-Wyoming	North Platte	5,806,438.37
Nevada	Truckee-Carson	5,029,591.66
New Mexico	Carlsbad	732,910.61
Do	Hondo	358,913.60
New Mexico-Texas	Rio Grande	1,690,604.78
North Dakota	North Dakota pumping	911,205.97
Oregon	Umatilla	1,365,259.84
Oregon-California	Klamath	2,083,143.40
South Dakota	Belle Fourche	3,104,846.96
Utah	Strawberry Valley	2,271,131.13
Washington	Okanogan	582,653.33
Do	Yakima	5,731,143.14
Wyoming	Shoshone	3,828,086.81
Total primary projects		75,174,283.26
Secondary projects		592,412.23
Arizona-California, Colorado River		43,710.00

State	Net investment
Oklahoma-Cimarron	11,723.99
Oregon, Central Oregon	40,366.67
Townsite development	16,916.04
General	89,272.27
Indian:	
Blackfeet, Montana, \$79,935.04; Flathead, Montana, \$99,094.28; Fort Peck, Montana, \$54,854.44.	233,883.76
Miscellaneous preliminary investigations	80,488.78
Total	\$76,233,056.95

Included in this table are the expenditures on investigations of various so-called secondary projects or enterprises which have not been found to be such as to warrant immediate undertaking. The estimated area of these projects when completed is 2,983,440 acres. The area for which service is prepared to supply water is 1,299,956 acres. The total reservoir capacity is 5,051,210 acre-feet. Canals have been built to a total length of 7961 miles, and there are 77 miles of tunnel. The total number of farms irrigated and cropped in 1912-13 is 16,554, and the value of the crops was \$14,479,368. The development of irrigated areas has been a source of disappointment to those who have them in charge. This is due largely to the spirit of speculation aroused by the opportunities offered through the reclamation of arid lands whether by public or private capital. This has been aroused by the rapid advances in the price of land wherever these projects are planned or completed. The prospective profits to be derived from the reclamation of otherwise worthless lands by the storage of waste waters have been among the most alluring of inducements to the investor. The results already attained show, however, that there has been no one class of investments which has uniformly been so unprofitable. The reason for this is that the success of the enterprise depends upon the prompt and successful development of agriculture within the reclaimed area. This development has rarely followed the construction of the works. In all plans for reclamation, the assumption has been that when the water was available there would not be merely an immediate increase in land prices, but these lands would be readily taken by competent farmers who would at once begin to produce crops, by the sale of which the money invested could be repaid. In all cases, however, there has been a very slow return. Although the lands have been advanced rapidly in price, this advance has been based upon the hopes of future productivity rather than upon actual crop returns. The proper development and use of these reclaimed lands is one of the most serious problems which has been presented to the Department of the Interior.

RED CROSS, AMERICAN NATIONAL. The year 1913 was the busiest in the history of the association in the character, magnitude, and number of its relief operations and in the work of the first aid department, while gratifying progress was reported in the growth of the town and country nursing service. The activities of the society during the year included relief services at Dayton, O., at the time of the floods, in Omaha in the tornado which destroyed a large portion of that city, in the *Volturno* disaster at sea, and in connection with Mexico. Medals in recognition of valuable un-

remunerated personal services in connection with the Red Cross were awarded to many persons, including Governor Cox of Ohio, John H. Patterson of Dayton, O., for services during the floods; Mrs. Edith H. Rockhill, Mr. John B. Jackson, and others, for work in the Balkan countries; and Hammon H. Buck, for services during the eruption of the Taal volcano in the Philippines. Medals also were given to others for general services. The Red Cross Christmas seals were again sold during the Christmas holidays. The proceeds of this sale are used in the campaign against tuberculosis. The sales approximated 40,000,000, for which \$400,000 were paid.

The erection of a new building for the American Red Cross Society was assured in 1913. Congress passed a law providing for \$400,000 for the erection of a memorial building to the women of the Civil War without regard to their sympathies or allegiance. If it is to become effective, there must be added to this appropriation \$300,000 by the American Red Cross in order that the memorial may cost at least \$700,000. At the end of the year this fund will be completed. The building is to be used as headquarters for the Red Cross Society.

The Red Cross town and country nursing service increased the field of its operations during the year. Nurses are found in Vermont, Massachusetts, Ohio, New York, New Jersey, Maryland, Virginia, West Virginia, Kentucky, and South Carolina. In order to explain and illustrate the work of the first aid department of the society, representatives of the Red Cross visited many railroad headquarters and mines during the year. There was an exhibit at the exposition at Knoxville, illustrating the methods of work. The Red Cross took an active part in the withdrawal of American citizens from Mexico. Aid was also furnished to inhabitants of the city of Mexico after the revolution in February, 1913.

The annual meeting of the association was held on December 10, 1913. President Wilson presided over one session and made a brief address. The officers elected for 1914 were as follows: President, Hon. Woodrow Wilson; vice-president, John Skelton Williams; national director, Ernest P. Bicknell; secretary, Charles L. Magee.

REDFIELD, WILLIAM C. An American public official. Secretary of Commerce in the cabinet of President Wilson. He was born in Albany, New York, in 1858 and was educated in the public schools of Pittsfield, Mass., whence he removed to Brooklyn, N. Y., and engaged in business, soon identifying himself with many important industries in that city. In 1902-03 he was commissioner of public works for the Borough of Brooklyn; in 1906 an unsuccessful candidate for Congress.

He was elected to the Sixty-second Congress in 1911.

REDMOND, JOHN. See GREAT BRITAIN, *Home Rule Bill and War or Conference.*

REFERENDUM. See ELECTORAL REFORM.

REFORM, ELECTORAL. See ELECTORAL REFORM; FRANCE, *History.*

REFORMED CHURCH IN AMERICA (DUTCH). A Protestant religious denomination known up to 1867 as the Reformed Protestant Dutch Church of North America. The denomination numbered in 1913 121,640 communicants, 707 churches, and 774 ministers. This represented a gain of 3076 communicants for 1912. There are connected with the denomination four particular synods and 35 classes. In the Sunday schools there were enrolled about 125,000 pupils. The contributions for benevolent objects amounted to about \$500,000; for congregational purposes, about \$1,700,000. There were connected with the denomination the foreign missionary board, women's foreign missionary board, domestic missionary board, board of education, board of publication, two theological seminaries, and several other educational institutions. The general synod met in 1913 at Asbury Park on June 5. See also RELIGIOUS DENOMINATIONS AND MOVEMENTS.

REFORMED CHURCH IN THE UNITED STATES, GERMAN. This denomination, known also as the German Reformed Church, had in 1913, 306,337 communicants, 1776 churches, and 1210 ministers. The gain in communicants for 1912 was 6190. The denomination is divided for administrative purposes into eight district synods and 59 classes corresponding to the presbyteries in the Presbyterian bodies. In the Sunday schools there are about 250,000 scholars and 25,000 teachers. Mission work is carried on practically in all the States of the Union, and in Canada. Foreign missions are also conducted in Japan and China. The denomination has theological seminaries in Lancaster, Pa., and Dayton, Ohio. Colleges maintained include Franklin and Marshall College, and Heidelberg College, at Tiffin, Ohio. Colleges for women are maintained at Frederick, Md., and Allentown, Pa. See also RELIGIOUS DENOMINATIONS AND MOVEMENTS.

REFORMED EPISCOPAL CHURCH. This denomination had in 1913 10,800 communicants, 80 churches, and 83 ministers. There was a gain of 400 communicants over 1912. There are six bishops at the head of the denomination. Domestic missions are carried on among the colored people in South Carolina, and foreign missions are maintained in India. The theological seminary of the denomination is in Philadelphia, and the official organ of the church is the *Episcopal Recorder*, published in the same city. See also RELIGIOUS DENOMINATIONS AND MOVEMENTS.

REFORMED PRESBYTERIANS. A general name given to several religious bodies of Presbyterian doctrine, founded by members of the Covenanted Reformed Presbyterian Church of Scotland. Included in the title are the Synod of the Reformed Presbyterian Church in North America; the Reformed Presbyterian Church in North America, General Synod; the Reformed Presbyterian Church, Covenanted; and the Reformed Presbyterian Church in the United States and Canada. The largest of these bodies is the Synod of the Reformed Presby-

terian Church in North America. This denomination had in 1913 9015 communicants, 110 churches, and 143 ministers. The Reformed Presbyterian Church, General Synod, had 3400 communicants, 18 churches, and 16 ministers. The Reformed Presbyterian Church in the United States and Canada had 398 communicants, one church, and one minister. The Reformed Presbyterian Church, Covenanted, had 40 communicants, one church, and one minister. The General Synod maintains a theological seminary at Philadelphia and a college at Cedarville, O. See also RELIGIOUS DENOMINATIONS AND MOVEMENTS.

REFRIGERATION. With the elaborate equipment of the Bureau of Standards at Washington, interesting tests have been conducted to determine the latent heat of ice and a value of 143.5 British thermal units per pound, instead of 144 B. T. U., as generally employed in the United States, was found approximately correct. The bureau was to take up the test of the resistivity of insulation, and also the properties of ammonia and other refrigerants. In connection with the properties of ammonia, the Engineering Experiment Station of the University of Illinois issued a new set of tables, and so much work had been done in this field that it was thought that many ideas, previously held, might require reconstruction. The Third International Congress of Refrigeration was held in Chicago, at which there were present engineers from twenty different countries and a number of important papers were presented.

REFUSE. See GARBAGE AND REFUSE DISPOSAL.

REID, SIR GEORGE. A Scotch painter, died February 2, 1913. He was born in Aberdeen, in 1841; studied art in Aberdeen; and was for many years a member of the Scottish Academy. It was not until he was past middle age that his work became well known in England. On the death of Sir William Fettes Douglas, in 1891, he was elected president of the Royal Scottish Academy. He was knighted soon after his election, and he held the presidency of the society until 1902, when he retired. He was especially eminent as a portrait painter.

RELIGIOUS DENOMINATIONS AND MOVEMENTS. The statistics of religious bodies were gathered in 1913 by the Federal Council of the Churches of Christ in America (q.v.), under the supervision of Dr. Henry K. Carroll. The statistics, as will be noted from the table below, show a net increase in the number of persons actually enrolled as members of the Christian Churches within the United States of 618,000, or 1.8 per cent. in 1913. Several of the small bodies lost in membership. If only the active bodies are taken into consideration, the total increase in 1913 was 655,000, or a fraction under 2 per cent. This is at the rate of 20 per cent. a decade, or about equal to the proportionate growth of the population. The figures do not include foreign mission fields, but the continental United States only.

Of all the denominations, the Methodist showed the largest increase, 220,000. The Methodist Episcopal Church North increased by 122,000, its largest growth in recent years. The next largest increase was made by the Roman Catholic Church, with 212,500. The

Baptist growth was 64,600, the Presbyterian 45,600, the Lutheran 36,100, the Disciples of Christ 21,800, and the Episcopalians 16,500. In compiling figures of the Roman Catholic Church, Dr. Carroll deducted 15 per cent. from the official Roman Catholic population figures for children not yet confirmed in an attempt to make these figures correspond with others, and represent actual membership of communicants.

The eight largest denominational bodies are the Roman Catholic, Methodist, Baptist, Lutheran, Presbyterian, Disciples of Christ, Protestant Episcopal, and Congregationalists, containing 34,000,000 of the 37,280,000 actual members of churches within the United States. The statistics show that all these large denominations grew with fair steadiness during 1913.

Dr. Carroll was unable to secure statistics for the Christian Science churches for 1913, and those given are for 1912. He was unable also to obtain late figures for the Latter Day Saints or Mormons, and the figures given in the table are an estimate. He estimates the Jews in the United States at 2,000,000, of which New York contains about 900,000, making it the greatest centre of Jewish population in the world.

The surprising feature of 1913 was the ex-

traordinary number of new churches. This is due, it is said, to the enterprise of many bodies in organizing scattered communicants, and also to the realization of the economic fact that small churches, except in particular cases in centres of large cities, are to be preferred to large churches, because relatively they reach and interest larger numbers of people at less cost for maintenance.

An interesting fact shown by the statistics is that few new religious fads or "isms" are making headway. Twenty years ago the number of new religious platforms put forth was some twelve or fifteen a year. Most of these were local to given cities, and had only one man or woman behind them. A few gained national headway each year. It is now a fact that the number of these annual outputs is hardly more than six, possibly some years eight, and very few gain in real following that lasts between four or five years. The statistics show an overwhelming preponderance of the large bodies that have assured standing. The total number of bodies having 100,000 communicants or more in 1913 was 36.

The following table gives detailed information of the religious denominations of the United States in 1913:

Denominations	Summary for 1913			Net gains for 1913		
	Min- isters	Churches	Com- muni- cants	Min- isters	Ch'h's	Com- muni- cants
Adventists (6 bodies).....	1,179	2,547	98,822	7	25	3,014

RELIGIOUS EDUCATION. See **UNIVERSITIES AND COLLEGES.**

RESERVOIRS. See **AQUEDUCTS, DAMS, and IRRIGATION.**

RÉUNION, or BOUBRON. An island in the Indian Ocean; a French colony. Area, 1980 square kilometers (764 square miles); population (1911), 173,822. Capital, St. Denis, with 25,689 inhabitants. Imports (1910), 18,853,000 francs; exports, 16,915,000. There are 126 kilometers of railway. The budget for 1911 balanced at 4,125,000 francs. The governor in 1913 was P. L. A. Duprat.

REVENUE. See articles on various countries; on States of the United States; and **UNITED STATES.**

REYES, BERNARDO. A Mexican soldier, killed in the revolt against President Madero on February 9, 1913 (see **MEXICO**). He was born in Guadalajara in 1847. He was still at school when the French under Marshal Bazaine invaded Mexico, for the purpose of overthrowing the republic and creating an imperial throne for Maximilian of Austria. Reyes joined the Mexican army and in one battle was shot through the wrist. He was captured by the French troops, but the French commander, admiring his courage, sent him to his home under military escort. He soon rejoined the army. He was commissioned second lieutenant, and distinguished himself. After the invaders were repelled Reyes continued in the army, and rose to the rank of colonel in 1872. In 1885, after suppressing a revolution in the state of Nueva Leon, he was made a general. His success in a series of battles which restored order in this state caused his appointment as military governor. This position he held for three years, and then declared an election. Garza Ayala was elected governor, and Reyes, having made himself a citizen of Nueva Leon, succeeded him. He served several terms as governor, and during an interim was made secretary of war, but charges were made against him while he held this position, and President Diaz sent him back as governor of the province. Rumors began to circulate that Reyes was instigating a revolution again Diaz. Within a month he had been stripped of his office and ordered to Paris "on a military mission." After a year and a half of practical exile, he was recalled by Diaz to aid in putting down the revolution headed by Madero. Before he had returned, however, Diaz had gone into exile, and the two men passed each other at sea. On his return to Mexico Reyes proclaimed his loyalty to Madero, but was soon on the side of the insurgents and led them against the federal forces. In November, 1911, he was arrested in San Antonio, Texas, on a charge of plotting to ship arms and ammunition across the border. In the following month he declared that he had failed to secure the support of the Mexican people and had given up his plans for a revolution. He was released from prison on bail, but in December the bail was confiscated, and on Christmas Day, 1911, Reyes surrendered and was placed in prison. Here he remained until the outbreak of the Diaz revolution. For the circumstances relating to his death, see **MEXICO.**

REYNOLDS, GEORGE GREENWOOD. An American lawyer and jurist, died January 23, 1913. He was born in 1821; graduated from Wesleyan University in 1841; in 1844 was admitted to

the bar; practiced at Milton and Poughkeepsie, N. Y., until 1854, when he removed to Brooklyn. From 1860-66, and again from 1872-87, he was judge of the City Court of Brooklyn, and in 1891 was appointed by the governor to hold Supreme Court in Brooklyn. In 1871 he received the degree of LL.D. from Wesleyan University and from that year until the time of his death served as a trustee of that university, of which he was the oldest living graduate.

RHODE ISLAND. POPULATION. The population of the State in 1910 was 542,610. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 579,665.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1913 are for estimates only.

		Acreage	Prod. Bu.	Value
Corn	1913	11,000	402,000	\$398,000
	1912	11,000	456,000	401,000
Oats	1913	2,000	52,000	26,000
	1912	2,000	57,000	26,000
Potatoes	1913	5,000	650,000	585,000
	1912	5,000	565,000	435,000
Hay	1913	58,000	668,000	1,442,000
	1912	58,000	66,000	1,465,000

c Tons.

MINERAL PRODUCTION. The only mineral products of the State are stone, mineral waters, lime, soapstone, and the manufactures of clay. In former years some clay was mined in the State, and in 1911 an effort was made to re-open and operate these mines, but the results were not encouraging. The value of the stone production decreased from \$958,733 to \$768,067 in 1912.

TRANSPORTATION. The total mileage of main and branch railroad lines in the State on December 31, 1912, was 211.64, and the total length of railroad tracks was 468.54. The total mileage of roads operated by railroad corporations which either owned or operated within the State was 2097.95.

EDUCATION. The total school population in 1913 was 106,613. The enrollment in public schools in 1911-13 was 81,799. The average daily attendance was 74,878. The teachers number 2428, of whom 200 were men and 2228 women. The average yearly salary of men teachers was \$1322, and of women teachers \$609.78. The legislature of 1913 passed several important measures relating to education.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions under the control of the State are as follows: Rhode Island Soldiers' Home, Bristol, 149 inmates; Butler Hospital, Providence; State Sanatorium for Consumptives, Wallum Lake, 311. At Cranston are: State Work House and House of Correction, 306; State Hospital for the Insane, 1245; State Prison, 149.

FINANCE. There was a balance in the treasury on January 1, 1912, of \$145,806. The receipts from January 1, 1912, to January 1, 1913, were \$3,250,631. The disbursements amounted to \$3,335,012, leaving a balance in the treasury at the end of the fiscal year of \$68,020. The principal receipts are from tax-

tion, and the chief disbursements are for education, State officers, and State institutions.

POLITICS AND GOVERNMENT. There was no election for State officers during the year as the term of Governor Pothier does not expire until January 5, 1915. The next State election is on November 3, 1914. On January 21 the legislature elected LeBaron B. Colt (q.v.) United States senator, to succeed George Peabody Wetmore, whose term had expired.

LEGISLATION. The legislature met in 1913 and passed two measures of importance. They both related to hours of labor for women and children. A maximum of ten hours per day and 54 hours per week for women and minors in certain employments was made mandatory, and the employment of children under fourteen years of age was prohibited in certain employments. Restrictions were also placed on the conditions of labor for children over that age.

STATE GOVERNMENT. Governor, Aram J. Pothier; Lieutenant-Governor, R. B. Burchard; Secretary of State, J. Frederick Parker; Attorney-General, Herbert A. Rice; Treasurer, Walter A. Read; Adjutant-General, Charles W. Abbott, Jr.; Auditor, Charles C. Gray; Commissioner of Public Schools, Walter E. Ranger; Commissioner of Insurance, Charles C. Gray—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, Edward C. Dubois; Associate Justices, Clark H. Johnson, C. Frank Parkhurst, W. B. Vincent, William H. Sweetland; Clerk of the Court, B. S. Blaisdell—all Republicans.

STATE LEGISLATURE, 1913. Republicans: Senate, 32; House, 61; joint ballot, 93. Democrats: Senate, 6; House, 39; joint ballot, 45. Republican majority: Senate, 26; House, 22; joint ballot, 48.

The representatives in Congress will be found in the section *Congress*, article **UNITED STATES**.

RHODESIA. A British protectorate (named for Cecil Rhodes) in South Africa, administered by the British South Africa Company. It is divided into Northern and Southern Rhodesia.

NORTHERN RHODESIA is made up of the two former provinces of Barotseland (Northwestern R.) and Northeastern Rhodesia, and was constituted a single British sphere in 1911. Its area is estimated at 291,000 square miles and its native population (1911) at 821,102; there were 1497 Europeans present May 7, 1911. The administrator (1913, L. A. Wallace) resides at Livingstone. Other towns are Fort Jameson, Broken Hill, and Lealui (the residence of the native king, Lewanika, chief of the Barotse).

SOUTHERN RHODESIA contains Mashonaland and Matabeleland: total area, 148,575 square miles. A census taken May 7, 1911, showed a total of 23,606 Europeans; 12,631 in Mashonaland, 10,975 in Matabeleland. Native population, 744,559 (495,451 and 249,108). Salisbury, the capital, had 3479 white inhabitants. Bulawayo (5200 whites) is the commercial centre.

PRODUCTION. Large tracts have been brought under cultivation (cereals, vegetables, tobacco, fruits, etc.), and the country is admirably adapted to the raising of stock of all kinds. Output of gold during 1912, 642,808 fine ounces (£2,707,368). Output of coal in 1912, 216,140 tons; silver, 176,531 ounces; lead, 590 tons; chrome iron ore, 69,250 tons. The following table gives

trade statistics for calendar, and financial statistics for fiscal, years:

	1908-9	1909-10	1910-11	1911-12
Imports...	£1,818,372	£2,214,014	£2,786,321	£2,975,112
Exports...	2,718,476	3,159,569	3,018,099	3,098,400
Revenue..	564,399	620,243	784,908	817,354
Expenditure	535,150	614,405	684,683	737,578

RAILWAYS. The railway from Cape Town reached Bulawayo October 19, 1897 (opened November 4); the Beira Railway extension from Umtali reached Salisbury May 1, 1899 (May 22) and Bulawayo October 6, 1902, completing the connection between Cape Town and Beira. The Bulawayo to Victoria Falls line was completed April 25, 1904, and extended to the Broken Hill mine September 1, 1906; still further extended to the Congo frontier December, 1909. Branches connect with the mining districts and with the Matopos, the burial place of Cecil Rhodes. The total mileage at end of 1911 was 2357. A protected line from Umtali to Victoria (75 miles) has been surveyed. Considerable progress in the increase of the Rhodesian Railway was made during 1913. The Blinkwater Railway Company was constructing 70¼ miles of new line from Gwelo and Umtali, their present terminus, to Victoria, the site of the famous Zimbabwe ruins, a distance of 70¼ miles. This new line was to serve the Athens Mine, and a number of intermediate stations were to be provided. The distance of Victoria by rail from Beira is 690 miles and 50 miles of the earth work was completed towards the end of the year, and 20 miles of track. The Mazoe and Shamva line, 50 miles in length, was opened during the year, and railway communication through Rhodesia was established between Cape Town to Kamboze in the Congo State, a distance of 2420 miles. Mazoe station is 38 miles from Salisbury, which, in turn, is 385 miles by rail from Beira. The new line runs via Rockwood and Kimberley. The Mashona Railway Company was enlarging its gauge from 2 ft. to the South African standard of 3 ft. 6 in., and was making substantial progress in the work which naturally involves the strengthening of the bridges for through traffic. Various extensions were also in progress, notably one from Eldorado, 78¼ miles from Salisbury, to Sinoia. Considerable additional equipment was added to the rolling stock of the protectorate, most of which was sent from England.

GOVERNMENT. In the spring of 1913 it was announced that the number of elected members of the Legislative Council of Southern Rhodesia would be increased from 7 to 12, and the nominees of the chartered company from 5 to 8. Administrator for the British South Africa Company (1913), Sir William Milton.

RICE. Exclusive of China, which publishes no data regarding the crop, and of British India, for which the 1913 figures are not available when the *YEAR BOOK* goes to press, the rice production in five other large producing countries as estimated by the International Institute of Agriculture at Rome, was approximately 570,000,000 bushels, or about 5 per cent. greater than in 1912. The acreage in these countries was also somewhat greater than in the previous year. The normal world's production is about 4,000,000,000 bushels, with

British India and China as the leading countries. Of the reporting countries Japan ranked first, with a yield of about 365,000,000 bushels, being followed by Italy with 27,000,000, the United States with 25,744,000, Egypt with 18,500,000, and Spain with 12,000,000 bushels. The yield in the United States was greater by 690,000 bushels than in 1912, and the area devoted to the crop was 827,100,000 acres, or 104,300,000 acres more than in the previous year. The crop was produced in 10 States, as follows: Louisiana, 11,760,000 bushels; Texas, 9,896,000; Arkansas, 3,769,000; California, 293,000; South Carolina, 147,000; Mississippi, 42,000; Georgia, 16,000; Florida, 10,000; and Alabama, 4000 bushels. The acreage as compared with the previous year was decreased in all the States except in Louisiana, Texas, Arkansas, and California, in which it was largely increased, California raising its acreage from 1400 to 6100 acres. The average yield per acre was 31.1 bushels, as against 34.7 bushels in 1912, and the highest average yield in any one State was 48 bushels per acre, secured in California. Based on farm prices, December 1, the crop of 1913 was valued at \$22,090,000, or \$1,333,000 less than the crop of 1912. (See also BERIBERI.)

RICE, DR. HAMILTON. See **EXPLORATION, South America.**

RICHARDSON, CHARLES FRANCIS. An American scholar and educator, died October 8, 1913. He was born at Hallewell, Me., in 1851, and graduated from Dartmouth College in 1871. From 1872-78 he was on the staff of the *Independent* in New York City, and from 1878-1880 was a member of the staff of the *Sunday School Times*. He was editor of *Good Literature* in 1880-1882. In the latter year he was appointed Winkley professor of Anglo-Saxon and English language at Dartmouth College, a chair he held until 1911. His published writings include: *A Primer of American Literature* (1878); *The College Book* (1878); *The Cross* (poems, 1879); *The Choice of Books* (1881); *American Literature, 1607-1885* (2 volumes, 1886-88); *The End of the Beginning* (a romance, 1896); *A Study of English Rhyme* (1909). He also edited editions of several American authors.

RICHARDSON, SIR GEORGE. See **GREAT BRITAIN, Home Rule Bill, War or Conference.**

RICHEL, CHARLES. A French physiologist, awarded in 1913 the Nobel Prize for medicine. He was born in Paris, in 1850, and was educated in that city. From 1881 he was a prominent member of the French Biological Society. He received a prize from the Institute of France for a monograph, the *Chemical and Physiological Properties of the Gastric Juice*. In 1867 he became professor of physiology in the medical faculty of the University of Paris, and in 1899 was chosen a member of the Academy of Medicine. His most recent work has been on anaphylaxis or serum sickness, and for results in these investigations he was awarded the Nobel Prize. He is a prolific writer on medical subjects, and edits an annual dictionary of physiology. He has also written books of poetry, romances, and books on psychology, psychic research, and peace.

RIGGS COLLECTION OF ARMOR. See **PAINTING AND SCULPTURE.**

RITUAL MURDER TRIAL. See **RUSSIA, History.**

ROADS AND PAVEMENTS. The use of bituminous-bound instead of water-bound broken-stone or macadam road surfacing increased during the year 1913, as did also portland-cement concrete pavements for country roads and city streets. Brick, asphalt, stone block, and rectangular wood block treated with a preservative against decay were still more extensively used than was concrete for city pavements. The choice of a material for wood surfacing or for street pavements should, of course, be governed by a variety of local conditions, which can best be weighed by the road or pavement engineer. Among these conditions volume and kind of traffic and local prices for materials and labor stand first.

EXPERIMENTAL ROADS. Object-lesson roads had been built by the United States office of public roads each year for the 9 years ending with 1913. The total area built ranged from 79,203 square yards in 1905 to 1,007,569 square yards in 1910. Twenty different kinds or combination materials were used, running from plain earth to brick and concrete. In 1913, the yardage was 488,331, including roads classed as experimental. The cost of the object-lesson roads was met by the communities in which they are located, except for the surveys, engineering, and inspection charges, which were borne by the Federal government. See Bull. 53, Office of Public Works (Washington, D. C.) for details of work for 1912-13, and summary of the work of the nine-year period; for an account of a service-test road 3.4 miles long, embracing 26 kinds of material or methods of construction built in 1912-13 by the bureau of highways, Philadelphia, see special report issued by the bureau in November, 1913.

ROAD CONGRESSES AND CONVENTIONS. The third International Road Congress was held at London, England, during the week beginning June 23. Owing to unfortunate conditions which cannot be discussed here, the United States again was not officially represented, but unofficially it was ably represented by a number of prominent American road engineers. Official "conclusions" were adopted on ten main subjects for discussion. (See *Engineering News*, July 24, 1913.) In the United States, national road congresses or conventions were held as follows: Third Annual Road Congress, including American Highway Association and American Good Roads Association, at Detroit, in October; United States Good Roads Association, St. Louis, November; American Road Builders' Association, at Philadelphia, in December.

BIBLIOGRAPHY. A new book published during the year was Blanchard and Droune, *Text-Book on Highway Engineering* (New York). New editions also appeared as follows: Baker, *Roads and Pavements*; Spaulding, *A Text-Book on Roads and Pavements*; Tillson, *Street Pavements and Paving Materials*; Whinery, *Specifications for Street Roadway Pavements* (all New York).

ROBERTS, SAMUEL JUDSON. An American editor and political leader, died March 23, 1913. He was born in Pomeroy, O., in 1858, and was educated at the Canton (Ohio) Academy. From 1878-82 he was on the staff of the *Cleveland Leader and Herald*. After serving on other papers he founded, in 1888, the *Lexington* (Kentucky) *Leader*, and remained editor and publisher of this paper until the time of his death. He was the Republican nominee for

mayor of Lexington in 1887. In 1896 he was chairman of the Republican State campaign committee of Kentucky and managed the campaign in behalf of William McKinley. His efforts resulted in Kentucky being carried for a Republican electoral ticket for the first time in its history. From 1897-1910 he was collector of internal revenue for the seventh Kentucky district.

ROBINSON, HENRY DOUGLAS. An American bishop of the Protestant Episcopal Church, died December 18, 1913. He was born at Lowell, Mass., in 1865, and graduated from Racine College in 1884. For several years he was instructor in mathematics at the San Mateo Military Academy, and then became successively head master and warden of the Racine College Grammar School. He was ordained priest in 1888, and in 1907 was appointed missionary bishop of Nevada.

ROBINSON, JOSEPH TAYLOR. United States senator (Democrat) from Arkansas. He was born in 1872 at Lonoke, Ark.; educated in the common schools and at the University of Arkansas; and in 1895 began the practice of law. In the previous year he was elected to the general assembly of the State and served in the session of 1895. In 1900 he was presidential elector for the sixth congressional district. Elected to the Fifty-eight Congress, he was re-elected to congresses up to and including the Sixty-second. He was chosen United States senator to succeed Jeff Davis (q.v.). His term of service expires March 3, 1919.

ROCHEFORT-LUCAY, VICTOR HENRI, Marquis de. A French politician, journalist, poet, and revolutionist, died July 1, 1913. He was born in Paris in 1831. He studied at the College Louis le Grand, where he was popular with his teachers and fellow students on account of his ready wit and his independence. After leaving school, he took to writing poetry for a living, but finding this unremunerative, he studied medicine. His parents were so poor, however, that he was obliged to abandon the idea of becoming a physician for lack of funds. He then secured a position as clerk of the town council of Paris. Soon he began to contribute articles to Parisian newspapers, in which he vigorously denounced the empire. This resulted in a systematic attempt of the government to prevent his writing, and the publications for which he wrote were seized. Rochefort himself was thrown into prison. Here he spent several years, but continued his writing which brought him eventually an income of over \$50,000 a year. In 1868 he established *La Lanterne*, a weekly paper, which after the third month of its existence, was suppressed. Rochefort was sentenced to one year in prison and to pay a fine of 10,000 francs. This offense, however, was pardoned by the emperor, and Rochefort resumed at once the publication of *La Lanterne* in Brussels, where it was more vigorous and scathing in its denunciation of the government than ever, and it was said that over 200,000 copies every week were smuggled into France. In 1869 he founded *La Marseillaise*, and in the same year he was elected to the Assembly in the first Parisian district. His paper was soon seized, and he was again thrown into jail. Convicted of libel, he was sentenced to six months of imprisonment. On the proclamation of the republic, the people of Paris attacked the jail

and took him triumphantly from his cell to the Louvre. During the siege of Paris by the Prussian army, Rochefort was president of the commission for barricades. In 1871 he was elected to the National Assembly. During the Commune he was head of the department of state. On the fall of the Commune he endeavored to escape from Paris, but was caught. On September 21, 1871, he was court-martialed and sentenced to deportation to Cayenne for life. After remaining in that island for two years, he escaped in company with two companions, and, after thrilling adventures, reached an English vessel, which had been chartered by a friend, and the refugees were taken from the island. Rochefort went to Switzerland, where he lived a quiet life and contributed to leading radical papers in France, England, and Germany. At the general amnesty on July 11, 1880, Rochefort was permitted to return to Paris. In that year he was badly wounded in a duel. He was an ardent champion of General Boulanger, and supported him strongly in his paper, the *Intransigeant*, which was founded in 1880. On the fall of Boulanger he was prosecuted, and again exiled. He left France with Boulanger to live in England, where he remained for several years. Rochefort has been described as one of the most trenchant satirical writers that France has produced. Before politics had embittered him, most of his writings were full of delicious humor. His published writings include *Les Français de la Decadence* (1866); *La Grande Bohème* (1867); *L'Evadé* (1880); *Les Aventures de ma Vie* (1895); *La Lanterne* (1868).

RODDENBERRY, SEABORN ANDERSON. An American public official, member of the House of Representatives from Georgia, died September 25, 1913. He was born in Decatur County, Ga., in 1870; was educated at the common schools and at Mercer University; and for a time he filled the chair of language and mathematics at South Georgia College. In 1891 he was elected to the Georgia legislature and served for the sessions of 1892-93. He then taught school, and studied law. He was admitted to the bar in 1894. After serving for several years as county judge, he was elected mayor of Thomasville. In 1910 he was elected to the Sixty-first Congress to fill an unexpired term, and was re-elected to the Sixty-second and Sixty-third Congresses without opposition.

ROLLER DAMS. See DAMS.

ROMAN CATHOLIC CHURCH. A general jubilee had been proclaimed by the Pope for the year 1913, in commemoration of the peace edict of Constantine, giving freedom to Christianity, and it was observed with fervor all over the Catholic world. The official ceremonies at Rome were carried out during the year with great splendor and it is estimated that during the jubilee period 200,000 pilgrims visited Rome. As a memorial, the new basilica of the Holy Cross, built during the year, was dedicated at the close. In this is an altar, costing \$25,000, given by leaders of the *Sacred Heart Review* of Boston, Mass.

The work of codifying the canon law was advanced during the year, and the biblical commission issued several important decisions on the text. The head of the commission, Right Rev. Abbot Dow Gasquet, made a tour of the

United States, explaining the scope of the commission and asking aid in its mission.

The Pope's sister, Rosa Sarto, died on February 11, and he himself had a serious attack of illness in April. At the social week held in Milan, Archbishop Rossi, of Udine, created a sensation, on December 1, by a speech in which he demanded the full and unfettered liberty of the church and an international guarantee of the complete independence of the Papacy. In a letter to the Patriarch of Lisbon in March, the Pope strongly protested against the persecution of the church by the officials of Portugal. Father Salvatore Brandi, the famous Jesuit editor of the *Civiltà Cattolica*, resigned that position because of ill health. He is a naturalized citizen of the United States.

The Catholic population of the world is estimated at 298,734,824, and of this total, 37,576,506 are in English-speaking countries. At the end of 1913, Pope Pius X. was assisted in the government of the church by 56 cardinals: 30 Italians; one each from Germany, Holland, Ireland, England, Belgium, and Brazil; 6 from France; 5 from Austria-Hungary; 4 from Spain; 3 from the United States; and 2 from Portugal. Six cardinals died during 1913: Nagl, Respighi, Aguirre, Vives y Tuto, Oreglia, and Rampolla, making 44 deaths in all during the reign of Pius X. The hierarchy of the world consists of 14 patriarchs, 1108 archbishops and bishops of residential sees, and 370 titulars, or 1437 in all. The senior is Bishop Laspro of Salerno, consecrated March 23, 1860, and the oldest, Bishop Monnier, titular of Lydda, and auxiliary of Cambrai, France, who was born January 5, 1820. During his ten years' pontificate, Pius X. has added to the Catholic hierarchy 18 new archbishoprics; 53 episcopal sees; 4 abbacies and prelacies "nullius"; 37 vicarates apostolic; and 34 prefectures apostolic. He has appointed 746 members of the living hierarchy; 661 were appointed by Leo XIII., and 30 by Pius IX. Among these 30 are included Cardinal Gibbons and Archbishops Ireland and Spalding. Of the regular orders the Franciscans have 2 representatives and the Jesuits, discaled Carmelites, Augustinians, Redemptorists, and Benedictines one each among the present cardinals. Cardinal Gibbons, of Baltimore, raised to the Sacred College, June 7, 1886, is the senior in service, but as he does not reside in Rome, the dignity of that rank is accorded to one of those who do. In 1913 the Pope created 13 new dioceses, chiefly in Africa and South America, 7 vicarates apostolic, and 6 prefectures apostolic.

These figures are given, in the *Official Catholic Directory* for 1913, for the numerical standing of the church in the United States: Archbishops, 16 (three of these metropolitans are cardinals); bishops, 100; priests, 17,945 (13,273 secular; 4672 regular); churches with resident priests, 9500; missions with churches, 4812; seminaries, 85, with 6169 students; colleges for boys, 230; academies for girls, 684; parishes with schools, 5256, pupils attending, 1,360,761; orphan asylums, 288, inmates, 47,415; total children in Catholic institutions, 1,593,316; homes for aged, 108; total Catholic population, 15,154,158.

The States having the largest Catholic population are graded in the *Directory* as follows: New York, 2,790,629; Pennsylvania, 1,633,353; Illinois, 1,460,987; Massachusetts, 1,383,435;

Ohio, 743,065; Louisiana, 584,000; Michigan, 568,505; Wisconsin, 558,476; New Jersey, 506,000; Missouri, 470,000; Minnesota, 454,797; Connecticut, 423,000; California, 403,500; Texas, 306,400; Iowa, 266,000; Maryland, 260,000; Rhode Island, 260,000; Indiana, 232,764; Kentucky, 163,228; New Mexico, 140,573; Kansas, 131,000; New Hampshire, 126,034; Maine, 123,600; Nebraska, 118,270; Colorado, 105,000. If to the Catholic population of continental United States are added the 7,131,980 Catholics in the Philippines, 1,000,000 in Porto Rico, 42,108 in the Hawaiian Islands, 11,510 in Alaska, and 900 in the Canal Zone, the total figure will be 23,329,047. The Catholic population of England and Wales is given in the *English Catholic Directory* as 2,100,446, an increase of over 300,000 for the year; Scotland, 518,969; a decline of 28,567; Ireland, 5,242,570; total Catholic population of the British empire, 13,385,565, viz: Europe, 5,800,526; Asia, 288,398; Africa, 498,365; Australasia, 1,184,500; America, 3,271,358. There are in Great Britain 27 bishops; 4449 priests, an increase of 48; 2264 churches and chapels, an increase of 82. Conversions numbering 6322 were made during 1913 in England and Wales.

UNITED STATES. Archbishop Harty, of Manila, returned to the United States in December, to get missionary priests for the Philippines and a congregation of teaching sisters for the schools there. Archbishop John L. Spalding celebrated his sacerdotal golden jubilee at Peoria, Ill., on November 25. Bishop William J. Kenny, of St. Augustine, Fla., died on October 23. Catholic governors were elected in Illinois, Edward Dunne; in Massachusetts, David Walsh; and in Rhode Island, Aram Pothier. Notable national conventions were the 10th of the educational association at New Orleans, June 30 to July 6; supreme convention of the Knights of Columbus at Boston, August 5-8; 58th of the Central Verein at Buffalo, August 3-8; 12th of the American Federation of Catholic Societies at Milwaukee, August 10-13; Second Missionary Congress at Boston, presided over by Cardinal O'Connell, and attended by 63 bishops and hundreds of priests. At Buffalo, the Central Verein discussed social problems and resolved to establish the Ketteler House for Social Studies at Chicago. At the federation convention at Milwaukee, Cardinal Gibbons and many prelates were present and Archbishop Ireland delivered a remarkable address on "Catholicism and Americanism." The Knights of Columbus presented the Catholic University with an endowment of \$500,000 for lay scholarships. This society now has 302,000 members.

OTHER COUNTRIES. The International Eucharistic Congress was held at Malta, April 22-27. A British cruiser was sent to transport the Pope's legate, Cardinal Ferrata, from the mainland to the island. The place for the congress of 1914 was fixed at Lourdes, July 22-26. In 1915 it will be at Sydney; 1916 at Palermo; and in 1917 at Lima.

Archbishop Fennelly, of Cashel, Ireland, resigned because of ill health, and the Rev. Dr. John Harty, professor of theology at Maymouth College, was appointed his successor. Rev. Dr. Arthur Beliveau was appointed auxiliary bishop to the archbishop of St. Boniface, Canada; the Rev. Dr. K. J. O'Brien was appointed bishop of Peterboro, and the Ruthenian

Bishop Budka assumed charge of the 215,000 Catholics of that race who are scattered over the Dominion. Archbishop Quisola, of Valencia, was transferred to the patriarchal see of Toledo to be primate of Spain, which carries with it later elevation to the cardinalate.

A general chapter of the brothers of the Christian schools was held in April at Lembee les-Hal, Belgium. These brothers now number 17,000, scattered throughout the world, teaching in the boys' parish schools.

ROOT, ELIHU. See ARBITRATION, INTERNATIONAL.

ROSE, URIAH M. An American jurist and peace advocate, died August 12, 1913. Born in Marion County, Ky., in 1834, he received his education in the public schools; studied law; and practiced from 1853-60 at Batesville, Ark.

He was chancellor of the Chancery Court at Little Rock, Ark., from 1860-65, and was in private practice in that city from the latter year until his death. He was for several years a member of the Democratic national committee; in 1901-02 president of the American Bar Association; in 1907 a delegate to the Second Hague Peace Conference. He was the author of *Rose's Digest of Arkansas Reports*, and of many articles on American and European jurisprudence in law journals.

BOWING. Syracuse broke Cornell's long string of victories by winning the varsity eight-oared race in the intercollegiate regatta, held on the Hudson River near Poughkeepsie. Cornell, however, retained part of her rowing prestige by capturing the varsity four-oared and the freshmen eight-oared events. The University of Washington, winner of the Pacific coast intercollegiate regatta, was represented in the Poughkeepsie races for the first time and made an excellent showing by taking third place in the varsity eight-oars. Wisconsin was fourth and Columbia fifth.

The Syracuse varsity eight consisted of C. T. Mahan, bow; W. L. Joslyn, 2; M. H. Kuehn, 3; H. W. Robbins, 4; R. W. Propst, 5; J. H. Rich, 6; M. F. Hillinger, 7; and G. B. Thurston, stroke. The crew's time for the four miles was 19 minutes 28½ seconds. The record for the event, 18:53½, was made by Cornell in 1901. The times made by the other crews in 1913 were: Cornell, 19:31; Washington, 19:33; Wisconsin, 19:36; Columbia, 19:38½; Pennsylvania, 20:11½. In the varsity four-oared event (2 miles), the time of Cornell, the winner, was 10:47½; Pennsylvania, 10:52½; Columbia, 10:54½; Wisconsin, 10:58½; Washington, 12:08½. Syracuse's time was not taken. The victorious four were C. W. Brown, bow; S. V. Hiscox, 2; W. F. Thatcher, 3; and E. S. Bird, stroke. Cornell, also the winner of the freshmen eight-oars, covered the 2 miles in 10:04½. Wisconsin was second in 10:07½; Syracuse third in 10:14½; Pennsylvania fourth in 10:25½ and Columbia last in 10:29. The winning eight were: J. C. Othus, bow; J. L. Moffatt, 2; J. H. Allen, Jr., 3; M. N. Shelton, 4; Q. A. Gillmore, 5; B. C. Duffie, 6; R. Welles, 7; and A. R. Gillman stroke.

Harvard, for the sixth year in succession, triumphed over Yale in the annual races held on the Thames River, near New London, Conn. The Cambridge oarsmen won all the events for the fourth time since 1909. Harvard's time in

the varsity eight-oars was 21:42½ and Yale's 22:20. The winning eight comprised Q. Reynolds, bow; F. H. Trumbull, 2; E. O. Morgan, Jr., 3; B. Harwood, 4; G. M. MacVicar, 5; A. M. Goodale, 6; G. F. Stratton, 7; and L. S. Chanler, stroke. In the varsity four-oars Harvard's time was 11:52 and Yale's 12:11. The winning four were: E. K. Carver, bow; G. von Meyer, 2; H. A. Murray, 3; and W. Pirnie, stroke. The closest of the three races was the freshmen eight-oars, in which Harvard's time was 10:41 and Yale's 10:45. The victorious crew included: A. T. Lyman, bow; D. P. Morgan, 2; E. W. Soucy, 3; H. F. Middendorf, 4; T. H. Potter, 5; K. B. G. Parson, 6; C. E. Schnall, 7; and L. S. Chichester, stroke.

In the Pacific coast intercollegiate varsity race over a 3-mile course at Oakland, Cal., Washington finished first, Leland Stanford, the winner in 1912, second, and California third. Washington's time was 17:44. Leland Stanford won the freshmen event with California second. Dual college regattas in 1913 resulted as follows: Cornell varsity eight defeated Harvard varsity eight; United States Naval Academy eight defeated Pennsylvania eight; Washington varsity eight defeated California varsity eight. The Princeton eight won the triangular race with Harvard and Pennsylvania, and Columbia in another triangular regatta defeated Princeton and the United States Naval Academy.

The Duluth Boat Club won the principal races at the 41st annual championship regatta of the National Association of Amateur Oarsmen held at Boston. These events included the senior eight and intermediate eight-oared shell races and the senior four and intermediate four-oared shells. The Argonaut Rowing Club of Toronto, Canada, which had carried off the chief laurels in 1911 and 1912, was victorious only in the senior international four-oared shells. R. Dibble of the Don Rowing Club won the sculling championship of the United States and Canada from E. B. Butler of the Argonauts, by capturing the senior sculls, the ¼-mile race, and the association single sculls. With F. H. Zepper, Dibble also won the senior double sculls.

The 11th annual regatta of the National Rowing Association, popularly known as the American Henley, was held on the Schuylkill River, over a course of 1 mile, 550 yards. The winners of the main events were: First four-oared shells, Puritan Cup, Vesper Boat Club of Philadelphia; first eight-oared shells, United States Naval Academy; junior collegiate eight-oared shells, New England Cup, Cornell University; first four-oared shells, Union Boat Club of Boston; first single sculls, Farragut Cup, John B. Kelley, of the Vesper Boat Club.

At the Henley regatta, held on the Thames, England, the Zeandees Club won the Grand Challenge Cup by defeating Jesus College; time, 7 minutes, 11 seconds. The Ladies' Challenge Cup was captured by First Trinity, Cambridge, and the Steward's Challenge Cup by New College, Oxford. The 70th annual Oxford-Cambridge regatta was won for the fifth successive year by Oxford in 20 minutes, 53 seconds. The record for the event, 18:29, was made by Oxford in 1911. In professional sculling matches Ernest Barry retained the world's championship by defeating Harry Pearce in a four-mile race at London. Edward Durnan defeated

Frank Greer for the championship of America in a three-mile race at Toronto, Canada.

RUBBER. The rubber industry during the year 1913 suffered through the various disturbances incidental to commercial conditions, especially changes of tariff and general depression and uncertainty on account of the diminished activity of the manufacturing industry. Crude rubber sold at a low price at American and European ports, and in the principal producing countries there was considerable distress at the poor commercial conditions. This was true especially in Brazil where at Manaus and Pará the business of some firms came practically to a standstill, while African rubber was also in slight demand. The progressive note from Malaysia in regard to the rubber plantations and the rubber industry generally, was not heard in 1913 as in previous years, and within six months the price of the best grades fell from \$102 to \$51 per 100 pounds. It was feared that with the present condition of affairs some 400,000 acres of the 1,400,000 that had been planted in rubber would lapse back into jungle. On the other hand, conservative authorities saw no occasion for serious apprehension, as the demand for rubber must increase, and the natural supplies would suffer from methods of harvesting so that the world must look eventually to the plantations which, if well managed, should afford ample returns. In this connection the following table of the estimated acreage planted in rubber for 1913 is of interest:

	Acres
Malay Peninsula	667,000
Ceylon	230,000
Java, Sumatra, etc.....	267,000
Other countries	55,000
Total	1,219,000

As exemplifying 1913 conditions in Brazil—the same is true of Bolivia and Peru—it may be said that in December, 1912, Pará rubber sold for \$1.12 a pound and Caucho for 82 cents a pound. During 1913 prices fell so that fine Pará sold for 73 cents per pound in October, and Caucho for considerably less, which were the lowest prices recorded since 1908. A large part of the supply was held in storage awaiting better prices, and there was much disturbance among the rubber gatherers due to the inactivity of the importers. The rubber fields of Brazil were examined during the year by a commission of British representatives of rubber interests with a view to ascertaining whether modern and scientific methods of culture and handling the crude product could be introduced in Brazil. Their opinion was that conditions in South America were quite different from those in Malaysia and the methods of the East would not apply.

As regards the manufacturing industry in the United States the most notable feature during the year was the over-production of rubber tires for motor vehicles with the result that during the year prices were reduced almost 25 per cent., these reductions coming after an earlier reduction made in 1912. While there was apparently no evidence that the demand for rubber or manufactures of rubber would be in any way curtailed in the future, yet it was apparent that stocks of manufac-

tured articles, as well as raw material, were equal to the demand.

WORLD'S SUPPLY OF RUBBER, 1912-1913

	1912 tons	Estimated 1913 tons
Wild—		
Brazil	40,500	39,000
West Africa	13,800	10,000
East Africa, Penang, Borneo, Rangoon, Assam, Madagas- car, etc.	4,000	3,000
Central America, Mexico, etc.	2,500	2,000
Guayule	7,000	2,000
Jelutong, etc.	2,700	2,000
Total Wild	70,500	58,000
Plantation (Ceylon, India, and Malaya)—		
Total Plantation	28,500	47,000
Grand total	99,000	105,000

The total exports of rubber from the Malay States in 1913 amounted to 52,557,409 pounds (23,463 tons) as compared with 34,732,415 pounds (15,506 tons) in 1912 and 19,695,330 pounds (8792 tons) in 1911. This indicates a steady increase in the output and the month of December, 1913, showed the largest amount ever exported.

WORLD'S CONSUMPTION OF RUBBER

	1912 tons	Estimated 1913 tons
Europe—		
England	14,500	17,500
Germany, Austria, etc.....	16,000	16,500
France	9,500	9,000
Russia	9,000	11,500
Italy, etc.	1,500	1,300
Japan and Australia.....	1,000	2,000
America and Canada.....	47,500	47,200
Total	99,000	105,000

The increase in consumption was mainly in the English and Russian consumption, the figure of 1913 for America and Canada being estimated at about the same as 1912.

The average New York prices for Pará rubber for 1913 and three preceding years were as follows:

	Average Prices			
	Up-river		Islands	
	Fine	Coarse	Fine	Coarse
1913....	\$0.87½	\$0.58	\$0.79½	\$0.36½
1912....	1.11½	.89½	1.05½	.59
1911....	1.18½	.95	1.10½	.64
1910....	2.01½	1.36½	1.89½	.90
				Cameta
				\$0.42
				.63½
				.70½
				1.00

The following table gives the importations of rubber into the United States:

	1910	1911	1912	1913
Fine Pará.....tons	10,274	10,818	13,185	10,073
Coarse Pará.....	4,622	5,074	6,056	5,257
Plantation Ceylon...	3,611	6,556	15,003	23,567
Centrals and Caucho	4,636	4,316	6,469	5,022
E. India and Africa	9,773	8,324	9,338	4,466
Total	32,916	35,088	50,051	48,724

RUBBER, WORLD'S PRODUCTION OF. See AGRICULTURE.

RUBBER INDUSTRY. See BOLIVIA, and BRAZIL.

RUM. See LIQUORS.

RUMANIA. A constitutional European monarchy, hereditary in the male line of Charles I. of the house of Hohenzollern. It is composed of the former principalities of Moldavia and Wallachia, with the territory of the Dobruja and, as a result of the wars in the Balkans, a strip of territory acquired from Bulgaria, between the Danube and the Black Sea. The capital is Bucharest.

AREA AND POPULATION. The preliminary results of the census of January 1, 1913, are compared in the table below with the actual results of the census of 1899; the inhabitants per square kilometer (D) are for 1913; the area is in square kilometers for the 32 departments, the acquired area, and total:

	Sq. kma.	1899	1913	D.
Argesh...	4,435	207,605	242,946	55
Bacau	3,973	195,194	232,146	60
Botoshani	3,148	171,437	197,118	63
Braila	4,358	145,284	181,033	42
Buzau	4,863	221,263	277,598	57
Constantza	6,910	141,056	217,740	32
Covurlui	2,961	143,784	171,710	75

* Territory ceded to Rumania by Bulgaria by the treaty of Bucharest, August, 1913.

The number of marriages in 1912 was 62,400 (74,542 in 1911); births, 314,090 (299,870); deaths, 105,616 (179,076); stillbirths (not hereinbefore included), 9032 (8144). Bucharest had (1913) 338,109 inhabitants; Iasi (Jassy), 75,882; Galatz, 71,719; Braila, 64,750; Poleshti, 56,594; Craiova, 51,973; Botoshani, 32,813; Buzau, 28,781; Constantza, 26,609; Barlad, 25,381; Focshani, 25,155; Turnu-Severin, 23,765; Tulcea, 21,764; Giurgiu, 20,893.

EDUCATION. Primary instruction is free and nominally compulsory, but the number of schools is totally inadequate, nearly 60 per cent. of the population over seven remaining illiterate. The total number of rural primary schools in 1909-10 was 4695, with 6460 teachers and 504,297 pupils (333,378 boys, 170,919 girls); urban primary schools, 379, with 1324 teachers and 80,656 pupils (46,276 boys, 34,380 girls). The average number of pupils per teacher in rural schools is 78. Secondary

schools are provided in tolerably adequate numbers and are fairly attended. The special schools are mainly agricultural. Universities, Bucharest and Jassy. The Greek Orthodox is the national religion.

PRODUCTION. But for its unfavorable climate, Rumania would be, in the proportion of its cultivated area, the most productive country in Europe. The soil is of extraordinary fertility; but the intense cold of the winters and the frequently severe droughts of the summers render production uneven. Yet even in poor years the country raises ample crops for its own use, and in good years has quantities of grain, fruits, and vegetables to export. The following table gives areas under great crops, in thousands of hectares, for six years; fibres include flax, hemp, etc.; legumes, etc., include peas, beans, lentils, etc., and potatoes; industrial plants include sugar beets, tobacco, etc.; grasses include sown and natural; vines, etc., include plum orchards.

	1906	1907	1908	1909	1910	1911

Beetst	14,363	13,014	2,922,389	2,600,000	203.5
Vinest	70,429	72,585	1,589,975	1,000,000	22.6
Tobacco	9,284	10,976	59,629	88,000	6.4

* Production of seed. † For sugar. ‡ Productive area; production in hectoliters of wine.

Livestock in 1911: 824,714 horses (864,324 in 1900); 2,666,945 cattle (2,588,526); 5,269,493 sheep (5,655,444); 186,515 goats (232,515); 1,021,465 swine (1,709,205); 4248 mules and asses (7701). The livestock industry has declined since 1882, when the Austro-Hungarian frontier was closed to the export of live animals. The fishing industry has developed; so that instead of an import of fish as formerly, there is an annual export valued at about 2,790,000 lei. Sericulture is carried on. A government land bank has been formed to afford to peasants the means for buying or leasing land and to act as a bank for peasant proprietors and cooperative societies.

Minerals are believed to be plentiful, but only coal and petroleum are worked. Output of petroleum in 1910-11, 1,325,743 metric tons; 1905-6, 681,496; 1899-1900, 222,012. Export of refined petroleum in 1910-11, 323,788 tons; of benzoin, 120,606 tons; of mineral oils, 8093; of waste products, 86,400. Output of coal in 1910-11, 131,278 tons. Value of out-

put from the quarries in 1911-12, 211,937 lei.
COMMERCE In the table below are shown imports and exports for four years in lei:

	1908	1909	1910	1911
Imps.	414,058,479	379,430,871	409,715,576	616,504,872
Exps.	368,800,099	465,056,619	570,317,744	691,720,408

In thousands of lei are given below imports and exports by great classes for 1910 and 1911:

	Imports		Exports	
	1910	1911	1910	1911
Animals & an. prods.	83,398	118,740	17,767	19,419
Agricultural	144,441	191,422	553,828	625,364
Mineral	112,512	138,789	43,399	45,726
Other	69,365	120,798	1,510	1,212

Among exports, the first place is occupied by cereals and their derivatives, valued at 557,653,135 lei in 1911 and 489,821,009 in 1910; petroleum and bitumens, 40,742,375 and 38,897,169; legumes, flowers, and seeds, 35,216,655 and 34,730,967; timber and wooden wares, 25,760,654 and 34,730,967. Among cereals wheat is first—244,823,761 lei in 1911 and 329,619,389 in 1910; corn, 183,218,092 and 69,597,101; barley, 59,835,102 and 41,184,096; oats, 26,385,777 and 17,041,715; rye, 16,605,914 and 16,015,108; flour, 18,420,669 and 12,508,768.

The principal countries of origin and destination follow, values in thousands of lei for 1910 and 1911:

	Imports		Exports	
	1910	1911	1910	1911
Germany	138,237	183,197	24,281	38,008
Austria-Hun.	97,980	137,940	37,284	62,874
United Kingdom	56,776	85,595	33,505	55,980
France	25,627	35,762	46,874	48,879
Italy	21,744	28,592	68,672	49,592
Belgium	13,983	28,114	226,242	263,468
Turkey	13,851	13,583	18,600	21,030
Russia	11,771	13,542	6,971

Vessels entered in the 1911 trade, 37,985, of 11,707,631 tons; 1912, 36,967, of 10,805,605 tons. Cleared, 1911, 37,849, of 11,739,333 tons; 1912, 36,729, of 10,740,173 tons. Merchant marine, January 1, 1913, 649 vessels of 198,159 tons (steamers, 117, of 30,762).

COMMUNICATIONS. There were in operation September 1, 1913, 3763 kilometers of railway, of which 3549 kilometers were state-owned, State telegraph lines, 7706 kilometers; wires, 21,661; stations, 3125; wireless stations, 1, and 5 on board vessels. Urban telephone lines, 590 kilometers, wires, 27,570; interurban lines, 25,826, wires, 56,305. Post offices, 2998.

FINANCE. The monetary unit is the leu (par value, 19.295 cents). The actual revenue and expenditure for years indicated are in lei:

	1897-8	1907-8	1908-9	1909-10
Rev.	210,838,729	331,517,072	468,959,752	522,842,688
Exp.	217,335,486	269,180,173	417,422,122	481,921,854

The revenue for 1912-13 is reported at 587,983,251 lei and the expenditure at 487,576,942 lei. The budget for 1913-14 is detailed in the accompanying table in thousands of lei.

The debt stood, April 1, 1913, at 1,640,895,699 lei.

Revenue	1000 lei	Expenditure	1000 lei

ARMY. The organization of the Rumanian army as carried out in 1912 showed in 1913 that the forces were in good condition and well trained. Service is compulsory between the ages of 21 and 42, while preliminary training takes place between the ages of 19 and 21. The active army is constituted by seven classes of recruits of ages from 21 to 28, two years being spent with the colors in the case of the infantry and three years in the case of the cavalry and artillery, the remainder of the service being on unlimited furlough, about half of the annual contingent of troops undergoing training and for those who provide their own horses a Schimbul cavalry, a sort of voluntary organization, attracts large numbers. Service for ten years in the reserve follows and four years in the militia. The army is organized in five army corps, two divisions, and a number of reserve divisions. In the infantry there are ten rifle battalions, 40 infantry regiments of 122 battalions, and 80 reserve battalions. The cavalry is made up of one escort regiment, 10 Roshiori regiments, eight Calarashi regiments formed from the Schimbul. The artillery comprises 120 field batteries, 10 field howitzer batteries and fortress regiments for the fortifications at Bucharest and Sereth. The engineers include 12 sapper companies, four telegraph companies, four pontoon companies, four railway companies, and one ballooning section, giving a peace strength of 101,348 and a war strength of over 500,000. Hitherto the eleven Rumanian hussar regiments and the nine regiments of chasseurs were grouped in ten brigades of two regiments each. By a decree of October 7, 1913, a 10th chasseur regiment was created and the 21 regiments and the escort regiment were grouped into six brigades of three regiments each and two brigades of two regiments.

NAVY. In 1913 the navy included 1 protected cruiser, of 1320 tons; 1 dispatch boat, 130; 5 gunboats, 607; 1 training ship, 350; 1 torpedo depot, 104; 3 gunboats, 135; 4 torpedo gunboats, 128; 3 torpedo boats, 150; 4 police boats, 2720; 8 torpedo vedettes, 360.

GOVERNMENT. The two autonomous provinces of the Ottoman Empire, Moldavia and Wallachia, combined with the Dobruja December 23, 1861, to form an independent kingdom. The king is the executive, assisted by a council of eight ministers. A Senate (120 members) and a Chamber of Deputies (183) compose the legislative body.

Charles I., the reigning king, is the son of Prince Carl of Hohenzollern-Sigmaringen; he

came to the throne in 1866 upon the deposition of Prince Alexander John, and was proclaimed king instead of prince in 1881. He married (1869) Princess Elizabeth von Wied, popularly known as Carmen Sylva. The heir presumptive is the second son of the king's elder brother, Prince Ferdinand, born August 24, 1865; he married (1893) Princess Marie of Saxe-Coburg-Gotha.

The ministry as constituted October 14, 1912, was (1913) as follows: T. Majoresco, premier and minister for foreign affairs; T. Jonesco, interior; C. G. Diasesco, worship and instruction; C. C. Arion, agriculture and domains; M. G. Cantacuzene, justice; A. Badereu, public works; Gen. C. Herjeu, war; N. Xenopol, industry and commerce.

HISTORY. At the beginning of the year Rumania was an interested onlooker of the struggle which the other Balkan states were waging against Turkey. From the outset M. Majoresco's government had made it plain that the price of their country's neutrality would be the cession by Bulgaria of Silistria and a strip of territory in the Dobruja—"rectification of the frontier" as it was euphemistically described. But the slowness and deliberation with which the government proceeded to put its foreign policy into effect were galling to Rumanian patriotism and to a group of politicians who were advocates of stern, quick action. When the czar of Russia, to whom the question had been submitted for arbitration, made a decision in April, awarding only Silistria to Rumania, a storm of indignation broke loose against M. Majoresco. M. Filipesco, minister of agriculture and domains and formerly premier, resigned from the cabinet and entered the opposition; and M. Carp, former leader of the Conservative party, reentered politics in order to denounce what he termed his country's humiliation. But M. Majoresco stolidly held his ground and the uncompromising attitude of Bulgaria afforded him an opportunity in July to repudiate the Russian award and to unite the Rumanian military forces with those of Serbia and Greece in order to despoil Bulgaria. The chief incidents of this second phase of the Balkan War are noted in the article on **TURKEY AND THE BALKAN PEOPLES**. So triumphant were Rumanian arms that M. Majoresco was able to dictate terms of peace at Bucharest and the treaty concluded there on August 10 transferred from Bulgaria to Rumania the lands in the Dobruja north and east of a line drawn from Turtukai to Baltchik. The successful intervention of Rumania in the Balkan War, attended as it was by relatively slight sacrifice of life or money, reestablished the popularity of M. Majoresco's government, for, with the extension in the Dobruja, Rumania still remained the most important of the Balkan states, numbering 7,600,000 souls, as compared with the 5,500,000 of Bulgaria. A *rapprochement* was effected between M. Filipesco and the Conservative party, and at the party conference on November 27 M. Majoresco was formally and unanimously elected leader in succession to M. Carp.

Meanwhile the government concerned itself with the financial and other problems which the war had created. At a two day's session of Parliament in July, supplementary military expenditures had been approved, amounting to 108,910,000 francs, and in September it was

planned to cover the expenses involved by the reorganization of the newly acquired territory by means of a German loan of 300,000,000 francs bearing 4½ per cent. interest. On September 13 King Charles signed a decree relegating the army to a peace footing and about the same time diplomatic relations were resumed with Bulgaria. Later in the month the war office announced that it was drawing up plans for fortifications along the new frontier and that great fortresses would be erected at Silistria, Dobritch, and Mangalia. For a navy, as well as for the army, elaborate schemes were on foot. A "Navy League" was formed early in the year in order to arouse popular interest in, and financial support for, making Rumania a naval power on the Black Sea comparable with Bulgaria and Russia. A commission of officers and engineers recommended in May that a heavily fortified harbor be constructed at Mangalia; that town already possessed a deep lake, connected with the sea by a narrow channel, so that it would not be difficult to construct a harbor large enough to contain the whole Rumanian navy, no matter how strong it might become in the future. Late in May a special commission was sent abroad to study the management of naval affairs in Italy, France, and Great Britain. At the same time, orders were placed for four torpedo destroyers of 1400 tons each and a speed of 35 knots; and in December four additional river monitors were authorized. The movement to provide for the higher education of women under Orthodox auspices, inaugurated in 1912, bore fruit in 1913 by the opening of an institution at Jassy on September 1. In December M. Take Jonesco, minister of the interior, expressed his approval of the idea of the expropriations of parts of large landed estates for distribution among the peasantry. In foreign affairs it was obvious that the Balkan War had caused Rumania, Serbia, and Greece to draw together; at any rate there were very cordial exchanges of visits between Bucharest and Athens, and an elaborate agreement to connect the railway systems of Rumania and Serbia by means of a great bridge across the Danube.

RUMBOLD, SIR HORACE. Eighth baronet. An English diplomat, died November 3, 1913. Born in 1829, he entered the diplomatic service at an early age, and in 1849 was appointed attaché at Turin, afterwards holding offices in the legations at China, Greece, Russia, and Turkey. From 1872 to 1878 he was minister to Chile; from 1878-79 to Switzerland; to Argentina in 1878; from 1881-1884 minister to Sweden and Norway; minister to Greece from 1884-1888; to the Netherlands from 1888-96; and from 1896-1900 ambassador to Austria-Hungary. He was one of the best-known of English diplomats. His published writings include: *The Great Silver River*; *Notes of a Residence in Buenos Ayres*; *Recollections of a Diplomatist* (1902); *Further Recollections* (1903); and *Final Recollections* (1905).

RURAL CREDIT. See **AGRICULTURE**.

RURAL PROBLEMS, ETC. See **AGRICULTURE**.

RUSSIA. An empire of eastern Europe and northern Asia, extending from the Baltic to the Bering and from central Europe and Asia to the Arctic Ocean. Capital, St. Petersburg. **AREA AND POPULATION.** The results of the

first and last census, taken January 28, 1897, are compared in the table below with the population as calculated January 1, 1911; the area is in sq. versts (1 sq. verst=.439408 sq. mile) exclusive of the great internal waters:

	Sq. versts	1897	1911
European Russia	4,238,711.7	94,215,400	120,588,000
Poland	111,554.2	9,455,900	12,467,300
Caucasus	412,310.8	9,248,700	12,037,200
Siberia	10,946,644.7	5,699,000	8,719,200
Central Asia	3,110,623.7	5,724,700	10,107,300
Finland	286,041.8	2,555,500	3,115,197
Total	19,099,886.9	126,896,200	167,034,200

* 21,741,600 sq. kilometers; 8,394,018 sq. miles.

Total area of the empire, including the inland seas, Khiva, and Bokhara, 22,556,520 sq. kilometers (Caspian Sea, 438,690 sp. kms.; Sea of Azov, 37,600; Lake of Aral, 67,770; Bokhara, 203,430; Khiva, 67,430). Population of Bokhara, 1,500,000; of Khiva, 800,000.

The population is made up of Slavs, including Little and White Russians, Poles, etc., 91.8 per cent.; Letts and Lithuanians, 3.1; Mongols (the Kalmuks of the Astrakhan steppes), Tatars (in southern Siberia), Kartvelians (14.5 per cent. of the population in the Caucasus), Turko-Tatars (20.2 per cent. of the population in the Caucasus), Cossacks (only in the Cossack provinces), etc. Urban population (1910), 22,506,800; rural, 141,272,000.

St. Petersburg had (1911) 1,911,400 inhabitants, Moscow 1,505,500, Warsaw 864,000, Odessa 498,100, Kiev 446,800, Lodz 403,720, Riga 327,940, Kharkov 223,700, Saratov 202,330, Vilna 188,300, Kazan 182,540, Ekaterinoslav 151,200, Astrakhan 149,830, Tula 135,130, Samara 124,900, Rostov-on-Don 124,500, Kishinev 120,710, Minsk 110,910, Nizhni-Novgorod 106,120, Khereson 85,300—all in European Russia; Baku 222,100, Tashkent 193,500, Tiflis 191,800, Kokand 115,000, Tomsk 108,800, Ekaterinodar 99,530, Vladivostok 93,200, Omsk 91,200, Irkutsk 88,700, Samarkand 81,810—all in Asiatic Russia.

The movement of the population is detailed in the table below for the latest available years (M. marriages, B. births, D. deaths, E. emigration to Siberia):

	M.	B.	D.	E.*
1901.....	862,408	4,801,190	3,218,501	218,879
1902.....	877,909	4,993,248	3,204,333	572,579
1903.....	919,082	4,978,305	3,103,213	758,812
1904.....	801,313	5,118,663	3,149,958	707,463
1905.....	839,986	4,819,155	3,410,569	352,950

* For years 1906, 1907, 1908, 1909, 1910.

The number of emigrants overseas is impossible to calculate, as many escape from Russia without passports, far the greater number having the United States as their ultimate destination.

EDUCATION, ETC. Instruction is totally inadequate and in the rural districts many of the reported schools exist on paper only. Not more than 10 per cent. of the total population have received even the most elementary instruction. Many of the teachers lack proper qualifications. A large part of the appropriation for education is controlled by the Holy Synod, which, with the ministry for education, has the direction of elementary instruction. Secondary schools are insufficient; special schools are few but show a tendency to increase. There are universities at Kazan, Kiev, Kharkov,

Moscow, Odessa, St. Petersburg, Saratov, Tomsk, Yuriev, and Warsaw. Finland has an admirable school system and a highly intelligent population.

The attendance of Jewish children at the general schools is severely restricted; special schools are supposed to be maintained for them, but are few and inadequately supported. Private Jewish enterprise maintains about 14,740 kheders, with some 202,000 pupils. Nearly 94 per cent. of the Jews in Russia are restricted to the pale, covering about 362,000 sq. miles, a little over 4 per cent. of the empire, a little under 20 per cent. of European Russia.

All Russians, Rumanians, most Kartvelians, and some Turko-Tatars and Finns belong to the Greek Orthodox church (69.90 per cent. of the population); most Turko-Tatars and the mountain tribes of the Caucasus, to Islam (10.83 per cent.); Poles and Lithuanians, to the Roman Catholic church (8.91); Finns, Germans, Letts, etc., to Protestant sects; and Armenians to the Gregorian church. Jews number about 4.05 per cent.

AGRICULTURE. Out of a total of 102,935,619 dessiatines (1 dessiatine=2.7 acres) under private ownership (1909), 26,812,251 belonged to the peasants; 49,361,865 to the nobles; 16,093,974 to merchants, etc.; 154,689,573 to the crown, churches, etc.; 15,778,677 to corporations. Sixty-five per cent. of the total forests of the empire is owned by the government (which derived a revenue of 70,000,000 roubles from the timber industry in 1910), 23 per cent. by landed proprietors, 9 per cent. by the peasantry. The distribution of agricultural lands (1909) is shown below in dessiatines:

	Cropped	Pasture	Forest
European Rus.*	74,880,300	23,549,600	139,543,700
Poland	5,163,700	867,700	2,177,200
Caucasus	7,546,300	1,953,100	4,967,200†
Siberia	5,273,300	5,568,500	228,189,100†
Central Asia...	1,733,600	2,597,900	15,370,700†

* Fifty governments. † Forests administered by the forestry department.

Much of the area of the empire is unfit for any kind of cultivation; the north is frozen during all but a few weeks during which pasture grass and berries grow; in the south sandy steppes meet the head of the Caspian Sea, and dense forests occupy large tracts in the interior provinces and in Siberia. Between the Baltic and the Black seas, however, the soil is exceedingly fertile, producing great quantities of grain.

The following table covers 63 governments (including Poland) in European (E) and 10 in Asiatic (A) Russia, areas in thousands of hectares, yield in quintals, average quintals per hectare in 1912; figures for 1912 are final, for 1913 subject to revision:

	1000 hectares	1912	1913	Quintals	1912	1913	Qs. ha.
Wheat E.	24,551	25,118	169,759,945	228,008,468	6.9		
" A.	4,342	5,303	28,105,593	37,558,920	6.5		
Rye E.	28,649	29,081	256,802,008	246,888,423	9.0		
" A.	1,046	1,255	8,401,472	7,624,620	8.0		
Barley E.	11,379	12,218	99,272,975	119,699,556	8.7

" A.	9	7	86,816	106,473	9.7		
Beets * E.	703	708	107,880,308	123,276,527	143.3		

* For sugar.

LIVESTOCK. There were in 1909 in the empire 32,114,000 horses, 48,491,000 cattle, 79,562,705 sheep and goats, 12,651,298 swine. In 1912 there were 23,860,178 horses in European and 6,865,878 in Asiatic (10 governments) Russia; cattle, 34,547,348 and 7,381,247; sheep and goats, 42,735,567 and 16,257,736; swine, 11,944,568 and 918,634. The dairy industry is important, the export of butter in 1909 being 3,540,000 poods, valued at 48,404,000 roubles. Poultry and eggs are exported—234,726,580 dozen of eggs in 1909.

MINING AND METALS. The empire is rich in minerals. Vast treasures are stored in the Obdorsk, the Ural, and the Altai mountains, and a large proportion of the mines in operation are found there. But the industry is undeveloped. Capital is wanting, and the government does not encourage foreign enterprise. The great distances to be traversed and lack of transportation facilities militate against economical transportation of the requisite machinery. The Russian government consistently refuses to make available such statistical information as is freely furnished by other governments; so that it is from unofficial sources that the following figures for production in 1910 are derived: 63,646 kilos unrefined gold (producing about 88 per cent. of fine gold), 5479 kilos crude platinum, 14,847 kilos unrefined silver (producing about 92 per cent. fine silver), 1285 tons lead, 10,667 tons zinc, 22,329 tons copper, 2,985,000 tons pig iron, 2,969,000 tons rolled iron and steel of all kinds, 25,094,000 tons coal, 9,474,000 tons petroleum, 2,035,000 tons salt, output of pig iron in 1911, 219,075,000 poods; iron and steel, 202,702,000; coal, 1,725,443,000 (1,209,710,000 from south Russia, 360,400,000 from Poland, 99,293,000 from Asiatic Russia, 41,800,000 from the Ural districts); petroleum, 559,000,000 poods (461,000,000 from the Baku district). Petroleum output in 1912, 560,000,000 poods (469,000,000 from the Baku district).

MANUFACTURES. The manufacturing industries are imperfectly developed. Political conditions are not conducive to business security nor to the certainty of justice that makes for expansion and prosperity. The number of factories under state supervision January 1, 1910, is given at 14,710, employing 1,831,396 persons. Distilleries 2809, output of alcohol 114,278,000 gallons; sugar works 277, output 85,856,000 poods; flax, jute, and hemp factories 414, value of annual output about 73,000,000 roubles; cotton spinning and weaving mills 140, value of annual production about 607,000,000 roubles. Value of the annual production of the timber industry, 155,000,000 roubles.

FISHERIES. The value of the fisheries products in 1911 was estimated at about 97,000,000 roubles.

COMMERCE. The trade for successive years, imports and exports of merchandise and precious metals, is shown below, values in thousands of roubles:

	Merchandise		Precious Metals	
	Imps.	Exps.	Imps.	Exps.
1907.....	847,365	1,053,010	10,937	13,108
1908.....	912,659	998,250	28,226	18,914
1909.....	906,336	1,427,675	46,284	26,806
1910.....	1,084,446	1,449,085	71,281	32,168
1911.....	1,161,682	1,591,411

The principal articles in the 1911 trade follow, with values in thousands of roubles:

Imports	1000 r.	Exports	1000 r.
Machinery	147,247	Cereals, etc.....	707,851
Cotton	116,788	Timber	142,368
Tea	59,180	Eggs	80,760
Metal wares.....	52,733	Butter	71,141
Woolens	48,536	Flax and tow....	70,393
Coal and coke....	39,790	Sugar	66,288
Metals	37,349	Seeds	49,100
Silks	27,253	Oilcake	34,427
Fish	32,586	Cottons	32,024
Rubber	27,838	Bran	31,615
Woolen yarn.....	25,285	Petroleum, etc....	30,439
Paper, etc.....	24,619	Hides †	30,112
Seeds, etc.....	23,979	Live animals.....	26,390
Hides*	20,864	Metals	22,327
Chem. products..	20,805	Hemp and tow....	17,572

* Prepared, and exclusive of 17,034,000 roubles raw hides. † Raw and prepared.

The principal countries of origin and destination which figure in the total trade of the empire are given in the table below, with import and export values in thousand of roubles:

	Imports		Exports	
	1910	1911	1910	1911
Germany	449,794	487,780	390,640	490,525
U. Kingdom..	153,847	155,081	315,476	337,032
China	78,813	82,311	20,158	25,598
United States	74,441	102,489	9,489	13,467
France	60,972	56,782	93,646	90,813
Persia	36,702	35,402	37,904	44,551
Finland	35,992	39,993	42,821	53,668
Aus.-Hun....	35,026	34,265	49,735	67,930
Netherlands..	20,444	17,513	195,982	188,799
Italy	18,916	17,559	75,196	52,709
Turkey	10,836	10,227	27,859	33,580
Egypt	10,144	7,834	3,310	3,198
Denmark	7,719	7,678	26,534	35,605
Sweden	7,615	9,988	8,907	8,940
Belgium	7,093	7,052	66,515	55,424
Norway	6,522	8,304	6,154	9,957
Rumania	2,312	2,846	15,049	29,720
Greece	1,587	1,634	18,331	14,579
Spain	444	1,994	7,007	4,567
Other	67,227	74,950	38,382	30,759
Empire	1,084,446	1,161,682	1,449,085	1,591,411

Separate figures are given for the trade passing by way of the European and Black Sea (Caucasus) frontiers and to and from Finland. The details below are for 1911 and (provisional) 1912, values in thousands of roubles:

	Imports		Exports	
	1911	1912	1911	1912
Foodstuffs.....	134,134	140,198	988,547	788,608
Raw materials*	517,046	516,267	473,486	578,788
Animals.....	3,457	2,581	25,831	30,068
Manufactures.	368,062	375,456	25,873	29,571
Total.....	1,022,699	1,034,502	1,513,737	1,427,033

* Raw and half raw materials.

Across the Asiatic frontier the principal articles of export are sugar (12,328,000 roubles in 1909) and cotton goods (21,519,000); of import, rice (7,025,000) and raw cotton (9,534,000).

SHIPPING. The shipping entered and cleared at all ports in the trade of the empire is detailed in the table below for 1911:

	Entered		Cleared	
	No.	Tons	No.	Tons
White Sea.....	1,054	797,000	1,001	794,000
Baltic	7,698	5,805,000	7,729	5,837,000
Black & Azov..	4,749	7,344,000	4,575	7,163,000
Pacific Coast....	725	1,068,000	708	1,035,000
Total.....	14,226	15,014,000	14,018	14,829,000

The details of the merchant marine January 1, 1913, are shown as follows, total vessels, and total steamers:

	Total		Steamers	
	No.	Tons	No.	Tons
White Sea.....	490	35,023	70	12,230
Baltic	963	186,129	243	112,908
Black and Azov.....	1,322	281,895	413	230,826
Pacific Coast.....	47	20,308	38	19,896
Caspian Sea.....	823	233,250	252	111,054
Total.....	3,645	756,605	1,016	486,914

COMMUNICATIONS. Railways in operation January 1, 1913, 70,259 versts (74,942 kilometers)—15,971 versts (17,036) in Asiatic Russia and 54,288 (57,906) in European Russia, the latter divided as follows: 35,211 versts (37,558 kms.) state lines, 16,820 (17,941) private lines, 2257 (2407) local lines. The development of the Amur region through railway construction progressed during 1913, the Amur railway being opened to traffic as far as Blagovestchensk. It was expected that sometime in 1914 the line would reach Khabarooka and there join the line from Vladivostok; its completion is scheduled for 1916. State telegraph lines (1911), 185,939 kms. (wires 503,197); police 389 (389); railway 15,872 (214,610); state telegraph stations 4438, railway 4284; wireless stations 19 and 2 on board vessels. Urban telephone lines 13,930 kms., wires 573,851; interurban lines 2328, wires 10,962. Post offices, 16,452. The principal railway construction of Russia during 1913 was the line from Ekaterinberg to the river Tavde, 220 miles in length and parallel to the eastern side of the Ural Mountains. A railway was being completed from Poti to Terapee that will be continued northwards to Novorossiisk with the aim of developing that portion of Russia on the east shore of the Black Sea, and part of the region between the Black Sea and the Caspian Sea, best known as an oil producing centre. The new railroad was to run along the seashore and was important because it would form a second means of communication with India, shorter by 372 miles than the proposed Constantinople-Bagdad line. The Trans-Siberian Railway was in course of duplication and progress was being made. During the year the ministry of ways and communication was authorized to purchase 17,000 ordinary freight cars, 1400 passenger cars, and 700 refrigerator cars for the government railways. The installation of refrigerator line routes was an innovation and it was proposed during the ensuing year to make a series of trial runs from Siberia and other districts with meat, fish, game, butter, and eggs, to Warsaw and other cities. In addition, the refrigerator car service was to be tried between Samarkand, Tashkent, Moscow, and St. Petersburg, and from the Crimea to the capital cities.

FINANCE. The monetary unit is the rouble (par value 51.456 cents), and the standard of value is gold. In the following table are shown revenue and expenditure in roubles, 1911 and 1912 actual, 1913 budget:

	1911	1912	1913
Rev. ord....	2,951,782,684	3,105,916,930	3,240,559,006
" extraord.	2,567,906	1,812,932	10,000,000
Total.....	2,954,350,590	3,107,729,862	3,250,559,006

	1911	1912	1913
Exp. ord....	2,535,995,758	2,721,763,595	3,012,264,284
" extraord.	309,694,698	449,296,921	238,294,722
Total.....	2,845,690,456	3,171,060,516	3,250,559,006

Preliminary figures for 1914 estimate the total revenue and expenditure to balance at 3,558,261,499 roubles.

The 1913 budget is detailed in thousands of roubles as follows:

Revenue	1000 r.	Expenditure	1000 r.
Direct taxes....	250,870	Public debt....	402,760
Indirect taxes:		Council, etc....	8,815
Customs	334,585	Holy Synod....	44,220
Beverages	50,777	Imperial house.	16,360
Tobacco	75,058	War	550,900
Cigaret. paper	4,261	Foreign affairs.	7,230
Petroleum	48,036	Marine	228,230
Beet sugar....	139,058	Finance	481,721
Matches	19,617	Commerce, etc.	60,559
Stamps, etc....	218,357	Interior	180,500
Royalties:		Instruction	142,736
Mining	555	Communications	639,412
Mint	7,588	Agriculture	135,503
Posts	76,690	Justice	88,650
Tels. & tels....	40,290	Audit	11,976
Sale of spirits	837,660	State stud....	2,593
Domains	1,004,220	Other	10,000
Redemp. pay'ts.	910	Total ord....	3,012,064
Various	132,031	Ry. construct.	110,634
Total ord....	3,240,559	Army	90,113
Extraord....	10,000	Ports	18,000
		Ry. repairs....	17,720
		Jap. war.....	195
		Other	1,633
Total.....	3,250,559	Total.....	3,250,559

The public debt stood January 1, 1913, at 8,841,723,911 roubles (8,941,640,620 in 1912, 9,014,141,796 in 1911).

A ridiculous incident was connected with the issuance, in commemoration of the Romanoff tercentenary, of postage stamps bearing the portraits of the present czar and some of his forerunners. They had to be withdrawn because of the refusal of the officials in charge of certain minor post offices to obliterate the imperial features with the necessary canceling stamp. Rather sinister than ridiculous is the impression left upon a non-Russian mind by this bit of orientaliam.

NAVY. The number and displacement of warships built and building, of 1500 or more tons, and of torpedo craft of 50 tons and over, were December 1, 1913, as follows: 7 battleships (dreadnought type, having a main battery of all big guns—11 inches or more in calibre), of 159,305 tons, building; 8 battleships (predreadnought type, of about 10,000 or more tons displacement and with main batteries of more than one calibre), of 112,050 tons, built; 2 coast-defense vessels (including smaller battleships and monitors), of 10,380 tons, built; 4 battle cruisers, of 128,000 tons, building; 6 armored cruisers, of 63,500 tons, built; 9 cruisers, of 52,845 tons, built, and 8, of 45,000 tons, building; 93 torpedo-boat destroyers, of 36,145 tons, built, and 45, of 54,810 tons, building; 14 torpedo boats, of 2132 tons, built; 30 submarines, of 6629 tons, built, and 25, of 14,577 tons, building. Total tons built, 283,681; building, 401,692; total, built and building, 685,373. Russia is the sixth, in point of naval strength, of the great powers. Total personnel, 50,425; including 8 admirals, 18 vice-admirals, 14 rear-admirals, 131 captains and commanders, 1011 other line officers. Air craft

include 9 military dirigibles on hand and 10 ordered, and 250 military aeroplanes on hand (monoplanes, biplanes, and hydro-aeroplanes).

Four of the battleships building (the *Sevastopol*, the *Gangut*, the *Petropavlovsk*, and the *Poltava*) are for the Baltic fleet; their keels were laid at St. Petersburg in June, 1909, all were launched in 1911, and they are expected to be ready for service at the end of 1914. The other three (the *Emperor Alexander III.*, the *Empress Marie*, and the *Ekaterina*) are for the Black Sea fleet; they were begun in 1911, and the *Empress Marie* was launched November 1, 1913. The four battle cruisers building (the *Navarin*, the *Borodino*, the *Izmail*, and the *Kimburn*) are to be finished in 1917. Four of the smaller cruisers building are for the Baltic and two for the Black Sea. Messrs. Vickers, Ltd., were awarded a contract in June, 1913, for the erection of a new gun factory at Zarizin, to be finished in two years.

ARMY. A new recruiting law was signed by the emperor on August 5, 1912, and came into effect on December 14, of that year, applying to the contingent of recruits called into service in the fall of 1913. The age of conscription was put back a few months, being placed at 20 years on January 14 instead of 21 years on October 14. The annual conscription was to take place early in the year, or between September 28 and October 28 so as to begin the training of the troops before the severity of the winter and the large number of holidays interfered. The list of exemptions was redrafted and in certain cases postponements instead of exemptions were arranged. Furthermore, the list of educational and professional exemptions was lessened and the incentive for educated conscripts to become officers was increased. The minimum time of short-term volunteers was increased from one year to two years, but it was shortened in the case of those who could pass examinations as officers. Men of educational qualifications, yet not entitled to serve as short-term volunteers under the new law, may enlist between the ages of 18 and 30 to complete the ordinary period of service as ordinary volunteers (*Okhopniki*) and great efforts were being made to induce men to enlist voluntarily and thus lower the average age of the contingent. The annual contingent of recruits in 1913 was fixed at 455,000 men, as in 1912, but owing to the application of the new law it was expected that there would be less wastage and that about 30,000 more men would be secured. The new law also provided that the short-term volunteers should join in the summer from June 28 to July 13, but this was objected to by the military authorities who wished them to join in the winter with the other recruits. In 1912 the normal organization of the Russian army was as follows: Number of army corps, 37; infantry divisions, 70; rifle brigades, 17; cavalry brigades, 58; reserve infantry divisions to be formed on mobilization, 38; the number of divisions in an army corps were two; the number of brigades in a division were two; the number of regiments in a brigade, two; battalions in a regiment, four; companies in a battalion, four. The peace strength for Europe and the Caucasus was estimated at 949,000, while for Asiatic Russia the force was estimated at 124,000.

In 1913 the Russian military authorities contemplated the creation of four new army corps, two of which were to be in Europe, one in the Caucasus and one in the Far East. This would make 30 instead of 28 army corps in European Russia and would involve an increase in the number of infantry regiments, but the method of securing this had not been definitely decided. Plans had been made for the provision of 24 to 36 additional field batteries, four to six batteries of field howitzers, two to four horse batteries, and one or two batteries of heavy howitzers, or a total of from 30 to 48 entirely new batteries of artillery. No provision, however, had been made for increasing the force of cavalry. The light field howitzer batteries had all been armed with the 12 cm. Krupp howitzer and there were enough available for the proposed increase. The heavy artillery had been rearmed with the new 10.6 cm. gun and the new heavy howitzer of 15 cm. (5.906 inches). There was available material for the proposed new batteries and new telegraph companies were to be added to the engineer battalions and three new railway battalions were to be added.

GOVERNMENT. Russia is a (nominally) constitutional monarchy under an autocratic czar, who is supreme ruler and legislator. The constitution of October, 1905, conferring upon the people civic liberty based upon individual inviolability and freedom of conscience, speech, assembly, and association, has turned out to be another Russian pleasantry. The council of empire is composed of an equal number of elected members and members nominated by the czar. The Duma (reduced to 442 members) has on paper large powers of legislation, so long as none of the "fundamental laws of the imperial administration" be not involved. These "fundamental laws," however, have proved a snare and a delusion to many a reform-enamored Duma member. The ruling senate, partly deliberative, partly executive, is the high court of justice for the empire; the Holy Synod is the regulator of religious affairs; the council of ministers is composed of heads of departments.

The reigning czar, Nicholas II. Alexandrovich, of the house of Romanoff-Holstein-Gottorp, Emperor and Autocrat of all the Russias, was born at St. Petersburg May 18, 1868, and succeeded his father November 1, 1894. He married (November, 1894) Princess Alix of Hesse; they have issue four daughters and a son, the heir-apparent, Alexis, born at Peterhof August 12, 1904, and during recent years in precarious health.

The ministry in 1913 was composed as follows: V. N. Kokovtsov, premier and minister for finance; A. A. Maklakov, interior; Gen. V. B. (Baron) Fredericksz, imperial household; Gen. V. A. Sukhomlinov, war; Admiral I. K. Grigorovich, marine; J. G. Stcheglovitov, justice; S. I. Timachev, commerce; V. K. Sabler, procurator of the Holy Synod; and industry; S. V. Rukhlov, communications; A. V. Krivocheyn, agriculture; P. A. Kharitonov, state comptroller; Dr. L. A. Casso, instruction.

HISTORY

THE IMPERIAL COUNCIL. The reforms passed by the third Duma could not take effect, so-

ording to the imperial ukase of March 6, 1906, unless approved by the imperial council. This latter body has proved to be the enemy of even moderate innovations. The bills dealing with the responsibility of officials, the admission of women to the bar, the establishment of municipal institutions in Poland, and the extension of the *Zemstvo* system of local self-government to the province of Archangel—these with other measures were either vetoed or postponed by the imperial council, and the important bill for the establishment of cantonal *Zemstvos*, passed in 1911 by the Duma, was still kept on the table of the imperial council.

THE FOURTH DUMA. Later returns regarding the strength of the parties in the Duma which met for the first time on November 28, 1912, placed the strength of the Right at 63; Nationalists, 90; Conservative Constitutionalists (a split from the Nationalist group), 34; Octobrists, 93; and Opposition, 152 (including Progressists, Cadets, Poles, and Extremists). The Octobrists occupied a central and decisive position in the new Duma; they could side with the 184 members of the government parties, or with the 152 of the Opposition: Without the Octobrists neither side could boast a majority. The Octobrists, it must be remembered, had stood for a policy of moderate reform as opposed to radicalism on the one hand, and reaction on the other; they were now torn by opposite tendencies. The manipulation of the recent elections and the growing urgency of reform impelled them away from the government and the Right. Yet they were reluctant to join with the Opposition, for that would mean too great a break with the government, too great a temptation to radicalism. Moreover, in the very first session, in the election of officers, the Nationalist-Right was unwilling to make the concessions necessary to acquire the coöperation of the Octobrists; the latter, therefore, joined with the Opposition in electing M. Rodzyanko (Octobrist) president of the Duma; Prince Volkonsky (non-party Right), first vice-president; Prince Urusov (Progressist), second vice-president; M. Dmitryukov (Octobrist), secretary; M. Nicholas Lvov (Progressist), assistant secretary. The coöperation of the Octobrists with the Left was hailed by the Russian press as an epoch-making event; in many quarters the Octobrists were severely criticised for it; and when M. Rodzyanko took the chair the Nationalists and the members of the Right walked out in indignation. The speech of the new president had significant emphasis on the need for legislative reform. "Gentlemen of the imperial Duma," he said, "I have ever been and always shall be a convinced champion of the representative régime based on constitutional principles, granted to Russia by the great manifesto of October 30, 1905, to consolidate the foundations of which must be the first and instant care of a Russian representative assembly. The Russian people, which has sent its representatives to the imperial Duma, expects of them earnest work and unceasing care, to contribute to the further development and support of the military power of Russia; it expects legislative work directed towards securing in all classes of the population an intelligent obedience to law, and removing from the conditions of the every-day

life of the country all manifestations of inadmissible official caprice. The country expects of you, gentlemen of the imperial Duma, legislative measures to assist the development of the principles of local self-government and of the economic forces of our people." The ministry, desiring to gain the support of the Octobrists and at the same time to satisfy the Right, attempted an impossible straddle. In his programme speech the premier, M. Kokovtsov, succeeded in antagonizing all parties, while attempting to please all. To satisfy the Octobrists he declared that, now the country was pacified, it would be possible to realize legally the principles laid down in the manifesto of October 30, 1905. Nevertheless, it was necessary to preserve the basic traditions of the Russian state—the unity and indivisibility of the empire, and the dominant position of the Russian nationality and the orthodox faith. Instead of presenting a clear-cut legislative programme, the premier contented himself with suggesting numerous but vague legislative reforms. The unsatisfactory character of the speech threw the Octobrists again into the arms of the Opposition, and before the adjournment on December 28, 1912, a resolution was passed inviting the government to declare frankly and unreservedly in favor of a legal régime and the Octobrist principles.

The first three months of the 1913 session were characterized by a singular paucity of legislative achievements, due to the refusal of the government to introduce any but petty finance bills. This neglect of much-needed reform made the ministry more unpopular than ever. Several bills were submitted by members of the Cadet party embodying provisions for religious freedom, free assembly, the liberty of the press, the right of association, and universal suffrage. The bills were discussed, but could not be taken seriously. Although the Duma did little legislative work, it directed numerous interpellations against the government; the most important were the interpellation on the illegal extension of the exceptional powers of local administration and that on the relation of petroleum syndicates to the high cost of fuel. Meanwhile the Octobrists in the Duma vacillated between the Right and Left and began to give evidence of a tendency to split.

THE DUMA AND THE BUDGET. The budget for 1913 was not taken up until the end of May, owing to the lateness of the convocation of the Duma. The budget discussions afforded opportunity for a thoroughgoing criticism of the administration. The ministry of the interior received the most bitter attacks. In his preliminary report, the chairman of the budget committee, M. Alexeyenko, struck the keynote of the debate which followed. Russia was governed by police rather than by laws, he said, and although the Russian peasants and artisans bore the burdens of taxation, they were not protected by the government. His concluding words, "We have given you good finances: give us good government," were heartily applauded by the Duma. An Octobrist deputy, M. Shidlovsky, accused the ministry of allowing the police to violate the law and arbitrarily to checkmate all progress. The Cadet party (an Opposition group) were even more outspoken in their condemnation of the unprogressive bureau-

cracy. In the words of M. Alexandrov, "The Russian government is unworthy of its people." The censure of the home policy was summed up by an Octobrist resolution passed on June 3 by a majority of 164 to 117: (1) That the ministry of the interior by continuing the use of exceptional measures after order has been restored in the country, arouses in the people general dissatisfaction and a legitimate feeling of revolt against unnecessary restrictions; (2) that the ministry has destroyed respect for law and order by refusing to introduce bills to carry out the long-needed reforms set forth in the manifesto of 1905 and in other imperial edicts; (3) that in delaying the reform of local self-government, which has been recognized as necessary by the government itself, and the extension of this reform to the whole of Russia, the government hinders economic and cultural development; and (4) that the application of the existing laws with regard to separate nationalities is disintegrating the people and weakening Russia. The government is called upon for the immediate realization of remedial measures. The situation was critical: A parliamentary majority had condemned the home policy in no uncertain terms. Possibly M. N. Maklakoff, who had only recently succeeded M. Makarov as minister of the interior, felt himself too much of a novice to undertake a justification of his department—at any rate, he observed a profound silence. Meanwhile the Duma went on to criticise the administration of justice and the conduct of education. The educational policy of the ministry was called "a menace to the moral development of the people." Only the departments of war and the navy were exempted from criticism, and these only because of the delicate international situation. The conclusion of the budget discussion on June 25 was welcomed with a sigh of relief by the ministry, and on July 8 the Duma was prorogued to October 8.

THE MINISTERIAL STRIKE. One of the most picturesque incidents of the spring session of the Duma was the "strike" of the cabinet following an insult. It was the result of ill-feeling between the government and the Right. M. Kokovtsov's speech had, as we remarked, deeply offended the Reactionaries by the mention of the legal principles of 1905. As the session progressed it became apparent that the Nationalists were bent upon the destruction of the ministry, which, they said, had been too weak and vacillating to safeguard the interests of the country. The quarrel became more and more noticeable until M. Markov, the leader of the Right, indulged in a tirade against abuses in the department of finance—M. Kokovtsov's department—and referring to the officials of that department, said "they must not steal." The deputy speaker called M. Markov to order and M. Markov attempted so to construe his own words that the premier would have no occasion to take offense. It was too late to mend matters, however. M. Kokovtsov had taken the allusion as a personal insult, and left the hall in a huff. The affair was taken up by the council of ministers and the Duma was notified that until the president of the Duma had made formal apology for the insult offered to the head of the ministry by a member of the Duma, no member of the cabinet would enter the hall. The Duma refused and the ministers

absented themselves from the remainder of the sittings of the session.

On October 28 the Duma reassembled, with the ministers still "on strike." The strike was proving uncomfortable, however, for both Duma and ministry; it paralyzed the Duma by excluding ministerial reports, and it tended to discredit parliamentary government, thus throwing the ministry somewhat unwillingly into the arms of the reactionaries—who just at this moment were getting themselves cordially hated in connection with the Kiev trial. The situation was much improved by the apology of M. Markov on November 14.

The fall session was signalized by the disruption of the Octobrist party. The party congress in November passed a resolution condemning the government. To this action the Right wing of the Octobrists took exception, whereupon the party disintegrated, the Right wing forming a separate group, and the other faction, with former president of the Duma M. Khomiakoff and present president M. Rodzyanko at their head, formed a new party. The Duma was adjourned by imperial ukase from December 20 to January 27. The Senate, which in Russia is a high court of justice, for the first time in 30 years exercised its prerogative to refuse to register an illegal administrative ordinance. The withdrawal of the illegal ordinance—which concerned the Military Medical Academy—was effected by informal means.

FINLAND. The conflict between Finnish nationalism and the imperial government's policy of Russification resulted in the resignation of General Langhoff, who for the last seven years as minister secretary of state for Finland had exerted himself to keep peace between the Finns and the St. Petersburg government. General Langhoff was succeeded by M. Markov, a Russianized Finn, who, as vice-president of the economic department in Finland, had given frequent proof of his subserviency to St. Petersburg. M. Borovitonov, a Russian, was appointed to take M. Markov's old place, in direct violation of the provision of the Finnish constitution that the office may be filled only by a native of Finland. Another infraction of law was observed in the introduction—contrary to the act of 1910—of a bill to apply the Russian law to political offenders in Finland. In the attempt to force Russian laws on the grand duchy, constitutionality was disregarded and the Finns were excited to strenuous though unavailing protests. The most striking incident of the year was the consequence of the imprisonment of an officer at Viborg for "political reasons." The officer appealed to the Court of Appeals at Helsingfors and obtained his release. At this juncture the imperial government intervened, called the Finnish judges to account for not applying the Russian law in the case, and put them on trial before a St. Petersburg court. The judges failed to vindicate themselves and were incarcerated in the Kresty prison. This was not the only instance of the kind, according to a Finnish writer. "Other officers who are still free are in a difficult and precarious situation, since it is their duty to follow the laws to which they have sworn an oath of allegiance, yet by so doing they not only lose their positions but are in danger of political persecution. Sorrow and indignation are great throughout the country. Mayors and other of-

ficers in Nystad, Tavastehus, and Helsingfors have already been condemned to terms of imprisonment of six months or longer."

POLAND. The Polish municipal government bill of the third Duma (see 1912 YEAR BOOK, RUSSIA, *History*), amended by the imperial council in the direction of anti-semitism, restricted suffrage, and increased government control, was taken up by the fourth Duma in the spring session. The Opposition attacked the amendments, but the Polish deputies accepted the measure—incomplete as it was. The Poles were reproached with opportunism and repudiated by the Cadets. In December the council of the empire rejected by a vote of 90 to 74 an essential clause of the bill which allowed the use of the Polish language in the municipalities.

THE PRESS. The persecution of indiscreet editors received a temporary setback in March when the czar issued an amnesty as an incident of the tercentenary celebration. The respite was only temporary, however, and the press continued to be subject to fines and editors to imprisonment. A press bill introduced in the Duma in July by the government provided for the censorship of journals an hour before they are exposed for sale, ecclesiastical censorship of religious items, and the responsibility of printers as well as editors. The condition of the press in Russia is well illustrated by the fact that, as the result of inadmissible comments on the Beiliss case, four editors were arrested, two journals were suspended, thirty editions were confiscated, and 34 fines—amounting to 10,000 roubles—were imposed.

LABOR AGITATION. In the spring of 1913 the anniversary of the Lena strike was celebrated by labor demonstrations in St. Petersburg. It is interesting to record that a thoroughgoing investigation of the circumstances of the strike, conducted by Senator Manukhin, proved that it was the result of oppressive economic conditions, and not of political anarchy. The captain of the rural guard was deemed by Senator Manukhin to be criminally liable. Many unimportant strikes occurred during 1913 and most of them failed for lack of organization, the government having effectively opposed the spread of trade-unionism. More solidarity was shown in July by the strike of 100,000 workmen in St. Petersburg as a protest against the prosecution of the workingmen's journals—*Luch* and *Prawda*. The two newspapers were suppressed, but reappeared under new names, as *Schivaja Schisny* and *Rabotschaja Prawda*.

See also **SOCIALISM**.

OTHER EVENTS. A large island north of Siberia was discovered and claimed for the czar under the name "Nicholas II. Land." In March was celebrated the tercentenary of the Romanoff house; the festivities were accompanied by the issue of an imperial ukase providing \$25,000,000 for the betterment of agricultural conditions and granting partial or, in some cases, complete amnesty to various grades of political offenders, among whom was the well-known writer and exile, M. Maxim Gorky. The visit of a Russian squadron to the United Kingdom in October directed international attention to the growth of the Russian navy, upon which about \$117,490,000 was expended in the current year. In regard to the army an important step was decided on in the spring. The legal term of active infantry service was extended from

three to three and one-quarter years in order to strengthen the army in the winter season while raw recruits are being trained.

FOREIGN RELATIONS. The unsettled condition of the Balkan nations made the year a trying one for the Russian foreign office. Russian interests in the Black Sea basin, the possibility that Bulgaria might obtain a foothold on the Sea of Marmosa, the weakening of Turkey, and its effect on Russian interests in Asia Minor, the promotion of pan-Slavic interests, the diplomatic duel with the Triple Alliance, the preservation of the Triple Entente in spite of divergent interests—these and less obvious considerations complicated the situation. In a general way it may be said that Russia wished to have the Balkan allies successful against Turkey, to have them look to Russia as their patron and protector, to prevent Austria-Hungary from intervening, and to secure such a settlement as would not readily allow of future Austro-Hungarian expansion southwards. It was quite natural that relations with Austria-Hungary should have been strained—the remarkable thing was that peace was maintained. The mission of Prince Hohenlohe, who brought the czar an autograph letter from Francis Joseph in February, was undoubtedly of great importance, coming as it did when misunderstandings and conflicting policies had almost brought the two nations to the point of war. The situation again became critical in March. Just before the fall of Adrianople, Gen. Radko Dimitryev visited St. Petersburg with the object, well-informed newspapers affirmed, of obtaining Russian support for the contemplated attack on Constantinople. While General Dimitryev was at the Russian capital, news of the fall of Adrianople inspired the pan-Slavists with wild enthusiasm. A thanksgiving service was held in the Church of the Resurrection; the Bulgarian national anthem was sung in the street; and the demonstration became so vigorous that the mounted police had difficulty in clearing the streets. The Duma, always enthusiastic over Slavic victories, resented the depression of the demonstration and interpellated the home minister on the subject. M. Maklakov shifted the responsibility to the police. On the following Sunday a procession was held in the Nevsky Prospekt, and banners were displayed with the motto "Scutari to Montenegro." The prefects of St. Petersburg and Moscow thereupon forbade demonstrations. In spite of the prohibition, a demonstration was held in St. Petersburg on April 24 to celebrate the capture of Scutari. Subsequently the excitement subsided as the situation in the Balkans grew less threatening. For subjects not discussed here, see **CHINA, Mongolia; TURKEY AND THE BALKAN PEOPLES; PERSIA; AUSTRIA-HUNGARY.**

RITUAL MURDER CASE. Small as is its political significance, the "ritual murder case" deserves mention because of the extraordinary interest with which it was followed by the press both in Europe and in America. Mendel Beiliss, a Russian Jew, was accused of murdering a Christian boy, Andrew Yushinsky on March 25, 1911. The murder, it was alleged, was not an ordinary crime, but had been committed in fulfillment of some secret bloody rite of the Jewish religion. Beiliss's co-religionists in all parts of the world repudiated the "ritual murder"; the charge was denounced as baseless by

authorities of the Catholic Church; and the prosecution failed to adduce evidence of murderous rites among the Jews. Some sections of the press went so far as to denounce the whole case as a trumped-up charge designed by reactionary elements in Russia to bring the Jewish religion into disrepute and to oppress the Jews. Former instances of anti-semitic agitation in Russia were called to mind, and popular sentiment was strongly aroused by persistent rumors that the reactionary "Black Hundred" was planning a "pogrom," or massacre, of the Jews.

Indignation meetings were held in various quarters of the civilized world; the British labor party passed a resolution of remonstrance; resolutions asking the United States government to protest were introduced in the New York State Assembly, and in the Federal Congress. On November 6 Russia informed the United States that it would receive no protests on the subject.

The trial of Mendel Beiliss began at Kieff on October 8. The accused plead not guilty. Shakhovsky, a leading witness for the prosecution, created a sensation on October 12 by the statement that he accused Beiliss under police threats. On October 21 Kressovsky testified to his suspicions that the boy was murdered not by Beiliss, but by a gang of robbers; and a woman by the name of Vera Techeberiak was implicated in the crime. It gradually became clear that no substantial evidence of Beiliss's guilt could be produced; and the case for the prosecution received a fatal blow when on the 29th a medical expert testified that the hairs found on the dead boy's clothes could not possibly have belonged to Beiliss. The lawyers finished summing up on November 8, and on the 10th Mendel Beiliss was acquitted, and the decision was promulgated November 24. See also JUDAISM.

RUSSIAN LITERATURE. Though the year 1913 may have added nothing epoch-making or of rare significance to Russian literature, it was not in any sense of the word a lean year. It is true, such noisy modernists as Gorky and Andréev have not kept the Russian literary pot boiling with their old-time intensity in the past twelvemonth; but writers of more recent fame, writers whose names are naturally little known outside of Russia, have done considerable work of real promise, if not genius. These younger contemporary writers, with one or two exceptions, manifest a commendable disregard for the manners and methods of the erstwhile spellbinders of Russian fiction, and an equally laudable regard for the approved literary conventions of the true masters of Russian literature—Gogol, Turgenév, Tolstoy, Dostéevsky, and Anton Chekhov. The result is as it should be: A broader realism, a fresher objectivism, a wholesome optimism, and a much saner art.

These encouraging tendencies are not, to be sure, things of today or of yesterday; discerning Russian readers have noticed them for years and have confidently prophesied the coming of a new era in Russian letters. Among those whose work best exemplified these new tendencies during the last twelvemonth were Ivan Shmelev, Boris Ropshin, Sergéev-Tsensky, A. Chapygin, Boris Zaitsev, Andray Bialy, Ivan Bunin, and Fiodor Sologub.

If the importance of literary events may be judged by the amount of discussion they provoke, then Rapshin's novel, *That Which Was Not*, was certainly the greatest event of the year in Russian fiction. This long novel has a revolutionary theme, while its style and spirit are very reminiscent of Tolstoy. Moreover, the author frankly adopts the great Russian's historical philosophy. For all of this he has been repeatedly charged with plagiarizing the immortal *War and Peace*. This fact, together with the great intrinsic merits of the work, have attracted unusual attention to it.

A less sensational and more deserved success was scored during the year by Sergéev-Tsensky's *Beauty*, a novel which more than sustains its author's reputation as the greatest realist and most genuine artist of his time. It is men like him—his sixth volume of short stories appeared last year—who prove the claim of a "new literature" in the Land of the Czar.

Another new writer of great promise, Chapygin, has published a much-praised novel, *The White Hermitage*, which gives a most vivid picture of peasant life in the "silent north" of Russia. The author, himself from the ranks of labor, enters fully and sympathetically into the lives of the toilers he describes, drawing his characters so well as to suggest Gogol's inimitable gallery.

A first piece of long fiction from a writer of impressionistic short stories was Zaitsev's *Remote Region*, which deals with the revolutionary days of 1904-06, and brings out the smallness of the characters that figured in those eventful times. This work, though not truly a novel, further accentuates the salutary tendencies that characterize Russian literature at the present time.

Dealing also with the revolutionary era, Bialy's *Saint Petersburg*, though not completed within the year under review, possesses sufficient merits to deserve mention in this summary. Mention must be made here, too, of Sologub's pretentious two-volume novel, *Sweeter Than Poison*, even if for no other reason than that its author was hitherto known chiefly as a poet. Finally, there was A. Serafimovitch's notable *City of the Steppe*, a realistic novel full of fine descriptions and interesting characters. Its author belongs to the group of quieter writers, who, naturally, win recognition very slowly in Russia.

Of course all the better known contemporary Russian writers—Korolenko, Kuprin, Chirikov, Gorky, and Andréev—were also heard from during the year; but their contributions were mostly short stories, the enumeration of which would give this brief review the aspect of a mere index. Gorky and Korolenko, however, have attracted unusual attention in 1913—the former by the publication of parts of his autobiography, and the latter by the celebration of his 60th anniversary.

The annual output of verse has been an average one—average in quality and quantity. Among the inevitable collections those of Sologub, perhaps the greatest living Russian poet, and Bunin, one of the foremost younger writers, cannot be passed over without special mention. Sologub's collection contains the choicest gems of his verse, while Bunin's includes many very admirable short stories as well as much real poetry.

In dramatic writing the year has been somewhat above the average. It produced, besides mediocre plays by Andréev (*Professor Storitsin*), A. N. Tolstoy (*The Aggressors*), and Alexander Bloch (*The Rose and the Cross*), Artsybashev's extremely popular social comedy, *Jealousy*. In this the author of the sensational novel *Sanin* makes his début as a playwright. Although his dramatic art is very crude and the plot unconvincing, Artsybashev's drama has had an unprecedented success, having already been staged in Russia and elsewhere. The very uncomplimentary view of woman taken in the play makes its great success, in these days of feminism, still more unaccountable.

A new impetus was given to historical writing by the recent jubilee of the Napoleonic invasion of Russia. Many new studies, based on documents and archives which have only recently come to light, have been published during the year; and every phase of that disastrous historical event is being reconsidered, from the Russian and non-Russian standpoints. Space does not permit, however, specific mention of authors and titles in this prolific field.

From the standpoint of literary history the year's most permanent contributions were the many volumes of letters and collected critical papers. The year brought forth, besides a new volume of Mikhailovsky's scholarly essays, hitherto unpublished letters of Tolstoy, Chernyshevsky, and Chekhov. The last is undoubtedly the most important contribution to Russian literary autobiography made in many a year, for Chekhov's letters shed a most welcome light on the life, art, and philosophical beliefs of one of the most reserved Russian literary masters.

Among new collections, of which 1913 yielded a goodly number, by far the most important is the new volume (the tenth) of Mikhailovsky's papers already referred to. All of this material—and there are over 1000 pages of it—had been unceremoniously suppressed by Russian censorship from the first edition. Hence the present lifting of the ban is a signal triumph for Russian literature. It not only makes generally accessible the precious contents of the tenth volume, but gives promise of the speedy publication of the next, which is to complete the edition of the works of Russia's greatest literary critic and publicist.

RUTGERS COLLEGE. An institution for higher education founded at New Brunswick, N. J., in 1766. The students enrolled in all departments of the college in 1913 numbered 934, of whom 417 were in the full courses leading to a degree; 203 in the short courses in agriculture; and 314 in the summer session. The faculty instructors numbered 61. There were no noteworthy changes in the faculty during the year. Among the gifts received was one of \$110,000 from J. Howard Ford, for a dormitory; and the income of \$40,000 from Mrs. Russell Moore for the establishment of a professorship of architecture. There were also received \$30,000 for a purchase of land. The productive funds amount to about \$733,000, and the annual income to about \$267,000. The library contains about 72,000 volumes.

RYE. The world's production of rye in 1913 was approximately 1,880,000,000 bushels, or about 40,000,000 bushels less than in 1912. European Russia led all countries with a yield of 986,000,000 bushels, of which 5,960,000 bush-

els was spring rye. This yield was about 75,000,000 bushels under the yield of the previous year. Germany, ranking next, produced 488,581,000 bushels, of which 5,913,000 bushels was obtained from spring sowing. The average yield per acre of the fall and spring sown crops, 28.9 and 19.8 bushels respectively. Total production and rate of yield were the highest recorded for 10 years. The production of Austria, which stood next in importance, was 114,115,000 bushels. Other countries yielding more than the United States were Hungary, which produced 56,000,000 bushels, and France with a crop of 53,360,000 bushels. The United States produced 41,381,000 bushels on 2,557,000 acres, as compared with 35,664,000 bushels on 2,117,000 acres in 1912. Although a long and severe drouth prevailed during the season, this had little effect upon the rye crop, which matured before the drouth became serious. In a measure the dry weather was of benefit to the crop as it greatly favored its harvest. The average yield per acre in 1913 was 16.2 bushels and in 1912 16.8 bushels. The farm price on December 1, 1913, was 63.4 cents per bushel and on the same date in 1912, 66.3 cents. The values of the two crops on this basis were \$26,220,000 and \$23,636,000 respectively. While 39 States reported yields, the bulk of the crop was grown in six or seven States. The leading States and their production were as follows: Wisconsin, 7,438,000 bushels; Minnesota, 5,700,000 bushels; Michigan, 5,362,000 bushels; Pennsylvania, 4,900,000 bushels; and New York, 2,288,000 bushels. In addition to these only North Dakota, Nebraska, Ohio, Indiana, New Jersey, and Iowa, mentioned in decreasing order of yield, produced over 1,000,000 bushels. Wisconsin increased its acreage from 341,000 acres in 1912 to 425,000 acres in 1913, while North Dakota increased its area from 48,000 to 125,000 acres, and Nebraska from 55,000 to 120,000 acres. The highest average yield, 22 bushels per acre, was secured in Idaho, being followed by Montana and Washington with 21 bushels. The lowest average yield, 9.5 bushels per acre, was secured in Georgia and Oklahoma. The Canadian crop, which amounted to 2,425,000 bushels, was about 200,000 bushels less than in 1912.

SABINE, WILLIAM TUFNELL. An American bishop of the Reformed Episcopal Church, died August 11, 1913. Born in New York City in 1838, he graduated from Columbia College in 1859, and from the General Theological Seminary in New York in 1862. Ordained priest in 1863, in the same year he became pastor of the Covenant Church in Philadelphia, and subsequently was appointed pastor of the Church of the Atonement in New York City. In 1874 he severed his connections with the Protestant Episcopal Church to become a member of the Reformed Episcopal Church, and in the same year he was appointed pastor of the First Reformed Episcopal Church of New York. In this pastorate he served until 1907. He was elected bishop of the New York and Philadelphia synod in 1902.

SAFETY AT SEA. One of the results of the loss of the *Titanic* on April 14, 1912, was the appointment of a departmental committee in August, 1912, to advise the British Board of Trade how best the safety of life on passenger vessels at sea could be secured, considering in particular the number, and most efficient ar-

rangement of stowing life-boats in steamships of all classes, apparatus for launching them in an emergency, mechanical appliances for the propulsion of such life boats, the question of rafts as a substitute for life boats, and other points of a similar bearing. This committee reported in June, 1913, and its report took up in detail the stowage of boats and the use of pontoon rafts for home-trade passenger vessels, as well as buoyant deck seats and other appliances that would act as life preservers. It dealt with the use and provision of life jackets and life buoys, and discussed in detail applications for launching boats, including the various forms of davits, cranes, etc., but without positive recommendation, the conclusions of the committee being that the board of trade should specify themselves as to the efficiency of the various devices used. The report further discussed the use of mechanically propelled life boats and recommended that the carrying of one be made optional for all classes of steamships, and that in general two motor boats on each side should be sufficient; but that they should be as large and as powerful as possible and carry fuel for a radius of 100 miles. The general tenor of the report was that the efficiency of life-saving at sea depended as much upon the competency of the officers and crew as upon life-saving appliances, and impressed the necessity for strict discipline and obedience.

As contrasted with discussion and the formulation of rules and regulations, mention should be made of the fact that during the year 1913, at the time when trans-Atlantic navigation was likely to be threatened by the presence of icebergs, the United States government provided revenue cutters to patrol the courses. These vessels were equipped with wireless apparatus of sufficient power to send bulletins of warning over long distances, and also carried scientific observers to study various methods of detecting the presence of ice.

Preliminary to the international conference to be held at London, Secretary of Commerce Redfield formed a committee on aids and perils to navigation, which recommended various devices for safety and changes in rules of the route. It also recommended that lanes for the various trans-Atlantic liners should be made obligatory, and that an ice patrol, supported by the coöperative action of the important maritime nations, should be begun on April 1. The committee further recommended that the United States should continue the destruction of derelicts in the North Atlantic west of a line drawn from Cape Sable to latitude 34°, longitude 70°, and thence through the Bahamas, and that other maritime nations be assigned the work of removing, or destroying, such menaces to navigation east of said line.

In the meantime in the United States Senate there was considerable discussion of a bill to improve conditions of navigation, so far as safety was concerned, by regulations regarding the rating of sailors employed and providing that an annually increasing per cent. of all crews should be able to understand the language in which orders are given, and that life-boat drills should be conducted under new and rigorous rules.

The International Conference on Safety at Sea was opened in London on November 12, 1913, with the object of securing coöperation and agreement among the great powers of the world

in regard to measures for securing conditions as to safety in the case of passenger steamers and the maritime passenger traffic generally. The sessions were held in secret, and no report of them was expected until the close of the conference, which was still in progress at the end of the year.

DISASTERS AT SEA. The year 1913 was one of the worst ever experienced by marine insurance companies (see *Marine Insurance under INSURANCE*), and the loss estimated for the various casualties was given as in excess of \$35,000,000. There were reported 5940 accidents of all descriptions to vessels of 500 tons and upwards, of which collisions were responsible for 2017, stranding for 1696, weather damage for 1039, and fires and explosions for 456. Ships to the number of 235, and aggregating 527,884 tons, were totally lost, of which 68 were British and 167 were of other nationalities. Of these 17 were posted at Lloyds as missing. The biggest losses of the year are indicated in the following table which gives the names and values of the ships and cargoes as was stated approximately at the time. The loss to the United States and Canada on the Great Lakes was estimated at over \$5,000,000.

LARGER LOSSES OF 1913

STEAMER	VALUE
<i>Clan Mackenzie</i> , Clan liner, Mersey for India, wrecked near Cadiz, with valuable general cargo.....	\$1,000,000
<i>Veronese</i> , Lamport and Holt liner, outward bound from Liverpool to South America, wrecked near Vigo.....	950,000
<i>Eastwell</i> , wrecked at Ymudien.....	650,000
<i>Estonia</i> , Russian East Asiatic liner, abandoned, on fire, bound from Gothenburg to Japan.....	500,000
<i>Volturno</i> , Canadian Northern liner, on charter, bound from Rotterdam to Halifax.....	325,000
<i>Haddon Hall</i> , wrecked in Saldanha Bay....	630,000
<i>Camphill</i> , wrecked off Cape Agulhas....	550,000
<i>Amiral Exelmans</i> , French liner, wrecked off Cape Palmas while bound from Havre to East Africa ports.....	750,000
<i>Tyrone</i> , wrecked on Otago Head, New Zealand.....	750,000
<i>Canterbury</i> , foundered off Karatsu.....	500,000
<i>City of London</i> , sunk through collision, reported from Cleveland, O.....	225,000
<i>Aberlour</i> , wrecked on Azalea Reef, Nauru for Antwerp.....	200,000
<i>Hektor</i> , wrecked at Dyer Islands.....	425,000
<i>Bries Huel</i> , foundered in Morte Bay.....	260,000
<i>Peruvia</i> , Narvik for Emden (missing).....	225,000
<i>Glenalvon</i> , sunk in the Elbe.....	215,000

Other losses during the year were:

Gardenia, sunk through collision in North Sea.
Clarence, wrecked off Marsh Point, Hudson Bay.
C. C. Hand, American lake steamer, sunk after being on fire.
Merced, wrecked at Point Garda, San Francisco for Portland.
Tell, stranded near Cap Camaret.
Kinneil, sunk through collision near the Scaw.
Cyclops, wrecked near Montevideo.
Ville de Toulon, dredger, foundered while in tow.
Regina Margherita, sunk at Genoa.
Paulina, ashore at Dally Bay.
Troga, wrecked at the South Orkneys.
Christiania, sunk near Borkum after collision.
Astillero, sunk near Sicily after collision.
Poseidon, missing. Newcastle for Spezzia.
Parana, ashore at Montevideo.
Alum Chine, wrecked by explosion at Baltimore.
Arnfrid, ashore at Cape Eugano.
Fred Jones, dredger, destroyed by fire.
Agadir, R. M. S. P., stranded at Mazagan.
Boeton, new Dutch liner, stranded near Hartlepool on trial trip.
Auchenarden, sunk outside Liverpool after collision.
La Blanca, damaged in collision with *Auchenarden*.

Loss of the Steamship "Vultorno." On October 10, 1913, the British steamship *Vultorno*, a Canadian Northern liner, on charter, bound from Rotterdam to Halifax, Captain Inch, was destroyed by fire in mid-Atlantic, and 136 lives were lost. Again wireless telegraphy was able to bring valuable assistance, and the ship was soon surrounded by various other liners. The ship carried 657 passengers and crew. Of these 540 were emigrant steerage passengers, of whom 521 were rescued. The fire was due to an explosion of chemicals in the cargo, and, as soon as it was found to be beyond control, a wireless distress signal was sent out. The first ship to reach the scene of the disaster was the Cunard liner, *Carmania*, which arrived at noon of October 11. A raging gale prevented rescue in spite of the lowering of a boat by the *Carmania*, and the big ship was unable to take off the passengers. In the meantime nine other vessels, the *Grosser Kurfürst*, the *Seydlitz*, the *Kroonland*, the *Devonlan*, *Rappahannock*, *Minneapolis*, *La Touraine*, *Czar*, and *Narragansett*, the last-named an oil-tank vessel, arrived on the scene, and, with the abatement of the storm, boats were launched, which picked up a number of passengers and crew. The use of the oil from the *Narragansett* aided considerably in smoothing the waters and made possible much of the rescue work.

See also UNITED STATES, *Congress*, sub-section *Safety at Sea*.

ST. ANDREW, BROTHERHOOD OF. An organization for the spread of religious faith among young men of the Protestant Episcopal Church. It is divided into senior and junior chapters. In 1913 there were 864 active senior chapters, and 524 active junior chapters. The membership of the Brotherhood is about 15,000. It maintains several field secretaries. In 1913 was observed the 13th anniversary of the founding of the brotherhood. The official organ is the *St. Andrew's Cross*. The 28th national convention was held in New York City from April 1 to 5, 1913.

ST. HELENA. A British island in the south Atlantic Ocean. Area, 47 square miles; population (1911), 3520. Capital, Jamestown (1439 inhabitants). The imports and exports were valued in 1911 at £42,412 and £9959, respectively. Revenue (1911), £11,122 (grant-in-aid, £2500); expenditure, £9129. Shipping entered and cleared, 172,358 tons. Governor (1913), Major H. E. S. Cordeaux.

ST. KITTS (or ST. CHRISTOPHER) AND NEVIS. A presidency (with Anguilla) of the Leeward Islands (q.v.). Capital, Basseterre (8469 inhabitants). Sugar-cane (17,000 acres), sea-island cotton (5000), arrowroot, etc., are grown; tobacco, once the main staple, is now of little importance. In 1911, 11,130 tons of sugar, 2339 puncheons of molasses, 19,380 gallons of rum, and 782,933 pounds of sea-island cotton were exported. External trade (calendar years) and finance (fiscal years) statistics for the presidency follow:

	1908-9	1909-10	1910-11	1911-12
Imports	£184,002	£172,220	£195,277	£306,666
Exports	180,539	182,446	205,693	190,747
Revenue	47,913	48,122	52,748	58,002
Expenditure....	46,443	48,698	49,872	50,736
Shipping * ...	638,751	593,932	625,636	685,852

* Tonnage entered and cleared.

Customs revenue (1911-12), £37,094. Public debt, £48,734. Acting administrator, 1913, Captain A. Roger. See LEeward ISLANDS.

ST. LUCIA. One of the (British) Windward Islands colonies. Area, 233 square miles; population (1911), 48,637. Capital, Castries (population given as 6266). It has a fine harbor, latterly greatly improved. Severe epidemics of small-pox and cholera have retarded development, but recent conditions show better sanitation and a tendency to less frequent outbreaks. The activities of the rapidly spreading mongoose have reduced the number of reptiles, formerly numerous, to a minimum. Principal exports are cacao, sugar, limes, logwood, and spices. Imports, 1911, £318,591; exports, £273,111; revenue (1911-12), £71,979; expenditure, £69,329. Tonnage entered and cleared (1911-12), 3,996,163. E. J. Cameron was administrator in 1913.

SAINT-PIERRE AND MIQUELON. A French island colony off the southeastern coast of Newfoundland, including some smaller islands. The total area is 241 square kilometers (93 square miles), with a population of 6482. The imports for 1910 were valued at 5,114,000 francs and the exports at 9,394,000 francs. The local budget for 1910 balanced at 489,000 francs. The administrator in 1913 was M. Marchand.

ST. THOMAS. See SÃO THOMÉ.

ST. VINCENT. One of the (British) Windward Islands colonies. Area, between 140 and 150 square miles; population, 41,877. Capital, Kingstown (4300 inhabitants). The principal products and exports are sugar, rum, cacao, arrowroot, and cotton. Imports, 1911, £110,926; exports, £118,625; revenue (1911-12), £34,852; expenditure, £33,735. Debt (1912), £550. Administrator in 1913, G. Gideon Murray.

SAKHALIN. An island off the eastern coast of Siberia; divided into Russian Sakhalin, with 16,370 square miles and 12,000 inhabitants, and the Japanese territory of Karafuto, with 13,155 square miles and 31,017 inhabitants at the end of 1910. Its fisheries are valuable and timber is abundant.

SALNARSITE. See MINERALOGY.

SALONS, THE PARIS. See PAINTING AND SCULPTURE.

SALVADOR. A Central American republic, situated on the Pacific coast and bordering Guatemala and Honduras. The capital is San Salvador.

AREA AND POPULATION. The area is officially stated at 34,126 square kilometers, but a recent planimetric calculation shows 21,160 square kilometers (8170 square miles). The estimated population at the beginning of 1913 was 1,200,000. Although the people are largely mestizo and Indian, they have achieved a considerable degree of economic development and governmental stability. In 1911 and 1912, births numbered 49,179 and 49,999, respectively; deaths, 26,472 and 24,925. The larger towns include: San Salvador, with about 60,000 inhabitants; Santa Ana, 59,136; San Miguel, 25,000; Ahuachapán, 20,600; San Vicente, 20,400; Chalchuapa, 20,400; Zacatecoluca, 20,000; Nueva San Salvador 19,000.

EDUCATION. In 1911, there were 486 public primary schools, with 851 teachers and 21,569 pupils. Children of school age numbered 173,495. Besides a number of private schools, there are several institutions for secondary and special instruction.

PRODUCTION AND COMMERCE. Agriculture constitutes the principal source of wealth, but mining is increasing in importance. The leading crop is coffee, to which 166,000 acres were planted in 1912, the estimated yield being about 70,000,000 pounds. Other products are cacao, rubber, tobacco, sugar, bananas, and indigo.

In 1911 and 1912 imports were valued at \$5,113,518 and \$6,774,859, respectively; exports, 22,208,380 pesos and 22,341,987 pesos. The average value of the silver peso in 1911 was about 42.5 cents and in 1912 about 44.5 cents; accordingly the gold value of exports in those years may be stated at \$9,438,561 and \$9,942,184 respectively. Leading imports in 1911 and 1912, in thousands of dollars (gold): Cotton cloth and manufactures, 1768 and 2017; hardware, 279 and 564; drugs and medicines, 208 and 419; flour, 263 and 393; boots, shoes, and findings, 259 and 214; cotton yarn, 175 and 181; machinery, 88 and 215. Principal exports in 1911 and 1912, in thousands of dollars (gold): Coffee, 6871 and 7765; gold in bars, 973 and 608; gold and silver amalgams, etc., 125 and 799; sugar 389 and 168; indigo, 261 and 95; balsam, 88 and 78. In 1912, imports from and exports to the United States were valued at \$2,627,700 and \$2,955,794, respectively; United Kingdom, \$1,904,546 and \$295,874; Germany, \$664,674 and \$2,294,500; France, \$397,252 and \$1,510,492; Italy, \$288,400 and \$941,137; Mexico, \$239,931 and \$12,634; Belgium, \$224,275 and \$11,108.

COMMUNICATIONS. The length of railway in operation is reported at 291 kilometers. The San Miguel to Usulután railway was opened to traffic in September, 1913. As stated for 1912, there were 3788 kilometers of telegraph line, with 203 offices. Post offices, 117.

FINANCE. The value of the peso fluctuates with the price of silver; in 1910, the peso was worth about 40 cents, in 1911 about 42.5 cents, and in 1912 about 44.5 cents. Revenue and expenditure in the fiscal year 1912 are reported at 16,190,338 and 16,678,370 pesos. Of the receipts, 8,324,869 pesos were from customs; of the disbursements, 4,295,771 were for the public debt and 3,544,347 for war and marine. The budget for the fiscal year 1914 showed estimated revenue and expenditure of 14,450,966 and 14,533,236 pesos. Public debt January 1, 1913: Foreign, 17,729,022 pesos; internal, 6,434,544; treasury bonds, 3,730,770; total, 27,894,337.

GOVERNMENT. The legislative power rests with the National Assembly of 42 members elected by direct vote. The president is elected by direct vote for four years and is assisted by a cabinet of four members. On March 1, 1911, Manuel Enrique Araujo was inaugurated president, succeeding General Fernando Figueroa. President Araujo was assassinated in February, 1913, dying on the 9th of the month. He was succeeded by Carlos Meléndez for the term ending March 1, 1917. The members of the cabinet are: Martínez Suarez, exterior, instruction, justice; Samuel Luna, interior; Dr. Ramon Garcia Gonzalez, finance, agriculture; Colonel Jose Maria Peralta, war and marine.

An executive decree issued in 1913 provided for the erection of granaries in the capitals of the departments of the republic, to be used by producers, under the supervision of the minister of agriculture (fomento), to hold products for

higher prices. The depositors pay 3 centavos a month per *fanega* (1.57 bushel) of grain.

SALVAGE. See SAFETY AT SEA.

SALVARSAN ("606"; ARSENO-BENZOL). This drug continued to be widely employed during the year 1913, in spite of the number of disastrous results. Syphilologists seem to agree that these are more than overbalanced by the general good effects of this remarkable substance. It was largely replaced, however, by a modified form, NEOSALVARSAN (q.v.) which was stated to be somewhat less toxic.

SALVATION ARMY. The following are most interesting and important statistics relating to the work of the Salvation Army for the year ending September 30, 1913. There were on that date in the United States 869 corps and outposts. The attendance at indoor meetings was 7,353,336, and at open-air meetings 160,396. The converts numbered 47,921. The Army supported 91 hotels, with accommodations for 7674 persons; 124 industrial homes with accommodations of 3139; 28 rescue and maternity homes; and 5 children's homes. Persons afforded temporary relief outside of industrial homes and hotels numbered 691,597. Summer outings were given to 7791 mothers and 41,292 children. There were distributed 1,800,654 pounds of ice, and 5,010,227 pounds of coal.

In its international aspects, the Army occupied 58 countries and colonies, and preached its gospel in 34 languages. There were 9415 corps and outposts; 1142 social institutions; 572 day schools; and 10 naval and military homes. There were issued 81 periodicals, and the total copies of these distributed numbered 1,029,804. During the year the new commander, H. Bramwell Booth, visited the United States and was cordially received.

SAMIRESITE. See MINERALOGY.

SAMOS. An Anatolian island; a principality tributary to the Porte, previous to November, 1912, covering an area of 468 square kilometers (181 square miles) and having a population of 53,424 in 1902, besides 15,000 natives of Samos residing on the Anatolian shore. The capital is Vathy, with about 8000 inhabitants. The imports in 1911 were valued at 37,036,352 piasters, and the exports at 19,741,212 piasters. The export of wine was valued at 8,595,000 piasters, tobacco 2,875,000, leather 2,764,000, cigarettes 1,492,000. The 1910 budget estimated the revenue at 3,651,660 piasters and the expenditure at 3,627,496. The debt amounts to 2,570,500 piasters. Upon the assassination of Kopassis Effendi in March, 1912, Turkey sent Begleris Bey to administer the country as prime-governor. In November, 1912, the island was occupied by Greek troops, and since that date has been administered by a Greek governor—M. Sephoulis, the former leader of the popular party in Samos against the Turks.

SAN FRANCISCO EXPOSITION. See EXPOSITIONS.

SANITATION. The continued decline of death rate in many cities, and particularly the reduction in typhoid fever and infant mortality, is in considerable measure due to improved sanitation, notably as regards the water and milk

supplies, the elimination of privies and cesspools and the reduction of domestic flies and malaria-spreading mosquitoes. This subject was discussed at length in the 1912 YEAR BOOK. See also GARBAGE AND REFUSE DISPOSAL; SMOKE ABATEMENT; SEWAGE PURIFICATION; WATER PURIFICATION; VITAL STATISTICS.

SANTO DOMINGO. See DOMINICAN REPUBLIC.

SÃO THOMÉ AND PRÍNCIPE. A Portuguese island colony off the coast of French Equatorial Africa. The total area is 939 square kilometers (374 square miles) and the population was estimated in 1909 at 68,221. The principal product and export is cacao, a large part of the world's supply originating in the colony. The powers have made representations protesting against prevailing methods of coercion of indentured labor. Imports 1910, 3,197,830 milreis (2,912,035 in 1909); exports, 9,896,000 (8,150,632). The budget for 1910-11 showed 931,429 milreis revenue and 703,315 milreis expenditure. Governor, 1913, M. Martins.

SAPPHIRE. See GEMS AND PRECIOUS STONES.

SARATOGA SPRINGS. The board of commissioners of the State Reservation at Saratoga Springs, N. Y., created by appointment by Governor Hughes under the statute of 1909, were contemplating the construction of a large bath house and a central drink-hall, together with the necessary buildings to provide the equipment of a modern health resort to be erected in 1914. The purchase of lands and mineral rights by agreement or by condemnation, naturally proceeded slowly. The termination of the pumping of the waters by commercial carbonic acid gas companies resulted in immediate recovery of the springs and the restoration of the waters. During the year 1913 many unnecessary bores and wells had been closed, additional waters were analyzed by the State Board of Health, graphs of water levels had been made, examinations and determinations of the interrelation of the springs had been pursued, artesian wells had been tested at many levels to ascertain the depth of the best veins of mineral water, new spouting springs had been developed from former "dry wells" or pumped bores, and arrangements had been made for free service of the waters at many springs.

The city coöperated with the State at many points. It bought a hotel, Congress Hall; razed it to the ground, and added its site to the acreage of public park comprised by the old Congress Park, and Canfield Park, thus combining in one continuous parcel ten acres of markedly rolling land, with lakes and brooks, evergreen and deciduous trees, broad lawns and winding paths, and including the old Congress Spring and Columbian Spring pavilions and the Casino, formerly the Canfield (and still less recently John Morrissey's) gambling house, with the Italian Garden.

Of about 100 wells, springs, and bores, many were to be sealed permanently, several were to spout unfettered for scenic effect, and about twelve were to be used for bathing or drinking purposes. The bathing springs, like all their fellows, are supersaturated with carbonic acid gas, and are suitable for giving such treatments as are administered in the spas of Europe, so many and varied are they. The drinking waters comprise saline-laxative, cathartic, alkaline,

chalybeate or ferruginous, iodic, and several strongly lithic springs, and are thus adapted for many ailments, especially gastro-intestinal disorders, diseases causing tissue change, and obesity. A new spring water was developed in 1913, the Minnonebe, a mildly antacid, alkaline table water, with half as much alkaline constituent as Grande Grille Vichy, which it resembles in effect. Additions to the bottled waters were made in 1913, so that the market now affords Hathorn No. 1 (laxative, alterative, tonic), Hathorn No. 2 (cathartic, tonic, lithic), Coesa (mild, saline, laxative, lithic), Geyser (antacid, ferruginous, alkaline table water), and Minnonebe.

Late in the year Dr. Albert Warren Ferris became the medical expert to the commission, and was to be closely identified with the future development and construction, as superintending director. The Geyser Park, a tract of 250 acres, was much developed during 1913, paths and drives being laid out in its forests and along its mile of picturesque Coesa Creek, and near its spouting springs. A visit of two weeks from Paul Haertl, Ph.D., director of the balneological and chemical laboratories of Bad Kissingen, and an expert on mineral waters and their handling, was productive of much benefit in technical instruction and counsel. Frederick Edwards, C.E., continued to be the engineer, in addition to whose services was obtained in December the consulting advice of Professor Charles G. Anthony, C.E., of the faculty of Union College, who was sent to Europe to study technical matters connected with transportation of carbonated waters and their storage. A trip to various English and Continental spas was made for the commission by Dr. Simon Baruch, professor of hydrotherapy in Columbia University, who without remuneration made extensive and valuable reports on general methods and results. The commissioners are Hon. George Foster Peabody, General Benjamin F. Tracy, and Senator Frank N. Godfrey, who serve without remuneration. The development planned will result in a large pecuniary profit for the State. See HYDROTHERAPY, and RADIOTHERAPY.

SARAWAK. A British protectorate covering about 42,000 square miles in the north-western part of the island of Borneo, with an estimated population of 500,000. Capital, Kuching (25,000 inhabitants). Gold, coal, and other minerals exist in export quantities. Timber, coffee, and pepper are exported. Total imports, 1911, 8,572,624 S. S. dollars; exports, 9,563,485; revenue, 1,420,420; expenditure, 1,341,761. Shipping entered, 55,537 tons; cleared, 58,856. Rajah, Sir Charles Johnson Brooke (C. Vyner Brooke, rajah muda, acting).

SASKATCHEWAN. A province of the Dominion of Canada. Area, 251,700 square miles; population (census of June 1, 1911), 492,432 (91,279 in 1901). Regina is the provincial capital, with 30,213 inhabitants in 1911; its population, along with that of other principal towns in the province, has increased enormously since the census was taken. The province is administered by a lieutenant-governor—G. W. Brown in 1913 (appointed October 5, 1910). Premier in 1913, Walter Scott. See section so entitled under CANADA, DOMINION OF.

SAULSBURY, WILLARD. An American pub-

lic official, elected in 1913 United States senator (Democrat) from Delaware. He was born in Georgetown, Delaware, in 1861, and was educated in private schools and in the University of Virginia. He studied law and in 1882 began practice at Wilmington, which he continued until his election to the Senate. He also took an active part in business and was an officer or director in many important financial institutions. In 1900-06 he was chairman of the Democratic State committee and was a delegate to the Democratic national convention at Chicago in 1896, and at St. Louis in 1904. In 1908 he was a member of the Democratic national committee and a member of the executive committee of that body. He was six times the caucus nominee of the Democratic party for United States senator. He was elected for the unexpired term of Isador Rayner, who died in 1912.

SAVERNE INCIDENT. See GERMANY, *Zabern Incident*.

SAVINGS BANKS. In the United States there are two general classes of savings banks, mutual and stock. The mutual savings banks are the prevailing type in the New England and Eastern States, while stock savings banks predominate through the Middle West. On June 4, 1913, there were 623 mutual savings banks and 1355 stock savings banks in the United States. The aggregate deposits of these banks were \$4,727,403,000, credited to 10,766,936 depositors. These figures show an increase of 756,632 in the number of depositors and \$275,585,000 in the amount of deposits, as compared with 1912.

The total resources of the mutual banks were \$4,104,639,000, of which the principal items were: Loans and discounts, \$2,038,915,000; bonds and other securities, \$1,818,633,000. Among the liabilities were surplus and undivided profits of \$330,175,000; and individual deposits of \$3,769,555,000. The States showing the largest number of depositors in mutual savings banks and their total deposits were as follows: New York, 3,144,240 depositors with \$1,700,063,000 deposits; Massachusetts, 2,249,824 depositors, with \$861,416,000 deposits; Connecticut, 616,530 depositors with \$306,428,000 deposits; Pennsylvania, 491,668 depositors with \$208,057,000 deposits; New Jersey, 318,103 depositors with \$111,780,000; and Maryland, 239,379 depositors with \$97,031,000 deposits.

The stock savings banks, although more than twice as numerous, had resources of only \$1,120,845,000. Their deposits aggregated \$956,917,000. Of these banks 870 were in the Middle Western States, 192 in the Southern States, 58 in the Western States, and 179 in the Pacific States.

By a statement furnished the comptroller of the currency by Mrs. S. L. Oberholtzer, it appeared that school savings banks were in operation at the beginning of the year in 1200 schools in 201 towns and cities of the United States; and that 210,320 pupils had deposited during the preceding year \$4,305,000 and withdrawn \$3,143,550, leaving on deposit \$1,101,450.

See also BANKS AND BANKING.

The table on the following page, computed by the Department of Commerce, gives latest statistics for savings banks of the world.

SAVINGS BANKS, POSTAL. See POSTAL SAVINGS BANKS.

SAWTELLE, CHARLES GREENE. An American soldier, died January 4, 1913. He was born in Norridgewock, Me., in 1834, and graduated from the United States Military Academy in 1854. In the following year he entered the army, and served in the Sioux expedition. He was promoted through the various grades, becoming staff captain and assistant quartermaster in 1861. In the following year he was appointed lieutenant-colonel of the United States volunteers. He served throughout the Civil War, rising to the rank of brevet brigadier-general. At the close of the war he was appointed major and staff quartermaster in the regular service, and rose through the different grades until in 1896 he was made brigadier-general and quartermaster-general. During the Civil War he was engaged as chief quartermaster in many of the more important operations. He remained in the quartermaster's department until he was retired at his head in 1897.

SAXONY. See GERMANY, *Other States*.

SCANDINAVIAN LITERATURE. DANISH. The main characteristics of contemporary Danish literature are a revolt against realism, the rise of a new form of romanticism, and a new interest in Danish life and culture of the present and the past.

Drama. Among the best plays of the year is Helge Rode's *Grev Bonde og hans Hus* (*Count Bonde and His House*), which reminds one of the life—and particularly of the death—of Tolstoy. *Affæren* (*The Business House*), by Henri Nathansen, shows the complications arising in a business office. Edith Rode's *Sejren* (*Victory*) and Henry Kistemecker's *Ildprøven* (*The Fire Test*) both met with success.

Poetry. *Blaaregn* (*Blue Rain*), by Sophus Michaelis, is rich in ideas. The volume contains poems of widely different kinds, not always, however, in the best vein of the author. Kai Hoffmann's *Hav og Rum* (*Sea and Space*) shows strong lyric power. Hans Ahlmann's *Aftenlandet* (*The Occident*) is a volume of poems of remarkable technical perfection.

Fiction. Otto Rung's *Den lange Nat* (*The Long Night*) is a good picture of the desolate old age of a selfish speculator. Karl Gjellerup's *Rudolf Stens Landpraxis* (*The Country Practice of Rudolf Sten*) describes the change taking place in a physician during one year spent in the country, and is somewhat autobiographic in character. *De der tog hjemmefra* (*Those Who Left Their Country*) is the third book by Karl Larsen about Danish emigrants in America. Henrik Pantoppidan surpassed his own high standard in *Storeholdt*, the sequel of *Torben og Jytte* (*Torben and Jytte*). Knut Hamsen is still interested in old age. In *Børn av Tiden* (*Children of the Time*), the most important character is an old man who endures the hardships and vicissitudes of life in the spirit of a conqueror. Sven Leopold's *En Nat i Esrom* (*A Night in Esrom*) and Aage Madelung's *Forvandlinger* (*Changes*) are good collections of short stories; the latter shows strong Russian influence.

NORWEGIAN. **Drama.** Several good plays were written through the year, mostly satire. Gunnar Heiberg's *Paradesengen* (*The Bed of*

STATISTICS OF SAVINGS BANKS

Countries	Population	Date of report	Form of organisation	Number of depositors	Deposits	Average deposit account	Average deposit per inhabitant
Austria	28,572,000	{ Dec. 31, 1910..... Dec. 31, 1911..... do.....	Communal and private savings banks..... Postal savings banks, savings department..... State), suggested by the burial of Bjørnson, portrays the unworthy feelings of a great man's children at the time of his death. Herman Wildenvey, in his comedy, *Lys over land* (*Light across the Country*), pictures real life in parts of Christiania, among other things the questionable business dealings of two free church ministers. Nils Kjer's *Det lykkelige valg* (*The successful Election*) is a representation on the stage of "practical" politics.

Poetry. Two volumes of poetry stand out preëminently: Herman Wildenvey's *Aarets æventyr* (*The Happenings of the Year*) and Alf Ingebrekt's *Vinterlandet* (*The Winter Country*). The latter shows great epic power. It is, however, more Danish than Norwegian.

Fiction. The psychologic fiction with a suggestion of lyric quality, rich in life but not in ideas, which displaced the "problem" writing of the eighties, is giving place to a new literature again turning to social problems. Kristian Elster in *Landeveien* (*The Highway*) voices a hopeless dissatisfaction with the actual present and a longing for a new and better future. Sven Elvestad wrote *De fortapte hus* (*The House of the Lost Ones*), in which the strongest elements are mood and sentiment. Johan Bojen in *Fangen som sang* (*The Captive Who Sang*) tells the adventures of a youth who uses his ability to act outside the theatre. Ove Ansteinsson in *Det røde vælde* (*The Red Power*), describing a modern strike, apparently gives his sympathy to the employer. Examples of good novels written in *landsmål* are Olav Hopreksstad's *Ingemaar Kvist* and Kristoffer Updal's *Trolldom i lufta* (*Magio in the Air*).

Miscellaneous. Halvdan Koht edited the letters of Bjørnson under the name of *Gro-tid* (*Time of Growth*). The two volumes contain a good introduction. They cover the period 1857-1870.

SWEDISH. In the literature of to-day three tendencies may be discerned: A gradual decline of poetry in the favor of prose, a revolt against the French influence in novelistic technique, and the development of a new prose according to new artistic ideals.

Drama. Selma Lagerlöf, the well-known novelist and short-story writer, dramatized her story, *Tösen från Stormyrtorpet* (*The Lass from the Stormy Hut*), a touching tale from Swedish peasant life. Ernst Diding wrote three one-act plays under the name of *Eros*.

Poetry. The Finlander Bertel Gripenberg, perhaps the most popular of poets writing in Swedish, added to his work a collection of lyric poems, *Skuggspel* (*Magio Lantern*). Hjalmar Procopé in *Under Stjärnorna* (*Under the Stars*) gives expression to a melancholy, which is, however, far removed from despair. Jacob Tegengren and Anders Österling each wrote a volume of poems.

Fiction. Alma Wittfogels *rykte* (*Alma Wittfogel's Reputation*) is the best book yet written by Marika Stjernstedt. It is the story of a woman who sets her own standards and goes through life unfettered by conventions and traditions and at the end wins the love of a man who discovers her innate nobility of nature. In Elin Wagner's *Helga Wisbeck, läkare* (*Helga Wisbeck, M. D.*) we miss the author's customary thesis, and find instead a novel of character. In *Tvedräktens barn* (*Children of*

Discord) Sven Lidman continued the chronicle of the Silverståhl family begun last year. K. G. Ossian-Nilsson again gave us a parsonage story *Lilla Benjamin* (*Little Benjamin*). Collections of short stories were: *Ur larmet* (*From the Noise*), by Henning Berger; *Nya noveller* (*New Stories*), by Per Hallström; and *Den talangfulla draken* (*The Talented Dragon*), by Hjalmar Söderberg.

Science, Art, and Literature. Henrik Schück and Karl Warburg revised their *Illustrerad svensk litteraturhistoria* (*History of Swedish Literature, Illustrated*). Of great importance for Tegnér criticism is a volume of Tegnér's, *Philosophio and Æsthetic Writings*, edited by Albert Nilsson and Bert Möller. Tor Hedberg's *Ett decennium* (*A Decade, i.e., 1897-1907*) contains a number of masterly essays on Swedish and foreign authors.

SCHILLER LITERATURE. See GERMAN LITERATURE.

SCHMIDT, ERICH. A German scholar and educator, died April 30, 1913. Born in Jena in 1853, his early life as a teacher was spent in Würzburg, Strassburg, and Vienna, where he gave instruction in philology and the history of literature. He became director of the Goethe archives at Weimar, and he succeeded Scherer as professor of the German language and literature at the University of Berlin. He wrote several books on Goethe. His *Life of Lessing* is considered the standard biography of that poet.

SCHNIEWIND, FRIEDRICH. An American chemist, died March 13, 1913. Born in Germany in 1861 and educated at Heidelberg University, at the age of twenty-eight he removed to the United States and became interested in the manufacture of coke. He was a pioneer in the coke-oven business, and was the first to introduce such an oven into the United States. At the time of his death he was president and owner of the German-American Coke and Gas Company and its subsidiaries, the United Coke and Gas Company and the Coke and Gas Construction Company.

SCIENCES, NATIONAL ACADEMY OF. A society incorporated in 1863 for the purpose of examining and investigating any subject of science or art, and for making reports of such investigations at the call of the United States

government, which makes appropriations for the expenses of such examinations and reports. Annual meetings are held in the spring at Washington, and autumn meetings are held in different cities of the United States. The academy celebrated the semi-centennial anniversary of its foundation on April 22, 23, and 24, 1913. It was the most successful meeting with the largest attendance of members in the history of the academy. There was no programme of technical papers, but in its place a series of addresses. The president, Dr. Ira Remson, read at the first session an address on the history of the academy, and Pres. Arthur T. Hadley of Yale, spoke on "The Relation of Science and Higher Education in America." Arthur Schuster, secretary of the Royal Society of London, addressed the society on "International Coöperation in Research." Other addresses were made by Dr. George E. Hale, director of the Mount Wilson Solar Observatory, on the "Earth and Sun as Magnets"; and by Dr. J. C. Kapteyn, director of the astronomical laboratory of the University of Groningen, on "The Structure of the Universe." The Watson medal for astronomical research was presented to Dr. J. C. Kapteyn; the Draper medal for astrophysical research to M. Henri Deslandres; the Agassiz medal for oceanographic research to Dr. Johan Hjört; and the Comstock prize for research in radiant energy to Prof. R. A. Millikan of the University of Chicago. The officers elected for a term of six years were: President, Dr. W. H. Welch of Johns Hopkins University; vice-president, Dr. Charles T. Walcott, secretary of the Smithsonian Institute; and home secretary, Dr. A. L. Day, director of the geophysical laboratory of the Carnegie Institute.

SECONDARY SCHOOLS. See AGRICULTURAL EDUCATION; EDUCATION IN GREAT BRITAIN; and EDUCATION IN THE UNITED STATES.

SEDGWICK, ADAM. An English zoölogist. He was born in Norwich, England, and at the time of his death in 1913 was about 58 years of age. He was educated at Marlborough School and at Trinity College, Cambridge. In the latter institution he came under the influence of Frank Balfour, whose assistant he became. He succeeded Balfour as professor of animal embryology at Cambridge. He succeeded as professor of zoölogy at Cambridge in 1907. In 1909 he resigned this chair and removed to London as professor of zoölogy in the Imperial College of Science.

SEISMOLOGY. See EARTHQUAKES.

SELANGOR. A state of the Federated Malay States (q.v.) on the western shore of the Malay Peninsula. The area in 1909 planted to rubber was 145,222 acres; under cocoanuts, 24,294 acres; rice, 9112; gambier, 39,000; coffee, 10,645; pepper, 1250. Tin is the most important mining product. Export of tin (1911), 5,097,877 Straits Settlements dollars; tin ore, 16,643,259; rubber, 23,852,273; copra, 294,676; gambier, 72,799; gutta, 34,453; hides, 38,518;

pepper, 51,278; coffee, 302,592; arecanuts, 19,784, etc.; total exports, 47,433,952 (4,732,136 in 1910). Total imports, 30,190,834 S. S. dollars (6,054,984, rice; 3,031,517, hardware; 1,484,594, opium; 1,185,872, tobacco and cigars; 522,323, spirits; 435,188, beer and stout; 255,385, plain, and 893,689, dyed cotton goods; 941,522, machinery; 506,747, petroleum; 490,672, cattle; 321,150, swine; 101,465, lard; etc.), against 24,315,540 in 1910.

Kuala Lumpur is the capital as well as the capital of the Federated Malay States. Reigning sultan, Suleiman bin Almerhum Raja Musa. British resident (1913), E. G. Broadrick.

SENATORS, DIRECT ELECTION OF. See ELECTORAL REFORM.

SENEGAL. A colony of French West Africa (q.v. for area, population, etc.). The Wolof is the dominant race and their language is the commercial idiom between the Senegal and the Gambia. They are estimated to number more than 407,000, and are in general Musulmans. Other elements of the population are Serers, fetishists, over 188,000; Toucouleurs, fanatical Mussulmans, over 158,000; Peuhls, pastoral nomad Mohammedans, 78,500; and various fetishistic remnants of tribes of a low order of intelligence and a degraded manner of life, unsuited for civilization and existing mainly by pillage. Industries properly so-called there are none. A primitive agriculture produces millet, peanuts, manioc, corn, cotton, rice, indigo, tropical fruits, etc. Rubber and other forest products are gathered. The pastoral peoples possess great herds, of which they take the utmost care. Horses are plentiful; there are well-defined breeds of cattle; the Moors possess large herds of camels which they send north of the river during the wet season to avoid the long rains. Minerals exist but are worked by the natives in primitive fashion only. The total imports in 1911 were valued at 74,743,558 francs and the exports at 53,382,434 francs; 82,607,568 and 63,679,878 francs in 1910. Principal articles of export with values in 1910 were peanuts, 49,770,741 francs; rubber, 5,060,048; gums, 1,331,601; live animals, 219,511; etc. Vessels entered (1910), 901, of 1,597,555 tons. The Dakar to Saint-Louis railway has a development of 264 kilometers. The projected Thiès-Kayes line is in operation as far as Malem; with a branch, opened to traffic January 1, 1912, from Guinguiné to Kaolak. Into the interior transportation is by pack animals.

Saint-Louis is the capital, with 22,093 inhabitants: Dakar has 24,914; Rufisque, 12,457. Lieutenant-governor (1913), M. Cor.

SERUM SICKNESS (ANAPHYLAXIS). See DIPHTHERIA.

SERUM THERAPY. The discovery of a new serum for the cure of anthrax was announced by Detré, a French physician. The serum is obtained by immunizing a horse with cultures of the anthrax bacilli, and it is said to be strongly bactericidal and successful in curing this very fatal disease. A number of new sera were also prepared for diagnostic purposes. These were the sera of animals immunized against various bacteria. They were marketed in powder form. For use the powder is dissolved in water to make a solution of a definite strength. This solution is added to a suspension of the bacterium to be tested, and

after being incubated for a certain period the mixture is examined. The clumping or agglutination of the bacteria may be determined macroscopically by observing whether they have sunk to the bottom of the container, or the process may be watched under the microscope. Agglutination sera were being extensively used to determine the character of an unknown infection, the body fluids of the patient being tested by various agglutination sera until one was found which reached to the patient's serum, thus identifying the infection. See AUTOSERO-THERAPY.

SERVIA. One of the Balkan states; a constitutional European monarchy, hereditary in the male line of the house of Karageorgevich. Until 1878 an autonomous Turkish dependency. Capital, Belgrade. Serbia recovered Ūskŭb, her ancient capital, from Turkey in November, 1912.

AREA AND POPULATION. By the terms of the Treaty of Bucharest, Serbia gained as the result of the wars in the Balkans the eastern part of Novibazar, Kossovo, and central Macedonia. The area (square kilometers) and the population (census of December 31, 1910) by departments of Serbia previous to the war are given in the table below, with estimated area and population for the acquired territories:

Depts.	Sq. km.	1910	Depts	S. km.	1913†
Belgrade *	12	89,876	Bitolj	345,759
Belgrade	2,025	155,815	Ishtib
Kraguyev's	2,295	189,025	Debar	82,476
Krayina	2,909	112,142	Kav'ar	97,763
Krushevats	2,710	167,371	Kum'vo	166,939
Morava	2,900	203,638	Novib'r	133,401
Nish	2,558	198,768	Pleviye	89,000	62,601
Ushitse	3,288	146,763	Pris'na	239,386
Pirot	2,419	112,314	Prizren	227,425
Podrinje	3,351	238,275	Ūskŭb	153,298
Pozharev's	4,157	259,906	Tetovo	187,249
Rudnik	1,569	85,340			
Smederivo	1,277	143,216			
Chachak	3,798	138,911			
Timok	3,196	149,638			
Toplitza	2,839	110,213			
Valjevo	2,458	157,648			
Vranya	4,342	252,937			
Total	48,303†	2,911,701	general	87,300

* City. † 18,650 sq. miles. ‡ Estimated.

Marriages, 1912, 13,289 (30,453 in 1911); births, 114,257 (107,229); deaths, 63,358 (64,415). Population of Belgrade (1910), 89,876; Nish, 24,049; Kraguyevats, 18,386; Lescovata, 14,266; Pozharevats, 13,613; Shabats, 11,541; Pirot, 10,737; Vranya, 10,487. In the new territories are Bitolj (Monastir), 59,856; Ūskŭb, 47,384; Prilip (Perlepe), 21,783; Prizren, 21,244; Prishtina, 18,174; Velez, 15,624; Novibazar, 13,434; Debar, 10,199; Tetovo, 10,070.

EDUCATION. More than 80 per cent. of the adult population is illiterate. Primary instruction has been made free, and it is nominally compulsory; but actual attendance is very low. The state maintains secondary schools; special schools are few. There is a university at Belgrade. The Greek Orthodox is the national religion, but other creeds are tolerated.

PRODUCTION. Agriculture is practically the only industry. Nearly every peasant occupies and cultivates his own freehold, varying from 10 to 30 acres, and enjoys immunity from dire necessity. Almshouses and pauperism are almost unknown. The country is rugged and broken by stretches of uncultivated heath. About 130,000 acres are devoted to plum or-

chards; the fruit is preserved in large quantities for export, as well as distilled for spirits. It is reported that, in 1911, 954,571 acres were sown to wheat; 254,593 to barley; 258,789 to oats; 123,218 to rye; 1,442,638 to corn; 11,263 to sugar beets. No complete crop returns are available; wheat is reported at 4,167,000 quintals for 1912; rye, 435,000; barley, 1,003,000; oats, 733,000; corn, 6,730,000. There were reported in the country December 31, 1910: 965,208 cattle; 3,808,815 sheep; 152,617 horses; 836,544 swine; 627,427 goats. Over 135,000 hectares are in worked forest, 167,000 in unworked forest. Sericulture is important.

The output of the mines was valued in 1911 at 15,413,945 dinars: 8,165,731 dinars copper; 3,775,776, coal; 1,433,603, gold; etc. Meat-packing, milling, brewing, distilling, sugar refining, carpet-weaving, etc., are the principal manufacturing industries.

COMMERCE. In the table below is shown the trade for three years, values in dinars:

	1909	1910	1911
Imports.....	75,535,000	84,697,000	115,425,000
Exports.....	92,982,000	98,388,000	116,916,000

The principal classes of the 1911 trade were as follows, values in thousands of dinars: Agricultural, animal, and forest products, 22,769 imports and 103,776,000 exports; metals, 20,304 and 9657; minerals and petroleum, 6936 and 718; drugs, chemicals, and dyes, 7573 and 288; textiles, manufactured and raw, 31,416 and 2143; hides and leather, 4575 and 37; luxuries, 2809 and 66; papers, 2513 and 13; stone and crockery, 1619 and 132; glassware, 1520 imports; machinery and implements, 12,350 and 28; other merchandise, 1041 and 43. The principal countries of origin and destination, values in thousands of dinars, were Austria-Hungary, 47,448 imports and 48,433 exports; Germany, 31,347 and 28,933; Turkey, 3814 and 11,984; Russia, 3391 and 53; France, 5746 and 3841; Italy, 4861 and 4394; United Kingdom, 9524 and 87; United States, 2136 and 3609; Belgium, 2081 and 6142; Rumania, 1539 and 6141; Bulgaria, 697 and 2803; etc.

COMMUNICATIONS. There were in operation, at the end of 1913, 555 kilometers of standard and 414 of narrow gauge railway; in the acquired territories, 387 kilometers standard gauge, 111 local lines, and 105 industrial lines. Under construction, 344 kilometers. Telegraph lines (1912), 4403 kilometers; wires, 8355; stations (state), 211. Urban telephone lines, 811 kilometers; wires, 7924; interurban lines, 2941; wires, 11,201. Post offices, 1556. The navigable rivers are the Danube, the Save, and the Drina. The roads are badly in need of repair.

FINANCE. The unit of value is the dinar (par value, 10.295 cents). Official financial statistics are at present unavailable. Some details of the 1913 budget are reported as follows: 30,613,000 dinars revenue from direct taxes; 31,655,698 from monopolies; 14,500,000 from customs; 16,000,000 from state railways; 9,001,000, excise; 8,402,000, fines; 5,547,485, domains; 4,100,000, posts and telegraphs; 5,852,165, various; 5,093,365, extraordinary. Expenditure for service of the debt, 32,394,550; civil list, 1,440,000; court employees, 45,650; Skupshtina, 663,000; council, 198,380; pensions

and subventions, 4,807,366; justice, 3,043,660; worship and instruction, 9,630,384; foreign affairs, 2,929,632; interior, 5,302,193; finance, 13,830,559; war, 30,116,313; public works, 19,615,734; agriculture and commerce, 5,480,829; etc.; extraordinary, 801,000. The debt stood, January 1, 1913, at 654,050,500 dinars.

ARMY. The successful test which Serbia's army had in the Balkan War when, with a population of barely 3,000,000, it was able to put into the field 12 complete divisions of no less than 405,000 men within three months of the declaration of war and to mobilize a force of 260,000 men in three weeks, was proof conclusive of the efficiency of its military system and of the patriotism of its citizens. Recruits are enrolled in the summer of the year previous to their liability for service and, in the case of those desiring to enter the cavalry, opportunity is given them to secure their mounts. Not only men, but carts and animals are registered and those not possessed of animals are required to pay a heavy tax which is used for the purchase of artillery horses from Austria and Russia. For military service the kingdom is divided into five districts, each of which furnishes a complete division of the three bans. These divisions are as follows: First, or Morava division, headquarters at Nish; second, or Drina division, headquarters at Valjevo; third, or Shumadja division, headquarters at Kraguyevatz; and the sixth, or Timok division, with headquarters at Zayechar. Each division is divided into four sub-divisions, each forming a regimental centre, and these again into battalion sub-divisions. Recruits for the cavalry, artillery, engineers, train and other special branches are taken from all over the kingdom, but they are grouped together as far as possible. The active army is composed of five divisions, each of four regiments of infantry of three battalions, one regiment of artillery of nine batteries, and one cavalry regiment of three squadrons. There is a complete organization of the second ban along similar lines and also of the third.

In 1912 the effective budgetary construction of the army was as follows: Officers, 2038; officials, 237; sergeant-majors, 788; sergeants, 1250; corporals, 2311; soldiers, 22,559; graduates of schools for petty officers, 467; graduates of the military academy, 125; musicians, 500; total, 28,000. This, of course, was prior to the Balkan War when the army was increased as indicated above. Late in 1913 the Servian war minister announced that the army was to be raised to a peace establishment of 80,000; barracks were to be provided, the infantry rearmed, the supply of air craft increased, and an increased artillery personnel developed to take over and man the guns which had been captured in the war. Seven officers who had served in the war were to be sent to the French superior war schools.

GOVERNMENT. By the terms of the treaty of Berlin, July 13, 1878, Serbia became an independent principality, and was proclaimed a kingdom March 6, 1882. After the abdication of Milan I. Obrenovich, March 6, 1889, the country was administered by a council of regents until April 13, 1893, when Alexander I. Obrenovitch, son of Milan I., attained his majority. He was assassinated May 29, 1903. June 2, 1903, Peter Karageorgevich, grandson

of Kara George and son of Alexander Karageorgevich, was elected king under the name Peter I. He married (1883) Princess Zorka of Montenegro. His first son, George, was forced in 1909 to renounce his right of succession, which descended to the second son, Alexander, born 1888.

The legislative body is the Skupshtina, composed of 169 members. The ministry as constituted September 12, 1912, and September 1, 1913, was as follows: N. P. Pashich, premier and minister for foreign affairs; Dr. L. Patchou, finance; S. M. Protich, interior; General Boyanovich, war; L. Yovanovich, worship and instruction; M. Diuritchich, justice; Dr. V. Yankovich, commerce, etc.; I. P. Ivanovich, public works.

HISTORY The chief events in the history of Serbia during the year were connected with the conduct and outcome of the Balkan War (see *TURKEY AND THE BALKAN PEOPLES*). Although the accord which had been reached with great labor between Serbia and Bulgaria was rudely broken by a lamentable quarrel over the division of the booty that had been snatched from Turkey, and although Austria-Hungary succeeded in thwarting Servian ambition to secure a port on the Adriatic, nevertheless, as results of the struggle, Serbia nearly doubled her area and population and secured valuable friends in Rumania, Greece, and Montenegro. A session of the Skupshtina in April granted a special credit of 90,000,000 francs for military purposes. Among the measures approved in the regular session of the Skupshtina, held from October 8 to November 8, were the budget for 1914, a loan of 250,000,000 francs, a pension bill, the erection of military academies at Uskub and Monastir, and the prolongation of the moratorium in respect of bills of exchange and acceptances until December 30, 1913, and of all other payments of debts until November 12, 1914.

The activities of the ministry as well as of the Skupshtina were directed chiefly toward the solution of problems resulting from the war. M. Pashich, the premier, encountered such vigorous opposition among his Radical colleagues and from M. Marinkovitch, the Conservative leader, on account of his pacific, temporizing policy towards Bulgaria, that on June 22 he presented his resignation to King Peter. M. Pashich was upheld by the king, however, and continued to act as prime minister, but was unable to prevent the rupture with Bulgaria. When war became inevitable, M. Pashich prosecuted it with zeal and ability. The new territories, definitively ceded to Serbia by the treaty of Bucharest (August 10), were at once divided into eleven administrative districts, and the government set about, with praiseworthy despatch, restoring order and prosperity in the provinces devastated by war. In dealing with the newly-acquired districts, in which there was a considerable Bulgarian population, statesmanlike leniency was displayed: Bulgarian schoolmasters were left undisturbed, and Bulgarian priests of the Exarchate schism were required simply to transfer their allegiance to the metropolitan at Belgrade. No little difficulty was encountered in dealing with the Albanian population in the western districts, but an efficient and active gendarmerie had established practical security by the close

of the year. It was announced in November that large new barracks would be erected at Gostivar, which would thus become an important centre for the preservation of peace, and that a university for New Serbia would be founded at Uskub. On December 6 the *Official Gazette* at Belgrade published a royal decree granting a constitution to New Serbia based in a general way upon the Serbian Constitution of 1903 but providing for a transitional period of ten years, during which the mixed nationalities in the new territories—Turks, Albanians, and Bulgarians—would be deprived of many civil rights and of the right of representation in the Skupshtina. A serious difficulty presented itself in the matter of the railways in the recently-annexed regions: Serbia desired to incorporate them into her state-owned system, while Austria-Hungary, whose citizens owned a majority of the stock, strenuously objected; the matter was being negotiated at the end of December. The definitive treaty between Serbia and Turkey was signed at Belgrade on December 21. Although diplomatic relations had not as yet been resumed with Bulgaria, a growing cordiality toward Rumania was witnessed. Late in December a mixed commission, appointed to consider the best means of joining the Serbian railway system with that of Rumania, recommended that a great bridge be constructed over the Danube at the village of Tziganesch, thirty kilometers above Gruia.

SEVENTH DAY ADVENTISTS. See ADVENTISTS, SEVENTH DAY.

SEVENTH DAY GERMAN BRETHREN. See BRETHREN, CHURCH OF THE.

SEWAGE PURIFICATION presented no marked changes in practice during the year. The usual plan continued to be a reliance on sedimentation to remove the bulk of the suspended matters. Where this is insufficient to prevent nuisance the effluent from the sedimentation tank is passed through some form of filter bed. Of the three types of filters in use—sprinkling, contact, and intermittent sand,—the sprinkling filter is most commonly employed on new installations. If a high degree of clarification is required, the sprinkling-filter effluent is subjected to a brief period of sedimentation, and if high bacterial removal is considered essential resort is had to disinfection by hypochlorite of lime (bleaching powder). Screens are sometimes used in the preliminary process for the removal of suspended matter. At Providence, R. I., the settled sewage is treated with hypochlorite and a disinfectant is used at a number of plants in New Jersey, but the practice is not a common one as yet. Sedimentation tanks are divided into plain, septic, and Imhoff. The septic tank retains the solid matter or sludge for partial reduction in volume by septic action. The Imhoff tank is simply a two-story septic tank, with the settling chamber above and the sludge-digesting chamber below, the two being separated by a sloping bottom to the upper tank, with slots cut in it through which the sludge slides into the digesting chamber. The Imhoff tank was modeled in part after the Travis tank, worked out in England, but little used there. The Imhoff tank is largely used in Germany and during the past few years it was being adopted by a considerable number of American cities as a part of new works. Atlanta, Ga., put its second set of Imhoff tanks and sprinkling filters

in use in 1913 and was to have still a third set—making one for each of the topographical drainage districts of the city.

Important studies of local sewage-disposal problems were carried on in a number of cities during the year. The Metropolitan sewerage commission of New York continued work which it began a number of years previously. By the close of the year it had nearly completed a comprehensive plan for bringing the sewage of the whole city to a number of central points and there treating it much or little, as local conditions demanded. The most interesting part of the whole scheme was an artificial "sewage island" well out in the Atlantic Ocean, beyond Coney Island, to which would be taken for a moderate degree of treatment the sewage of the lower east side of Manhattan Island, and also the sewage of Brooklyn. The commission named was a State-created body, with its members appointed by the mayor, and its expenses paid by the city of New York, but it was connected in no other way with the city government. During the year the city government created a sewer plan commission, made up of city officials. It was expected that this commission would also report a plan for sewage disposal. Experiments on sewage treatment were conducted at Cleveland, Ohio, during the year, preparatory to planning sewage-treatment works for that city. Indianapolis established a station for the same purpose and Akron, Ohio, published a report on the operations of a sewage-testing station which it operated in 1912. The result of the Akron studies was the recommendation of Imhoff tanks, sprinkling filters, and small secondary settling basins. The tests showed that these would operate satisfactorily, notwithstanding the industrial wastes which enter the sewers from rubber, salt, and paper works.

SEWERAGE. The construction of sewers for the collection of liquid wastes from houses, stores, and other buildings, and for the removal of those wastes to some point of final disposal consists chiefly in digging trenches and laying pipes or other conduits therein. For these wastes alone comparatively small conduits are required, but when sewage and storm water from the streets are conveyed through one set of conduits much larger capacity is necessary. For the smaller conduits, vitrified clay pipe, commonly known as sewer pipe, is used. For the larger one brick was almost universally employed until concrete and reinforced concrete came into such wide use for all sorts of engineering construction. Besides the collecting and outfall systems it is sometimes necessary to provide pumps for lifting the sewage of flat cities to the level of the water into which the sewage is discharged. Three 100,000,000-gallon submerged centrifugal pumps were proposed for this purpose for the Passaic Valley Sewerage District, in connection with the great trunk sewer which it is building from Paterson to Newark, N. J., beneath Newark Bay and the Bayonne Peninsula and beneath New York Harbor to a submerged outlet near the Statue of Liberty. For sewage disposal and methods of treatment, see SEWAGE PURIFICATION.

SEX DETERMINATION. See ZOÖLOGY.

SEX HYGIENE. See HYGIENE, and EDUCATION IN THE UNITED STATES.

SHAFROTH, JOHN FRANKLIN. An American public official, elected in 1913 United States

senator (Democratic) from Colorado. He was born in Fayette, Missouri, in 1854, and graduated from the University of Michigan in 1875. He studied law and in 1876 was admitted to the Missouri bar, practicing at Fayette until 1879, when he removed to Denver. He served as city attorney from 1887 to 1891; in 1895 was elected to the 54th Congress; and was reelected to successive Congresses up to and including the 58th. He refused to retain his seat in the 58th Congress as it had been proved that his election had been obtained by fraud. In 1909 he was elected governor of Colorado and was reelected in 1911.

SHEEHAN, PATRICK AUGUSTINE An Irish Roman Catholic priest and author, died October 6, 1913. Born in Mallow, Ireland, in 1852, he was ordained to the Roman Catholic priesthood in 1875; from 1875-77 he served in the English mission at Exeter; was curate in Mallow and Queenstown; and in 1903 received the appointment of canon of Cloyne. He wrote many novels, and several volumes of essays and poems. His novels are racy of the soil, and have their roots in a full knowledge of Irish character and customs. The Roman Catholic point of view is the point of departure for all of them. His published writings include: *Geoffrey Austin, Student*; *The Triumph of Failure*; *My New Curate*; *Lost Angel of a Ruined Paradise*; *Cithara Mea* (poems); *A Spoiled Priest and Other Stories*; *Lisheen* (1907); *Parerga* (1908); *The Blindness of the Reverend Dr. Gray* (1909); *The Queen's Fillet* (1911); *Miriam Lucas* (1912).

SHEEP. See STOCK-RAISING AND MEAT PRODUCTION.

SHEPPARD, MORRIS. An American public official, elected in 1912 to be United States senator from Texas (see TEXAS). He was born in Wheatville, Morris County, Texas, in 1875, and graduated from the University of Texas in 1895. After graduating from Yale Law School, he practiced in Pittsburgh and Texarkana, Tex., from 1898 until 1902, when he was elected to the 57th Congress to fill the unexpired term of his father, who had died. He was reelected to the 58th, 59th, 60th, 61st, and 62nd Congresses (1903-13). On the announcement, in 1911, by Senator Bailey that he did not care to continue his services in the Senate for another term, Mr. Sheppard became a candidate and was elected by the legislature in 1913. During his service in the House he gained a reputation as a gifted and fluent orator.

SHERMAN, LAWRENCE Y. United States senator (Republican) from Illinois. Born in Miami County, Ohio, in 1858, he spent his early years on a farm, and was educated in the common schools and at McKendree College. He studied law and was admitted to the bar. A member of the State general assembly from 1897-1905, he was speaker from 1899-1903, and lieutenant-governor and president of the State Senate from 1905-1909. He was elected to the Senate March 26, 1913. At that time he was president of the State board of administration, having control of all the public charities. His term in the Senate expires March 3, 1915 (see ILLINOIS).

SHIELDS, JOHN KNIGHT. United States senator (Democrat) from Tennessee. He was born at Clinchdale, Grainger County, Tenn., in 1858; was educated privately; and in 1879 was admitted to the bar. In 1893 he was appointed chancellor of the twelfth chancery division,

serving one year. In 1902 he was appointed associate justice of the Supreme Court in the State, in which position he served until 1910, when he was reelected and made chief justice. This position he held when he was elected to the United States Senate, January 23, 1913. His term of office expires March 3, 1919.

SHIPBUILDING. The annual statistics of shipbuilding in various countries, compiled by *Lloyd's Register* and giving the tonnage of merchant ships exceeding 100 tons launched in all countries, shows that the total output of the world for 1913 was 1750 vessels of 3,332,882 tons, of which 3,188,578 tons were steamers. This represents a total increase in the world's production of 2,651,000 tons, as the wastage, including all vessels lost, broken up, etc., during the year was 628,000 tons. The production was 431,000 tons more than in the year 1912. Of the output of 1913, 641 merchant steamers of 1,919,578 tons were launched in the United Kingdom, an excess over 1912 of 193,639 tons and a total exceeding the former previous record made in 1906 by 104,000 tons. An increased number of large vessels were launched during the year. In 1913 84 vessels over 6000 tons were launched in the United Kingdom, and 21 of these were over 10,000 tons. Only 16, however, were capable of a speed of 16 knots and over, the fastest being the Cunard liner *Aquitania* and two other turbine steamers for the Irish Sea and English Channel service, respectively. These three vessels were designed for a speed of over 20 knots.

The British proportion of the total merchant tonnage of the year 1913 was 58 per cent., which was less than in 1912 and 1911, when the proportion was 60 and 68 per cent., respectively; but the ratio was about the same as in 1907, the last year of great activity in shipbuilding. In 1913, Germany's proportion was 14 per cent., as compared with 13 per cent. in 1912, and 9.7 per cent. in 1911. In the United States the proportion for the year 1913 was 8.3 per cent., as compared with 9.8 per cent. in 1912, and 6.5 per cent. in 1911, and 17 per cent. in 1910. The French total was 5.3 per cent., which was greater than in the three preceding years. Holland showed a smaller proportion, or 3.1 per cent. of the world's total merchant output.

While the total number of warships launched in 1913 throughout the world was 180 vessels of 676,909 tons displacement, this tonnage, which exceeded that of the previous year by 142,000 tons, was the largest, with the exception of 1911. The detailed production by nations will be seen from the accompanying table. It is interesting to note that the German warship production was the highest ever recorded, Germany building 25 vessels of 148,000 tons, or nearly 50,000 more tons than in 1912, and nearly 20,000 more tons than in 1911.

	1911	1912	1913
Austria-Hungary	58,105	88,742	68,258
Belgium	7,563	18,542	30,181

On June 30, 1913, the merchant marine of the United States, including all kinds of documented shipping, comprised 27,070 vessels of 7,886,518 gross tons, an amount in excess of the combined tonnage recorded in *Lloyd's Register* for 1913 under the German flag, 5,082,061 tons, and under the Norwegian flag, 2,457,890 tons and, excepting the British Empire, greatly in excess of the tonnage of any other three nations combined. The total tonnage under the British flag, as recorded by *Lloyd's*, was 20,431,543 tons (steam, gross; sail, net). Unfortunately, the American tonnage on the great seas suffers in comparison as 2,939,786 gross tons are on the American Great Lakes. The geographical distribution of the merchant marine of the United States in 1912 and 1913 is shown by the accompanying table.

COMPARISON OF UNITED STATES MERCHANT MARINE OF 1912 AND 1913

Classification	1912		1913	
Geographical distribution	No.	Gross tons	No.	Gross tons
Atlantic and Gulf.....	16,874	3,625,525	16,924	3,743,354

							1,501 382,569

GREAT BRITAIN. In ten years the net increase to the tonnage of the merchant marine of the United Kingdom was 3,759,470 tons, but in that time 1,092,164 tons of sailing ships had been removed and the steam tonnage in the period increased by nearly 5,000,000 tons. In other

words, more than one-half of the merchant marine of the United Kingdom, or 11,185,976 tons of new steamers alone had been built within the ten years ending with 1913, as on December 31 the total number of vessels on the register of shipping was 20,968, with an aggregate tonnage

of 19,617,324, or 76 vessels and 438,147 tons more than at the end of 1912. In 1913 the British ships lost, broken up, etc., amounted to 157, aggregating 234,685 tons, while there were sold to foreign nations 375 vessels of 714,778 tons, and to the colonies there were transferred 29 vessels of 43,268 tons.

The following table (from *Engineering*, London) shows the notably large merchant steamers launched during the year in British yards:

Name	Tons	I.H.P.	Builders
Cunard liner <i>Aquitania</i>	47,000	60,000†	John Brown & Co., Ltd.
Pacific liner <i>Andes</i>	15,620	12,150*	Harland and Wolff, Ltd., Belfast
— <i>Orduña</i>	15,800	9,150*	do do
Royal Mail liner <i>Alcantara</i>	15,800	12,150*	do Govan
Allan liner <i>Albatross</i>	18,000	20,000†	W. Beardmore & Co., Ltd.
" <i>Calgarion</i>	18,000	20,000†	Fairfield Co., Ltd.
Holt liner <i>Ulysses</i>	14,499	8,000	Workman, Clark and Co., Ltd., Belfast
Royal Holland Lloyd liner <i>Gelria</i>	14,053	A. Stephen & Sons, Ltd.
Royal Holland Lloyd liner <i>Tubantia</i>	14,053	do do
Cunard liner <i>Andania</i>	13,404	8,000	Scott's Co., Limited, Greenock
Cunard liner <i>Albatross</i>	13,404	8,000	do do
Union-Castle liner <i>Llandovery Castle</i>	11,800	7,500	Barclay, Curle and Co., Ltd.
Union-Castle liner <i>Llanstephan Castle</i>	11,800	7,500	Fairfield Co., Ltd.

" <i>Borda</i>	11,136	9,000	do
Norwegian Atlantic liner <i>Bergensfjord</i>	10,600	8,500	Cammell Laird and Co., Ltd.
Anglo-Mexican oil-carriers:			
<i>San Hilario</i>	10,157	4,100	Palmer's Co., Ltd.
<i>San Jeronimo</i>	10,150	4,100	Wm. Doxford and Sons, Ltd.
<i>San Gregorio</i>	10,100	4,600	Swan, Hunter and Wigham Richardson, Ltd.
<i>San Fraterno</i>	10,100	4,700	do do
<i>San Lorenzo</i>	10,100	4,700	do do
<i>San Isidoro</i>	10,074	4,700	Sir W. G. Armstrong, Whitworth & Co., Ltd.

* Combination machinery. † All turbines.

The following table from *Engineering*, London, gives the aggregates of production in the United Kingdom in the year 1913 as compared with 1912:

	1913 tons	1912 tons
Power-driven tonnage*	2,205,400	1,924,320
Sailing tonnage	31,600	129,680
Totals	2,237,000	2,054,000
His majesty's dockyards	74,960	54,230
Grand totals	2,311,960	2,108,230
Foreign-owned tonnage	507,000	471,600
Per cent. of total	22	22.4
Total merchant tonnage†	2,042,760	1,911,535

	1913 tons	1912 tons
Per cent. of power-driven merchant tonnage to total merchant tonnage	99.85	93.2
Horse power of engines	2,679,000	2,271,775
Per cent. of all naval tonnage to merchant tonnage	13.2	10.8

* Includes warships built in private yards.
† Excludes British and foreign warships.

The above table includes vessels smaller than the 100-ton limit observed by *Lloyd's Register* and floating dry docks.

GERMANY. Excluding Great Britain Germany had the largest output of any country, and in fact a record production for that nation, the number of vessels of over 100 tons, including merchant and warships, being 201, while the tonnage was 618,673 tons. In this there were included 39 warships, of 153,447 tons, five torpedo-boat destroyers for the Austro-Hungarian navy, in addition to German ships. The merchant tonnage was 465,226 tons, exclusive of the river craft. There were 36 steamers of 5000 tons and under 10,000 tons; while over the latter figure there were five, the largest being the Hamburg-American liner *Vaterland*, of about 56,000 tons, launched at Hamburg, and the biggest vessel afloat at the end of 1913. There was also included the Norddeutscher Lloyd liner *Columbus*, of 35,000 tons, launched at Danzig, and the turbine steamer *Admiral von Tirpitz*, of 21,600 tons, launched at Stettin. Four vessels, totaling 28,000 tons, were fitted with internal combustion engines, the largest being the oil-carrying steamer *Wilhelm A. Riedemann*, of 9800 tons. In addition there were a number of small vessels with oil engines. At the end of the year there remained in course of construction in Germany a turbine steamer, of about 56,000 tons, a sister-ship to the *Vaterland*; three of between 18,000 and 20,000 tons, to be fitted with a combination of reciprocating and turbine engines; one of 15,200 tons; and 23 other vessels of between 5000 and 10,000 tons.

FRANCE. The total output for France was the largest for eleven years, and included 75,891 tons of warships, counting one of 490 tons for Japan. The merchant total, 176,095 tons, showed an increase of over 65,000 tons, and included two steamers of close upon 15,000 tons, the *Gallia* and the *Lutetia*, launched respectively at La Seyne and St. Nazaire. There were two other vessels between 12,000 and 13,000 tons, and twelve between 5000 tons and 8600 tons. At the end of the year there were under construction merchant ships aggregating 229,000 tons, including eight vessels of from 5000 to 9000 tons, five between 12,000 and 13,000 tons, one of which will be fitted with combination machinery, as will also one of 15,000 tons, while yet another vessel of 30,000 tons will be driven entirely by turbines.

NETHERLANDS. The Dutch total was the largest ever recorded for that country in *Lloyd's* returns, as, in addition to 3075 tons of Dutch warships, there were built 104,296 tons of merchant ships, exclusive of river craft. Of the latter, including steamboats, barges, and other vessels, 126,000 tons were launched, so that the total merchant output of Holland seems to have

been about 230,000 tons—a very satisfactory aggregate. The largest vessels launched were three of about 9000 tons each. Internal-combustion engines were fitted to three ships of a combined tonnage of 10,800 tons, as well as to a number of small craft. There are six vessels building of between 7000 and 11,000 tons.

JAPAN. The total for Japan, in addition to the two large "capital" ships for the navy, was 64,664 tons of merchantmen, and included two vessels of about 10,500 tons with combination machinery, and one of 9534 tons. The principal work now in hand is three vessels, of 12,000 tons each.

AUSTRIA-HUNGARY also had a record year; the warship work totaled seven vessels, of 6501 tons, including one vessel of 204 tons for Denmark, while the merchant work totaled 61,757 tons, and exceeded the previous record total of 1912 by 23,000 tons. The merchant ships launched were almost entirely vessels of between 5000 tons and 8000 tons, and at the end of the year there were six such ships in progress, and one of nearly 15,000 tons.

NORWAY showed an output about the same as 1912 and composed almost entirely of small vessels, the largest being only of 1900 tons, and the warship work comprised only one vessel, of 520 tons.

ITALY, in her 53,810 tons of warships, included three small vessels, of 1182 tons, for Brazil.

DENMARK had a record, and the interesting point is that two of the largest and two smaller vessels are fitted with Diesel engines.

BRITISH COLONIES also enjoyed a record year, and the output of 48,339 tons included two large vessels built in the North American lakes, one of 6900 tons and the other of 7862 tons. This last, which was the largest vessel ever built in Canada, was lost during the violent storm which struck the Great Lakes in November, 1913.

MARINE ENGINEERING. In 1913 the *Vaterland*, the sister ship of the *Imperator*, 940 feet in length, was launched for the Hamburg-American line and another ship of similar dimensions was laid down. Work was proceeding on the *Aquitania* so that it would be completed the following year and the *Imperator* was in active service. Aside from questions of mere size the leading topic of discussion during the year was the application of the Diesel engines to marine propulsion and the use of various methods for transforming, or transmitting, power. The *Hagen*, driven by Diesel engines of 2300 horse power across the Atlantic to the port of

New York, made a successful voyage, and the *Wotan*, a tank steamer, 404 feet in length, capable of carrying 7680 tons of oil, also made this voyage driven by a Carrels-Diesel engine of 2400 horse power. This vessel differed in that a single propeller and single engine was used. This was stated to be the largest Diesel marine engine yet built, and the tests of the vessel and its motor seemed apparently successful. Perhaps the greatest mechanical novelty of the year was the freight steamer *Tynemount* of 2400 tons capacity, which had for its motive power two six-cylinder Diesel engines directly connected to three phase generators from which electric current was taken for an induction motor mounted directly on the propeller shaft. The *Tynemount* was the first large commercial vessel designed to carry a large electric reduction drive and was designed for service on the Great Lakes. In the United States navy one collier of 19,300 tons displacement was fitted with the Westinghouse mechanical gear, while a sister ship was fitted with an electrical reduction gear with motors on the propeller shafts and a generator delivering current to them. In Germany a Foettinger gear was thoroughly tested at loads of from 5000 to 10,000 horse power and was being installed on large German steamships.

During the year the Alabama and New Orleans Transportation Company had under construction a fleet of fifteen barges equipped with twin-screw propellers driven by producer gas engines and designed to operate between the coal fields of Alabama and New Orleans, La. These barges were 240 feet in length and 32 feet in width, with a possible gross tonnage of 1300 tons. The shape followed was that of the barges used in the canals of Amsterdam, Holland. The hull, with machinery, weighs about 220 tons, drawing when empty two inches forward and two feet eight inches aft. Each barge has twin propellers, each driven by a 75-horsepower engine located five feet from the centre and three rudders are employed for the steering, the middle one being balanced. It is estimated that 1000 tons of coal can be moved at the rate of 200 miles per day at a total fuel cost of two tons of coke, and the crew of such a barge consists of two pilots, two engineers, two deck hands, and a cook.

WORLD'S SHIPPING IN 1913. In the accompanying table are given the steam and sailing vessels of over 100 tons, number and gross tonnage of the several countries of the world, as recorded in *Lloyd's Register* of 1912-1913.

Flag	Steam		Gross tons	Sail		Total

SHOOTING. The United States was the scene of the international rifle shooting matches in 1913 for the first time in the history of the sport. The contests were held at Camp Perry, Ohio, Congress appropriating \$25,000 and the State of Ohio \$15,000 for prizes and expenses. The events and results follow: Palma Trophy match won by the United States with a score of 1714; Argentina second with 1684; Canada third with 1675; Sweden fourth with 1484; Peru fifth with 1465. International Team match with free rifle—won by Switzerland with a score of 4959; France second with 4767; United States third with 4578; Sweden fourth with 4577; Argentina fifth with 4061; Peru sixth with 3893; Canada seventh with 3760. Pan American Team match with army rifle won by Argentina with a score of 4600; United States second with 4573; Peru third with 4176. International Team match with pistol won by United States with a score of 2325; France second with 2234; Sweden third with 2228; Switzerland fourth with 2097; Peru fifth with 1182. Pan-American Team match with pistol won by United States with a score of 2315; Argentina second with 2005; Peru third with 1005. Individual Championship of the World with army rifle won by Erikson, Sweden. Individual Championship of the World with free rifle won by Staheli, Switzerland. Individual Pistol Shooting Championship of the World won by Carlberg, Sweden. Individual Pan-American Championship with rifle won by Cavatorta, Argentina. Individual Pan-American Championship with revolver won by Hanford, United States.

In the National Team matches the United States Cavalry Team (2675) won in Class A, Alabama (2547) in Class B, and Utah (2493) in Class C. Edward W. Sweetney of the 16th Pennsylvania Infantry, won the National Individual match, and J. H. Snook, of Columbus, Ohio, the individual revolver match.

The winners of the principal rifle matches held under the auspices of the National Rifle Association were: Individual Military Championship, Captain W. H. Clopton, Jr., United States Cavalry, score 266; Wimbledon Cup (1000 yards, 20 shots), Captain T. E. Vereer, 14th United States Infantry, score 99; Leech Cup (800, 900, and 1000 yards, 7 shots), G. W. Chesley, Ct., score 105; Marine Corps match (600 and 1000 yards, 15 shots), J. W. Hessian, Ct., score 195; Regimental Team match, Fifth Infantry, Massachusetts Volunteer Militia, score 832; Company Team match, Company A, First West Virginia Infantry, score 380; Revolver Team match, First Squadron Cavalry, Colorado National Guard, score 1007.

The intercollegiate indoor championship was won by the University of West Virginia, and the outdoor by the Massachusetts Agricultural College.

Considerable interest was shown in trap-shooting in 1913. The Interstate Association's first Southwestern Handicap Tournament held at San Antonio, Texas, was won by R. B. Barnes of Bay City, Texas, with a score of 96 out of 100. M. S. Hootman of Hicksville, Ohio, won the Grand American Handicap held at Dayton, Ohio, his score being 97 out of 100. The national amateur championship went to Barton Lewis of Auburn, Ill., with 195 out of 200, while C. A. Young of Springfield, Ohio, was the winner of the national professional championship, scoring 197 out of 200. The amateur championship at double targets was won by George L. Lyon of Durham, N. C., who made 94 out of 100, and the professional championship by J. R. Graham of Ingleside, Ill., who scored 88 out of 100. Ralph L. Spotts won the United States indoor championship with a perfect score of 100, and Charles H. Newcomb the United States outdoor championship with 179 out of 200. The intercollegiate spring championship was won by Princeton (407), Yale (312) was second, and Dartmouth (294) third.

SHOPS ACT. See **GREAT BRITAIN, Work of Parliament.**

SHORT BALLOT. See **ELECTORAL REFORM.**

SIAM. An independent kingdom in the southeast of Asia; a buffer state between Brit-

ish Burma and French Indo-China. Bangkok is the capital.

AREA, POPULATION, ETC. The total area is estimated at 600,000 square kilometers, or 198,900 square miles. Population (1910-11), 8,149,487. Persons in holy orders, 142,636. Births (1910-11), 162,491; deaths, 84,495. Immigration of Chinese coolies in 1912, 68,361, and emigration, 45,986; in 1911, 71,258 and 52,562; in 1910, 75,408 and 63,007. Siamese, Chinese, Malays, Cambodians, Mohms, Karens, Annamites, etc., make up the population. Foreign residents, about 2000. Bangkok has 628,675 inhabitants, of whom 197,918 Chinese.

Buddhism is the state religion, and the priests are in large measure in charge of educational matters. A new plan of education has been drawn up by the ministry of public instruction and government-aided secular schools are being introduced. There are several missions.

PRODUCTION. Serfdom until recent years was the lot of a large part of the population, enslavement for debt being abolished only during the reign of Chulalongkorn. Partly for this reason agriculture is in a backward condition. Rice is the leading crop and the introduction of irrigation has greatly extended the available area. There are 26 rice mills (2 British, 2 German, 22 Chinese) in Bangkok. Next in importance after rice is the teak industry, carried on in the great northern forests mainly by British enterprise. Cattle and hides are exported.

Tin and wolfram are mined on a commercial scale. Gems have ceased to be an important product since the cession to the French of the Pailin district in 1907.

COMMERCE AND COMMUNICATIONS. A large proportion of the overseas trade is with Great Britain; much of the trade passes through Singapore and Hongkong, though German and Norwegian shipping exceed British. The table below shows countries of origin and destination with the value of their trade for 1910-11 and 1912-13, in thousands of ticals (par value of a tical, 37.085 cents):

	Imports		Exports	
	1910-11	1912-13	1910-11	1912-13
United Kingdom.....	11,479	20,622	7,479	3,013
China	6,334	15,286	172	212
British India.....	7,092	8,222	3,163	2,008
Germany	3,474	5,668	5,982	4,194
Singapore	13,118	5,326	41,199	36,870
Dutch Indies.....	2,497	5,957	843	475
Hongkong	15,036	1,445	38,178	25,343
Switzerland	734	561	30	13
Other	8,441	13,136	11,864	9,843
Total	68,205	76,225	108,910	81,971

Total imports in 1909-10, 69,811,711 ticals, exports, 102,570,434; in 1911-12, 73,139,000 and 84,634,000. The export of rice in 1912-13 was valued at 65,320,000 ticals; 1911-12, 65,841,000; 1910-11, 91,060,879; 1909-10, 85,078,585. Teak export 1912-13, 5,600,000 ticals; 1911-12, 6,113,000; 1910-11, 7,624,092; 1909-10, 6,975,057. Vessels entered in the 1912-13 trade, 664 steamers, of 566,172 tons. Merchant marine (1913), 33 steamers, of 8621 tons, and 45 sail, of 3612.

State railways (1912), 1024 kilometers, of which 213 kms. local lines; private railways, 106 kms. Bangkok has well-equipped electric street railway and lighting systems. Telegraph lines (1912), 9457 kms.; wires, 10,628; stations,

142; receipts, 1,678,442 francs; expenditure, 1,440,968. Urban telephone wires 6716, inter-urban 1122; receipts, 202,426 fr.; expenditure 161,926. Post offices 223. Roads are few.

FINANCE. The budget for 1913-14 estimates to revenue at 65,093,654 ticals (62,321,000 in 1911-12). Ordinary expenditure, 64,599,423 (62,235,539 in 1911-12); for railway construction, 12,850,500 (9,660,670); for irrigation, 1,569,624 (2,014,399); making total ordinary (with various), 15,228,059 (11,675,069)—total ordinary and extraordinary, 79,827,482 (73,910,608). The public debt stood (1913) at £5,712,320; paper currency, March 31, 1913, 26,051,070 ticals.

ARMY. Military service is obligatory for 17 years under the provisions of the law of 1904, two years being spent in the regular army, five years in the first reserve, and 10 in the second reserve. There are both cadet and war schools. The Siamese army is organized in three army corps and one independent division. Each corps consists of three divisions, making 10 divisions in all. The infantry is armed with a Mauser rifle manufactured in Japan, and the other arms of the service with carbines of the same type. The army of Siam in 1913 was in course of formation and development. It comprised about 12,000 to 15,000 men in time of peace, capable of being increased to an effective of 30,000 in case of war.

NAVY. The fleet includes a protected cruiser (3000 tons) and some 20 small craft, besides a torpedo-boat destroyer and 3 torpedo boats. In November, 1913, a new protected cruiser was reported to have been ordered.

GOVERNMENT. The sovereign is absolute monarch, and though the succession is nominally hereditary, he frequently appoints his successor. He has a council of ministers, chiefly chosen from among his relatives; and a legislative body of 39 members is similarly composed. A commissioner appointed by the ruler administers each of the 18 provinces; certain tributary territories are under the control of their own chiefs. The reigning king is (Somdetch Phra Paramindu) Maha Vajiravudh, born January 1, 1881, proclaimed successor and crown prince 1895, succeeded October 23, 1910.

SIERRA LEONE. A British colony and protectorate on the west coast of Africa. Total area, 32,110 square miles; total estimated population, 1,327,560. Population of the Sierra Leone Peninsula (1911), 75,318. Freetown (34,090 inhabitants) is the capital. The country is unhealthy and the inhabitants are averse to agriculture and other industries. Wild products constitute the bulk of the exports—kola nuts, palm kernels, palm oil, rubber, copal, and ginger. The imports were valued in 1911 at £1,274,031 (£1,162,470 in 1910, £978,807 in 1909), and the exports at £1,307,038 (£1,240,367 and £981,466). The revenue amounted (1911) to £457,759 (£424,215 in 1910), and the expenditure to £432,448 (£361,222). Shipping entered and cleared, 2,487,577. The Freetown-Pendembu is a government railway (227½ miles), with a tramway connection to Baiima (7 miles); another tramway connects Boia station with Yonni (21 miles). The gauge for both railway and tramway is the same (2 feet 6 inches), and the same rolling stock is used on both. There are short local lines. Telegraph lines, 298 miles. Governor (1913), Sir E. M. Merewether.

SILK. The silk industry during 1913 was marked by extraordinary conditions both in Europe and the United States. The Balkan War, which involved a certain portion of the silk producing territory, had its effect further in the general feeling of unrest which pervaded all the markets of Europe. In the United States the tariff revision was in progress, with the inevitable uncertainties attaching to this process, and, at the same time, for twenty-two weeks, from February until the end of July, a great strike was in progress at Paterson, which closed every silk mill in that city and affected establishments in other regions dependent for their dyed silk upon the Paterson dye houses. There were involved in this strike some 340 manufacturing plants and dyeing establishments, employing approximately 25,000 people, and representing a monthly output of \$4,000,000. As a result some \$5,000,000 in wages was lost to the operatives, while the loss of production to the manufacturers was conservatively estimated at \$20,000,000.

The year 1912 had seen a large consumption of raw silk, and the visible stocks of the world on January 1 were less than at the same date in 1912, while the consumption continued, and the first few months in the year were marked by increased activity. This, however, so far as America was concerned began to decrease, but European manufacturers were acquiring considerable amounts of the raw material. The silk crop of 1913 was below that of the crop of 1912, which was the largest on record, and the shortage was due to diminished supplies from Italy and France, and, naturally, from the Balkan states and European Turkey, although Hungary maintained its record of the previous year, and Syria and Brutia were favored by good weather conditions and did better than in the previous year. The Caucasus showed a deficit of 25 per cent., Persia and Turkestan maintained about the same position, and, while China indicated an export slightly below that of the previous year, the first three crops of Canton were thought to exceed those of 1912. Exclusive of Tussah silks, the production of the world, as estimated by the *American Silk Journal*, for 1913 in comparison with the previous two years, is given as follows in kilograms of 2.2 pounds each:

	1913	1912	1911
Europe	4,150,000	4,980,000	4,330,000
Levant	2,400,000	2,300,000	2,950,000
Japan	11,100,000	10,820,000	9,320,000
China	4,400,000	4,865,000	4,300,000
Canton	2,400,000	2,175,000	2,030,000
India	150,000	180,000	220,000
	24,600,000	25,320,000	23,150,000

During the year a bulletin from the bureau of the census on the silk industry in the United States for 1909 was published. The following are the more important items from this document.

The total number of establishments in the silk industry in the United States in 1909 was 852; the persons engaged in the industry were 105,238, of whom 99,037 were wage earners; the capital invested was \$152,158,002; the wages paid out amounted to \$38,570,085; the cost of materials was \$107,786,916; and the value of products was \$196,911,667.

The total value of products for the industry increased \$89,655,409, or 83.6 per cent., between 1899 and 1909. The total production of silk goods of broad weave (broad silks, velvets, plushes, tapestries, and upholstery) in 1909 was 198,787,027 running yards, valued at \$115,136,724, as compared with 97,940,935 yards, valued at \$58,122,622, in 1899, the increase in output being 103 per cent., and that in value 98.1 per cent.

The silk industry was concerned in numerous "pure fabric" bills introduced in Congress and in the various State legislatures. One of these bills provided "that the term 'pure silk' as used in this act, should be held to mean either a reeled or spun silk from the cocoon of the silk worm, and that the compound part of silk thereof does not contain more than its original gum weight." This brought up the question whether or not the silk, after being boiled, might be weighted to bring it up to its original weight in the gum, as well as other interesting trade customs. Other bills provided for the labeling and tacking of all fabrics and articles of clothing intended for sale, and the placing of the name of the manufacturer upon clothing or products involving the assemblage of parts of textiles. Up to the end of the year none had been passed. See also **CHEMISTRY, INDUSTRIAL SILK, ARTIFICIAL.** See **CHEMISTRY, INDUSTRIAL.**

SILK, WORLD'S PRODUCTION OF. See **AGRICULTURE.**

SILVER. The silver production of 1913, according to the estimates of the United States Geological Survey, was the greatest in the history of silver mining. It had an increase of nearly \$4,000,000 over the output of 1912. The value of the output, however, has been surpassed, although not since 1893. The notable increase in the production may be attributed chiefly to the record output and increase of over 1,500,000 ounces from the silver-lead ores in Idaho, and increases from the silver-lead and other mines of Colorado, Nevada, Montana, Oregon, Arizona, and California. The chief decrease in the production of 1913 was that of nearly 1,000,000 fine ounces in Utah. (See also **METALLURGY.**) The following table, taken from the *Engineering and Mining Journal*, shows the production of silver in the several States and in the United States in 1912-13, as reported by the director of the mint and the United States Geological Survey:

SILVER PRODUCTION OF THE UNITED STATES

(In fine ounces)

	1912	1913	Changes
Alabama	200	84	D. 116
Alaska	539,700	379,575	D. 160,125

The average commercial price of silver, at New York, in 1912, was 60.835 cents per fine ounce. In 1913 it was 59.79 cents.

The imports of silver into the United States for the calendar year 1912, amounted to 48,401,068 fine ounces, and the exports to 71,961,755 fine ounces. The bureau of the mint estimated the world's production of silver in 1912 at 224,000,000 fine ounces, in 1913 at 212,000,000. The New York equivalent of the average price of silver in London for the year was 60.45 cents per ounce. Purchases of silver for coinage by the United States amounted to 2,288,000 fine ounces. The world's production for 1912 is given in the accompanying table.

WORLD'S PRODUCTION OF SILVER, CALENDAR YEAR 1912

Countries	Ounces (fine)
North America:	
United States	63,766,800
Canada	31,625,451
Mexico	74,640,300
Africa:	
Transvaal	984,672
West Coast
French Colonies	73,286
Rhodesia	158,572

SIX-HUNDRED-AND-SIX. See NEOSALVARSEAN, and SALVARSEAN.

SKATING. The international outdoor championships were held at Saranac Lake, in February. R. M. McLean, of Chicago, and R. L. Wheeler, of Montreal, for the second year in succession made practically a clean sweep of the races. McLean won the half-mile, mile and two-mile events, and Wheeler the 440-yards and three-mile events. R. T. Logan won the 220-yard dash. In the international indoor championships, held at Cleveland, McLean won the $\frac{1}{4}$ -mile, $\frac{1}{2}$ -mile, $\frac{3}{4}$ -mile, and mile, while Wheeler won the $\frac{1}{4}$ -mile and $\frac{1}{2}$ -mile. McLean made a new American amateur record of 1 minute 16 $\frac{1}{2}$ seconds for the half-mile during the year, and abroad O. Mathiesen of Norway established a new world's amateur record of 17 minutes 22 $\frac{1}{2}$ seconds for 10,000 meters. The winners in the Canadian championship were: 220-yards, W. H. Jackson; 880-yards, R. M. McLean; 440 yards, R. T. Logan; mile, R. M. McLean; 2 miles, R. L. Wheeler.

SKEMMATITE. See MINERALOGY.

SKY-SCRAPERS. See ARCHITECTURE, and TALL BUILDINGS.

SLEEPING-SICKNESS. Some interesting discoveries were announced by the commission, headed by Surg-Gen. Sir David Bruce, which had been sent to Central Africa to investigate this disease. The commission found that the sleeping-sickness of this region differs from that of Uganda, and is more rapid in its course and more fatal, no cases of recovery having been known. It was established that the disease is carried by *Glossina morsitans*, a fly which is distributed over the whole continent, and not confined, like *Glossina palpalis*, which has hitherto been regarded as the sole carrier of the disease, to limited areas. Bruce's work covered a district of Nyassaland, on the eastern shore of the lake, extending 50 miles north and south and 25 miles east and west. The wild animals of this district seemed to be thoroughly infected, and human cases were found not only in Nyassaland, but also in northeastern Rhodesia, Portuguese East Africa, and South Zambesia. Bruce, however, did not believe that the disease would spread, nor that it would ever assume the terrible proportions of the sleeping-sickness of the Congo or Uganda, since it had probably existed in these areas from time immemorial.

SMALL-POX AND VACCINATION. The question as to the duration of immunity following vaccination is a much disputed one, and in the nature of the case, impossible of definite solution. A number of investigations, however, based on the percentage of successful revaccinations threw some light on the matter. Kitasato's results, from the Imperial Institute at Tokyo, were based on a series of 931 revaccinations. He obtained successful revaccinations approximately as follows: After 1 year, 14 per cent.; after 2 years, 33 per cent.; after 3 years, 47 per cent.; after 4 years, 57 per cent.; after 5 years, 61 per cent.; after 6 years, 64 per cent.; after 7 years, 73 per cent.; after 8 years, 80 per cent.; after 9 years, 85 per cent.; after 10 years, 89 per cent. Lescohier, of Detroit, published in 1913, the results of a series of nearly 500 revaccinations. The percentage of "takes" being as follows: After 1 year, 28 per cent.; after 2 years, 33 per cent.; after 3

years, 48 per cent.; after 4 years, 40 per cent.; after 5 years, 50 per cent.; after 6 years, 23 per cent.; after 7 years, 68 per cent.; after 8 years, 80 per cent.; after 9 years, 77 per cent.; after 10 years, 85 per cent. After an interval of ten years the percentage rose steadily until at 17 to 34 years revaccination was practically always successful. King reported also in 1913, some interesting data based on observations made on Asiatics (Shans, Burmese and Chinese). In a group of 380 adults who had been vaccinated when under 15 years of age, 5.6 per cent., and in a group of 94 who had been inoculated above that age, 3.2 per cent. had been attacked by small-pox in later life. In a series of 312 patients who had been inoculated under 15 years, vaccination resulted successfully in 80.3 per cent., and in 22 with a history of having been previously vaccinated after their 15th year, 81.8 per cent. resulted in "takes." In 96 adults, who had suffered from natural small-pox at various ages, and who were freely marked, 75 per cent. were successfully vaccinated. Kitasato estimated that immunity was practically gone after 10 years. Millard states that the government report of the German confederacy shows from 91 per cent. to 93 per cent. of successful revaccinations after 10 years, and concludes that immunity acquired through vaccination begins to disappear from the second year, and by the tenth year it disappears almost completely. Sanitarians are agreed that the present system of vaccination is not sufficiently rigid. The disease has been widely disseminated during the last few years, indicating that the country as a whole is far from being well protected. See VITAL STATISTICS.

SMITH, BENJAMIN ELLI. An American lexicographer, died February 24, 1913. Born in Beirut, Syria, in 1857, where his father was a missionary, he graduated from Amherst College in 1877, and afterwards studied at Leipzig University, and for a time taught in Johns Hopkins University. In 1889 he became managing editor of the *Century Dictionary*, and from 1894 until the time of his death was its editor. He was also editor of the *Century Cyclopædia of Names*, the *Century Atlas*, and the *Century Dictionary Supplement*. He translated several Latin authors, including Cicero, Marcus Aurelius, and Epictetus.

SMITH COLLEGE. An institution for higher education of women, founded at Northampton, Mass., in 1871. The enrollment in all the departments of the college in the autumn of 1913, was 1549. The faculty numbered 128. There were in addition several members of the library staff and secretaries. There were no noteworthy changes in the faculty during the year. The college received pledges for donations amounting to \$1,052,000 in 1913. The productive funds at the end of the collegiate year 1912-13 were \$1,512,475, and the income, \$69,767. The library contains about 48,000 volumes. The president is Marion L. Burton.

SMITHSONIAN INSTITUTION, THE. The activities of the institution under its plan of organization cover practically the entire field of natural and physical sciences, as well as anthropological and archaeological researches. The institution was founded for the increase and diffusion of knowledge. It affords facilities for the advancement of human knowledge through original research and investigation in

every field, and educates the people through the publication of the results of such researches. The extent of the activities of the institution is limited only by the amount of funds available. During recent years its private income has been supplemented on several occasions by friends of the institution, who have provided the means of carrying on certain explorations and lines of research. Some of the projects proposed are such as could not properly be carried on through government appropriations, but which the institution could readily undertake with the means available.

In 1912, there was organized the Research Corporation. This was founded primarily for handling Cottrell patents offered to the institution for the benefit of research. Work of this corporation progressed steadily during 1912-13. The work is chiefly related to investigations into the precipitation of dust, smoke, and chemical fumes, by the use of electrical patents.

During the year the institution continued to carry on field work in various lines throughout the world by means of allotments from its funds. The institution came into the possession of a laboratory for the study of questions relating to aerodynamics, which was closed from the time of the death of its director, the late Dr. S. P. Langley, formerly secretary of the institution. In May, the secretary of the institution was authorized to reopen this laboratory under the name of the Langley Aerodynamical Laboratory. Its functions include the study of problems of aerodynamics, particularly those of aerodynamics, with such research and experimentation as may be necessary to increase the safety and effectiveness of aerial locomotion for the purposes of commerce, national defence, and the welfare of man. This laboratory was organized in 1913.

During the year 1912-13, the director of the institution, Charles D. Walcott, continued his geological work in the Canadian Rockies. Considerable collections of fossils were made in several localities, and at the close of the field season, the collection of several thousands of specimens was shipped to Washington.

A plan has been formulated for a geological survey of Panama, under the joint auspices of the Isthmian Canal Commission, the United States Geological Survey, and the Smithsonian Institution. The general plan of the survey comprises a systematic study of the geology and mineral resources of the Canal Zone, and as much of the adjacent areas of the Isthmian region as is feasible.

Explorations in Borneo were carried on during the year, and many interesting and valuable results were obtained. The Lyman Siberian Expedition, which returned in September, 1912, resulted in securing 350 mammals for the national museum. This collection is one of the most important received in recent years. The expedition also made anthropological studies in Siberia and Mongolia. Studies were also made in Peru.

It is proposed to establish an American School of Archaeology in China, under the auspices of the institution, and preliminary arrangements were undertaken to bring this about in 1913.

During the fiscal year, the institution issued 6260 printed pages, and the aggregated distribution comprised 182,883 copies of pamphlets

and bound volumes. During the year, 12,930 volumes and parts of volumes; chiefly on scientific topics, were added to the Smithsonian deposit in the Library of Congress.

In memory of S. P. Langley, the board of regents of the institution in 1908, established the Langley Medal, "to be awarded for specially meritorious investigations in connection with the science of aerodromics and its application to aviation." The first award of the medal was voted in 1909 to Wilbur and Orville Wright. The second award of the medal was voted, on February 13, 1913, to Glenn H. Curtiss, and to Gustave Eiffel. See also UNITED STATES NATIONAL MUSEUM.

SMOKE ABATEMENT. The New York board of health ordinance prohibiting the discharge of dense smoke from any building, vessel, engine, or motor vehicle in New York City was declared unconstitutional by the court of special session in the summer of 1913, in a case involving the Edison Electric Company, but at the close of the year the decision was reversed by the appellate division of the State Supreme Court. The case was to go to trial to ascertain whether the ordinance was really violated. If the lower court decides in the affirmative the company can carry the case to the Court of Errors and Appeals and obtain a final ruling on the constitutionality of the ordinance. The lower court declared the ordinance unconstitutional because it arbitrarily prohibited the discharge of dense smoke, irrespective of volume or time of discharge. The history of attempts to control the smoke nuisance in New York, with a review of court decisions prior to those just mentioned, is given in *Bull. Dept. of Health, City of New York*, April, 1913. Several New Jersey court decisions during the year seemed to leave in a doubtful state the power of Jersey City to exercise full control over the emission of smoke from locomotives. *Smoke Investigation Bulletins* 3, 4, and 5, of the University of Pittsburgh (1913), deal respectively with the psychological, economic, and meteorological aspects of the smoke nuisance.

SOCIAL CENTRES. See MUNICIPAL GOVERNMENT, under heading so entitled, and also under *Statistics of Social Centres*.

SOCIAL ECONOMICS. Within the past decade a department of economic study under the title of social economics has been differentiated from the traditional problems pursued by the professional economists. The viewpoint of social economics is not new, since it was presented by John Stuart Mill and was an important factor in the rapid development of sociology. In contradistinction to theoretical economics and the orthodox approach to the problems of industrial life, social economics lays stress upon problems of human welfare considered in terms of health and safety, rather than upon the volume of production or the profits of enterprise. It would, therefore, so modify industrial organization as to enlarge the opportunities of unskilled labor, remove every vestige of exploitation, and the industrial causes of poverty, and prevent accidents and sickness due to employment. It gives much attention to the protection of child workers and of women in industry. It seeks the establishment of minimum standards in industry,

these to include minimum wages, maximum hours of employment for children, women, and men, and health and safety standards in all factories and shops. Material coming within the scope of social economics will be found under the following headings: BUREAU OF SOCIAL HYGIENE; CHILD LABOR; LABOR LEGISLATION; MINIMUM WAGE; OCCUPATIONAL DISEASES; OLD-AGE PENSIONS; PROSTITUTION; SOCIOLOGY; WELFARE WORK; WIDOWS' PENSIONS; WOMEN IN INDUSTRY; and WORKMENS' COMPENSATION.

SOCIALISM. THE INTERNATIONAL ORGANIZATION. In the interim from one international Socialist congress to the next, the general affairs of the international movement are managed by a bureau formed of delegates of the 41 Socialist parties of 27 countries and having its permanent seat in Brussels. In December, 1913, however, the bureau held an important special session in London. Its immediate concern was with attempts to harmonize more or less discordant Socialist groups in Great Britain and in Russia, an account of which is given in paragraphs below, dealing particularly with the movement in those countries. The bureau also busied itself in drawing up the programmes for the international congress which was to be held in Vienna in August, 1914: it was decided to discuss at that time problems connected with unemployment, the high cost of living, alcoholism, imperialism, and Socialist tactics in case of war, and to celebrate in a fitting manner the fiftieth anniversary of the establishment of the International Association of Workingmen, by Karl Marx.

SOCIALISTS AND MILITARISM. One of the most striking effects of the Balkan War (see TURKEY

AND THE BALKAN PEOPLES) was the feeling of apprehension and alarm which the conflicting interests of the great powers in the outcome of the struggle provoked and which swept over the whole continent, carrying in its wake all manner of proposals to increase armaments. In Germany bills enacted in June augmented the peace-footing of the army by 19,000 officers and 117,000 men. France replied in August, with an act lengthening the term of compulsory service in the army to three years and thereby increasing her peace strength to 673,000. Austria-Hungary prepared to raise her peace-footing from 464,000 to 600,000. Italy added 25,000 men to her military establishment. Great Britain and Russia materially increased their naval expenditure. Army increases were made in Belgium, and a naval recruitment bill was debated in Spain. Elaborate fortifications were planned for the Netherlands, and even in the peaceful Scandinavian countries militarism found staunch champions. Theoretically, at least, Socialists were opposed to all these measures. Pursuant to an appeal addressed by the international bureau to the Socialist organizations of all European countries, demonstrations on behalf of peace had been held in the capitals and leading cities on November 17, 1912; and on November 24, a great international Socialist congress had been convened in Basle to consider the best means of preventing a general European war. But in practice, even the Socialists were affected by the high tide of national patriotism that engulfed Europe. Of course they talked a good deal about the disadvantages of militarism from the standpoint of labor; they kept up demonstrations and protests; in France they even coöperated with Syndicalists and Anarchists in inciting French soldiers to mutiny. But the undoubted unpopularity of their anti-militaristic propaganda made their leaders fearful of attempting the much-heralded general strike as a cure for militarism. No general strike occurred, and when the military bills came before the various parliaments the Socialist deputies, while openly disclaiming them and unanimously voting against them, as a rule aided in passing the financial measures which made them possible, contenting themselves with the assurance that the new taxes would fall most heavily upon capital. Thus, the 111 Socialist deputies in the Reichstag fought the new German army bill, but did not obstruct it, and then, with unanimity, voted the resources demanded by the government for its enforcement. This somewhat ambiguous attitude of Socialist deputies provoked considerable factional differences within the party not only in Germany, but also in France, Italy, Austria-Hungary, and Russia.

GERMANY. August Bebel (q.v.), the Socialist veteran and for many years the organizer and leader of the large Social Democratic party, died in Switzerland, on August 14, at the age of 72. He was succeeded in the leadership of the party by Herr Friedrich Ebert. The principal acts of the 111 Socialist deputies in the Reichstag were: voting against the new army bill, securing a progressive tax on wealth, supporting Herr Liebknecht's charges of bribery and corruption preferred against the Krupp firm, and participating in the vote of censure against the government on account of the Zabern incident (for these subjects in detail, see *GERMANY, History*). At the twenty-second na-

tional congress of the German Socialists, opened at Jena, on September 14, two questions were uppermost: (1) Should the action of the deputies in the Reichstag with special reference to militarism be endorsed; and (2) Should a general strike be attempted in order to secure electoral reform in Prussia. The opposition to the former on the part of strict Marxians, who would repudiate any suggestion of compromise with militarism, was so slight that a commendatory resolution was carried by a large majority. On the question of the general strike, the division was sharper: the Marxians vigorously supported it; the Reformists declared it would inflict great hardship upon labor unions and would alienate many votes from the party. The result was that the Reformists, with the aid of trade unionists, secured the adoption of a mild resolution stating that the German Socialists, while permitting the preaching of the idea of the general strike as a last resort, condemned the principle of the revolutionary, anarchistic strike and promised to preserve a close alliance between the Socialist party and the trade unions. Membership statistics reported to the Jena congress showed no important gain during the year. Socialism received a distinct set-back in the October elections in the grand-duchy of Baden. The bloc of National Liberals and Progressives deprived the Socialists of several seats in the Diet and some 11,000 electors out of the 36,000, who in 1909 voted the Social Democratic ticket.

FRANCE. The tenth annual congress of the Unified Socialists was held at Brest, March 23-25, 1913. The number of paying members of the party had increased during the year by 5246, bringing the total membership of the eighty-one federations up to 68,903, of whom fully a third belonged to the two departments of the North (Lille) and of the Seine (Paris). It was reported that the party had lost municipal elections in several places, but had won in Toulouse, Limoges, Brest, Roubaix, Draguignan, Commeny, St. Denis, and St. Ouen. The financial statement showed the year's receipts amounting to 161,525 fr. and expenditures of 140,656 fr. The congress adopted a resolution condemning the proposed three years' service in the army, but did little else because its leaders, MM. Jaurès, Guesde, Sembat, and Albert Thomas, were absent in Paris on account of the cabinet crisis.

For some time French workingmen who are inclined toward Socialism have been divided in allegiance between two irreconcilable groups. On one hand are the Unified Socialists, affiliated with international Socialism, a political party seeking to undermine the present social system by parliamentary methods; on the other hand is the General Confederation of Labor (the C. G. T.), the great central organ of French Syndicalism, decrying politics and applauding direct action, sabotage, and violence. The former denounce the latter as impractical and dangerous; the latter accuse the former of being mere self-seekers, who pose as champions of the proletariat. To add to the confusion and the polemics, a third group—that of the revolutionary, anarchistic communists—held a congress on August 14, formed a federation, and proceeded to assail Socialists and Syndicalists as politicians and temporizers. The quarrel between the Syndicalists and the Anarchists was

particularly vituperative. The only common ground which all three groups found was a vigorous campaign against militarism. Mutinies among the soldiery at Toul, Macon, and Rodez were said to have been inspired by revolutionary anarchists. *L'Humanité*, the organ of M. Jaurès and of the Unified Socialists, published a protest of soldiers of the 153rd regiment at Toul against three years' service. In September, the General Confederation of Labor openly urged military sedition and a general strike. Twelve officers of the Syndicalists, including M. Yvetot, were arrested; and the anti-militarist agitation speedily subsided. In the chamber, the Unified Socialist deputies resisted the three-year service bill at every step, and on July 20, a formal protest, signed by all members of the group, was read from the tribune.

GREAT BRITAIN. Two matters especially affected Socialism in Great Britain during 1913. The first, and more spectacular, was the rise of Larkinism. Mr. James Larkin was the organizer and leader of the strike of the Irish Transport Workers' Union, which began in Dublin on August 26 and continued into the winter months (see **STRIKES; GREAT BRITAIN, History**). Mr. Larkin's organization and his methods of sabotage and violence were markedly similar to those of the French Syndicalists. Nevertheless the rough and sometimes brutal treatment accorded the strikers by the Dublin police elicited strong protests not only from the English Syndicalists, headed by Mr. Tom Mann and Mr. Guy Bowman, but also from the Socialist and Labor parties. On October 7 Mr. Larkin was condemned to imprisonment for seven months on a charge of sedition. The Socialists and Syndicalists replied by howling down Liberals at public meetings, until, on November 9, the government released the Irish leader. Mr. Larkin at once opened a "fiery cross" campaign at Manchester for a general strike in England in support of the Dublin strikers. There was rioting at his meeting in London on November 19, but no general disposition of the English workmen to act on his appeals. However, the monument with which his name was commonly associated attracted a considerable following and tended, at least in its more extreme aspects, to approximate Syndicalism rather than Socialism. In this connection it may be stated that the first International Congress of Anarchistic Syndicalists was held in London September 27-October 2, 1913, and was attended by 33 delegates representing 47 organizations with about 125,000 members. Germans preponderated, and only a few unions of France and Great Britain sent delegates. Portugal, Switzerland, Austria-Hungary, and the United States were not represented at all. The congress issued a long declaration of principles, which particularly condemned political action. Resolutions were adopted protesting against the alleged persecution of Syndicalists by the Portuguese government and against the use of force in the Dublin strike. Reports showed that the Syndicalist movement is at a standstill in France; that its strength in the Netherlands is due to the unrepresentative character of the Parliament of that country; that in Italy against the 740,000 workers organized under Socialist auspices only 52,710 belong to purely Syndicalist unions; but that Syndicalism is making headway in the British unions.

The second matter affecting British Socialism was the effort to fuse the three separate societies into a single political movement. For many years there had existed side by side the Socialist party, the Independent Labor party, and the Fabian Society, all aiming to bring the Socialistic state into existence, but each clashing at times with the others. The International Socialist Bureau, which held a session in London in December, gave special attention to plans to unify these three groups. It was believed that its endeavors would be fruitful, for a common national council was formed whose proposals must be accepted and registered by the three parties as those of a national congress.

ITALY. The first general elections under universal manhood suffrage resulted, as was expected, in notable gains for the Socialists. Of 508 deputies in the new Chamber, 78 were Socialists—a gain of 37—and 2 described themselves as Syndicalists. The bulk of the Socialist party's seats represented the industrial proletariat of the prosperous north: each of the large northern cities of Milan, Turin, Florence, and Bologna returned three Socialists. In Rome alone did the party meet a rebuff and defeat. The electoral manifesto of the Italian Socialists bitterly arraigned military and colonial expenditures, but the leaders were soon divided over the question of imperialism as definitely applied to the subjugation of Libya. The majority of the new deputies followed the leadership of Signor Turati, who, like Guesde in France, remained literally loyal to the full Marxian doctrine and promised rigorously to oppose every request of the government for increased armaments or for financial appropriations for Libya. On the other hand, the followers of the reformist, Signor Bissolati, whom the election increased in numbers from 15 to 23, urged more conciliatory tactics, such as would not estrange the patriotically-minded from the Socialist cause. Signor Bissolati went so far as to reaffirm his willingness to cooperate with the Radical government. What with these divergencies within the Socialist party and with the common repugnance of both groups to the Syndicalists, Italian Socialism did not seem destined immediately to important achievement. It is interesting to note that the king appointed three Socialists to the Italian Senate.

NETHERLANDS. Dutch Socialists were able to profit by the confused political situation following the general elections in June. In the preceding Chamber the Socialists had 7 seats; in the new, thanks to agreements with the Liberals on second balloting, they secured 18. The combined Right, reduced to 45, lost its majority, and the ministry of Dr. Heemakkerk, representing bourgeois and clerical interests, was therefore forced to resign. But the Liberals, who themselves had 37 seats, could take office only with the support of the Socialists, to whom, accordingly, they proposed to give three portfolios in a fusion cabinet and to allow full freedom of propaganda. The offer was tempting, and M. Troelstra, the Socialist leader, was disposed to accept it. But Bebel, Kautsky, and other prominent German Socialists at once pointed out that the Amsterdam International Congress of 1904 had strongly condemned the participation of Socialists with other parties in the actual conduct of government, and M. Troelstra was persuaded to con-

sult his followers. At length a national congress of Dutch Socialists assembled at Zwolle, voted by a large majority, composed largely of trade unionists of Amsterdam, against fusion. The immediate acquiescence of M. Troelstra in this verdict prevented the Liberals from forming a ministry, but the Socialist deputies promised to support the extra-parliamentary cabinet of Cort van der Linden if he would adopt a programme of electoral reform and old-age pensions.

DENMARK. A political situation confronted Danish Socialists somewhat similar to that which faced their Dutch comrades. The elections to the Folkething in June brought in 31 Socialists, 31 Radicals, 41 Liberals, and 7 Conservatives, and obliged the Liberal-Conservative ministry of M. Klaus Berntsen to retire. Three times the Radicals offered ministerial fusion to the Socialists, and three times, mindful of the decisions of the International Congresses, especially those of Paris (1900) and Amsterdam (1904), the Socialists declined the offer. At last, however, the Socialist deputies decided, temporarily at least, to support a Radical ministry of M. Zahle. According to an interview published in *Le Peuple* (Brussels), M. Stauning, the Danish Socialist leader, declared that he told the king the Socialists were republicans, but, not possessing a majority, they did not think they had the right to urge the substitution of the republican form of government for the existing form, and that the king replied, "Such a declaration is quite natural."

UNITED STATES. Mr. William D. Haywood, organizer of the Industrial Workers of the World, gave offense to American Socialists by reason of his sympathy with Syndicalism and his utterances in favor of "direct action," and in February was removed from the national executive committee of the Socialist party by a referendum vote of 22,500 to 11,000. The Socialists won the mayoralty election in Two Harbors, Minn., March 18, but lost control of Berkeley, Cal., in April, and of Schenectady, N. Y., in November. Socialists were active in the coal miners' strike in West Virginia (see **STRIKES**), and in protesting in July against the arbitrary action of the municipal government of Seattle. For other American topics affecting Socialism, see **UNITED STATES, History**.

OTHER COUNTRIES. The great general strike which was undertaken in April by the Belgian Socialists in order to obtain electoral reform from the clerical government is discussed in detail under **BELGIUM, History**. In spite of universal suffrage and the comparatively large number of their professed partisans, the Austrian Socialists were apparently unable to make their party's principles felt in the Balkan events. The Hapsburg dominions are divided among so many hostile nationalists that they do not appear to be a very productive field for international Socialism. The Russian Socialists in the new Fourth Duma were torn in 1913 into two rival sects, as are the Russian Socialists outside the Duma. For ten years, despite the growth of the workingmen's movement, the two Russian Socialist groups—the Social Democracy, akin to the Social Democratic party in Germany, and the Revolutionary Socialist party—have fought each other with great virulence. Of the fifteen Socialist deputies in the Duma, eight affiliated with one side and seven with the

other. Not even the anxious appeals of the International Socialist Bureau, meeting at London in December, served to unite them.

SOCIAL SERVICE, AMERICAN INSTITUTE OF. An organization founded in 1898 for the purpose of gathering and disseminating information on all branches of social thought and service. It supplies information, and advises as to method by correspondence. Its publications, lectures, and special reference library are open to the public. The services of the institute are free except when special investigations are required. Through its lecture foundation, the institute has been able to offer to its classes without compensation the services of Rev. James H. Ecob, D.D., as speaker on social subjects. These lectures have been in three series, treating of industrial problems, towns and villages, and the social gospel. The *Gospel of the Kingdom*, published monthly by the institute, took up during 1913 the subjects of Poverty, Wealth, Socialism, Eugenics, The Unfit, Rural Communities, The Mormon Menace, The Coming Church in Society, The Moral Training in the Public Schools, The Unemployed, and Peace. The officers are: President, Dr. Josiah Strong; lecturer, Dr. James H. Ecob; treasurer, John T. Perkins.

SOCIÉTÉ NATIONALE DES BEAUX ARTS. See **PAINTING and SCULPTURE**.

SOCIOLOGICAL CONGRESS, SOUTHERN. This body held its second annual meeting at Atlanta, April 25-29. It was attended by eight hundred delegates. The plan of organization of the meeting included seven special conferences on the following topics: Organized charities; court and prisons; public health; child welfare; traveler's aid; race problems; the church and social service. The four days' conference on race problems was attended by both white and colored delegates and developed a spirit of coöperation and mutual understanding. The convict-lease system, the road chain-gangs, and other features of antiquated penology still found in the South were severely arraigned and plans for improvement discussed. Each of the seven divisions drew up resolutions setting forth new standards and programmes of reform. A committee of representative white men presented a statement setting forth the need of coöperation between health authorities and negro physicians, ministers and teachers, to fight tuberculosis and other contagious diseases; the need of less prejudice and partiality by the courts in their treatment of negroes; the shame of lynchings; and the necessity of better schools for negroes. The congress made a deep impression on Atlanta and the State of Georgia; its influence extended throughout the South; and it was an impressive demonstration of the new social aspirations of the Southern States.

SOCIOLOGICAL SOCIETY, AMERICAN. The eighth annual meeting of this society was held at Minneapolis, Minn., December 27-30. The general subject of the meeting was "Problems of Social Assimilation." The first address was that by Robert A. Woods of the South End House, Boston, on "The neighborhood in social reconstruction." There followed an informal conference with Prof. John M. Gillette, University of North Dakota, as chairman, on "What are the best contributions sociologists can make at the present toward improvement of the conditions of life in the United States, particularly the central portion of the country?" As a phase of this problem was the question whether any kind of sociological instruction should be introduced into the lower grades of our educational system? The address of Prof. Albion W. Small of the University of Chicago, president of the society, was on "A vision of social efficiency." At the same time was the address of President David Kinley of the American Economic Association, on "The renewed extension of government control of economic life." Prof. F. A. McKenzie of Ohio State University presented an address on "The assimilation of the American Indian"; and Prof. H. A. Miller of Olivet College, on "Rising national individualism, with particular reference to the Bohemians." Mr. Albert E. Park of Boston read a paper on "Racial assimilation in secondary groups with particular reference to the negro"; and Prof. William I. Thomas of the University of Chicago, on "The Polish situation: An experiment in assimilation." A round table with Prof. F. R. Clow of the State Normal School, Oshkosh, Wis., as chairman, was held on "The teaching of sociology in the normal school"; and an informal conference with Pres. George E. Vincent of the University of Minnesota, chairman, on "Is it possible for American sociologists to agree upon a constructive programme?" An entire forenoon was devoted to a paper by Albert E. Jenks of the University of Minnesota on "The American policy in the Philippines" and one by Charles R. Henderson of the University of Chicago, on "The relation between China and the United States."

SOCIOLOGY. Material of sociological interest will be found under many headings. Under the article LABOR will be found cross references to numerous articles treating various phases of the labor movement. Likewise the article SOCIAL ECONOMICS contains a list of topics treating social aspects of industrial life. See also POLITICAL ECONOMY; and CARNEGIE INSTITUTION OF WASHINGTON, *Department of Economics and Sociology*.

SOILS. A realization of the fact that the demands of increasing population for food had in recent years outrun increase in production led to great activity in the study of the present and prospective production capacity of the soil. This activity was rapidly becoming world wide, and was evident not only in the older countries which had long been under the necessity of resorting to most intensive methods of culture to maintain their teeming populations, but also in the newer countries which, like the United States, had hitherto been able even by careless methods of farming to draw from vast virgin soil resources not only abundant food for domestic consumption but large amounts for export to less fortunate countries.

SOIL SURVEYS. While many countries were giving more or less attention to the subject, the United States continued to lead the world in the comprehensiveness of its soil survey work. Since the beginning of such work in 1899 the United States Bureau of Soils had up to June 30, 1913, surveyed and mapped 703,235 square miles, or 450,070,400 acres of soil. During the year ended June 30, 1913, the bureau surveyed and mapped 80,640 square miles, or 52,609,600 acres. Of this area 21,210,880 acres in 31 States were covered by detailed surveys (1 inch to the mile) and the remainder (in 4 States) by reconnaissance surveys (4 or 6 miles to the inch). Nineteen States coöperated with the Bureau of Soils in the surveys in 1913. The reconnaissance surveys were restricted mainly to undeveloped areas and to the classification of lands in the forest reserves for which Congress made special provision during the past fiscal year. As a result of the examination of the lands in the forest reserves about 1,000,000 acres were made available for agricultural purposes, while the areas now being examined for classification total about 3,000,000 acres.

SCIENTIFIC INVESTIGATION. The volume of scientific investigation relating to soils during 1913 was large, but opened up few new lines and revealed no startling discoveries. Important additions were made to the knowledge of the organic constituents of the soil. Schreiner and his colleagues in the Bureau of Soils added a number of compounds to those already isolated from the organic matter of the soil, demonstrating the harmful or beneficial effect of many of these compounds on plant growth in water cultures and field experiments. Among the compounds so isolated and studied was salicylic aldehyd, which was found to be toxic to plants and to inhibit bacterial activity in the soil. It appeared to be a common constituent of infertile soils.

Other causes of soil sterility—bacteriological and chemical—were studied. Much additional light was thrown on the nature of soil acidity and its relation to soil fertility. The suggestion was offered by F. V. Coville that a system of farming with acid tolerant crops might be worked out which would make it possible to profitably utilize acid soils without the expense of correcting the acidity by liming or otherwise. Further investigations by H. L. Bolley tended to show that his previous conclusion regarding the cause of infertility in "flax-sick" soils applies equally to "wheat-sick" of the Northwest, viz., that it is due to

disease infection of seed and soil and not to depletion of plant food in the soil.

In general it was shown that while in some cases infertility is due to chemical causes and must be corrected by chemical means, in many other cases it is due to biochemical or bacteriological causes and is corrected by partial sterilization, particularly by means of heat or volatile antiseptics. It seemed quite probable that the practice of heating soils might be profitably extended not only in case of greenhouse soils but within certain limits to outdoor soils. Attention was called during the year to what seemed a gigantic natural demonstration of the advantage of partial sterilization of soils by heat, viz., the rapidity with which the soils of St. Vincent recovered after being devastated by the eruptions of Soufrière in 1902-3. Although the island was covered and vegetation was almost completely destroyed by the volcanic dejects, not only had the natural vegetation largely reappeared but the soils seemed more fertile for cultivated crops than before, a result attributed to partial sterilization and destruction of harmful organisms in the soil. Similar conditions appeared to prevail on certain Alaskan soils covered by dejects from Katmai June 6 and 7, 1912.

LITERATURE. The most important contribution to the literature of soils during the year was probably United States Bureau of Soils Bulletin 96, *Soils of the United States*, which describes the soils encountered in the soil survey of the bureau to January 1, 1912, and also discusses methods of soil classification.

SOLAR PHYSICS. See **ASTRONOMY**.

SOLOMON, SIR RICHARD. A British administrator, died November 10, 1913. Born in Cape Town in 1850, he was educated at the South African College in that city, and at St. Peter's College, Cambridge; in 1879 was called to the bar; was appointed legal adviser to Lord Rosemead on the latter's mission to Mauritius in 1886; held many offices in the government of Cape Colony; and was legal adviser to the Transvaal administration, and to Lord Kitchener in 1901-02. From 1902-07 he was attorney-general of the Transvaal, and was acting lieutenant-governor of that colony in 1905-06. From 1907-10 he was agent-general in London for the Transvaal, and in the latter year was appointed high commissioner for the Union of South Africa. He was created a knight in 1905.

SOMALI COAST. See **FRENCH SOMALI COAST**.

SOPHIE, QUEEN MOTHER OF SWEDEN, died December 30, 1913. She was born in 1836 at Biebrich, the daughter of Duke Wilhelm of Nassau and Princess of Württemberg. On June 6, 1857, she was married to Prince Oscar of Sweden, the third son of King Oscar I. The eldest son, Prince Gustave, died in 1852 and the second son, Charles, who ascended the throne in 1859, died in 1872, without leaving a direct heir. Prince Oscar thereupon became king of Sweden and Norway and Sophie became queen. For the last twenty-five years of her life she was practically an invalid, and took little part in court functions or public affairs. When her health permitted, she devoted herself chiefly to religious interests.

SOUTH AFRICA, UNION OF. A British colony, consisting of four provinces, forming a

legislative union under a governor-general. Pretoria (29,618 inhabitants) is the capital, and Cape Town (29,863) the seat of the legislature.

AREA AND POPULATION. The table below shows area and population (census of May 7, 1911), with the white population, by provinces and annexed territories, as follows:

	Sq. m.	Pop. 1911	Whites
Cape of Good Hope.....	206,860	1,553,630	546,162
Bechuanaland	51,524	99,553	14,917
Transkelan Territories:			
East Griqualand....	7,594	249,088	7,950
Tembuland	4,129	236,086	8,138
Transkel	2,552	188,895	2,189
Pondoland	3,906	234,637	1,383
Walfish Bay	430	637	32
Total Cape Province.....	276,995	2,564,965	582,377
Natal	24,866	974,437	95,994
Zuzuland	10,424	219,608	2,120
Total Natal.....	35,290	1,194,043	98,114
Transvaal	110,426	1,686,212	420,562
Orange Free State... ..	50,389	528,174	175,189
Total Union.....	473,100	5,973,394	1,276,242

Total number of natives, 4,019,006; other colored, 878,146. European birth and death rates: Cape Province, 30.711 and 10.834 per 1000 (colored, 33.000 and 21.349); Transvaal, 36.78 and 11.92; Orange Free State, 29 and 8. See articles on the separate provinces.

See also **CAPE OF GOOD HOPE PROVINCE**.

MINING. The extensive mineral deposits constitute the chief source of the country's wealth. In the output of gold and diamonds the union leads the world. Other important products are coal, copper, and tin, asbestos, graphite, manganese, zinc, lime, salt, etc. Experts of tin and copper ores, 1911, were valued at £411,871 (Transvaal, £410,848; Cape, £1023) and £552,145 (Transvaal, £48,237; Cape, £503,908) respectively. Value of total export of tin ore to end of 1911, £1,123,262; of copper ore, £279,750. Value of other base minerals produced in 1911, £246,073. Value of total mineral output and number of white and colored laborers employed (1911) are shown below:

	Laborers		Output £
	White	Col'd	
Transvaal	32,245	227,852	38,892,509
Cape Provinces.....	4,395	26,198	6,152,554
Orange Free State....	1,341	13,652	1,829,159
Natal	580	11,677	805,072
Total Union.....	38,561	279,379	47,679,294

Gold. In June, 1912, there were employed in the gold mines 25,165 white and 210,604 colored laborers—25,129 and 210,362 in the Transvaal, 9 and 20 in the Cape province. 5 and 10 in the Orange Free State, 22 and 212 in Natal. The total output for 1911 was £35,049,041 (world's output for the year, £97,250,000), of which the Transvaal furnished £35,041,485 (8,249,461 fine ounces). The Witwatersrand mines contributed £33,599,689 to the Transvaal output. The estimated value of the Transvaal output for 1912 was £38,757,560.

Diamonds. The laborers employed in the diamond mines numbered in June, 1912, 4617 white and 41,442 colored (878 and 15,475 in the Transvaal, 2647 and 15,603 in the Cape

province, 1092 and 10,364 in the Orange Free State), besides several thousand individual diggers. In the table below is given the output in carats, with value in pounds sterling, for two years:

	Carats		£	
	1910	1911	1910	1911
Transvaal...	2,090,068	1,843,341	1,416,464	1,628,876
Cape.....	2,586,294	2,250,506	5,267,659	5,506,412
O. F. S.....	780,195	798,152	1,505,074	1,611,436
Total.....	5,456,557	4,891,999	8,189,197	8,746,724

Coal. Employed in the coal mines in June, 1912, were 1223 white and 22,863 colored laborers (Transvaal, 530 and 9826; Cape, 83 and 1070; Orange Free State, 121 and 1749; Natal, 489 and 10,218). Steamers calling at Durban take much of Natal's supply of coal and most of the remainder is exported. The output from the other provinces is consumed by the railways, mines, and other local industries. Below are given production figures for the year 1911, the value, and the pit's mouth value of the total output to end of 1911 (in Natal, from 1903 only):

	1911	Total
	Tons	£
Transvaal	4,343,680	1,020,539
Cape	89,023	51,550
Orange Free State	482,690	137,616
Natal	2,679,551	725,448
Total Union.....	7,594,944	1,935,153

CROWN LANDS AND FORESTS. The land settlement act passed in 1912 provides for government purchase and sale of lands to bona fide settlers on easy terms, and for the advance of funds for the purchase of necessary implements, stock, etc. The government controls for such distribution about 10,196,306 morgen in the Transvaal, 10,690,611 in the Cape province, 52,880 in the Orange Free State, and in Natal and Zululand, 403,825 acres surveyed and 1,688,580 acres unsurveyed. The government forest reserves aggregate approximately 1,843,036 acres. The total revenue from crown forests in 1911 was £90,874; expenditure, £112,815.

COMMERCE. Trade figures beginning with 1910 are for the Union as a whole, not for the separate elements. The imports into the Union in 1910 and 1911 were valued at £36,727,367 and £36,925,384 respectively, exclusive of specie, which amounted to £2,165,430 in 1910 and £1,097,698 in 1911. There is a slight discrepancy between these figures and the totals generally quoted as official—£38,940,694 in 1910, and £38,035,495 in 1911—due to the inclusion of specie imported from Rhodesia, amounting to £47,897 in 1910 and £12,413 in 1911. Included with the foregoing totals for merchandise are imports of government stores—£2,720,189 in 1910 and £1,979,937 in 1911. Imports of mining machinery: £1,279,403 in 1910 and £947,283 in 1911; of manufacturing machinery, £306,775 and £262,814; of electrical machinery, £803,168 and £528,395; of agricultural machinery, £148,964 and £196,417; of printing machinery, £44,430 and £58,485.

Exports for 1910, £53,939,112, including gold and silver, £81,742; diamonds, £8,480,875;

wool, £3,830,830; ostrich feathers, £2,272,846; etc. For 1911: £57,308,214.

Imports for 1912, £38,833,960, including cottons, £3,209,000; apparel, £2,847,000; machinery, £1,757,000; novelties, £1,420,000; leather goods, £1,267,000; iron wares, £1,231,000; iron, £1,145,000; iron wire, £1,027,000; chemical products, £1,003,000; etc. Exports, 1912, £62,970,219, including gold, £38,362,000; diamonds, £9,153,000; wool, £4,781,000; ostrich plumes, £2,610,000; hides, £1,691,000; coal, £1,174,000; mohair, £967,000; corn, £453,000; copper, £449,000; etc.

Tonnage entered in 1910, 11,494,855; in 1911, 12,552,708.

COMMUNICATIONS. The South African railways include the late Central South African Railways and the Cape and Natal government lines; the mileage of 3 ft. 6 in. gauge, 2 ft. 0 in. gauge, and the total, are given below:

	3 ft. 6 in.	2 ft. 0 in.	Total
Cape	3,159	238½	3,397½
Orange Free State.....	1,076½	1,076½
Transvaal	1,993½	26½	2,020½
Natal	875½	176½	1,052½
Total	7,104½	441½	7,546½

Privately owned lines in operation aggregated 545 miles. Miles of telegraph lines open, 14,920; of wires, 55,934; telephone mileage, 47,852.

FINANCE AND GOVERNMENT. Revenue and expenditure for 1910-11 are placed at £14,448,150 and £15,075,627, including on both sides £1,477,000 for repayment of debt specially appropriated out of balances at date of union; for 1911-12, at £17,284,848 and £16,603,693. The public debt totaled, March 31, 1912, £117,260,535 (exclusive of Swaziland loan of £100,000).

The governor-general (1913, Viscount Gladstone of Lanark) is aided by an executive council as follows: Gen. L. Botha, premier and minister for native affairs; Gen. J. C. Smuts, finance and defense; Capt. H. Burton, railways and ports; N. J. de Wet, justice; H. C. van Heerden, agriculture; F. S. Malan, instruction; A. Fischer, interior; Sir Thomas Watt, public works, etc.; H. S. Theron, public lands; J. A. C. Graaff, without portfolio.

HISTORY

THE BOTHA-HERTZOG CONTROVERSY. The conflict between imperialism and local patriotism was responsible for a new and significant development in South African politics: The partial disruption of the South African party and the alignment of Dutch South Africans on both sides of a political issue, rather than on one side of a racial conflict. In the 1912 YEAR BOOK the ministerial crisis of December, 1912, was noted. Imperialism then triumphed in the dismissal of General Hertzog from the ministry and the reconstitution of General Botha's cabinet. The prime minister vigorously condemned General Hertzog's statement that he "believed in imperialism only in so far as it benefited South Africa"; "General Hertzog," the premier declared, "has gratuitously and unnecessarily put the question whether the interests of South Africa should take preference over those of the British Empire. This ques-

tion should not have been put. . . . Under our free constitution within the empire the South African nation can fully develop its local patriotism and national instincts." The controversy was continued throughout the session and stultified the legislative activity of Parliament. The government bill for the establishment of a national university was shipwrecked on the rocks of racial antipathy. Upon the question of increasing the present contribution to the imperial navy—£85,000 per annum—the ministry seemed undecided, even after two of its members had conferred with the imperial government in London. The Unionist Opposition, led by Sir Thomas Smartt, as well as a small group of Laborites, were thoroughly dissatisfied with the government, which, they asserted, had been paralyzed by party dissensions; and both Unionists and Laborites joined with General Hertzog's dissidents in upholding a motion of no confidence; the motion was defeated, however, by 68 to 42. This parliamentary victory for the ministry was subsequently confirmed by the Congress of the South African party at Cape Town on November 20, when General Botha was supported by 131 delegates. The minority faction of 90 delegates, led by General Hertzog, "bolted" the congress. To all intents and purposes General Hertzog had formed a new party; whether he would formally organize it or not remained yet to be seen.

THE INDIAN IMMIGRANTS' STRIKE. The weighing of South African interests over against imperial interests became painfully apparent in the latter part of the year, when the protests of Indian (Hindu) immigrants in Natal against racial discrimination aroused a lively sympathy in India and caused the Indian government no little anxiety. The issue then became clear: Would South Africa deal with the Indians in its own way regardless of the disquietude of the Indian government, or would it place the empire before the union? As a result of the discontent of the Hindus a large proportion of the 140,000 Asiatics in South Africa went on strike. In Ladysmith 1000 Indian strikers fought the police and gathered around one of their temples, armed with sticks, iron standards, and sugar-cane cutters; they were dispersed by the combined police and militia. Meanwhile Lord Hardinge, viceroy of India, was bringing pressure to bear on the South African government, hoping to obtain favorable terms for the Indians. General Botha, however, could not venture in the face of South African public opinion to yield to imperial considerations. As a convenient way out of the difficulty he appointed a commission—Sir William Solomon, Mr. Ewald Esselen, and Mr. James Wylie—to investigate the grievances of the Indians. See also **STRIKES**, under the section *South Africa*.

THE RAND STRIKE As an industrial dispute, the strike of the miners in the Rand district has been treated in the article on **STRIKES**; but the struggle, which lasted from June 13 to July 5 and culminated in the Johannesburg riot, when an unruly crowd was fired upon and dispersed, leaving 22 persons killed and over 200 wounded, was not without political significance. On the one hand, by proclaiming martial law and allowing strikers to be shot down in the streets, the government had incurred the enmity of the workmen. Even the

government in London was somewhat embarrassed by Laborite disapproval of General Botha's policy. The Labor movement in South Africa, strengthened by the strike, was more formidable than ever before, and was not likely to rest content with the government's promises to appoint commissions of inquiry to consider the railwaymen's demands for an 8-hour day with a minimum daily wage of 8 s. for white adults, and to investigate general industrial conditions. On the other hand, employers and the upper classes generally concurred in the sentiments expressed by the two judges who investigated the strike. The government, according to this view, was not only justified in the use of the military, but should have taken action sooner.

SOUTHARD, PROF. ELMER E., M. D. See **INSANITY**.

SOUTH AMERICA. See various South American countries, and also **EXPLORATION, South America**.

SOUTH AUSTRALIA. A state of the commonwealth of Australia. Area, 380,070 square miles. Population (census of April 3, 1911), 408,558, exclusive of full-blooded aborigines. Adelaide is the capital, with (1911) 32,981 inhabitants; population of the local government area, 42,294; with suburbs, 189,646. During the year railway lines amounting to 228 miles were opened and those under construction, twelve in number, aggregated 438 miles. Governor in 1913, Admiral Sir Day Hort Bosanquet, succeeded (March, 1914) by Lieut.-Col. Sir Henry Lionel Galway. Premier, A. H. Peake. See **AUSTRALIA**.

The premier, Hon. A. H. Peake, had under consideration a scheme for the construction of a large storage basin at Lake Victoria on the Murray River. In his budget speech Mr. Peake announced that the actual surplus for the year ending June 30, 1913, was £176,416; he estimated the revenue for the year 1913-14 at £4,550,720 (of which £2,280,000 was to be derived from the state railways), and the surplus at £7413.

SOUTH CAROLINA. POPULATION. The population of the State in 1910 was 1,515,400. According to the report of the Bureau of the Census, made in 1913, the population in that year was 1,572,285.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1913	1,975,000	38,512,000	\$37,357,000
	1912	1,915,000	34,278,000	29,136,000
Wheat	1913	79,000	972,000	1,264,000
	1912	79,000	727,000	865,000
Oats	1913	360,000	8,460,000	6,007,000
	1912	324,000	6,968,000	4,698,000
Rye	1913	3,000	32,000	48,000
	1912	3,000	28,000	41,000
Rice	1913	4,900,000	147,000	132,000
	1912	8,000,000	200,000	186,000
Potatoes ...	1913	10,000	800,000	1,040,000
	1912	10,000	900,000	1,008,000
Hay	1913	210,000	244,000	4,563,000
	1912	194,000	223,000	4,014,000
Tobacco	1913	43,800	38,288,000	4,594,000
	1912	35,000	32,500,000	2,670,000
Cotton	1913	2,701,000	c1,330,000	80,621,000
	1912	2,695,000	1,182,000	69,963,000

a Tons. b Pounds. c Bales.

MINERAL PRODUCTION. The State produces phosphate rock and clay products. The phosphate mining industry does not have the same relative importance at the present time as it had in the later years of the last century. Until the discovery of the phosphate beds in Florida in 1899, South Carolina enjoyed practically the monopoly in the production of this mineral, but with the development of the more extensive beds in Florida, the State lost its supremacy. In 1912 131,490 long tons, valued at \$524,760 were produced. South Carolina is one of the two States in which monazite has been produced in commercial quantities; the other and more important producer being North Carolina. In the three years prior to 1912 owing to heavy imports from Brazil, the production in both States had practically ceased. There was some gold mined in the State, but this had shown considerable decrease in recent years. In 1912 it was little less than \$20,000. It was produced chiefly from a single mine. In addition to the substances mentioned, the State produces fuller's earth, lime, mica, mineral waters, sand and gravel, silver, and building stone. The total value of the mineral products in 1912 was \$1,106,989, compared with \$1,803,579 in 1911.

FINANCE The report of the treasurer shows a cash balance on December 31, 1912, of \$766,216. The receipts for the fiscal year 1913 were \$3,582,950. The expenditures were \$3,610,533, leaving a cash balance on January 31 of \$738,634. About one-half of the income is derived from tax on real estate, railroads, and personal property. More than one-half is for educational purposes, State Hospital for the Insane, and pensions. During the year, the State retired \$350,000 of its bonded debt.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions under the control of the State include the South Carolina Industrial School for White Boys at Florence; South Carolina Institute for Deaf, Dumb, and Blind at Cedar Springs; South Carolina Penitentiary at Columbia; and the Hospital for the Insane at Columbia.

EDUCATION. The total enrollment in the public schools of the State in 1913 was 361,161. Of these 167,914 were white, and 193,247 were colored. The average daily attendance of white pupils was 110,148, and of colored, 128,020, or for both races, 238,168. There were 777 male white teachers and 3807 white women teachers. The colored men teachers numbered 773, and the colored women teachers, 2101. The average salary for white male teachers was \$530.28; for white women teachers, \$302.48. For colored teachers, the average yearly salary for male teachers was \$126.87, and for women, \$123.90.

TRANSPORTATION. The miles of single track operated in the State on June 30, 1913, were 3492.58. The railroads having the longest mileage in the State are the Southern Railway, 1122; the Atlantic Coast Line, 886; the Seaboard Air Line, 362; the Charleston and West Carolina Railway Company, 319.

POLITICS AND GOVERNMENT. The legislature met in 1913, but passed no measures of more than local interest or importance. There was no election for State officers during the year, as the term of Governor Blease does not expire until January 12, 1915. The next State election is on November 3, 1914. The legislature

on January 29 reelected Benjamin R. Tillman United States senator. In January, Governor Blease revoked the commissions of notaries public, and State constables and officers in the State, and in May constables were dismissed because of the construction of the Webb liquor law prohibiting the shipment of liquor into prohibition territory. Governor Blease continued the free use of the pardoning power, bringing his record for the three years ending December 31, 1913 (less the ten days of January, 1910, before his inauguration) almost to the 1000 mark in pardons and paroles. One hundred of these were granted the day before Thanksgiving. Sumter completed its first year of government under the "city manager plan." In Orangeburg the recall in city politics, under the commission form of government law, was invoked for the first time, an effort being made to recall Mayor Bryant and Councilman Van Orsdale. Both officials were retained in office by large majorities. After a fierce factional fight for the Democratic nomination for Congress from the first district, John P. Grace, mayor of Charleston, brought charges of wholesale corruption against Richard S. Whaley, who got the nomination in the primary and later was elected without opposition. The charges were taken before a congressional committee on elections and were later thrown out by the committee. Mr. Whaley was elected in a special election called to fill the vacancy caused by the death of George S. Legare. In August seven counties voted for a return to the county dispensary system, thus bringing the total number of counties having dispensaries to 13. The other 31 counties of the State are under prohibition.

STATE GOVERNMENT. Governor, Coleman L. Blease; Lieutenant-Governor, C. A. Smith; Secretary of State, R. M. McCown; Attorney-General, J. F. Lyon; Treasurer, S. T. Carter; Comptroller-General, A. W. Jones; Superintendent of Education, J. E. Swearingen; Adjutant-General, W. W. Moore; Commissioner of Agriculture, E. J. Watson; Commissioner of Insurance, F. H. McMaster—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, Eugene B. Gary; Justices, D. F. Hydrick, R. C. Watts, and Thomas B. Fraser; one vacancy; Clerk, U. R. Brooks—all Democrats.

STATE LEGISLATURE, 1913. Democrats: Senate, 43; House, 124; joint ballot, 167.

The names of senators and representatives to Congress will be found in the article UNITED STATES, section Congress.

SOUTH DAKOTA. POPULATION. The population of the State in 1910 was 583,888. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 643,121.

AGRICULTURE. The area, production, and value of the principal crops in 1912-1913 are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1913	2,640,000	67,320,000	\$37,699,000
	1912	2,495,000	76,347,000	28,248,000
Wheat	1913	3,775,000	33,975,000	24,122,000
	1912	3,675,000	52,185,000	36,008,000
Oats	1913	1,590,000	42,135,000	14,326,000
	1912	1,550,000	52,890,000	13,098,000
Rye	1913	50,000	660,000	330,000
	1912	16,000	312,000	162,000

	Acreage	Prod. Bu.	Value
Potatoes ...1913	60,000	4,680,000	2,948,000
1912	62,000	6,510,000	2,344,000
Hay1913	460,000	a 552,000	3,588,000
1912	460,000	672,000	4,099,000

a Tons.

MINERAL PRODUCTION. The total value of the mineral products of the State in 1912 was \$8,436,240, compared with \$8,047,259 in 1911. The production of gold in the State in 1912 was \$7,891,370, compared with \$7,439,874 in 1911. The output in 1912 was the largest in the history of the State. The greater part was taken from the Homestake mine in Lawrence County. The silver production in 1912, mainly from refining gold bullion, was 206,460 fine ounces, compared with 203,755 in 1911. The gold production of the State in 1913, according to the estimates of the United States Geological Survey, made in December of that year, was \$7,207,000, which is \$691,370 less than the yield of 1912. The silver production fell from 206,260 ounces to 164,800 ounces. A nominal quantity of lead and copper was produced.

FINANCE. The report of the State treasurer for the fiscal year ending June 30, 1913, shows a balance in the treasury at the beginning of the year of \$992,289. The receipts for the fiscal year amounted to \$4,056,117, and the disbursements to \$4,123,271, leaving a balance at the end of the year of \$925,135. The State debt at the end of the fiscal year amounted to \$15,925.

TRANSPORTATION. Railway mileage on January 1, 1912, was 4195. In 1912-13 there was very little additional construction carried on.

EDUCATION. The total enrollment in common schools of the State on June 30, 1912, was 90,389. Of these, 47,318 were male, and 43,071 were female. The total number of teachers employed was 5167, of whom 4322 were women and 845 were men. The average monthly salary of men teachers was \$54.17, and of women teachers \$48.75. The total expenditures for education in the year ending June 30, 1912, was \$2,085,001.

CHARITIES AND CORRECTIONS. The institutions under control of the State Board of Charities and Corrections, with their populations in 1913, are as follows: The Penitentiary, Sioux Falls, 212; State Training School, Plankinton, 113; State Hospital for the Insane, Yankton, 910; State School for Deaf Mutes, Sioux Falls, 237; State School for the Blind, Gary, 28; State School and Home for the Feeble Minded, Redfield, 241; and State Tuberculosis Sanatorium, Custer, 20.

POLITICS AND GOVERNMENT. There was no election for State officers during the year, since the term of Governor Byrne does not expire until January 1, 1915. The next State election is November 3, 1914. The legislature on January 21 elected Thomas Sterling (q.v.) United States senator to succeed Robert J. Gamble, whose term expired in 1912.

LEGISLATION. The legislature met in 1913 and passed several important measures, nearly all relating to conduct of business in the State. Among these was a uniform bulk sales act, and a uniform bill of lading act. A bill providing for a commission to study rural credits was introduced, but failed of action. See LIQUOR REGULATION.

STATE GOVERNMENT. Governor, Frank M.

Byrne; Lieutenant-Governor, E. L. Abell; Secretary of State, Frank Glasner; Treasurer, A. W. Ewart; Superintendent Instruction, C. G. Lawrence; State Land Commissioner, Fred. Hepperle; Attorney-General, Royal C. Johnson; State Auditor, Henry B. Anderson—all Republicans.

JUDICIARY. Supreme Court: Presiding Judge, Charles S. Whiting; Justices, Ellison G. Smith, James H. McCoy, S. C. Polley, and J. H. Gates; Clerk, E. F. Swartz—all Republicans.

STATE LEGISLATURE, 1913. Republicans: Senate, 35; House, 89; joint ballot, 124. Democrats: Senate, 10; House, 11; joint ballot, 21. Republican majority: Senate, 25; House, 78; joint ballot, 103.

The names of senators and representatives to Congress will be found in the article UNITED STATES, section Congress.

SOUTH DAKOTA, UNIVERSITY OF. A State university of higher education, founded at Vermillion in 1882. The enrollment in all departments in the autumn of 1913 was 389. The faculty numbered 45. The most notable event in the history of the university during the year was the election of Dr. R. L. Slagle, president of the Agricultural College at Brookings, as president of the university. There were no notable gifts received during the year. The annual income of the university is about \$135,000, most of which is derived from the State legislature. The library contains about 20,500 volumes.

SOUTHERN NIGERIA. A British west African colony and protectorate, lying about five degrees north of the equator and bordering the gulf of Guinea. It covers an area of 79,880 sq. miles, and had in 1911 a population numbering 7,857,983—Yorubas (the most important), Jejis (or Effons), Benins (or Binis), etc., in the western or Lagos province; Binis, Sobos, Jekris, Igaras, Ibos, Ijaws, Munchis, etc., in the central or Niger province and the eastern or Calabar province. Lagos (town) is the capital with 73,000 inhabitants (population of Lagos district, 102,190). Ibadan has 175,000 (district, 341,875); Abeokuta (capital of Egbaland, a native state), 51,000 (264,723); Oyo, 45,000 (217,583). Above are in Lagos province. In the central province are Warri, Onitsha, Benin City, Asaba, Forcados, Burutu, etc.; in the eastern province, Calabar, Opobo, Degema, Bonny, etc. The country is generally agricultural, but unfit for human habitation. The chief articles of export are palm kernels (176,390 tons valued at £2,574,405 in 1911), palm oil (79,337 tons, £1,696,876), rubber (2,164,285 lbs., £179,355), cacao (9,858,774 lbs., £164,664), cotton lint (2,238,208 lbs., £66,935), mahogany (£55,576), cotton seed (£4577), corn (£3128). Total exports in 1911, £5,354,101 (£5,258,451 in 1910); total imports, £5,234,186 (£5,122,370). Shipping entered and cleared (1911), 1,610,668 (1,601,045 in 1910). Revenue (1911), £1,956,176 (£1,933,235 in 1910); expenditure £1,717,259 (£1,592,282). F. S. James administered the colony and protectorate in 1912, under the governorship of Sir F. J. D. Lugard (A. G. Boyle, under Sir Walter Egerton, in 1911).

RAILWAYS. The railways of northern and southern Nigeria are controlled by the government of the latter colony. The line from Iddo Island (the southern terminus, connected by bridges with the mainland and with Lagos

Island) to Ibadan (123½ miles) was opened March, 1901; it was extended to Jebba (northern Nigeria) (182¾ miles), and thence to Minna (about 25 miles east of Zungeru) (about 145 miles). There it joins the original Baro-Kano line (356 miles).

See also NIGERIA, for an account of the amalgamation of northern and southern Nigeria, under the name "Nigeria."

SOUTHERN SOCIOLOGICAL CONGRESS.

See SOCIOLOGICAL CONGRESS, SOUTHERN.

SOUTHERN STATES EXPOSITION of 1914. See EXPOSITIONS.

SOUTH GEORGIA. A dependency of the Falkland Islands (q.v.).

SOUTH ORKNEY ISLANDS. A dependency of the Falkland Islands (q.v.).

SOUTH POLE. See POLAR EXPLORATION, ANTARCTIC.

SPAIN. A constitutional monarchy of south-eastern Europe, hereditary in the male and female lines of the house of Bourbon-Anjou. It occupies the eastern part of the Iberian Peninsula and is separated from France by the Pyrenees. Madrid is the capital.

AREA AND POPULATION. The total area is 504,547 sq. kilometers, or 194,794 sq. miles. The population, according to the census of December 31, 1910, was 19,943,817, an average density for the kingdom of 40 to the sq. kilometer. The number of marriages in 1912 was 142,897 (141,756 in 1911), births 637,901 (625,172), deaths 426,269 (463,678), emigrants (provisional figures), 240,045 (175,567), immigrants 118,071 (105,055). The communal population (1910) of Madrid was 599,887, Barcelona, 587,411, Valencia 233,348, Seville 158,287, Málaga 136,365, Murcia 125,057, Saragossa 111,704, Carthagena 102,519, Bilbao 93,536, Granada 80,511, Lorca 72,795, Valladolid 71,066, Palma (Balears) 67,544, Cádiz 67,174, Córdoba 66,831, Santander 65,046, Santa Cruz de Tenerife 63,004, Jerez de la Frontera 61,250, Las Palmas 60,338, Alicante 55,300, Gijón 55,088, Oviedo 53,269, Badajoz 35,039.

EDUCATION AND RELIGION. The municipalities bear the main cost of education, which is free but totally inadequate. The clergy still control many schools, though recent legislation provides for inspection and direction of staff and curricula. Illiteracy is widespread. Each province maintains a high school, but the curricula are defective. Special schools are few and ill attended. There are universities in ten cities.

The Roman Catholic is the state religion and until 1910 public exercise of all other creeds was prohibited. In that year limited privileges were tendered to Protestant worship. It is estimated that, exclusive of sums expended on the service of the debt, one-tenth of the total national expenditure goes to the church. As a result of this heavy tax upon public resources and the creeping encroachment of church privileges, has developed the anti-clerical movement that has played so large a part in the history of Spain in recent years. Legislation is under advisement tending to secularization of schools, institution of civil marriage, neutralization of cemeteries, and prevention of the further multiplication of religious orders. There were in the country in 1910, 3007 convents, harboring 41,526 nuns, and 794 monasteries with 12,801 monks.

PRODUCTION. The interior is an elevated tableland, surrounded by mountain ranges. The soil

is fertile, but 60 per cent. of the area is uncultivated. All sub-tropical fruits thrive. Grains are easily grown and the vine flourishes in every province of the kingdom. Sherry, tent wines, malaga, and alicante are Spanish wines in demand for export, and large quantities of ordinary wines are produced for home consumption.

The table of main crops below shows area and production for 1912 and (provisional) for 1913, with quintals (average) produced per hectare in 1912:

	Hectares		Quintals		Qs. per ha.
	1912	1913	1912	1913	
Wheat	3,895,069	3,809,767	29,878,446	29,963,813	7.7
Rye ...	786,905	770,345	4,792,506	6,356,125	6.1
Barley	1,334,800	1,535,568	13,062,280	13,878,230	9.8
Oats ...	517,439	542,797	3,343,551	3,895,579	6.5
Corn ..	465,045	465,000	6,368,002	6,800,000	13.7
Rice ...	38,498	39,000	2,442,260	2,500,000	63.4
Flax ...	1,800	768	8,600	5,875	4.8
Beets ...	43,075	48,100	10,789,738	10,800,000	250.5
Vines* ..	1,259,641	1,258,974	16,464,050	16,376,224	13.1
Sg. cane	7,242	2,732,760

* Yield in hectoliters of must.

Olives, citrous fruits, almonds, pomegranates, dates, etc., are exported. There were in 1911 (December 31) 546,035 horses, 904,725 mules and hinnies, 836,741 donkeys, 2,541,112 cattle, 15,725,882 sheep, 3,369,624 goats, 2,472,416 swine, and 3398 camels.

Iron, copper, and lead deposits exist in profitable quantities; the mines in operation, however, are run with foreign capital under foreign management. The total output for 1909 was valued at 200,555,171 pesetas. Some of the details of the 1910 output follow: 3,600,056 metric tons of coal (value, 54,411,891 pesetas), 3,231,418 of copper (35,054,004), 150,891 argentiferous lead (25,726,588), 216,738 lead (20,259,487), 8,666,795 iron (43,890,055), 156,113 zinc (7,046,461), 22,714 mercury (3,791,867), 211,958 anthracite (3,319,124), 245,518 lignite (2,414,791), 294,184 iron pyrites (1,784,590), 857 silver (992,977).

The value of the fisheries products is estimated at about 60,000,000 pesetas per annum. There are cotton, woolen, paper, cigarette, glass, and cork factories.

COMMERCE AND COMMUNICATIONS. The value of imports for home consumption and exports of domestic produce are shown in the table below in pesetas:

	1908	1911	1912
Imports	981,625,369	993,632,238	1,140,651,000
Exports	896,342,677	961,969,310	1,145,992,000

The principal countries of origin and destination in the 1912 trade (with values in thousands of pesetas) were Great Britain, 200,585 imports and 236,229 exports; France, 182,954 and 257,681; United States, 155,232 and 67,328; Germany, 138,330 and 74,340; Argentina, 39,576 and 71,043; Portugal, 56,858 and 50,579; Belgium, 33,122 and 49,913; British India, 45,248 and 914; Russia, 20,908 and 6666; Italy, 12,688 and 48,752; Switzerland, 21,670 and 12,380; Norway, 18,259 and 3022; Mexico, 12,246 and 18,331; Sweden, 15,563 and 1550; Philippines, 18,393 and 8430; Canaries, 1326 and 13,882; Netherlands, 16,867 and 62,485; Cuba, 3452 and 63,643, etc.

Vessels entered in the 1911 trade, 38,256, of 15,567,553 tons; cleared, 40,179, of 17,236,145. Merchant marine January 1, 1913, 596 steamers, of 761,281 tons net, and 301 sail, of 44,325.

Railways in operation January 1, 1912, 14,805 kilometers. Telegraph lines, 42,935 kms.; wires, 93,495 kms.; stations, 1956 (state 1118); wireless stations, 22 and 66 on board vessels. Post offices, 6041. During the year a government decree was issued authorizing the minister of public works to invite bids for constructing a 75-mile railway from Puertollano to Córdoba, thus shortening the route between Madrid and Seville. It was provided, in case no tenders were received and the final plan of the government was accepted, that the government engineers would draw up specifications for such a line.

FINANCE. The peseta (par value 19.295 cents) is the unit of value. Spain has still a paper currency. Gold is quoted at about 7 to 9 per cent. premium. Revenue and expenditure are given in pesetas below for three years:

	1910	1911	1912
Revenue	1,071,240,342	1,132,847,211	1,165,304,472
Expenditure	1,028,214,361	1,122,632,456	1,142,736,860

The details of the 1913 budget are given in the following table, in thousands of pesetas:

Revenue	1000 ps.	Expenditure	1000 ps.
Direct taxes...	481,465	Public debt....	410,515
Customs	177,300	Pensions	72,200
Sugar tax....	41,000	Civil list	8,750
Alcohol tax...	16,500	Legislature	2,486
Salt tax.....	45,500	Council	808
Transport	28,200	Foreign affairs.	6,115
Stamps	90,000	Justice	19,512
Light tax.....	12,000	Worship	41,017
Other indirect	4,600	War	159,789
Tobacco *	155,000	Marine	70,673

Treasury	28,768	Colonies	1,900
		Morocco †	51,387
Total	1,165,304	Total	1,142,737

* Monopoly. † Campaign.

The public debt stood January 1, 1913, at 9,941,918,985 pesetas.

ARMY. Since the adoption of the law of June 29, 1911, providing for personal obligatory service, there has been considerable improvement in the Spanish army and in 1913 the effective strength of the permanent army, which had been 115,440 in 1912, was increased to 123,000. A decree issued in October, 1913, fixed the effective strength of the contingent called to the colors for the following year at 71,000 men. The contingent of recruits called for service are divided into two groups in which the first serves with the colors theoretically three years, but in practice usually two, while the other receives less than one year's training. In 1913 the second line, or portion of the army numbered about 260,000, the reserve 290,000 and the territorial reserve about 500,000.

NAVY. The number of warships built and building in October, 1913, was as follows: One second-class battleship (9890 tons), 3 first-class protected cruisers (25,133), 1 second-class

(5871) and 2 third-class (4083), 4 torpedo-boat destroyers (1845), 1 torpedo boat (127) of the first and 4 (284) of the second class, 8 first-class gunboats (6925) and 8 second- and third-class (3202)—all built.

The act of January 7, 1908, provides for 3 battleships—the *España*, launched February 5, 1912; the *Alfonso III.*, launched May 8, 1913; the third begun October 2, 1911—building at Ferrol. The *España* completed her trials September, 1913; she has a displacement of 15,460 tons and carries eight 12-inch and twenty 4-inch guns. Also building are 4 gunboats, of 800 tons, and 3 destroyers, of 370—all at Cartagena; and 24 torpedo boats for coastal service.

GOVERNMENT. The constitution of June 30, 1876, vests the executive power in a sovereign, acting through a responsible council of ministers. The legislative authority rests, conjointly with the king, in the Cortes, composed of a senate (180 life members—princes of the blood, nobles, magnates, and functionaries—and 180 members indirectly elected for five years) and a chamber of deputies (404 members elected for five years by the electoral colleges).

The reigning king, Alfonso III., was born May 17, 1886, after his father's death. Until he was sixteen years old (the age at which a Spanish sovereign attains his majority) his mother reigned as queen-regent. He married May 31, 1906, Princess Victoria Eugenie of Battenberg, and has three sons and two daughters. Heir-apparent, Prince Alfonso, born May 10, 1907.

The ministry formed by Señor Dato, upon the final resignation of Count Romanones, October 27, 1913, was as follows: E. Dato, premier; Marques del Vadillo, justice; Marquis del Lema, foreign affairs; Lieutenant-Colonel (Conde) del Serrallo, war; Vice-Admiral A. Miranda, marine; Conde de Bugallal, finance; J. Sánchez Guerra, interior; F. Bergamín, instruction; J. Ugarte, agriculture, etc.

HISTORY

THE LIBERAL MINISTRY. Count Alvarado de Romanones, who succeeded the assassinated Liberal premier, M. Canalejas, in November, 1912, re-arranged his cabinet on December 31, 1912, as follows: Interior, S. Alba; foreign affairs, J. Navarro Reverter; finance, S. Suarez Vucian. For the moment, Count Romanones proposed merely to secure the ratification of the Franco-Spanish Treaty (see 1912 YEAR BOOK, FRANCE, History) and the approval of the budget. These secured, he proceeded, on January 31, to elaborate a programme including educational and tax reform, the negotiation of new trade treaties, the augmentation of the army and navy, the development of Morocco, and the creation of a department of labor to investigate industrial disputes, to supervise the conduct of means of communication, and to encourage workmen to make collective agreements with their employers.

Against Count Romanones the Conservatives waged an extremely bitter campaign, and early in January Señor Maura, followed by 92 Conservative senators and deputies, withdrew from the Cortes. In justification for this unusual procedure, Señor Maura said, "I consider the alliance of the Liberals with the Republicans and Socialists to be most dangerous for the monarchy. . . . Revolutionary propaganda is carried on with impunity and assassination is

recognized as a legal means of resistance against the prerogatives of the crown." The monarch, however, took no warning from the Conservatives; on the contrary, he openly signified his approval of Count Romanones' ministry, and on January 14 invited S. Azcarate, the head of the Republican-Socialist Union, to confer with him at the palace. Finding their withdrawal of no avail, the Conservatives resumed their seats in the Cortes and S. Maura recalled his resignation from the leadership of the party. This humiliation of the Conservatives was hailed with joy by the other parties.

THE ATTEMPTED ASSASSINATION. On April 18, as the king was returning from a military review in Madrid, he was assaulted by a Catalan anarchist, Sanchez Alegre. Alegre ran into the street near the Bank of Spain, seized the bridle of the king's horse, and drew a pistol. Alfonso, ready of wit, dismounted with more haste than grace, and stood sheltered behind his mount while the would-be assassin discharged three useless bullets. The police arrived in time to arrest Alegre, the king saluted the crowd, smiled at the incident, and rode on. The crowd, proud of their ruler's coolness, sent up ringing cheers for Spain and the king.

CABINET CRISIS. The Cortes assembled on May 26. Only three days had elapsed when S. Maura delivered a virulent attack on the ministry, concluding with the words, "the present policy of the Liberals has become an infectious Styx, which must at once be dammed by all anti-revolutionists." Shaken by this attack, Count Romanones resigned on May 31. Alfonso refused to accept the resignation, however, and firmly upheld the Liberal ministry. Confident of royal support, Count Romanones resolutely prepared to put through the Senate the regional decentralization (*Mancomunidades*) bill, which had already passed the Chamber, and which has been amply discussed in the 1912 YEAR BOOK. In spite of the rebellious attitude of the Senate Liberals, the premier pressed his bill and secured the approval of article I. by a vote of 111 to 97. The Liberals in the Senate, headed by Señors Montero Rios and Garcia Prieto, passed from disapproval to open insubordination and twice occasioned cabinet crises—on June 1 and 11—but each time King Alfonso upheld his premier. Further action on the decentralization bill was plainly out of the question, and on June 16 the session was suspended for four months. Attempts to restore the lost integrity of the Liberal party proved futile. In October 125 senators and deputies applauded Garcia Prieto's anti-ministerial remarks. Rather than allow Count Romanones longer to remain in office, the dissident Liberals were ready to overturn the Liberal ministry, even at the risk of helping the Conservatives into office. This indeed was exactly what took place on October 25, after the reopening of the Cortes, when the Senate defeated a vote of confidence by 106 negative to 100 affirmative voices. Count Romanones at once resigned, and this time his resignation was accepted.

THE CONSERVATIVE CABINET. Turning to the Conservatives, the king would naturally have selected Señor Maura, the leader of the party. But Señor Maura, after an interview with Alfonso, abruptly betook himself to an unknown destination, leaving the capital in surprise. Apparently he had refused to form a government,

whether because he foresaw trouble with the Liberal-minded monarch, or because he realized that the Conservative party was fast dividing into a reactionary irreconcilable wing led by S. La Cierva and a Liberalizing wing led by S. Azcarra and S. Dato, or because, realizing his unpopularity he feared for his life,—it is difficult to decide. In his stead, Señor Eduardo Dato undertook to carry on the government with a cabinet constituted as given above (see *Government*). Some uncertainty was felt as regards the religious policy of the new government. Count Romanones had, it is important to note, reestablished relations with the Vatican and appointed an ambassador to the Papal court. The anti-clerical programme of associations laws, lay education, civil marriage, and neutralization of cemeteries had not been expressly abandoned. It was not yet certain, although it appeared highly probable, that the present government, composed of loyal Catholics, would adopt an opposite policy.

RAPPROCHEMENT WITH FRANCE. After the ratification by the French and Spanish legislatures of the Franco-Spanish Treaty relative to Morocco (see 1912 YEAR BOOK, FRANCE, *History*), the relations between France and Spain exhibited remarkable cordiality. In the words of an official *communiqué* issued after M. Poincaré's visit to Madrid in October, "The conferences which took place between Count de Romanones, M. Lopez Munoz, and M. Pichon, and which touched on all the political, economic, and commercial questions interesting France and Spain, have made possible a perfect agreement of views between the representatives of the two countries. Their policy in Africa and in Europe will be developed in accordance with the principles laid down in the accords of 1904, 1907, and 1912, and will be inspired more and more by the sentiments of harmony and cordial friendship which respond to the interests as well as to the aspirations and the needs of both nations. These principles will find their very natural application in the general policies of the governments of Paris and Madrid, as well as in the special questions which attach to the work which they are accomplishing in Morocco." See also MOROCCO, *History*.

SPANISH LITERATURE. Many of the old favorites continued during 1913 to delight their audiences; some of the more recent writers strengthened their reputations; and a few new names claimed attention. According to official statistics, Spanish literature was slightly more prolific in 1913 than it had been in 1912, the exact figures being 920 works for 1912, and 973 for 1913. Under the term literature, the statisticians include literary criticism, classic and modern literature, novels, poetry, and dramatic works.

LITERARY CRITICISM suffered by the deaths, in 1910, 1911, and 1912, of such men as Julián Apraiz, Clemente Cortejón, and Menéndez Pelayo, critics in different, although neighboring, fields; and the year 1913 itself brought several other losses, which will be mentioned later, in the same branch of literature. The production of critical editions of classical texts, however, was in fairly good number. Fitzmaurice-Kelly has given us not only *The Oxford Book of Spanish Verse*, and a new *Life of Cervantes*, based entirely on the known authentic Cervantes documents, but a revised and enlarged French ver-

sion (the French by himself) of his excellent little *History of Spanish Literature*, and also a revised *Bibliographie de l'Histoire de la Littérature espagnole*, published separately. Urban Cronan published in the *Sociedad de Bibliófilos Madrileños* the first volume of his *Teatro Español del Siglo XVI.*, containing eleven plays. In the *Clásicos Castellanos* there appeared the following works of scientific popularization: Guillén de Castro, *Las Mocedades del Cid* (by Said Armesto); Arcipreste de Hita, *Libro de Buen Amor* (by Cejador y Frauca); Marqués de Santillana, *Canciones y decires* (by García de Diego); *Celestina* (by Cejador y Frauca); Villegas, *Eróticas ó amatorias* (by Narciso Alonso Cortés); *Poema de Mio Cid* (by Menéndez Pidal).

After the death of Cortejón, one of his favorite pupils, Juan Givanel Más was entrusted to carry on his excellent critical edition of *Don Quixote*; and the final volume of the text appeared this year. Its vocabulary is said to be in press. Francisco Rodríguez Marín has also completed his editions of *Don Quixote*, and of Suárez de Figueroa's *El Pasajero*. Although printed in one of the 1911 volumes of the *Revue Hispanique*, Miss Alice H. Bushee's edition of Mateo Alemán's *Sucesos* did not appear until 1913. John D. and Leora A. Fitz-Gerald published in the *Romanische Forschungen* a critical annotated edition of Lope de Vega's *Novelas*.

FICTION. Novel writing has continued to flourish, although there have been no markedly new tendencies. Spain's best novelists still think it wise to be thoroughly and independently Spanish, and it is to be hoped that they will long continue of that opinion. Pío Baroja presented to the public two volumes of *Memorias de un hombre de acción*, and a third novel entitled *Camino de perfección* (*Passión mística*). Among other works that deserve attention are Manuel Machado's *El Amor y la Muerte*; Azorín's *La voluntad*; Pardo Bazán's *Cuentos trágicos*; several novels reprinted by Ricardo León, who was recently elected to the Spanish Royal Academy, among them *Los Centauros* and *El Amor de los Amores*; Felipe Trigo's *La Bruta*, *Los Abismos*, and *En la Carrera*; and Dicenta's *Encarnación*. Arturo Reyes, the author of *La goletera*, *De mis parrales*, *Romances andaluces*, *Cielo azil*, etc., died in June.

POETRY flourished even better than fiction. In the early summer there were Floral games (*Juegos Florales*) at Leon. Each year the king awards, on recommendation of the Royal Spanish Academy, the Fastenrath prize "for the best literary work in Spain during the year." In 1913 it was awarded to the editor of the *Ilustración Española y Americana*, R. Blanco Belmonte (already favorably known as the author of such works as *Aves sin nido*, *La Vida humilde*, *Los que miran mas allá*, and *La Patria de mis sueños*) for his volume of poems *Al sembrar los trigos*. Juan Menéndez Pidal, after a silence of twenty years since the appearance of his *Don Nuño de Roncaliegos*, *El Conde de Muñazán*, *Alalá*, and other works, reappeared with a volume of *Poesías* that are heartily applauded. Manuel Machado published *Poesías escogidas*, which have been highly praised. He is even spoken of as a modern Spanish Villon. A poet of the younger generation who had a cordial welcome was the humble day-laborer of Extremadura, Juan Luis Cordero, who gave to the public

Mi patria y mi dama. Another of the younger men is the poet, also a writer of prose, Gabriel García Maroto, whose book of verse *La caravana pasa* was hailed as promising still more brilliant things for the future.

DRAMA. The drama was the most prolific genre of the year. Early in the season the celebrated actors María Guerrero and her husband Fernando Díaz de Mendoza brought out *Veletas*, a very creditable work by a young playwright, Eusebio Gorbea, and the brilliant modern play (with a distinctly unusual ending), *Sobrevivirse*, by Joaquín Dicenta. In December Dicenta offered the public *El Lobo*, a keen, psychological study with intense dramatic power. Galdós received an ovation on the occasion of the first performance of his *Celia en los infiernos*. María Guerrero and her company staged brilliantly three plays by the poet Eduardo Marquina. The acting was enthusiastically applauded. The same can not be said of the plays: *Cuando florecen los rosales* (fairly well received), *Por los pecados del Rey* (which as a drama is not very strong, but is a brilliant study of the characters of the time of Philip IV.), and *El Retablo de Agrellano* (a fantastic religious drama, so utterly fantastic that the audience could not understand the author's purpose). A really great success was won by Jacinto Benavente with his *La Malquerida*. A pretty comedy that was warmly received was *Mamá*, by Martínez Sierra. The Álvarez Quintero brothers, Serafín and Joaquín, have again pleased the public with a bright two-act comedy, with an epilogue, *Nena Teruel*, staged and acted as a benefit performance for and by that brilliant actress, Matilda Moreno, who created in 1901 the difficult title-rôle of Galdós's *Electra*. The pathological play was also in evidence, and tuberculosis was seriously treated by Dr. Bernabé Malo de Poveda in his *Amor y Conciencia*. There were also interesting revivals of a *Farsa* of Lucas Fernández, and a *Paso* of Lope de Rueda.

SPEAR, WILLIAM THOMAS. An American jurist, died December 8, 1913. He was born at Warren, Ohio, in 1834; studied law at Harvard; began practice in Warren, O., and continued it there until 1878, in which year he was appointed judge of the Court of Common Appeals, serving until 1888, when he became justice of the Supreme Court of the State. He was five times elected chief justice. His last term expired in December, 1912.

SPRIGG, SIR JOHN GORDON. A former premier of Cape Colony, died February 4, 1913. He was born in Ipswich, England, in 1830. After serving as an apprentice in a shipbuilder's yard, he became one of the shorthand writers in both houses of Parliament. On account of failure of his health he removed to South Africa in 1858 and soon afterwards bought a farm at King William's Town in Cape Colony. For the next ten years he devoted himself to dairy farming and sheep rearing. In 1869 he entered the Cape House of Assembly and there continued until 1904, when he was defeated. He was

again returned in 1907. One of the most conspicuous figures in the political history of Cape Colony, he first achieved distinction by assaults upon the immoral conduct of the Molteno government, and in 1878, after Molteno was dismissed by Sir Bartle Frere, he became prime minister and colonial secretary, serving until 1881. From 1884 he was treasurer, and from 1886 to 1890 prime minister and treasurer. He served again as treasurer from 1893 to 1896, and as prime minister and treasurer from 1896 to 1898. From 1900-04 he was prime minister and treasurer. He was an ardent Imperialist, and at the conference of colonial prime ministers held in London in 1897 made an offer of a battleship in behalf of the Cape Colony. This offer was afterwards changed into a contribution of £50,000 a year.

SPRINGS, MINERAL. See **HYDROTHERAPY**; and **SARATOGA SPRINGS**.

STAFFORD, JOHN ALOYSIUS. An American Roman Catholic priest and educator, died January 21, 1913. Born in 1857, he was educated at St. Vincent's College, Pennsylvania, and at Seton Hall College. For a time he served as assistant in several parishes in New Jersey, and in 1893 was appointed vice-president of Seton Hall College. He served in that capacity until 1899, when he was made pastor of St. Augustine's Church at Union Hill, New Jersey. In 1903 he became president of Seton Hall College. He was made a monsignor by Pope Leo XIII. in the same year. In 1909 he became pastor of St. Patrick's Church, Jersey City.

STANDARD TIME. See **ASTRONOMY** under section so entitled.

STATE BANKS. According to the report of the Comptroller of the Currency there were on June 4, 1913, 14,011 State banks in the United States with total resources of \$4,143,052,000. The principal items of resources were loans and discounts of \$2,746,650,000, bonds and other securities of \$351,496,000, and cash on hand of \$246,341,000. Among the liabilities were included \$483,103,000 of capital stock, \$285,000,000 of surplus and undivided profits, and \$3,081,011,000 of individual deposits. See also the articles on **BANKS AND BANKING**; **FINANCIAL REVIEW**; **LOAN AND TRUST COMPANIES**; and **SAVINGS BANKS**.

STATISTICS. See **VITAL STATISTICS**.

STAUFFER, DAVID MCNEELY. An American engineer, author and soldier, died February 5, 1913. Born in 1845, he entered Franklin and Marshall College, but left to serve in the Civil War, becoming commanding officer of the gunboat *Alexandria*. At the end of the war he studied civil engineering; became division engineer on the Philadelphia and Reading Railway; and in 1870 was made engineer in charge of the construction of the South Street Bridge in Philadelphia. He is said to have been the first American engineer to use a pneumatic process for sinking cast iron columns. In 1874 he became assistant engineer of the Delaware and Boundbrook Railway, and afterwards construction engineer of the Philadelphia water department. In 1879 he built the Dorchester Bay tunnel in Boston. From 1882 to 1896 he was one of the proprietors and the editor of the *Engineering News*.

STEAM ENGINES. The tendency towards high speed engines was emphasized during the year 1913 especially in the United States, and

there were importations from Europe of prime motors employing the Lentz and the Uniflow principles. The first American locomobile was also installed, which developed an indicated horse power on 9.65 pounds of steam and 1.51 pounds of Holwick coal. In Europe units up to 1000 horse power had been constructed and the economies in space and operation were manifest. The locomobile, it will be recalled, is a self-contained boiler and engine making use of superheated steam with a device for reheating the steam on its way from the high pressure to the low pressure cylinder. American manufacturers of steam engines were beginning to take up in earnest the locomobile, which, originating in Germany, had achieved considerable efficiency and success. One of the typical American locomobiles designed for 225 pounds pressure and constructed in sizes from 75 up to 600 horse power inclusive, had an internal corrugated fire box from which, after traversing the tubes, the gases pass through a special casing to the stack. In this casing the gases give up a large amount of their heat to the superheater and some to the reheater just beyond. The engine was described as of the tandem compound, centre crank type, having the bed plate bolted to a substantial saddle spanning the boiler at the crank end and having a sliding fit on a similar saddle at the crosshead end. Both high and low pressure cylinders have piston valves; but the governor, of the centrifugal-inertia type, controls the engine through the high-pressure valve only, the low-pressure valve working at a fixed point of cut-off and having a hand adjustment feature that is valuable under certain working conditions.

An important hoisting engine, which on the score of rope stress and length of cable, was considered to be the largest ever constructed, was contracted for during the year by the Inverness Railway and Coal Company, of Inverness, Cape Breton Island. It was a Nordberg Corliss duplex double-drum hoisting engine, 34 and 34 by 72 inches, designed to work with a 41,000-pound load on a 10,000-foot incline of 16 degrees at the surface and 35 degrees at the bottom. While not the largest hoisting engine as regards size of cylinders ever built, yet for the points above noted, it was considered a remarkable machine.

STEAMSHIPS. See **SHIPBUILDING**.

STEAM TURBINE. The steam turbine during the year 1913 continued as the approved prime mover for large units in central stations, but there was little development in the way of applying the turbine to smaller sizes so that it could compete successfully with reciprocating steam engines and with internal combustion motors. While the small sized steam turbine can be used profitably for various auxiliaries, such as pumps and blowers, its field seems sharply defined for units above a certain capacity, just as reciprocating engines and internal combustion engines remain unchallenged for prime movers of less power. During the year, however, the steam turbine advanced in economy due to the use of highly superheated steam gas with superheating between stages, as first outlined by Dr. Ferranti, where he stated that with oil fuel at full load consumption at .55 pounds of fuel for one short horse-power hour a thermal efficiency of 24 per cent. or better, could be secured. His researches indicated the thermal

possibilities with a highly superheated steam gas, and further experiments involved a construction in which mechanical difficulties were overcome and the high temperature medium could be satisfactorily used. The result was that the use of highly superheated steam gives the steam turbine an economic position not far below that of the Diesel engine.

The steam turbine unit of 25,000 kilowatts capacity, referred to in the 1912 YEAR BOOK, was installed, and it was reported that four 30,000 kilowatt units and one 35,000 kilowatts capacity had been ordered. A departure from previous designs was to be observed in that these machines were all horizontal instead of the vertical type, as used so extensively at the Fisk Street Station of the Commonwealth Edison Company, of Chicago. Such enormous units have rendered necessary changes in the auxiliaries they require, such as condensers and air pumps, as only by due attention to these adjuncts can the increased economy desired be maintained. Thus, for the 25,000 kilowatt turbine the condenser has 39,000,300 square feet of tube surface and will condense 300,000 pounds of steam per hour, and the air pump was replaced with a kinetic air-ejector, the first one to be installed in the United States. This plant has a feed-water heater with a capacity sufficient for 300,000 pounds of water per hour from a temperature of 65 to 130 degrees Fahrenheit.

The use of the turbine in connection with a reciprocating engine working at low pressure with the exhaust steam of the engine continued, and what is known as a mixed pressure turbine, was developed with sufficient flexibility to meet the varying conditions of central station demand and to increase the advantages accruing from the use of the turbine with reciprocating engine units. These mixed pressure turbines may receive steam directly from the boiler or from the engine exhaust, or from the pump exhaust, so that the thermo dynamic range of all steam employed is extended to the lower limits of the turbine.

STEEL. See IRON AND STEEL, and METALLURGY.

STEEL CORPORATION OF THE UNITED STATES. See UNITED STATES STEEL CORPORATION, and WELFARE WORK.

STEFANSSON, VILHJALMR, his explorations. See POLAR EXPLORATION, *Arctic*.

STERLING, THOMAS. United States senator (Republican) from South Dakota. He was born in Fairfield County, O., in 1851. At the age of three years he removed with his parents to McLean County, Ill.; graduated at the Illinois Wesleyan University in 1875; for two years succeeding was superintendent of schools at Bement, Ill.; was admitted to the bar in 1878; and in 1880-81 he was city attorney of Springfield. In 1882 he removed to Spink County, South Dakota. From 1886-88 he was district attorney for this county; he was a member of the constitutional convention of 1889; was elected to the Senate of the State legislature in 1890; was engaged in the practice of law until 1901, when he was appointed dean of the college of law of the State University. He held this position until September, 1911. He was elected to the United States Senate in 1913 to succeed Robert J. Gamble. His term of service expires 1919.

STILLBIRTHS. See VITAL STATISTICS.

STINESS, JOHN HENRY. An American jurist, died September 6, 1913. He was born in Providence, R. I., in 1840, and entered Brown University in 1857. He did not finish his course, but in 1861 entered the Federal army and served throughout the war. The university later conferred upon him the degrees of A. M. and LL. D. He was admitted to the bar in 1865, and engaged in practice at Providence. In 1874-75 he was a member of the State House of Representatives. In the latter year he was appointed an associate justice of the Supreme Court of the State, and served in that position until 1900, when he became chief justice. He resigned from the bench in 1904. From 1897-1907 he was a member of the State Commission of Uniform Legislation, and was chairman of the Rhode Island Commission on the Revision of the Judicial System. He wrote *Two Centuries of Liquor Legislation in Rhode Island* (1882); *History of Lotteries in Rhode Island* (1896); and *Civil Changes in the State* (1897).

STOCK MARKET. See FINANCIAL REVIEW.

STOCK-RAISING AND MEAT PRODUCTION. THE MEAT SUPPLY. The supply of livestock at the five principal cattle markets in the Mississippi Valley consisted approximately of 7,500,000 cattle, 18,500,000 hogs, and 13,000,000 sheep, and represents decreases of about 100,000 cattle, 350,000 hogs, and a gain of 200,000 sheep. (See LEATHER.) The receipts of cattle at Chicago were the smallest for many years. At Kansas City there was a big gain in the number of feeder cattle sold, but this was due to the severe drought in the Southwest. High prices prevailed for cattle early in the year, there being but little spread between feeders and finished steers. Consequently thousands of cattle were finished for market in the corn belt at a loss, for in addition to the high cost of steers and high-priced corn, the price for finished cattle during the last quarter was \$2.00 per hundredweight less than a year ago. The dwindling supply of meat animals *per capita* of population, especially in cattle, has brought about a serious situation.

A movement which is spreading rapidly and promises to encourage the livestock industry in the future is the organization of boys' pig clubs and girls' poultry clubs. Another new departure was the holding of a cattle feeders' day at the Kansas Agricultural College, at which there was an attendance of over 500 cattle feeders and stockyard representatives, and which was so successful that it is to be made an annual event. The number of fowls kept in the United States is annually on the increase and laying contests and judicious selection of breeding stock have increased the number of eggs laid per year. At the Oregon experiment station the entire flock averaged 210 eggs per hen; the five best hens averaged 280 eggs each, and one hen laid 303 eggs. The two best layers were crosses between the White Leghorn and the Barred Plymouth Rock breeds.

TRANSPORTATION AND MARKETING OF LIVESTOCK. A study of the shrinkage of live cattle during shipment to market, made by the Federal Department of Agriculture with 265 shipments comprising over 19,000 cattle, showed the net shrinkage to vary from 15 to 75 pounds per head, or 2.14 to 7 per cent. of the live weight. The shrinkage depended upon

the length of time, condition at time of shipping, treatment during the drive to the loading pens, length of time held without feed and water and nature of the "fill" before loading. The shrinkage was greater during the first 24 hours than for any succeeding period of the same length.

Approximately 24,556 square miles were declared free from the cattle tick and released from quarantine, making a total of 187,204 square miles since the beginning of the work in 1906. The number of cattle shipped from the quarantined area to northern markets was 1,320,579, an increase of 32 per cent. since 1912.

An elaborate statistical study of the cold storage of fresh beef, mutton, pork, dressed poultry, butter, and eggs, covering the period March, 1909-August, 1911, was made by the Department of Agriculture. The average length of time kept in storage varies each year with each commodity, but for 1909, was as follows: The fresh beef received into storage during the year beginning May, 1909, was kept there on an average 2.28 months; mutton, 4.46 months; fresh pork, 0.88 months; butter, 4.43 months. Poultry and eggs were kept on an average 2.42 and 5.91 months respectively. The cost of keeping these products the average length of time was as follows: Beef, .997 cents per pound; mutton, 1.564 cents; pork, .35 cents; poultry, 1.079 cents; butter, 2.532 cents; and eggs, 3.505 cents per dozen. In round numbers, the estimated amounts put into cold storage were 131,000,000 pounds of beef, 20,000,000 pounds of mutton, 176,000,000 pounds of pork, 157,000,000 pounds of butter, and 10,000,000 cases of eggs.

MEAT IMPORTS. Under the tariff which went into effect October 3, 1913, animals imported for breeding purposes were admitted as heretofore free of duty, the duty on live poultry was reduced from 3 cents to 1 cent per pound, and dead poultry from 5 to 2 cents. The duty on other livestock was reduced to 10 per cent. As indicating the immediate effect of the new law, the number of imported cattle inspected by the Bureau of Animal Industry in October and November, was 209,327 head, as compared with 72,420 for the corresponding period of 1912. All came from Canada and Mexico except 447 head of pure-bred cattle, for breeding purposes, imported from Great Britain. The imports were largely for immediate slaughter, and as stockers and feeders. The bulk of the slaughter cattle came from Canada, while Mexico furnished over four-fifths of the stockers and feeders. Imported meats and meat-food products inspected during October amounted to 6,000,735 pounds, and in November to 11,792,576 pounds, making a total of 17,793,311 pounds for the two months. The bulk of this consisted of fresh and refrigerated beef. Of the total meat imported, Canada furnished 8,098,197 pounds; Argentina, 6,209,700 pounds; Australia, 2,725,142 pounds; Uruguay, 559,843 pounds; and other countries much smaller quantities. The imports of fresh beef for a short period before the passage of the tariff act were as follows: 567,205 pounds in June, 642,333 pounds in July, and 824,342 pounds in August.

MEAT INSPECTION. Federal meat inspection was conducted at 510 establishments located in 251 cities and towns, and during the fiscal

year 1913, 56,423,312 animals were slaughtered at establishments under Federal supervision. This represents a decrease of 375,000 cattle and 2,700,000 hogs from the figures of 1912. There was, however, an increase in the number of sheep. The number of condemned animals was 47,000 more than the previous year, most of the increase being due to hog cholera, but tuberculosis continued to be the cause of the largest number of condemnations.

On reinspection a total of 18,851,930 pounds of meat and meat-food products was condemned because of having become sour, putrid, unclean, or otherwise unfit for food. For export 90,653 certificates of inspection were issued covering a total of 977,182,936.

The regulations of the Department of Agriculture to govern the importation of meat under the new tariff act provide for anti-mortem and post-mortem inspection in the countries where slaughtered. It is also subject to inspection in this country.

HORSES. There was a very active trade in draft horses during the year. Many high prices were paid for high-class draft stallions. The work in breeding army horses by the government had been organized in two districts and 34 stallions purchased. A national horse-breeding association was formed to develop a strain of American horses by using selected Arabian stallions for crossing with American stock. There were 13 States which disqualified unsound stallions for public service, and although these laws did much to prevent undesirable animals from breeding, they accomplished less than was expected, owing to unscrupulous stallion owners and weaknesses in the laws. Because dourine had been introduced into the United States through the importation of horses for breeding purposes, greater restrictions were placed upon the entry of pure-bred horses.

LIVESTOCK IN FOREIGN COUNTRIES. The dwindling meat supply of the United States and the loss of foreign markets compelled the American packers to erect packing plants in Argentina which sent to Europe in 1901 only 25,000 quarters of chilled beef. In 1913 shipments increased to about 2,300,000 quarters, thus supplying the deficiency from the United States. Argentina bred in 1913 about 29,000,000 head of cattle, a small number compared with what can be kept there. The official statistics for Canada showed that during the year 1913, a large increase in the number of pigs and small increases in other kinds of livestock had occurred. England and the continent were suffering from a shortage of meat animals, due to the butchering of breeding stock and the increase in population.

In Germany there was a steady decrease in the number of cattle, swine, sheep, and goats since 1907, but a slight increase in other kinds of livestock. In Hungary the latest census returns showed a decrease in all kinds of domestic animals except swine. The number of cattle in Sweden was on the increase since 1865, but since 1895 not so fast as the increase in population. The dairy and poultry industries made remarkable strides in Russia and Siberia for a number of years. In 1913 both butter and eggs were exported from Siberia to the United States. In Australia the government was taking steps to take charge of

slaughtering, freezing, and selling of meat and animal products in order to prevent the control of the business by the meat trust.

WOOL. The number of sheep in Australia fell off to the extent of nearly 10,000,000 head from a year ago, due to a drought and a heavy mortality. The wool clip decreased to 749,997,291 pounds, but in spite of this loss the high price made the value of the clip more than that of 1912. About 69 per cent. of this wool was merino and the rest cross bred. There was also a considerable shrinkage in the American clip, and though trade in wool was quiet for a long time because of the tariff discussion, the shortage became apparent in December and at the close of the year trade in fine raw wool was unusually brisk. The price for fine scoured wools was 12 cents per pound less than in 1912 and represents the full effect of the tariff. Only a small part of the wool put in bond awaiting tariff reduction was of the finer grades.

LITERATURE. Among the more important publications of the year were the following: Will C. Barnes, *Western Grazing Grounds and Forest Ranges* (Chicago); F. T. Barton, *Cattle, Sheep and Pigs* (London); J. T. Craig, *Sheep Farming in North America* (New York); Geo. E. Day, *Productive Swine Husbandry* (Philadelphia); W. S. Dixon, *The Complete Horseman* (London); C. and A. Douglas, *The Shetland Pony* (London and Edinburgh); P. B. Hadley, *Studies on Inheritance in Poultry* (R. I. Experiment Station Bulletin 155, Kingston, R. I.); G. K. Holmes, *Cold Storage Business Features* (U. S. Department of Agriculture, Bureau of Statistics Bulletin 93); *Cold Storage and Prices* (U. S. Department of Agriculture, Bureau of Statistics Bulletin 101); and George Woodward, *The International Poultry Book* (Ballarat, Victoria, Australia).

STOKES, ANSON PHELPS. An American banker and philanthropist, died June 28, 1913. He was born in New York City in 1838 and was educated by tutors and in private schools in New York City. He became a member of the firm of Phelps, Dodge, and Company, merchants, and was later connected with many other important financial companies and institutions in New York City. He was a pioneer in civil service reform, the first president of the Reform Club of New York City, and was at one time the vice-president of the Civil Service Reform Association. He was the author of *Joint-Metallism* (1894-96); *Cruising in the West Indies* (1902); and *Cruising in the Caribbean with a Camera* (1903).

STORAGE BATTERIES. See **ELECTRIC BATTERIES.**

STRAITS SETTLEMENTS. A British Malayan crown colony composed as follows: Singapore, 217 square miles; with its dependencies—the Cocos (or Keeling) Islands, about 20 in number (no definite area given); Christmas Island, about 62 square miles; Labuan, 28½ square miles (total population of Singapore and dependencies, census of 1911, 311,985). Penang, 108 square miles; with province Wellesley, about 280 square miles; and the Dindings, about 183 square miles (total population, 278,003). Malacca, 720 square miles (population, 124,081). Total area, between 1600 and 1650 square miles; total population, 714,069. Chief town of Singapore, Singapore;

of Penang, George Town; Malacca, Malacca. Capital of the colony, Singapore. The ports are free. The trade is chiefly transit, the only articles produced for export in the colony being tapioca, rice, rubber, sugar, and coal (from Labuan; 86,689 tons in 1910). The table below shows trade and finance statistics in Straits Settlements dollars and shipping in tons entered and cleared:

	1909	1910	1911
Imports	313,358,427	364,470,653	398,034,421
Exports	281,183,021	324,189,786	341,889,822
Revenue	8,795,001	9,336,328	11,409,221
Expenditure.....	8,542,731	7,532,242	9,085,389
Shipping	22,192,354	28,429,495	24,086,904

The railways are operated by the government of the Federated Malay States (q.v.). Sir Arthur Henderson Young (appointed 1911) was governor in 1913.

STRIKES. See also **ARBITRATION AND CONCILIATION**. As in the immediately preceding years there was a great amount of labor unrest in all western nations. While there were no strikes as spectacular as that of the British coal miners of 1912, there were a great number of them, and some were marked by unusual bitterness and violence. In all probability the fundamental cause of these disturbances was the rising cost of living. During a period of rising prices wages as a rule rise more slowly than the cost of customary articles of consumption. Moreover, employers do not as a rule advance wages during normal times without considerable pressure from the workers themselves. According to *Bradstreet's*, the strikes of the first eleven months of 1913 involved about 400,000 persons. For an entire preceding year numbers involved were as follows: 1912, 475,000; 1911, 255,000; 1910, 550,000; 1909, 223,000; 1908, 230,000; 1907, 175,000; 1906, 550,000; and 1903, 650,000. Space permits the description of only a few of the more significant strikes of the year.

CALUMET COPPER MINERS. On July 23 about twenty copper mines of the Keweenaw Peninsula, Michigan, were closed by a strike called by the Western Federation of Miners. This was the first serious dispute in fifty years. Nearly 15,000 men were idle, but only a portion of these were members of the federation. Thirty-eight nationalities were represented among them, a very large proportion being Finns. The miners demanded the recognition of the federation, either the complete removal of one-man drills or the placing of two men on each drill, a minimum wage of \$3 for trammers and \$3.50 for miners, and an eight-hour day. These demands, however, were formulated only after the operators had scornfully refused a request for a conference to discuss conditions. Within a few days after the strike began the governor of Michigan sent 2700 militia to the scene. In addition the

companies employed from a detective agency a considerable number of guards, called by the miners, "gun-men." Here, as in West Virginia, these mercenaries, profiting by aggravating disorder, were a chief cause of extremely tense feeling. Their outrages, especially the wanton murder of two innocent persons because an Austrian miner had used a path across company land, led to retaliation and an increasing use of firearms by both sides. The main point at issue was the recognition of the union. The Western Federation, which is the only union among metal miners in this country, was strongly supported by the American Federation of Labor and by other labor organizations. The United Mine Workers sent \$100,000 to support the strike and other bodies made assessments for the same purpose. Prominent labor leaders, such as John Mitchell, John B. Lennon, and T. L. Lewis, went to the scene to give encouragement. The operators and owners, however, resisted every effort at mediation. Governor Ferris offered to arrange a joint conference. This being refused he sent Judge Murphy to work out a plan of settlement. The Copper Country Commercial Club also investigated with a view to an adjustment of differences; but the union refused their advances because the club had condemned the union in advance. The main effort was made by John A. Moffit, sent by Secretary of Labor Wilson. He proposed arbitration of all matters except recognition of the federation. The union accepted but the managers rejected this plan. A similar fate met a like proposal from the president of the Michigan Federation of Labor. Efforts to persuade leading officials of the Calumet and Hecla Company at Boston to meet their miners failed, the officials declaring that the men might return individually but that the union would be resisted to the last degree. On November 28 the managers announced that they would on December 1 introduce the eight-hour shift into all shafts, except those on a contract basis, and would set aside Tuesday afternoon each week for the hearing of grievances. On the afternoon of December 24 a panic occurred at a Christmas celebration in Italian Hall at Calumet, 72 lives being lost following a cry of "Fire." It was thought that this calamity would prepare the way for settlement but resentment seemed to be only intensified. Bad feeling was further aggravated when the stricken miners refused the proffered aid of \$25,000 from citizens. On December 28 President Moyer of the Western Federation was beaten, shot, and forcibly ejected from the strike zone. Though the companies gave the men until January 1 to resume their places it was evident that the strike would continue into 1914.

COLORADO. Of almost equal importance with the miners' strikes at Calumet, Mich., and in West Virginia, was that of the coal miners in southern Colorado. This began on September 23, and continued into the new year. Preceding the strike, representatives of the miners sent a letter to the operators requesting a conference. This and subsequent ones were ignored. Between 75 and 85 per cent. of the miners went out. After a few days of peace, friction, due in large part to outsiders and to the mercenary guards employed by the companies, led to considerable violence. The governor

ordered militia to the scene on October 28. He also endeavored to secure a settlement, but his advances were rejected by the operators. To understand the demands of the miners it is necessary to state certain provisions of the Colorado laws. These prohibit any attempt to prevent the organization of workers; they prohibit payment of wages in script, or anything but lawful money; they require operators to provide check-weighmen to pay wages twice per month, and to operate on an eight-hour-day basis; and they guarantee to employees freedom to trade elsewhere than at company stores. There was much evidence to show that the coal-mining companies had ignored these provisions. Congressman Keeting, who introduced a resolution in Congress for a Federal investigation, said, "For more than ten years the coal companies have owned every official in both Las Animas and Huerfano Counties. Administration of the law has been a farce. As an example: Hundreds of men have been killed in the southern Colorado mines during these ten years, yet no coroner's jury, except in one case, has returned a verdict holding the companies responsible, the blame being placed on the dead miner." The deputy labor commissioner and chief factory inspector of Colorado and numerous others similarly declared that the laws have been violated continually. The miners' demands included the enforcement of the mining laws, particularly those above enumerated, a readjustment of the wage scale, and union contracts. They contended that the individual miner must continue to be helpless unless he can secure the backing of a strong union. On November 26 a conference of operators and strikers led by the governor and Federal Secretary of Labor Wilson, adjourned without reaching an agreement. Just previous to this, numerous editors of the State had met at Denver and proposed a plan of settlement. This was rejected by the miners on the ground that it did not provide for union contracts. On December 1, President White, of the United Mine Workers, the vice-president, and secretary of the same union, a labor editor of Trinidad, and five others were indicted at Pueblo for conspiracy in restraint of trade. The Federal grand jury made a report in December criticizing both operators and miners in very severe terms.

WEST VIRGINIA. The most bitter labor war of the year, and one of the most prolonged in American history, was that centering in the Cabin Creek and Paint Creek collieries of the Kanawha Valley of West Virginia. Bad feeling had been engendered by many years of brutal treatment; open hostilities were begun in the spring of 1912. Company stores and other points of advantage were equipped with machine guns; the mine guards, who had been a chief cause of the bitter hatred of the miners, were increased in numbers; and the miners themselves smuggled in arms and ammunition. In August Governor Glasscock called out the militia; and martial law was in force almost continuously, until the summer of 1913. Great numbers of guns and quantities of ammunition were confiscated from both guards and miners. Nevertheless, so intense was the feeling that excesses by both sides were frequently committed and thirteen men were killed.

The principal demands of the miners were: The recognition of the union; freedom to trade

at other than company stores; payment of wages in cash instead of credit script good at the stores; a weighing system at the mines and payment on the basis of the short ton; a nine-hour day; and better housing. The strikers were supported financially by the United Mine Workers, and by operators in competing fields already unionized. This support alone enabled them to keep up the fight. Temporary settlements were reached in April through the intervention of Governor Hatfield, but agreements were not signed until July. Practically all the strikers' demands were granted. Not only did they win a 12 per cent. increase in pay, through a change from the long to the short ton, but they gained the nine-hour day, semi-monthly pay, the right to employ one of their own number as a check-weighman, and the privilege of trading where they pleased. They also secured the introduction of the check-off system, whereby the union dues are deducted from pay by the company and turned over to union officials.

The money cost of this struggle according to *Coal Age* was as follows: Operators' loss in business, \$2,000,000; cost to State of militia, \$400,000; cost to Kanawha County for civil, police, and the criminal expenses, \$100,000; cost to the United Mine Workers, and paid by union miners of Illinois, Ohio, Indiana, and Pennsylvania, \$802,000; property destroyed, \$20,000. These, with other costs, totaled \$4,612,000.

In May the United States Senate provided for an investigation of the entire situation. A Senate committee of three was authorized to inquire whether or not peonage existed in the coal fields; whether or not the postal facilities had been interfered with or the immigration laws violated; whether citizens had been arrested, tried, and convicted contrary to the laws of the United States; and the causes of the industrial war. It held hearings in June at Charleston, which is only about twenty miles from the disturbed area.

PATERSON. One of the most spectacular and significant strikes of the year was that of the silk workers of Paterson, N. J. Their strike began February 25. About 27,000 employees were out, including broad silk weavers, ribbon workers, and dye-house workers. The weavers struck primarily because of the introduction of the three- and four-loom system. Previously a weaver had tended two looms and made fine silks. They feared that an increased employment of women and children on looms making coarse silks would throw thousands of skilled weavers out of work and lower family standards. Other workers demanded an eight-hour day and minimum wages of \$12 a week. Organizers of the Industrial Workers of the World (I. W. W.) were early on the scene and about 10,000 of the strikers joined that organization. Although the strikers embraced many nationalities, here, as in other similar strikes led by the I. W. W., great solidarity of purpose prevailed. From the beginning most unreasoning hostility to William D. Heywood, Patrick Quinlan, Carlo Tresca, and Elizabeth Flynn, I. W. W. leaders, was manifested. In March, Heywood and Lessig were arrested and sentenced by the local recorder's court to six months in jail for unlawful assemblage. On April 5 they were released by order of Justice Minturn of the Supreme Court, who declared that he could find

no evidence even of any assemblage having been held at the time charged. There were more than one thousand arrests of strikers, including many women; many fines and some jail sentences were imposed; yet by common consent the strike was peaceful, not a single weapon being found on any arrested striker and there being not a single case of assault on a "scab." Nevertheless the leaders were repeatedly arrested on trumped-up charges; personal rights and freedom of the press were interfered with. Alexander Scott, editor of a Socialist paper, was convicted of "hostility to government" and sentenced to one to fifteen years. Strikers were greatly angered by the arrest and conviction of Patrick Quinlan. The jury disagreed in his first trial, but he was found guilty on the second, about March 15, of inciting to riot. Believing a fair trial in Passaic County impossible Justice Minturn on May 22 ordered the drawing of a jury from outside that county to hear other cases against strike leaders. Following the conviction of Scott a petition signed by 29 social workers of New York was sent to President Wilson calling for a Federal investigation of conditions at Paterson. On June 7, in Madison Square Garden, New York City, thousands of strikers participated in a monster demonstration. The strike was concluded in July when nine-tenths of the strikers had returned to work. Their total loss in wages was estimated at \$5,000,000. Early in October Mr. Frederick S. Boyd of New York was convicted of having advocated sabotage at Paterson and was sentenced to one to seven years in the penitentiary and a fine of \$500. The case was appealed. On November 10 Justice Bergen of the Supreme Court set aside the conviction of Heywood, Tresca, and Lessig, who had been sentenced to six months. In November occurred a second outbreak of formidable size among the ribbon weavers; but other branches failed to go out in support and the strike collapsed.

CINCINNATI ICEMEN. During three very hot weeks in July the drivers, helpers, engineers, and firemen of the Cincinnati ice companies were on strike. They demanded higher wages and recognition of a newly-formed union. Efforts of the mayor and others to bring about arbitration failing, they first secured a small supply of ice from a brewery and distributed it by the aid of the street cars and the fire-engine houses. Then somewhat larger amounts were secured by rail shipments; but this supply soon dwindled because outside dealers began to cancel agreements. It was claimed that all these dealers were in a combination known as the Middle States Ice Producers' Exchange, charged by Mayor Hunt with violating the Sherman anti-trust law. In the fall the Federal Department of Justice began an investigation of this combination. The next important step in the strike was the seizure by the city of eight of the largest ice plants under orders of the board of health. The plants were then operated by the city for eleven to thirteen days. Ice was sold at much less than company prices. This unique strike raised the question of arbitration and municipal ownership in new forms.

CINCINNATI TRACTION. On May 9 began a ten-day strike of the 1800 employees on the street railway system of Cincinnati. The men's principal demand was recognition of the union. The company was finally forced to grant this

demand by the determined resistance of the strikers, and more especially by the institution by Mayor Hunt of a suit asking for a receivership for the company. The ground for this suit was that the company having evidently failed to operate its cars according to schedule, had violated its charter and forfeited its rights in the streets of the city. When the union was recognized and an agreement made to arbitrate other differences, this suit was withdrawn. The other demands of the men were: A work day of ten consecutive hours; payment of at least half wages to extra men who spend from four to seven hours a day waiting for runs; and a higher wage scale.

NEEDLE TRADES OF NEW YORK CITY. The memorable strikes of the shirtwaist makers and the cloakmakers in 1910 stimulated unrest in other branches of the ready-made clothing industry. On December 30, 1912, nearly all the unions in the various branches of men's tailoring went on strike. They were followed on January 5 and 6 by the workers on ladies' waists, dresses, kimonos, and wrappers, and on January 9, 10, and 15 by the underwear or white-goods workers. More than 100,000 persons were involved, most of them affiliated with the United Garment Workers of America or the International Ladies' Garment Workers. There was some disorder and during the two-months' strike many fines were imposed on both men and women strikers, and some men were sent to the workhouse.

The men's tailors demanded the following: Abolition of the subcontracting system; abolition of foot power; that no work be given out to be done in tenement houses; time and one-half for overtime and double time for holidays; a 48-hour week; a general increase of 20 per cent. in wages; and the adoption of a wage scale giving \$25, \$22, and \$16 per week respectively to first-, second-, and third-class operators, \$24, \$21, and \$17 per week respectively to first-, second-, and third-class tailors, \$24 and \$18 per week to pressers, and \$12 and \$10 to women and children. From the first there was not much favor among this branch of the strikers for the protocol agreement whereby the 1910 strike of the Cloak, Skirt, and Suit Makers' Union had been settled. (See *ARBITRATION AND CONCILIATION, INDUSTRIAL*.) The New York Clothing Trade Association, representing the strongest section of the employers, declared firmly that it would not recognize any unions and would not agree to the preferential union shop. On February 28 the strike was declared off. Meanwhile about 20,000 strikers had returned to work under individual shop agreements. The remainder of the strikers returned under the following conditions drawn up by Mr. Marcus M. Marks: The question of hours to be submitted to an arbitration committee whose award shall be binding; week-workers in tailor shops to receive an advance of \$1 per week and piece-workers to receive a proportionate advance; no wage reductions in dull seasons; all sub-contracting to be abolished in both contracting and inside shops; sanitary conditions to be maintained; contract shops to maintain same conditions and hours as inside shops.

The shirtwaist-makers had been out in the great strike of 1910 with a union numbering 40,000. But unlike the cloak and suit-makers

they did not secure such an agreement as insured peace. But they were the first to reach a settlement in 1913 and that on the basis of a protocol similar to that secured by their fellow-workers in 1910. This new agreement, known as the "white" protocol, provided for the preferential union shop; for a board of grievances to which disputes are to be taken in the first instance and from which appeal may be made to a board of arbitration; for a joint board of sanitary control, which began by adopting the sanitary standards devised by the like board in the cloak, suit, and skirt trade; for the adoption of a white label as a means of appealing to consumers; for a wage-scale board for the permanent adjustment of wages on the basis of living standards and efficiency; for a maximum week of 50 hours; and for the abolition of sub-contracting. The agreement also fixed a temporary week-wages scale; established a piece-wage committee; and provided that, pending rulings by the wage-scale board, no week-worker not an apprentice should receive less than \$8 per week and no piece-worker less than 30 cents an hour. Most of the distinguished men serving on the boards of the suit and cloak industry consented to serve in like capacity on these new boards. (See *ARBITRATION AND CONCILIATION, INDUSTRIAL*.)

Near the close of February the other two branches of the ladies' wear industry, namely, the kimono and wrapper, and the white-goods or underwear trades reached agreements. The white-goods workers numbered nearly 20,000, fully 95 per cent. women, and of Jewish, American, Italian, and Slavic descent. Investigation showed that seasonal fluctuations were most extreme; less than 10 per cent. were employed throughout the year; of 7123 workers employed in about 120 of the shops, only 20 per cent. were employed in July and August, 75 to 80 per cent. September and October, over 90 per cent. in December, 80 per cent. in January, 90 per cent. again in February and March, and thereafter a gradual drop to 80 per cent. in May and 40 to 60 per cent. in June. With this intermittent unemployment were coupled wages averaging \$5 or less per week for one-third of the employees, and between \$5.50 and \$7 for another one-third. The protocol in this branch provided grievance and arbitration boards but no sanitary board; pledged the manufacturers to maintain safe and sanitary conditions; required the manufacturers to register with the union the names of contractors to whom work is sent; prohibited the sending out of work to tenements after six months; established a minimum wage of \$5 a week; created a permanent wage board to standardize piece prices and fix week wages; and set the hours per week at fifty.

The kimono-workers secured a less favorable agreement, especially the 2000 of the East Side branch. These were very young girls, recent immigrants, largely Spanish Jews from Russia and the Balkan States. The West Side branch was composed of 3000 older workers more experienced in American labor disputes. Their agreement provided for grievance and arbitration boards and sanitation committees. The West Side protocol provided that standard union conditions should prevail within a radius of twenty-four miles of New York in shops of association members and their outside con-

tractors. Moreover, manufacturers signing the agreement must assist the union to establish union conditions beyond the twenty-five-mile limit by refusing to send out goods to any shop where the union might call a strike.

SOUTHERN PACIFIC. After six months of futile negotiations to settle differences, about 4000 conductors, engineers, firemen, and trainmen of the Sunset Division of the Southern Pacific Railroad quit work on November 13. All freight and nearly all passenger traffic between New Orleans and El Paso, Tex., was brought to a standstill. The road had already provided a thousand strike breakers, and their examination to determine fitness was at once begun. The most serious aspect of the situation was the danger of losses to the sugar-cane and rice growers. Both crops were being harvested, and, while the latter could be stored with comparative ease, the former would have been ruined by frost and the lack of immediate transportation to sugar mills. The union officials declared themselves strongly opposed to violence of any sort, but nevertheless there was some intimidation and some destruction of property.

The employees had drawn up a list of sixty-seven complaints. These included demands for the reinstatement of engineers and others discharged in alleged violation of contracts; complaint of excessive demerits and of harsh letters from subordinate officials; opposition to the number of reports required outside of company time; request for regulation of lay-overs at terminals away from home; demand that officials should confer with local union committee in making assignments of men to new runs; demand that passenger rates be paid for motor car service; protest against physical reexaminations and against reexaminations on rules. Chairman Julius Kruttschnitt of the executive committee of the road declared that the unions had refused proposals to arbitrate. He said the main question involved from the road's point of view was whether it should secure peace with the men at the price of safety to the public. He stated the willingness of the road to confer with a committee from the four unions regarding a new system of settling grievances, or to have all matters in dispute arbitrated as provided by act of Congress.

INDIANAPOLIS STREET RAILWAYS. On November 1 the entire street railway system of Indianapolis was tied up by a very determined strike by a newly organized union. The company at once imported about 400 strike breakers, but their appearance was attended by such violence that for six days no cars were run. In the rioting four persons were killed and many injured. The local police refused to aid the company, thirty of them resigning when ordered to protect strike breakers. The sheriff summoned 200 citizens to act as deputies but most of them refused; it was charged that nearly all those summoned were Republicans, the sheriff being a Democrat and election being at hand. The mayor appealed to Governor Samuel M. Ralston for assistance in maintaining order, but the governor at first refused on the ground that the citizens had not done their duty. On November 5, however, he ordered the entire National Guard of Indiana, numbering about 1800, to the scene. Suit was brought by a local attorney for the annulment of the company's franchise. Finally on the 7th, Mr. Ethelbert Stewart, representing

the National Department of Labor, aided by the governor, induced the company to submit the union demands for higher wages and shorter hours, but not the demand for recognition, to the State public utilities commission. Traffic was resumed the next day. The bitter feeling engendered by the strike led to fierce denunciation of Mayor Samuel L. Shank by a committee of the Chamber of Commerce. This feeling was not lessened by acquittal of the disobedient policemen. Mayor Shank finally resigned November 28, because of his inability to prevent the teamsters' strike.

INDIANAPOLIS TEAMSTERS. On November 30 the teamsters of the city to the number of over 3000 went on strike. In a street riot on December 2 one man was killed and four wounded by special officers. On December 6 about one-third of the strikers returned to work, demands having been conceded.

GENERAL ELECTRIC COMPANY. Late in November, occurred a strike of 14,000 employees of this company at Schenectady. The company had followed the policy during slack periods of laying off some workers and employing others at full time. The employees demanded the employment of all at part time. A settlement was effected by a conference brought about by Mayor Lunn. The company agreed to take back all workers on part time; but those workers whose lay-off caused the strike and whose reinstatement was the direct issue were taken on in other departments than those they had previously worked in.

GREAT BRITAIN. The year passed in Great Britain without any strikes attracting world-wide attention, except that at Dublin described below. There were, however, a multitude of small strikes, only a few of which are here noted. On January 1 the London taxicab drivers struck against the increase from sixteen to twenty-six cents charged by employers for gasoline. The men were closely organized, and were supported by independent drivers. On March 18 an agreement was made to leave the price of gasoline at the old price of sixteen cents and to dismiss drivers who had worked during the strike. About 6000 men were affected. The Journeymen Bakers' Amalgamated Union demanded a limitation of hours and a minimum wage of \$7.50 or \$8.00 per week for factory or private baking houses respectively. They planned to strike March 15, but a few days earlier settlement was reached whereby demands were granted, except that sixty hours per week were allowed in private establishments. At the same time foreign bakers, known as Vienna bread bakers and formed into an international union, put forward a demand for a minimum wage of \$8.50. In March also the cooks and allied kitchen workers in London hotels and restaurants demanded a weekly half holiday. Like the foreign bakers they adopted a method known as the "lightning" strike. The demand of the union was presented just before an important bake or immediately preceding dinners when important banquets were about to be served. Their demands were generally conceded. In the spring serious trouble was only narrowly averted on the Great Northern Railway. Owing to the discharge of an engine driver indignation meetings were held by the Union Railway men. The company yielded.

A unique movement was the organization of British farm laborers. Several fairly extensive unions were formed. It was reported that these

farm workers labored from daybreak to sunset for weekly wages under five dollars. Moreover, their living conditions were found to be very degrading. In the early summer the National Agricultural Laborers' Union of Lancashire put forward a demand for a twelve-hour day with extra pay for overtime, a Saturday half holiday, a minimum wage of six dollars a week, and recognition of the union. There resulted various clashes with the police and a great interruption in the traffic in farm produce destined for Liverpool. Owing to a projected visit of the king every effort was made to bring about a settlement in July. The farmers as a rule conceded the demands.

Another notable strike was that of some 40,000 unskilled workers in the engineering shops and iron works in and around Birmingham. Their modest demand was for a minimum wage of \$5.75 a week. The strike was attended by great suffering, generally borne heroically. On July 11 the strike was terminated successfully. About the middle of July an extensive strike in the shipbuilding yards of the country was threatened, but was averted by the employers conceding one-half the increase in pay demanded. Eleven trades altogether were concerned. About the end of August there was a strike of organized painters and decorators in London for an increase of wages. Their demand was generally conceded. In October British railway men were again thrown into a state of discontent owing to the imprisonment of engine driver Candell for manslaughter in connection with a wreck in which sixteen lives were lost. The workers looked upon him as a victim of circumstances, holding that the real criminals were higher up. On November 1, the government granted him a full pardon.

DUBLIN. Late in August as the result of fiery speeches by James Larkin and other leaders a threatened strike by the Transport Workers' Union of Dublin was met by a lockout. Just previously five of the leaders had been arrested on a charge of seditious libel and conspiracy. While the principal trades affected were those handling the shipping trade and the street cars, thousands of other workers were soon thrown out of employment. It was estimated that the total number made idle reached 30,000. The dispute soon developed into a very stubborn resistance of the employers to the union and of the union for recognition and complete reinstatement of all strikers. The lack of adequate strike funds resulted in great privation and suffering. On September 27 a ship with \$27,000 worth of food arrived in Dublin from English trade unions. Several other loads followed. By September 1 the contributions of the English unions had reached a total of £70,000 (\$350,000), and were being made at the rate of several thousand dollars per week. Early in December at a conference of English labor leaders it was decided to continue this policy of financial aid rather than to adopt the method of a general sympathetic strike to assist the Dublin workers. The strike was attended at various times by much rioting; thus on August 31 a police attack upon a crowd cheering Larkin resulted in one killed and 500 sufficiently injured to require hospital treatment. The sentencing of Larkin to seven months' imprisonment greatly intensified the feelings of the workers in both Great Britain and Ireland. Being released on bond, Larkin made a series of speeches in England in which he threatened to arouse the entire working population to

revolutionary and violent resistance to existing conditions. By the middle of December employers had yielded sufficiently to grant employees permission to join the Transport Workers' Union. The only issue then remaining was whether all or a part of the members of that Union should be reinstated in their employments.

ITALY. On August 3 a general strike began at Milan, Italy. This had been preceded by various labor disturbances, particularly among the metal workers and the street railway employees. Within a few days the strike had spread to a great variety of employments, it being estimated that 150,000 men were out in Lombardy and Piedmont. Milan and vicinity were practically placed under martial law, the garrison being increased to 30,000 troops and the police forces being extended. Following a meeting of 50,000 strikers on August 10, it was determined to call a general strike throughout Italy. Such an order was issued the next day from the Socialist and Syndicalist workmen's headquarters at Milan. There resulted a temporary but rather complete tie-up at Pisa and considerable disturbance at Rome and Genoa. This nation-wide strike, however, was a failure. In the Milan district several deaths, nearly 200 wounded, and over 2500 arrests were reported. By August 15 work had been resumed even at Milan in most industries, and negotiations under government auspices were proceeding to determine a basis for settlement.

SPAIN. Early in August the Spanish Federation of Labor called a general strike at Barcelona. The government at once proclaimed martial law in the city. The number out on strike was estimated at 30,000 to 90,000 and 337 factories were closed. Newspapers were ordered to suspend publication. Machine guns were mounted in streets and factories. Sympathetic disturbances occurred in Madrid and other places. The government endeavored to settle the dispute by a committee of arbitration; and introduced a bill into the Cortes to remedy some of the grievances, particularly those arising from the employment of women and children.

SOUTH AFRICA. In the early days of July occurred a most violent strike of the Rand miners. This was due mainly to a demand for an eight-hour day; but in addition the miners demanded the right of free speech, press and public meeting, better compensation for men suffering from tuberculosis, an annual ten-days' vacation, recognition of their union, and a share in the appointment of mine inspectors. The miners numbered 25,000, of whom one-half were white underground workers. They resorted to revolutionary tactics, tearing down the Union Jack and hoisting the red flag. Johannesburg, which was the centre of the disturbance, was thrown into a state of anarchy. A clash between troops and strikers resulted in the killing of many, including a considerable number of women and children. A statement was reached after a few days through the intervention of General Botha, the premier, and General Smuts, minister of mines. It was agreed that all strikers should be reinstated and that there should be no victimization. The government was then to make an investigation. Important political consequences followed the use of the troops, the governor-general of the Union of South Africa, Viscount Gladstone, being roundly denounced by labor leaders, and in the British House of Commons.

Equally important with the foregoing was the

strike of the Hindus in Natal. This centred at Ladysmith, where considerable rioting occurred. Aroused by rumors that Hindus in coal mines had been flogged to death or shot, a thousand East Indian miners near Ladysmith quit work in November and marched into the city. The agitation spread and soon the vast majority of the 140,000 Hindus and other Asiatics in Natal were on strike. Great alarm was felt for the safety of women and children, and great loss resulted to the sugar-cane crop, which was then ready for harvest. Sugar plantations near Durban were burned. The strike spread as far as the South Coast, with the result that farms, railroads, sugar and tea plantations, mines, mechanical trades, and domestic service were seriously interfered with. While extra police safeguards were instituted martial law was not declared. The strike was conducted mainly by the method of passive resistance. Nevertheless a number of Hindus were killed and many wounded. Behind this strike was a general feeling of discontent due to political disabilities from which the Hindus suffer in South Africa. They are forbidden to migrate from one province to another and yet they are subjected to a poll tax of \$15. Moreover the South African law prohibits not only the importation of polygamous wives, but of any wife married by the rights of a religion permitting polygamy. SUBWAYS. See **RAPID TRANSIT.**

SUDAN, THE ANGLO-EGYPTIAN. A country in Africa, south of Egypt, under the joint administration of the British and the Egyptian governments. It extends westward from the Red Sea, Eritrea, and Abyssinia to Wadai, and southward from Egypt to Uganda and the Belgian Congo. Area, 984,520 sq. miles, carrying a population estimated in 1911 at 3,000,000. Khartum with (1909) 18,235 inhabitants is the capital. Opposite the capital, on the Blue Nile, is Khartum North, with 35,285 inhabitants. Omdurman, on the White Nile, the former Mahdist capital, has 42,779. An increasing number of West African tribes are settling in the Sudan and as they are hard-working and law-abiding their advent is regarded with favor. Vernacular and industrial schools have increased in number, but are still insufficient. An agricultural school is needed. The natives are being educated in modern methods and show great aptitude. It is proposed to develop irrigation in the Dongola province and in the region between the Rahad and Dinder rivers. The 1912 Nile flood was the lowest on record in many years. Under cultivation in 1911 were 1,426,497 feddans, of which 116,556 were artificially irrigated, 1,192,265 under main crops, and 117,676 irrigated by the river at flood. The protection of gum forests is being urged, and arrangements have been made for the exploitation of hitherto undeveloped products, among which are wild fibres and floss and divers sorts of Sudan beans. The total imports were valued in 1912 at £E1,338,791, and in 1911 at £E2,561,238; exports in 1912 £E1,918,243 and in 1911 £E1,505,277. These figures include specie. Dura (African millet) was exported in 1911 to the value of £E86,657; cattle, £E129,375; sheep and goats, £E86,606; gums, £E435,622; cotton, £E195,840; ivory, £E73,932. The revenue

for 1911 amounted to £E1,305,000; 1912, £E1,375,000; 1913 budget, £E1,631,000. Expenditure 1911, £E1,350,000; 1912, £E1,538,000; 1913 budget, £E1,631,000. There were about 1500 miles of railway in operation in 1911. The El Obeid extension was opened to traffic in 1912. A line from Kassala to a point of junction on the Red Sea line is under consideration. South of Khartum communication is established by boats on the Blue Nile, the White Nile, Sobat, and Bahr-el-Ghazal; inland, mainly by camels and donkeys. Gen. Sir F. Reginald Wingate continued in 1913 as governor-general of the Sudan and sirdar of the Egyptian army.

Punitive expeditions were undertaken in 1912 against the Beirs and the Anuaks. The results were a check to the extension of the traffic in arms carried on across the Abyssinian frontier by the latter tribe, and their submission to the administration.

SUGAR. In 1913 the sugar beet crop for sugar making in the United States was the largest ever produced, and exceeded by 34½ per cent. the average for the previous five years. The beet sugar yield of the crop was estimated by the United States Department of Agriculture at about 727,000 tons, and by Willett and Gray at 640,000 tons. The cane sugar crop of Louisiana and Texas was placed by the latter authority at 267,000 tons. The value of the products of these two sugar industries, including the by-products, was placed at about \$119,000,000. The sugar crop of the world for the year 1913-14 was estimated by Willett and Gray (December 24) at 18,923,514 tons, an increase of 779,077 tons. The total beet sugar crop of Europe was estimated by F. O. Licht at 8,475,000 tons, as compared with 8,342,000 tons in 1912-13. The production of cane sugar in the principal sugar growing countries was as follows (Willett and Gray): West Indies and Lesser Antilles, 284,500 tons; Cuba, 2,400,000 tons; Hawaii, 500,000 tons; Porto Rico, 345,000 tons; Mexico, 125,000; Brazil, 220,000; Argentina, 200,000; Peru, 145,000; British India, 2,550,000; Java, 1,450,000; Philippine Islands, 220,000; Formosa, 177,000; Australia and Fiji Islands, 310,000; Africa, 473,714; and Spain, 13,000 tons.

The free sugar clause in the new tariff was expected to cripple both sugar beet and cane production in the United States, except in localities which were particularly favorable. A cut of 50 cents a ton in sugar beets was made in the contracts at certain factories. Other factories closed their doors. In Porto Rico, where the industry had been developing rapidly, largely on borrowed capital, difficulty in securing loans resulted in closing up many plantations, and this threw out of employment large numbers of people who lived on these plantations and depended on them for labor.

More sugar was brought into continental United States in the fiscal year 1913 than in any other year in the history of the country. The quantity entering from foreign countries and American insular possessions was 6½ billion pounds, exceeding by 500 million pounds the

figures of the former high record year, 1912. Of this amount $4\frac{1}{2}$ billion pounds came from Cuba, one billion from Hawaii, three-fourths of a billion from Porto Rico, nearly a quarter of a billion from the Philippines and the remainder chiefly from South America. In round numbers foreign countries supplied approximately one-half the sugar consumed in the United States, one-fourth being grown in the insular possessions and one-fourth in continental United States.

SULPHUR. The production of sulphur in the United States in 1912 was 303,472 long tons, valued at \$5,256,422, compared with 265,664 long tons, valued at \$4,787,049 in 1911. Sulphur was produced in Louisiana, Texas, Nevada, and Wyoming. By far the larger quantity is produced in Louisiana. During the present century the growth of the sulphur industry in the United States has been phenomenal. In 1900 the production was only 3147 long tons. During the seven years prior to 1913 came the destruction of the dominating position held by Sicily in the world's sulphur market, and within this period the United States advanced to the position of one of the leading sulphur producers of the world. This condition was due entirely to the development of the sulphur deposits in Louisiana. The process employed in mining Louisiana sulphur is known as a Frasch process, from its inventor Herman Frasch (q.v.).

IMPORTS AND EXPORTS. The imports of sulphur in 1912 were 29,927 long tons, valued at \$583,974. This includes imports of all varieties, including crude, refined, flowers of sulphur, and other grades. The largest quantity, 24,505 tons, was imported from Japan. The exports in 1912 amounted to 57,736 long tons, valued at \$1,076,414.

SUN BATHS. See **HELIO THERAPY.**

SUN YAT-SEN. See **CHINA, History.**

SURGERY. Several new methods of draining collections of fluid from the body cavities came into more general use in 1913, all of them aiming at a cure without repeated tapplings. Evler, when dealing either with pleural or abdominal ascites, merely makes an opening by separating muscles or boring through bone, thus permitting the effusion to ooze into the subcutaneous tissues. This not only drains away the fluid, but has the effect of autoserotherapy (q.v.). In the case of abdominal dropsy he separates the muscles in the median line and draws the peritoneum up over the edge of the hole thus made, this being large enough to admit the tip of the finger. In the case of a pleural effusion, Evler drills through a rib and allows the fluid to escape externally through the loose subcutaneous tissues. In bursitis he sutures the internal capsule to the external layer so as to preserve the opening for a time. His results are remarkably good even in cases of abdominal ascites from cancer, and his only failures were in cases of effusion of the knee complicating a deforming arthritis. Dobbartin obtained permanent drainage of abdominal ascites into the saphenous vein. This method was not entirely new, but was improved upon by Dobbartin. He mobilizes the saphenous vein in the upper third of the thigh and draws it up through a passage made under the skin directly into the peritoneum, thus diverting the ascitic fluid into the circulation. He feared at first that blood would escape from the vein into the peritoneum, but found that this never occurred,

as the attraction of gravitation aided in the evacuation of the ascitic fluid. The procedure is very simple and harmless, as he describes it, and it is applicable not only where the Talma operation (omenteopexy) is indicated, but also with stasis in the portal circulation, hypersecretion from carcinosis, unoperable ovarian tumors, etc. He regards it as a physiologic process, providing a passage back into the blood of the fluid which came from the blood. The fluid drains away at once after the operation without the necessity of waiting for a collateral circulation to develop, as with omenteopexy.

The removal of masses of abdominal fat in cases of extreme obesity is now practiced with increasing frequency. The condition is very embarrassing to men, and especially to women, interfering with exercise and comfortable dressing. It is a notable but unexplained fact that the anterior abdominal wall has a special predilection for this form of overgrowth. The operation consists of the following stages: (1) a horizontal incision, midway between the umbilicus and symphysis pubes; (2) a vertical incision joining this line and extending half way to the sternum; (3) the skin is now dissected back, the layer of fat separated from it and the underlying muscular structures, and removed *en masse*; (4) the incisions are closed, with small drainage tubes in the angles of the wound. These operations, according to Kelly, Spencer, and Weinhold, are always successful, and the relief conferred upon patients is enormous. See **AUTOSEROTHERAPY; CANCER; RADIUM; and SERUM THERAPY.**

SUTHERLAND, CHOMARTIE SUTHERLAND-LEVESON-GOWER, 4th Duke of. An English nobleman, died June 27, 1913. He was born in 1851; educated privately and at Eton; and from 1874 to 1886 was member of Parliament for Sutherland. He was a Liberal, and of those who helped to secure the rejection of Mr. Gladstone's first home rule bill. He retired from the House of Commons because of his dissatisfaction with the developments of the Liberal policy. To the titles and estates of his father he succeeded in 1892, and was the largest land holder in England, owning estates in England, and large tracts in Canada. His estates numbered all told nearly 1,500,000 acres.

SWAMP LANDS. See **DRAINAGE.**

SWARTHMORE COLLEGE. An institution of higher education at Swarthmore, Pa., founded in 1869. The enrollment in all departments of the college in 1913-14 was 420. The faculty numbered 48. There were no notable changes in the faculty during the year and no noteworthy benefactions. A new system of marking was put into effect at the beginning of the collegiate year 1913-14. The productive funds of the college amount to about \$1,575,000. The library contains about 25,000 volumes. The president is Joseph Swain, M.S., LL.D.

SWAZILAND. A British protectorate in South Africa, bounded on the north, west, and south by the Transvaal and on the east by Portuguese territory and Natal. Area, 6536 square miles. Population (1911 census), 99,959 (44,805 males, 55,154 females). White inhabitants numbered only 1083. Native crops consist of corn, millet, sweet potatoes, etc., but the production does not supply local demands. There are approximately 59,000 cattle and 170,000 sheep and goats. Tin and gold are mined. In the years 1910-11 and 1911-12 tin pro-

duction amounted to 476 and 313 tons respectively, valued at £42,250, and £32,397; gold, 13,543 and 14,781 ounces, valued at £57,530 and £62,783. Swaziland is included for customs purposes with the Union of South Africa. Revenue for the fiscal year ended March 31, 1912, £57,307; expenditure, £62,192; debt on that date, £100,000. The headquarters of the administration is Mbabane. Paramount chief, Sobhuza; his grandmother, Nabotsibeni, widow of Mbandini, acts as regent. Resident commissioner in 1913 (since 1907), Robert Thorne Coryndon, C.M.G.

SWEATING. See CHILD LABOR, and FACTORY INVESTIGATING COMMITTEE.

SWEDEN. A constitutional European monarchy hereditary in the male line of the house of Bernadotte. It occupies the eastern part of the Scandinavian Peninsula. Capital, Stockholm.

AREA AND POPULATION. The land area is 158,692 sq. miles; the total population was estimated December 31, 1912, at 5,604,192. The total area is shown below by prefectures in sq. miles, with population according to the census of December 31, 1910:

	Area	Pop.	Area	Pop.
Stockholm*	13	342,323	Värmland	7,461
Stockholm	3,016	229,165	Örebro	3,623
Uppsala	2,067	128,171	Västland	2,602
Söderland	2,630	178,577	Kop'berg	11,525

			Total	172,920
				5,522,474

* City.

Marriages numbered 32,612 in 1911 and 33,162 in 1912; births, 136,334 and 138,976; deaths, 79,820 and 80,563; stillbirths, 3358 and 3351 (included); emigrants, 19,997 and 27,816; immigrants, 7752 and 8142. At the end of 1912 Stockholm was estimated to have 350,955 inhabitants, Göteborg 173,875, Malmö 92,338, Norrköping 46,674, Gäfle 35,838, Hålsingborg 33,863, Örebro 32,075, Eskilstuna 28,729, Jönköping 27,864, Karlskrona 27,446, Uppsala 27,155, Linköping 23,613.

EDUCATION. Elementary schools are maintained by local taxation with state aid. Free elementary instruction is provided and is obligatory. Illiteracy is not common. The secondary and special school systems are well developed. There are universities at Lund and Uppsala, as well as private faculties. The Lutheran is the national creed; all others are tolerated, Mormonism excepted.

PRODUCTION. The northern regions are under forest; in the central districts are the majority of the mines; and the southern part is devoted to agriculture, in which about 49 per cent. of the people are engaged. The principal crops, with yield in metric quintals, are as follows:

	1909	1910	1911	1912
Wheat.....	1,881,000	2,047,619	2,241,070	2,122,060
Rye.....	6,338,000	6,237,350	6,270,240	5,861,480
Barley.....	3,037,000	3,385,320	3,199,720	3,082,150
Oats.....	11,728,000	12,876,680	11,025,770	12,739,260
S. beasts..	8,211,230	9,901,842

Forests cover half of the total area, and supply timber, pitch, tar, and fuel. Pine, birch, and fir are most abundant. The mineral wealth is great. Coal is mined; an excellent grade of iron (Dannemora) is converted into the finest steel made; gold and silver are produced in small quantities, and copper, lead, zinc, nickel, cobalt, alum, and sulphur are mined. Output of copper ore in 1911, 1623 tons, silver and lead ore 2999, zinc 51,242, manganese 5377, sulphur pyrites 30,096, coal 311,809, iron 6,153,778. Iron ore exported (1911), 5,086,898 tons; pig iron 150,444, bar iron 158,000. Total pig iron produced 634,392 tons, bar iron 423,170.

There were (1910) 1232 saw and planing mills (value of output, 182,456,197 kronor), 519 joineries and furniture factories (27,058,674 kr.), 166 wood pulp mills (95,670,178 kr.), 70 paper and pasteboard mills (53,885,555 kr.), 1384 flour mills (106,392,847 kr.), 658 iron and steel works (94,153,755 kr.), 459 machinery factories (82,333,521 kr.), 21 sugar mills (40,289,831 kr.) and 10 refineries (65,099,661 kr.); etc.

Livestock (1911): 588,485 horses, 2,689,609 cattle, 945,709 sheep, 951,164 swine.

COMMERCE. In thousands of kronor are shown below imports and exports, including precious metals, for consecutive years:

	1907	1908	1909	1910	1911
Imports....	682,105	608,932	616,806	671,633	696,617
Exports....	524,663	482,017	472,980	592,864	663,576

The principal articles of import and export in the 1911 trade, with values in thousands of kronor, are given as follows:

Imports	1000 kr.	Exports	1000 kr.
Coal	55,111	Timber	166,051
Cereals	47,782	Wood pulp.....	84,307
Coffee	40,025	Iron	54,777
Machinery	28,779	" ore.....	51,413
Hides	28,601	Butter	46,791
Cotton	24,050	Machinery	42,205
Vegetable oils....	20,916	Paper	33,912
Oil cake.....	20,360	Hides	15,371
Petroleum	20,002	Iron mfrs.....	14,912
Iron mfrs.....	18,601	Live animals....	14,769
Copper	15,012	Stone	13,968
Iron	13,524	Wooden wares... 11,912	
Wool	13,289	Matches	11,787
Seeds	12,276	Fish	10,116

The principal countries of origin and destination in the 1911 trade were as follows, values in thousands of kronor: Germany, 244,188 imports and 133,518 exports; United Kingdom, 160,830 and 195,829; United States, 54,656 and 24,280; Russia and Finland, 46,096 and 34,347; Denmark, 46,779 and 66,136; France, 32,231 and 48,510; Norway, 20,113 and 37,559; Netherlands, 19,394 and 23,927; Brazil, 18,273 and 1412; Belgium, 9939 and 18,276; Argentina, 8446 and 7422; British India, 8319 and 4585; Italy, 5276 and 3503; etc.

Vessels entered in the 1911 trade, 14,183, of 6,084,000 tons, of which 8656, of 3,783,000 tons, Swedish; cleared 22,012, of 8,331,000 tons, of

which 12,204, of 4,400,000 tons, Swedish. Merchant marine, January 1, 1911; 1539 sail, 154,968 tons; 1219 steamers of 610,100 tons.

COMMUNICATIONS. There were in operation, at the end of 1912, 14,272 kilometers of railway, of which 4683 belonged to the state and 9589 to private companies. State telegraph lines, 10,419 kms. (railway lines 10,564 kms.); wires, 32,247 (28,041); stations, 2904; wireless stations, 5, and 29 on board vessels. Urban telephone wires, 151,863, interurban, 139,108. Post offices, 3790.

ARMY. Progress continued during the year 1913 on the reorganization of the Swedish army, and it was thought that by 1914 the entire scheme would be in full effect. Every citizen is liable for personal military service over a period of 19 years, but the periods of actual training are short and consist of from eight to twelve months, according to the branch of the service, which is spread over a period of four years. In 1913 the classes of troops known as *Indelta*, based on the feudal system of land tenure by military service, disappeared, having survived until this year after over four centuries. The war strength of Sweden was estimated at 230,000 men in the first line, 90,000 in the second line, and 165,000 in the *Landsturm*, while with the new and complete organization which was in progress it was estimated that a total strength of 600,000 eventually would be reached.

NAVY. The navy included (1913): 12 coast defense vessels, of 42,600 tons; 1 armored cruiser, of 4100; 10 protected monitors, 7200; 5 torpedo gunboats, 4000; 4 gunboats, 1850; 8 destroyers, 3450; 31 first-class torpedo boats, 3100; 22 second-class torpedo boats, 1300; besides submarines, school ships, dispatch boats, etc. A coast-defense vessel is building—the *Sverige*, of 6800 tons displacement, 22.5 knots, speed; four 11-inch, eight 6-inch, and six 12 pdr. guns. Five torpedo boats building, and several submarines, number undisclosed. The gunboat *Urd* was sunk in a collision August 22, 1913. Personnel (1913), about 7500 of all ranks; also 20,000 yearly conscripts available, but seldom called up.

FINANCE. The *krona* is the monetary unit (worth 26.8 cents). For 1913 the budget balanced at 263,027,200 *kronor*; for 1914, at 273,739,700 *kr.* Revenue in 1914 from customs and excise, 110,800,000; tax on income, invested capital, etc., 58,000,000; personal tax, 850,000; revenue-earning administrations, 39,398,000; from loans 42,314,000; state bank profits, 7,058,000; etc. Ordinary and in parentheses extraordinary expenditure as follows: 50,048,112 (5,185,988) *kronor* for army, 20,694,927 (7,247,873) marine, 12,102,013 (11,212,587) interior, 14,727,495 (4,153,605) finance, 27,495,266 (5,482,234) worship and instruction, 5,414,645 (4,705,655) agriculture, 6,059,198 (3,172,302) pensions, 5,118,120 (1,074,680) justice; 1,794,052 (541,848) foreign affairs, 1,493,000 (100,000) civil list; total ordinary 144,946,828 *kr.*, total extraordinary 42,876,772 *kr.*

GOVERNMENT. The constitution of June 6, 1809, as amended June 22, 1866, vests the executive authority in a king, assisted by an executive council. The upper chamber of the legislative body (*Riksdag*) is composed of 150 members elected for six years by provincial and communal electors; the lower has 230 members elected for three years.

The reigning king, Gustaf V., was born June 16, 1858; he married September 20, 1881, Princess Victoria of Baden, and succeeded his father to the throne December 8, 1907. The heir-apparent is Prince Gustaf Adolf, born November 11, 1882, married June 15, 1905, to Princess Margaret of Great Britain and Ireland; issue, three sons and a daughter.

The ministry as constituted October 7, 1911, was composed in 1913 as follows: Karl A. Staaff, minister of state; Dr. J. J. A. (Count) Ehrensvärd, foreign affairs; Gustaf Sandström, justice; Dr. David K. Bergström, war; Jacob L. Larsson, marine; P. Axel V. Schotte, interior; A. T. (Baron) Adelsvärd, finance; Dr. F. Berg, worship; P. Alfred Petersson, agriculture; B. A. Petré and Karl J. Sternström, without portfolio.

HISTORY. Parliament was opened on January 16. The speech from the throne foreshadowed several important reforms of which national insurance and old-age pensions were perhaps the most significant. The old-age pension bill passed the *Riksdag* on May 21, receiving in the first chamber a majority of 111 to 28, and in the second chamber an even larger majority of 172 to 25. During the summer and autumn great interest was manifested in the question of national defense. The ministerial position was defined in December by the premier, M. Staaff, who insisted that, although Sweden's foreign relations are peaceful and there is no immediate menace of war, the general international situation demanded the augmentation of Sweden's military power. In order to assure her neutrality, Sweden must multiply and strengthen her fortifications, build new naval units, construct torpedo and submarine boats, and enlarge the army. The term of service in the marine was to be lengthened; and the extension of the period of service in the infantry would also be desirable; but for parliamentary reasons, the government would defer this question until after the elections of September, 1914. In order to cover the increased expenditure for defense the government would prepare a bill for a non-recurring contribution, graduated so as to fall mostly on the wealthier classes.

In connection with these increased warlike preparations, it is interesting to recall the Scandinavian neutrality agreement signed at Stockholm on December 23, 1912, by the Danish and Norwegian ambassadors and the Swedish minister of foreign affairs. The document related only to the securing of identical neutrality regulations for all three countries, but some sections of the European press interpreted it as a move towards federation with the purpose of resisting hypothetical Russian aggression.

SWIFT, Lewis. An American astronomer, died January 5, 1913. Born at Clarkson, N. Y., in 1820, and educated at the Clarkson Academy, he went into business in a small town in New York, but soon decided to make astronomy a life study. He came into prominence in scientific circles in 1862, when he discovered the great comet which was given his name. Following this discovery, he removed to Rochester and in that city set up on the roof of a cider mill the first observatory in the United States. He discovered more comets and nebulae than any other man in the world. He was engaged in the hardware business from 1872-81, but in the meantime devoted his leisure moments to

a search for comets, making discoveries in 1877, 1878, 1879, 1880, 1881, and 1882. For three successive years the Imperial Academy of Vienna awarded to him its medal for the most important contributions to astronomy. The people of Rochester presented him with a 16-inch refractor, at a cost of \$16,000. With this Dr. Swift discovered 900 nebulae at Rochester, and over 300 at Echo Mountain, California, and in both places discovered all told a dozen comets. In 1878, during a total solar eclipse, at Denver, he discovered two intra-Mercurial planets. The telescope given to him by the people of Rochester was installed in the Warner Observatory. When this was closed through the failure of its principal benefactor, Dr. Swift became director of the Lowe Observatory on Echo Mountain, California. Soon after this, his sight failed, and he returned to his old home in Marathon, N. Y. He was a Fellow of the Royal Astronomical Society of England, a member of the British Astronomical Association, and the author of *Simple Lessons in Astronomy* (1888).

SWIMMING. Three new swimming records were established in 1913. Duke P. Kahanamoku of Honolulu swam 50 yards in 23½ seconds; L. J. Goodwin of the New York A. C., swam 1 mile in 27 minutes 6 seconds, and Perry McGillivray of Chicago swam 500 yards in 6 minutes 20½ seconds. A new figure also was set for the 400-yard relay race by a quartette from the Illinois A. C., consisting of P. McGillivray, E. W. McGillivray, H. J. Hebner, and A. C. Raithel. Their combined time was 3 minutes 46½ seconds. The championships of the Amateur Athletic Union were held in several different cities of the United States at various times during the year. The winners of the principal events were: Indoor—50 yards, P. McGillivray, Illinois A. C.; 100 yards, H. J. Hebner, Illinois A. C.; 220 yards, P. McGillivray; 500 yards, P. McGillivray; 400 yard relay, Illinois A. C.; springboard diving, A. McAleenan of Yale University. Outdoor—440 yards, J. C. Wheatley, unattached; 880 yards, G. E. Tomlinson, Philadelphia Swimming Club; 1 mile, L. J. Goodwin, New York A. C.

Yale won the intercollegiate team championship, defeating Princeton in the deciding match by a score of 34 to 19. Cross of Princeton won the 100-yard and 220-yard events and Robinson of Princeton captured the plunge for distance. Yale won the 600-foot relay race; Howe of Yale won the 50-yard race, and McAleenan of Yale won the fancy diving event. Illinois won the conference college championship with Wisconsin second and Northwestern third. In water polo Princeton captured the national intercollegiate championship by defeating Illinois 3 goals to 1.

Several long-distance swims took place during the year. S. Richards swam from the Battery, New York, to Sandy Hook in 8 hours 12 minutes, this being the second time this feat has been accomplished. C. B. Durborow made three attempts to emulate Richards's example but failed although once he got within half a mile of his goal. H. Elionsky swam from the Battery to within half a mile of Coney Island with wrists and ankles manacled. An attempt made by H. F. Sullivan to swim the English Channel failed.

SWITZERLAND. A central European republican confederation composed of 25 cantons and demi-cantons. Bern is the capital.

AREA AND POPULATION. In the table below are found the area and the *de jure* population of the 25 divisions; area in square kilometers, population according to the census of December 31, 1910:

	Sq. kms.	Pop.		Sq. kms.	Pop.
Zürich	1,724.76	503,913	Appenzell		
Bern	6,844.50	645,877	I.-Rh.	172.88	14,659
Lucerne	1,500.80	167,223	St. Gall	2,019.00	302,896
Uri	1,076.00	22,113	Graubün-		
Schwyz	908.26	58,428	den	7,132.80	117,069
Obwalden	474.80	17,161	Aargau	1,404.10	230,634
Nidwalden	290.50	13,788	Thurgau	1,011.60	134,917
Glarus	691.20	33,316	Tessin	2,800.90	156,166
Zug	239.20	28,156	Vaud	3,252.00	317,457
Fribourg	1,674.60	189,654	Valais	5,224.49	128,381
Solothurn	791.51	117,040	N'châtel	807.80	133,061
Basel-Stadt	35.76	135,918	Geneva	282.35	154,906
Basel-L'dt	427.47	76,488			
Schaff-			<i>De jure</i>	41,323.99	3,753,293
hausen	294.22	46,097			
Appenzell			<i>De facto</i>	3,765,123
A.-Rh.	242.49	57,973			

Those of the population speaking German as their native tongue numbered 2,599,194; French, 796,220; Italian, 301,323; Romanish, 39,912; other languages, 28,172. Protestants numbered 2,108,642, and Roman Catholics, 1,590,832. The number of marriages in 1911 was 27,809 (27,346 in 1910), births 94,185 (96,669), deaths 62,484 (59,653), stillbirths (included) 2865 (3155). Emigration in 1912, 5871 (5512 in 1911), of whom 4417 went to North America, 1256 to South America, etc.

The communal population of Zürich as estimated in the middle of 1913 was 200,600; Basel, 137,500; Geneva, 135,000; Bern, 90,800; St. Gall, 80,000; Lausanne, 69,400; Lucerne, 41,500; Chaux-de-Fonds, 38,600; Winterthur, 25,800; Neuchâtel, 24,100; Bienne, 24,000; Fribourg, 21,200; Montreux, 19,700; Schaffhouse, 18,600; Vevey, 14,000.

EDUCATION. Primary instruction is free and enforced in the Protestant cantons. The cantons and communes are responsible for educational affairs within their limits. There are efficient secondary and special schools, well attended; and seven universities.

PRODUCTION. Switzerland is the most mountainous country in Europe, and agriculture is possible only in the valleys. Here cereals, fibre plants, tobacco, fruits, and vegetables are grown. Principal crops with area and yield for two years (1913 provisional) are shown below, with average quintals per hectare in 1912:

	Hectares		Quintals		Qs.
	1912	1913	1912	1913	ha.
Wheat....	42,200	42,365	865,000	955,000	20.5
Rye.....	24,500	24,254	433,000	445,000	17.7
Barley....	5,000	5,182	93,000	98,000	18.6
Oats.....	33,000	32,644	583,000	739,000	17.7
Corn.....	1,330	1,800	27,000	30,000	20.3
Vines*...	23,700	23,000	903,000	264,000	38.1
Tobacco..	320	320	5,500	6,020	17.2
S. Beets..	792	316,800

* Yield in hectoliters of wine.

The livestock census of April 21, 1911, returns 1,443,483 cattle (796,909 cows), 144,128 horses, 3151 mules, 1566 asses, 570,226 swine, 161,414 sheep, 341,296 goats.

Silk-worm eggs placed for hatching (1912), 188 hectograms, producing 31,200 kilograms of cocoons.

The manufacture of butter, cheese, condensed

milk, and milk chocolate constitutes an important source of the country's wealth and great quantities are exported. The timber industry, pisciculture, salt mining, cement manufacture, and distilling are flourishing industries. Great numbers of men and women are engaged in house industries, which include the making of watches and clocks, leather goods including gloves, pottery, tobacco, snuff, etc. About sixty thousand persons are employed in silk and cotton mills.

COMMERCE. Imports and exports of merchandise and precious metals are given below in francs:

	1910	1911	1912
Imps. mdse..	1,745,021,011	1,802,358,995	1,979,100,604
" pr. mets.	42,890,821	41,484,268	60,329,609
Total Imps..	1,787,911,832	1,843,843,263	2,039,430,213
Exps. mdse..	1,195,872,131	1,257,309,404	1,357,616,671
" pr. mets.	28,258,200	31,528,813	33,118,057
Total Exps..	1,224,130,331	1,288,838,217	1,390,734,728

The principal articles of the special trade for 1912, with values in thousands of francs, are shown in the following table:

Imports	1000 fr.	Exports	1000 fr.
Cereals	214,000	Cottons	247,000
Silk	157,700	Watches	173,800
Coal	97,100	Silks	167,200
Precious metals..	81,800	Machinery	93,000
Iron	73,200	Cheese	84,700
Animals	72,700	Chemicals	63,800
Cottons	69,400	Spun silk	59,100
Chemicals	68,500	Chocolate	55,200
Woolens	61,700	Raw silk	52,700
Machinery	56,700	Milk	50,500
Meats	55,100	Cotton yarn	25,100
Cotton	51,700	Hides	21,900
Sugar	50,900	Iron mfrs.	21,200
Wine	49,400	Straw mfrs.	16,800
Iron mfrs.	41,700	Animals	16,400
Timber	37,800	Jewelry	15,700
Leather	30,900	Woolens	15,300

The principal countries of origin and destination, with the value of their trade expressed in thousands of francs, are as follows: Germany, 647,161 imports and 307,029 exports; France, 376,334 and 137,943; Italy, 192,623 and 90,608; Austria-Hungary, 122,366 and 88,662; United Kingdom, 116,765 and 230,005; United States, 83,761 and 135,672; Russia, 80,226 and 47,808; Rumania, 43,217 and 9706; Belgium, 38,938 and 27,620; Argentina, 35,979 and 29,827; Spain, 30,408 and 27,280; Brazil, 20,686 and 22,060; Netherlands, 21,647 and 11,870; Canada, 13,900 and 31,774; etc.

COMMUNICATIONS. There were in operation January 1, 1912, 5112 kilometers of railway. About a third of the railways have been nationalized, but they have not proved a profitable enterprise. The extension of the most-favored-nation treatment to Germany and Italy, as well as to Great Britain, over the entire federal system was effected by the ratification, in 1913, after much dissension, of the St. Gothard convention. Both nations were already possessed of that privilege over the St. Gothard line, to which both contributed considerable subscriptions for construction. Although the official report on state railways shows an excess of revenue over expenditure for the year 1911 of 71,864,082 francs (revenue 190,511,857 francs, expenditure 124,647,775), this apparent profit is

fictitious, certain expenditures classed as extraordinary not appearing in this table.

The year 1913 saw the completion of several notable tunnels and parts of other tunnels. The 48-mile connection between Fruitgen and Brigue, which includes the 9½-mile Lötschberg tunnel, which had been under construction since October, 1906, not to mention other smaller tunnels and important engineering works connected with the approaches, was completed and opened in June. To improve the connection between France and Switzerland heavy tunnel work was prosecuted on the Münster-Legnau Railway, including the 4-mile tunnel through the Grenchenberg. On the Sissach-Olten line the Hauenstein tunnel was well under way. The duplication of the Simplon tunnel by the construction of a new gallery was also in progress. In September there was opened an 18-mile electric railway from Bern to Wiessenthal, while earlier in the summer, in June, the Lower Engadine Railway, St. Moritz to Schul and Terasp, was opened.

There were 442.23 kilometers of tramway in operation in 1911 and 423 kilometers funicular railways. Telegraph lines (state), 3575 kilometers; wires, 26,306; stations, 2291. Telephone lines, 21,336 kilometers; wires, 360,425. Post offices, 1957.

FINANCE. The monetary unit is the franc (par value 19.295 cents). Revenue and expenditure are given below in francs for three years:

	1909	1910	1911
Revenue.....	155,678,421	166,866,721	172,209,361
Expenditure...	158,842,817	161,330,520	172,461,307

The new basis of circulation, by which after 1911 only the net amounts of administration of posts and telegraphs are included in the totals, makes the revenue for 1911, 98,044,100 francs and the expenditure 98,296,046. Revenue from customs, 80,947,509; investments, 4,458,870; military, 4,404,585; posts, telegraphs, 3,751,374; railways, 81,499; real property, 1,993,338; industry and agriculture, 3,832,873; general administration, 98,668; etc. Expenditure on military, 44,777,894; interior, 16,866,864; industry and agriculture, 14,975,613; finance and customs, 8,515,698; debt charge, 7,108,367; justice, and police, 2,029,891; general administration, 1,414,809; political departments, 1,108,051; posts and railways, 539,211; etc. The debt stood, January 1, 1912, at 255,130,031 francs. The budget for 1913 is unofficially reported at 98,725,000 francs revenue and 103,155,000 francs expenditure.

ARMY. The Swiss army constitutes a federal militia in which there is liability for service of thirteen years in the Auszug, or Elite, eight in the Landwehr, and the remaining years, up to 48, in the Landsturm. The figures for January 1, 1912, were as follows: Auszug, 143,851; Landwehr, 60,575 men, making a total for the field army of 213,426 men. Of the Landsturm there were about 70,000 and for the complementary service 207,004. The instructional staff is the only permanent body in the Swiss military system which consists of cadres to be filled as required.

GOVERNMENT. The constitution of May 29, 1874, vests the executive authority in a federal council elected by the Federal Assembly, composed of two houses—a national council of 167 members directly elected for three years, and a

council of states of 44 members. The assembly also elects a president each year from among the members of the Federal Council, and a federal tribunal of 19 members and 9 supplicants for six years. President in 1913, E. Müller, chief of the political department; vice-president, Dr. A. Hoffmann, military department; interior, F. Calonder; justice and police, C. Decoppet; finance, G. Motta; commerce, etc., E. Schultess; posts and railways, Dr. L. Forrer.

HISTORY. The ratification of the Gothard Railway convention caused great agitation in Switzerland. The convention, it may be well to note, was drawn up on October 13, 1909, and subsequently ratified by Germany and Italy. It was bitterly opposed by the French cantons because it gave to Germany and Italy the treatment of "most favored nation" on Swiss railways, and might, it was feared, enable the Triple Alliance to dominate Switzerland, and by economic means to hold the Swiss confederation in vassalage. In spite of opposition, the National Council passed the convention on April 4 by a vote of 108 to 77, the Liberals of the German provinces voting in the affirmative, and the Democrats, Social Democrats, French, and Clericals constituting the minority. In the State Council the convention was approved by 33 to 9 votes. Indignation was widespread and active. In Bern a popular meeting of protest was attended by 100,000 persons, and it was announced that 125,000 signatures had been secured for a petition of protest. There were also circulating among the people petitions for proportional representation and for compulsory popular ratification of all long-term treaties. In March the Federal Assembly received a message from the Federal Council regarding the reorganization of the federal executive. Hitherto the conduct of foreign affairs had been subject to annual interruptions by the presidential elections; in the future the department of foreign affairs was to be under a more continuous management. The former department of industry and agriculture was transformed into a department of political economy. On December 11, Dr. Arthur Hoffmann, a Radical Democrat of St. Gall, was elected to be president for the year 1914, and Dr. Giuseppe Motta, an Italian Catholic-Conservative, was chosen as vice-president. For the Bern conference, see GERMANY.

SYKES, FREDERICK HENRY. An American scholar and educator, appointed in 1913 president of the Connecticut College for Women. He was born at Queensville, Ontario, in 1863; graduated from the University of Toronto; and was a student, scholar and fellow at Johns Hopkins University from 1891-95, receiving the degree of Ph.D. from that university in 1894. He was a member of Exeter College, Oxford, in 1899. For many years he was a teacher. He became professor of English and history at the Western University, London, Ontario, in 1895, and in 1897 was appointed staff lecturer of English literature for the American Society for the Extension of University Teaching. In 1903 he was appointed professor of English literature and director of extension teaching at Columbia University, and in 1910 became director of technical education at the Teachers' College in Columbia University, holding this position until his appointment as president of the Connecticut College for Women. He was also lecturer at Johns Hopkins University and the Brooklyn In-

stitute; the author of several books on English and composition; editor of various English texts, and general editor for the Scribner English Classics Series.

SYNDICALISM. This is the most radical of the modern labor movements. Begun in France, it derived its name from the French trade unions, or *syndicats*. Its representatives have within a few years spread its philosophy of the labor movement to England, South and Central Europe, Australia, and the United States. The American Industrial Workers of the World (q.v.) hold many similar doctrines which they developed quite independently. Syndicalism differs from trade unionism in that it would organize the workers by whole industries rather than by trades or crafts; thus all men engaged in railroading, or even in transport work of any sort would be brought into one mammoth body which would thus achieve control over the industry. To the theory of industrial unionism is added the policy of direct action. This is such action as brings immediate pressure upon the employer and is opposed to political action or the betterment of conditions through legislation and other governmental interference. Direct action includes the general strike and sabotage; the latter is the destruction or spoiling of materials, the choking of machinery and other crippling of the industrial processes so as to reduce or destroy the profits of the employer. In 1913 Syndicalist ideas were prominent in the Dublin strike and in those at Milan and Barcelona. They were preached by James Larkin through Great Britain and by Tom Mann, an Australian and British agitator who made addresses in the United States. See also GREAT BRITAIN, *History*; *INDUSTRIAL WORKERS OF THE WORLD*; *SOCIALISM*; *STRIKES*; and *TRADE UNIONS*.

The main feature of the year's history of Syndicalism was the flood of expository, critical, and apologetic literature called forth by the popular interest in a new and spectacular social philosophy. Among the recent works were the following: *Syndicalism and the General Strike*, by Arthur S. Lewis; *The New Unionism*, by André Tridon; *American Syndicalism—The I. W. W.*, by John Graham Brooks; *The Minimum Wage and Syndicalism*, by James Boyle; *Syndicalism*, by J. Ramsay MacDonald; *Syndicalism, Industrial Unionism and Socialism*, by John Spargo; *Worker and His Country*, by F. A. G. Ware; *Trial of a New Society*, by J. Ebert; *Sabotage*, by Emile Pouget. There was in addition a flood of explanatory periodical literature, for which consult the *Readers' Guide*.

SYPHILIS. See *INSANITY*, and *SALVARSAN*.

SYRACUSE UNIVERSITY. An institution for higher education at Syracuse, N. Y., founded in 1870. The students enrolled in all departments in 1913-14 were 38,000. The faculty numbered 278. In 1913 Dr. W. P. Coddington, professor of philosophy, died. He had been on the faculty since its foundation and was previously at Geneva College, the forerunner of Syracuse University. Among the benefactions received during the year was one of \$30,000 from Mrs. Russell Sage for the equipment of the Joseph Slocum College of Agriculture, and \$4000 for the University Y. W. C. A. The productive funds of the university amount to about \$2,000,000, and the income to about \$605,000. The library contains 92,000 volumes. The president is James R. Day, S.T.D., LL.D.

TAGORE, RABINDRA NATH. A Hindu poet, in 1913 awarded the Nobel Prize for literature. He was born in Calcutta in 1860, and spent his childhood years in that city. At the age of 17 he was taken to Europe to complete his education. After his return to India, he devoted most of his time to writing for magazines, particularly for a magazine conducted by his family. He became one of the best known journalists in India, and was also known as an educator, philosopher, religious teacher, and preacher. His first poems were romantic and sensual, but in later years a marked change took place, and these qualities were succeeded by idealism and spirituality. He wrote many poems which became extremely popular in India. His poetry has made an extraordinary appeal to his compatriots and has shown a strange power to move the hearts of the masses of Bengal. Although his native language is Bengali, he has attained an excellent English style, and the spell he casts over his countrymen has extended to alien and western peoples. The works of his that have been translated into English are *The Crescent Moon* (child poems), *The Gardener*, *Gitanjali*, *Song Offerings*, and *Sadhana: the Realization of Life*. See also NOBEL PRIZES.

TAIWAN. See FORMOSA.

TALL BUILDINGS. Financial conditions and general lack of activity in building in the larger cities of the United States were responsible for an apparent decrease in the number of skyscrapers under erection, or contemplated for the larger cities of the United States. It was thought by many that the erection of buildings of extreme height had been overdone from the standpoint of the investor, as regards their general effect on property and property values. Accordingly, throughout the United States there was general agitation in the larger cities towards restricting the height of buildings, and where building codes were being changed this found expression in discussion and, in some cases, in regulations adopted. The highest building yet to be designed was planned during the year by Francis H. Kimball and the plans were filed on December 31, 1913, in the building department of the Borough of Manhattan in the City of New York. It was evident that the filing of these plans was to forestall limitations of building height quite as much as with any view to the immediate erection of such a structure. The site selected was bounded by Broadway, Eighth Avenue, 57th and 58th streets, and the new building was to be 51 stories high, surmounted by a female figure with an extreme height of 804 feet 6 inches. The estimated cost of the building was \$12,500,000.

TANGIER. See MOROCCO, *History, The Spanish Zone*.

TANGO. The general movement of dancing in 1913 in the United States and European countries took the name of "tango," which comes from the Argentine Republic, and signifies a peasant dance in minuet time. From Argentina the tango was introduced into the Bohemian quarter of Paris, and later taken up by fashionable masters, and fitted for society. Thence it came to America. Its vogue in the United States began in April, 1913. The negroid one-step dances known as the turkey-trot, the bunny-hug, the grizzly bear, the Texas tommy and others had become so widespread in

New York City, that in early April, Mayor Gaynor ordered an investigation of dance halls where liquor was served. The inspectors found that the dance craze had grown so that young girls were dancing at all hours without restriction of manner or place, and that public dancing had in many cases degenerated into a mere orgy. Several of the so-called "tea-trotteries" were closed temporarily, 150 licenses revoked, and strict orders given for the dance halls to close promptly at 1 o'clock A. M. At about the same time, the turkey-trot, attacked by society people and the clergy, and investigated by students of sociology, suddenly came into bad repute.

Gradually a new form of one step took on the name of the new dance from Argentina which was at the time being exhibited by a number of professionals. But this new variety which was now popularly called the tango was entirely different from the Argentine dance; it differed from the old turkey-trot only in discarding the violent movements of the shoulders and waist, which had previously been considered so objectionable.

With the advent of the summer months, and its new name of tango, the expurgated one-step took on a new impetus. Expensive cabaret performers of 1912 were displaced by dancing masters in hotels and cafés, who taught the patrons to do the new dances; studios of the dance, run sometimes by experienced dancing masters or former vaudeville artists, were set up on all sides under the advanced scales of prices for instruction which ran as high as \$25 an hour. Many of their pupils after a few lessons constituted themselves teachers of the tango in all parts of the United States.

Under such unskilled instruction and the improvisations of many who, under the exciting stimulus of the new dances, danced for the first time, hundreds of variations crept into the one-step, and the tango came to mean anything except the old-fashioned waltz, two-step, and Boston. A few of the varieties were the maurice, castle-walk, tangle, dip, lame-duck, hesitation, aeroplane. So wide did variations in dances become, it was almost impossible for two people to dance together the first time except in a few of the simpler steps.

Meanwhile, the "tea-trotteries" had changed their names to become *thés dansantes* (tea-dances); dancing at meals was the vogue; and most of the large New York restaurants gave parts of their floor to the dancers. On the night of December 31 every important hostelry in the metropolis had provided space to dance the new year in. At this time the craze in the United States was at its height.

When, however, it had been discovered that the spirit of the turkey-trot had not changed with the change of name, agitation began anew for the reform of the tango. Investigations were conducted by the authorities of Chicago, Cleveland, and other smaller cities; the tango was forbidden in the Panama Canal Zone. Realizing that the trouble lay not in the dance, but in the close position of the dancers, an attempt was made by several New York society leaders to start a vogue for better dances such as the innovation. A convention of dancing masters in Chicago recommended a rule requiring six inches distance between partners. But neither of these movements was successful.

In New York dancing masters of reputation agreed an attempt should be made to standardize and eliminate all objectionable and useless varieties, and this for the first time cleared up in the popular mind what the genuine tango was. In December, the Argentine dance and with it the Brazilian maxixe were much danced in public, and by the end of the year were beginning to bid in popular favor against the one-step.

In May controversy raged in England about the tango. Though it was said to be opposed by Queen Mary, and denounced by other prominent people, it gained in popularity throughout the summer. Tango clubs were formed, and professionals were brought from Paris as instructors. By November the craze had reached its height in London. As in New York, dancing with dinner was popular, and many fashionable hotels afforded opportunities for it. Toward late December, the minuet form of dance gained favor, as it did in the United States at the same time.

In Paris there was a short reaction in August in favor of the quadrille, but interest revived in the tango again later in the year. October 25, M. Jean Richepin read a much discussed paper on the "Tango" before the five academies of the Institute of France. In part, he claimed that the tango was derived from the Pyrrhic games of the Greeks, testimony to which fact was borne out by sculptures in the British Museum, and on tombs at Thebes; and that there was also evidence from the writings of Pindar, Sophocles, Socrates, and Homer that a dance much like the tango existed in their time.

The tango met with most opposition in Germany, where in November, German officers in uniform were forbidden by the kaiser to dance it, and members of the ballet of the Royal Opera warned not to take part in entertainments at which it was permitted. The king of Bavaria issued a like order in December. But these decrees checked its spread little outside of official circles. It was danced in hotels; department stores in Berlin opened dance floors; and enormous prices were paid for instruction. A play called "The Tango Princess" had its *première* in Berlin, and the king of Denmark paid \$500 for a special impression of its music score.

The king of Italy was violently opposed to the tango, and forbade it at the state ball, December 30. The Pope left the regulation of this matter to his bishops. Most Catholic authorities, including Cardinal Farley, protested against indulgence in this dance on the part of their communicants.

Two recent books on dancing, each notable in its way, are: A. and V. Castle, *Modern Dancing* (New York), and T. and M. W. Kinney, *The Dance: Its Place in Art and Life* (New York).

TANNING BY NERADOL. See **CHEMISTRY, INDUSTRIAL, Synthetic Products.**

TARIFF. The enactment of the Payne-Aldrich law of 1909 was followed by the steady defeat of the Republican party and an increasing demand for a real reduction of duties. The tariff became the principal issue in national politics. Lines were clearly drawn, the Republican party defending the protective system and the Democratic demanding a tariff in which

protection should be subordinate to revenue. The Progressive party's position differed little from the Republican, but was somewhat more insistent on the need of revision. The Democratic party felt that it had received a clear mandate from the country to revise rates downward. Consequently the committee on ways and means of the House having held hearings in January, presented early in the special session, April 7, a bill containing their proposals. This was very largely the work of Chairman Underwood of that committee, Democratic House leader. Two weeks later there was issued House Report Number 5 (Sixty-third Congress, first session), giving a general survey of the tariff situation and a most elaborate and detailed comparison of rates and imports. This document was considered by economists and other experts one of the few great reports on public finance. It set forth the facts and principles on which the committee had revised the tariff schedules. Two general principles to produce revenue without the thought of protection; and, secondly, the attainment of this end without injury or destroying legitimate industry. The committee also sought to eliminate the production of profits and to cut off the duties which enabled manufacturers to exact a bonus without rendering a compensating service. Moreover, and perhaps most important of all, the committee sought to introduce in every line of industry a competitive tariff basis which would allow some importation and thus prevent the monopolization of the whole market except by the sale of better goods at lower prices.

Just what was meant by a competitive tariff was not perfectly clear, though it was doubtless intended to imply rates lower than those justified by the Taft principle of making rates so as to equalize costs of production. This latter principle might have been interpreted so as to barely preclude foreign competition, while the Democratic principle would make rates low enough so as to insure competition without destroying domestic production. In this connection the meaning of "legitimate" industry was also doubtful; but its use very clearly made possible such a reduction of rates and such a consequent increase of foreign importation that domestic production would cease.

The Democrats rejected every proposal to revise the tariff board as a means of arriving at a true level of rate making. They were thus charged with not producing a "scientific" tariff. But they had previously opposed the tariff board. There was thus a partisan element attaching to this history, and revision by schedule on the basis of tariff board findings would have met endless delay. It was determined therefore to make a complete revision at once on the basis of the best evidence obtainable, leaving to experience the suggestion for further change.

After a very notable contest in Congress a bill was passed and signed October 8. The vote in the House was 254 to 103, 4 Democrats voting against and 3 Republicans in favor. In the Senate the vote was 36 to 17, Senators La Follette and Poindexter voting for the bill and the 2 Democrat senators from Louisiana voting against it because it lowered the rates on sugar. The historical significance of this event was very great, because it very sharply reversed the tariff policy which had prevailed for half a cen-

tury. In the debates Chairman Oscar W. Underwood had stated that the average duty under the new law would be 26 per cent., the lowest imposed in 75 years. It was notable also because of the controversy part played by the Executive of the nation in its passage.

WOOL. One of the principal points of attack in the Payne-Aldrich law was Schedule K, the woolen schedule. In bills introduced in 1911 and 1912 the Democrats had proposed to reduce the tariff on raw wool to 20 per cent.; but in 1913 they boldly removed the duty entirely, admitting raw wool free. This step was defended by previous reports of the tariff board, and by the absence of arguments other than those derived from vested interest and extreme protectionism for maintaining the duty. It was felt also that this reduction would affect the cost of living.

This latter consequence was to be realized by the removal of the compensated specific duties on woolen cloth in the new tariff. Only *ad valorem* duties are retained on woolen goods. These are about 35 per cent., as compared with 50 to 55 per cent. plus the compensation duties previously. Actually, the previous rates ranged as high as 100 per cent. on goods imported and up to 140 or 150 per cent. on many other goods which were thus prohibited. Thus on goods which have been imported, the reduction would be about that from 95 per cent. to 35 per cent. Nevertheless, opinion greatly varied as to the effect on the prices of woolen goods. The duties on woolen yarns are 20 per cent.; on tops 15 per cent.; on carpets 20 to 35 per cent.; on woolen stockings 20 per cent.; on flannels 25-30 per cent.

COTTON. Another schedule which had been vigorously attacked during and following the Payne-Aldrich revision was that of cotton goods. The entire schedule was greatly simplified; and above all the combination of specific and *ad valorem* duties, which had been utilized to make the schedule integrate, misleading, and the means of special favoritism, was abolished. In the new rates a duty of 5 per cent. *ad valorem* is placed on cotton yarns of the lowest counts, and 25 per cent. on the best yarns. Cheapest cloths will pay $7\frac{1}{2}$ per cent., and fine grades 30 per cent. In the latter is included $2\frac{1}{2}$ per cent. imposed on all bleached, dyed, printed, or mercerized cloths. On hosiery the rates range from 20 per cent. to 50 per cent. Cotton knit goods will pay 30 per cent., as will all goods not included under special rates. But cotton gloves will pay 35 per cent.

SILKS. Here also was a schedule which had been intricate and often deceptive; and here also a system of specific rates or their combination with *ad valorem* rates was replaced by the *ad valorem* system. The general rate on silk fabrics was fixed at 45 per cent.; on velvets and plushes at 50 per cent. While these rates were lower than those of previous tariffs, they were considered sufficiently high so that little disturbance would be felt in the industry.

OTHER REDUCTIONS. On pottery and earthenware reductions were not decisive, being from 55 per cent. to 35 per cent., and from 60 per cent. to 40 per cent. on principal classes of pottery and earthenware, and from 55 per cent. to 50 per cent. and from 60 per cent. to 55 per cent. on the two chief classes of china and porcelain. These duties were believed to be sufficiently high

to afford substantial protection; they might have been lower and still have afforded protection, but produce more revenue.

In the iron and steel schedule the free list was increased and duties generally reduced. There were, however, no changes of great consequence on account of the commanding positions of the domestic industry.

The sugar duty was a cause of much controversy. In the tariffs of 1897 and 1899 the duty on the standard grade of sugar was $1\frac{3}{4}$ cents per pound. Under the new law the duty will be 1 cent per pound until May 1, 1916; but on sugar from Cuba it will be $\frac{1}{2}$ cent per pound. After May 1, 1916, sugar will be free. This three-year transition period was partly to avoid too sharp loss in customs revenue; and partly to give sugar producers time to accommodate themselves to new conditions. The cane sugar producers of Louisiana and the beet-sugar growers of other States vigorously emphasized their dependence on the tariff and the injustice involved in hastily destroying a large part of their great investments. It was expected that the new duty would result in considerable decline in importation from Hawaii and Porto Rico, but in larger shipments from Cuba and Java.

FREE LIST. The free list was made very extensive. It included wheat and wheat flour, except when imported from a country imposing a duty on American wheat and flour. Other food products included were: Cattle, swine, bacon, hams, fresh beef, veal, mutton, lamb, and pork; eggs, fish, milk and cream, oatmeal, potatoes, rye and rye flour, corn meal, bread. Many other food products had their rates greatly reduced. The free list also included flax, hides, leather, boots and shoes, lumber, coal, books, steel rails, iron ore, harvesting and other agricultural implements, cash registers, linotype and type setting machines, sewing machines, typewriters, and shoe machinery.

EXCLUSIONS. Two very notable exclusions under the new law were white phosphorus matches, the manufacture of which is attended by the disease known as "phossy jaw," or phosphorus necrosis; and aigrettes, osprey, and the feathers, heads, wings, and tails of wild birds. The principle of maximum and minimum duties carried out in 1909 was dropped. Instead the Secretary of the Treasury was authorized to add to the duties the amount of any grant or bounty given by a foreign country on goods exported therefrom.

REBATE TO AMERICAN SHIPS. The new law granted a rebate or discount of 5 per cent. of the duties on goods imported in American ships, with the provision that "nothing in this subsection shall be so construed as to abrogate or in any manner impair or effect the provisions of any treaty concluded between the United States and any foreign nation." This rebate was a disguise subsidy assigned to assist the American merchant marine. There were, however, seventeen treaties which forbade such discrimination. These countries and others had filed protests. The enforcement of this rebate was suspended following an opinion by the attorney-general that rebate could not be granted without impairing the stipulations of existing treaties and that consequently the sub-section by its own terms became imperative.

ADMINISTRATION. From the beginning of

American history the administration of tariff duties has been a serious problem. Every administrative system however carefully safeguarded and efficiently enforced has not succeeded in preventing fraud by shrewd and dishonest importers. The great changes in the rates in the Underwood act and especially the extensive reliance on *ad valorem* rates required great changes in administrative methods. The considerable lowering of the duties was naturally expected to reduce the temptation to fraud and evasion; but with *ad valorem* rates, instead of specific, fraud is relatively easy through undervaluation. Moreover, some of the duties exceed the rate of 25 to 30 per cent. which experience has shown to be the danger line in the *ad valorem* system. The new law therefore provides more certain penalties for fraud; it prohibits all litigation on contingent fees; it increases the powers of collectors; it provides that an importer suspected of fraud must either submit his books for inspection or, at the discretion of the Secretary of the Treasury, pay an additional duty of 15 per cent.; it increases the discretionary powers of the Secretary of the Treasury in other respects; and it makes provision for more accurate and better arranged statistics of foreign trade. In many details the administrative features were strengthened in the light of past experience, so that various practices making difficult the fixing of responsibility for fraud have been prevented. The very great increase in the discretion of the Secretary of the Treasury was a conspicuous feature of the administrative features of the new law. This was due to the severity of the penalties imposed by the act and the desire to permit an avoidance of undue harshness in enforcement. (See also CANADA, under *Tariff Debate*; FINANCIAL REVIEW; and GREAT BRITAIN, *passim*.)

TASMANIA. A state of the commonwealth of Australia. Area, 26,215 square miles. Population (census of April 3, 1911), 191,211, exclusive of full-blooded aboriginals. Hobart is the capital, with (1911) 27,505 inhabitants; population of the local government area, 27,526; with suburbs, 39,937. Governor in 1913, Sir William Grey Ellison-Macartney (appointed 1913). Premier, A. E. Solomon. See AUSTRALIA.

TAVIGNANO. See ARBITRATION, INTERNATIONAL.

TAXATION. In an unusual number of States special investigations bearing on taxation were begun or concluded during the year. Some of these were made by special commissions and others by recently created, but permanent, tax commissions. In Connecticut a special commission submitted a report on the taxation of corporations. In general this advocated the simplification of methods of taxing corporations by making gross earnings the general basis. With reference to the Connecticut practice of taxing railways according to market value of stock the commission found that high finance operations had resulted in such a decline in the market price of the principal railroad stock that taxes had decreased nearly \$400,000 in two years, 1910-12. The report analyzed matters of taxing express companies, telephone and telegraph companies, sleeping, parlor, and dining car companies, bank and trust companies, stock and mutual insurance companies, and building

and loan associations. It recommended that bank and trust companies and stock insurance companies instead of being taxed upon the market value of their shares be taxed upon the book values of such shares. Mutual insurance companies it would tax on the basis of income from investments and from premiums on Connecticut business. It would so adjust the rates on various companies that the yield under the new system would not at present vary much from the yield in the past. It found that the following rates on gross earnings were equivalent to one per cent. of true value of corporation property: Steam and electricity railways, 4.75 per cent.; car and telephone companies, 3.75 per cent.; telegraph companies, 3 per cent.; express companies, 2 per cent.; bank and stock insurance companies, 1 per cent. on book values; mutual insurance companies at 4 per cent. (but sinking to 3 per cent in eight years) upon computed incomes; savings banks and building and loan associations, 4 per cent. on taxable deposits and sums due members.

In 1912 a commission of five members submitted a report bearing mainly upon the general property tax. It found a lack of uniformity in assessments of different parcels in the same district and between different districts; an arbitrary and systematic assessment of personal property and public utility corporations; and a lack of coördination and responsibility. Although the total State and local revenue amounts to \$45,000,000 per year from property assessed at \$2,000,000,000 the commission found tax officials insufficiently paid, unprovided with proper equipment or records, and working independently in 500 different districts with little guidance or supervision. The commission therefore recommended a thorough revision of the tax assessing machinery so as to provide greater centralization and a definite location of responsibility. It would give the State board of equalization power to bring about uniformity throughout the State. It would create a State supervisor and a county assessor in each county, all of whom should be adequately paid. It would assess public utilities through the State board of equalization; it would exempt household furniture and personal effects and abolish the poll tax. It recommended the taxation of bank and trust companies by a uniform tax of 1 per cent. on capital surplus and undivided profits, with no deduction for exempt securities. Finally it would substitute a semi-annual for the present annual period for tax collections.

In Ohio numerous reforms were enacted on the basis of recommendations of the tax commission. A system of appointive county assessors and boards of review was substituted for the existing elective system. The so-called unit rule previously applicable to public utilities was extended to all corporations, but the franchise tax on capital stock was unchanged. Mortgage loans were made subject to taxation without deduction of indebtedness and mortgages on real estate of domestic corporations were made taxable where the property is located. Moreover, residents are to be taxed on similar investments outside of the State. In either case mortgaged property is to be taxed without reduction. Assessing officers are given increased powers of inspection and inquisition. Real estate is to be assessed annually instead of quadrennially. The State tax commission

is to equalize valuations of personal property as well as of real estate.

The Arizona tax commission in its first report set forth the abuses and inequalities of the existing taxes. It showed the necessity of new laws to enable the commission to equalize assessments between counties. The subject of mine taxation was dealt with extensively, the commission being unable to agree as to the best method of taxation. The majority favored the classification of all produce houses on a graduated scale, their annual assessable value to be based on both gross and net output. The mining men themselves held conferences on the same subject, but likewise failed to reach a harmonious conclusion. The matter was then taken up by the State legislature.

FEDERAL INCOME TAX. In 1909 Congress adopted a resolution proposing an amendment to the Constitution authorizing Congress to levy a tax on income "from whatever source derived, without apportionment among the several States and without regard to any census or enumeration." By the beginning of the year this amendment had been ratified by thirty-four out of the necessary thirty-six States; and early in the year it was approved by several more. When therefore the Democrats took up the problem of tariff revision and were confronted with the practical certainty that a decided revision downward would result in a decrease of customs receipts, they found this new constitutional amendment almost essential. They consequently embodied in the tariff revision law sections levying an income tax.

The new act applies to all citizens of the United States, whether at home or abroad, resident aliens, and in some instances to non-resident aliens. It provides a "normal" and an "additional" income tax. The normal tax applies to incomes above \$4000 for a married person living with wife or husband, and above \$3000 for all other persons, and levies thereon a tax of one per cent. Incomes are computed for the calendar year. An "additional tax" of one per cent. is levied on the amount by which any income exceeds \$20,000; of two per cent. on the amount above \$50,000; of three per cent. on the amount above \$75,000; of four per cent. on that above \$100,000; of five per cent. on that above \$250,000; and of six per cent. on that above \$500,000. This means for large incomes that the first \$20,000, less the exemption of \$3000 or \$4000, will be taxed one per cent.; the next \$30,000 will be taxed two per cent.; the next \$25,000, three per cent.; the next \$25,000, four per cent.; the next \$150,000, five per cent.; the next \$250,000, six per cent.; and all income above that point seven per cent. In this manner the principle of progressive taxation is realized. Indeed by many the tax was criticised as being a rich man's tax. Careful estimates of yield of the tax were \$125,000,000, but some estimates were much below that figure.

Incorporated in the new law is the one per cent. tax on the net incomes of corporations as provided under the corporation or excise tax, passed in the Taft administration. This one per cent. on the dividends which corporations distribute to stock holders is accompanied by a provision that the taxable incomes of individuals under the normal tax shall not include dividends from stock. This corporation tax covers also insurance companies; but see **INSURANCE**.

Foreign corporations are taxed on net income derived from business in this country.

Following the British system effort was made to apply the principle of collecting the tax on incomes at their sources. This has the advantage of greater certainty of reaching taxable incomes, because it reduces to a minimum the opportunities for evasion. The application of this principle, however, in the American law is considerably reduced in extent because of the large exemption and because the progressive principle requires from all persons whose incomes exceed the minimum exemption a declaration of their total income. Under the stoppage-at-source principle any person or corporation making payments of more than \$3000 in interest, rent, salary, or otherwise to any one person in any one year must in each instance deduct the normal tax and pay it to the tax collector. An exception to this general rule is that of dividends paid by corporations, since these are reached by the tax on the earnings of corporations above referred to. Moreover, every interest payment by a corporation, whether more or less than \$3000, is taxed one per cent. Thus corporation bond holders will be taxed on the interest from their bonds regardless of their total incomes. Some corporations guarantee to purchasers the interest on their bonds free from taxes. The new law contained a proviso intended to prohibit any future issue of corporation bonds from guaranteeing exemption from the income tax. The act provides that incomes taxed at the source must be fixed or determinable. This will undoubtedly prove a source of considerable difficulty in administration, because in the course of a year the payer of income as well as its recipient may change at least once. As regards income from investments in foreign countries, the law provides for the deduction of the tax by "any banker or person who shall sell or otherwise realize coupons, checks, or bills of exchange drawn or made in payment of any such interest or dividend." The law requires that every individual, firm, or corporation must make a return covering payments by them on which the tax has been deducted, giving if possible the name and residence of the person to whom such payments are made; except that no such return need be made when such payment of income is less than \$3000.

In order to secure the exemption of \$3000, or in case of a married person of \$4000, the tax payer must himself take the initiative. He may either forestall the deduction of the tax or he may secure a refund of the tax after it has been collected. In order to forestall the retention of the tax as regards exempted income all that is required is "to file with the person who is required to withhold and pay the tax for him, a written notice claiming the benefit of such exemption." In order to forestall the retention of the tax on any income offset by allowable deductions on account of business expenses, interest on indebtedness, taxes, losses, dividends, and the like, the tax payer must file "a true and correct return of his annual gains, profits, and income from all other sources and also the deductions asked for." The tax returns are due March 1 for the preceding calendar year, and claims for deductions must be filed not less than thirty days previous. Notice of amount of tax assessed

will be given by the collector by June 1, and the tax must be paid by June 30.

Income exempted includes interest on bonds of the United States, States, and other political subdivisions; salaries of President Wilson and Federal judges in office October 3, 1913; and salaries of officers and employees of any State or political division thereof, except such salary as may be derived from the Federal government.

One of the great objections to an income tax has been its inquisitorial nature. The stoppage-at-source principle is designed to remove this obnoxious feature by relieving persons from the necessity of declaring their total incomes. In general the act provides that every person with an income of \$3000 or over must make a return under oath of their gross income from all sources and the total deductions therefrom for expenses and allowances authorized by the law. Such gross income would include income already taxed at the source or in transit. But persons liable to the normal tax only need not declare dividends received from corporations or insurance companies. Moreover, a person whose entire income has been taxed at the source need make no declaration. These two exceptions to the general rule that a return must be made will not, it is evident, exempt any considerable proportion of tax payers from making a personal declaration, so that the inquisitorial nature of the tax remains. The additional tax will in every instance be levied on the basis of personal returns and collected direct from the tax payer. In all such cases, therefore, the stoppage-at-source principle does not apply, and the inquisitorial feature remains. Penalty for refusing or neglecting to make a return is not less than \$20 nor more than \$1000. For making a fraudulent return a person may be fined as much as \$2000, or imprisoned for one year, or both.

WISCONSIN. The report on the progressive tax of Wisconsin showed that the first year's yield was about \$3,500,000. This law, effective in 1912, was formulated by the best scientific experts of the State, and its administration was placed in the charge of Mr. K. K. Kennan, the author of an inductive study of forty systems of income taxation. It exempted all the more intangible forms of personality; made extensive use of the stoppage-at-source principle whereby the tax is extracted before the income reaches its owner; taxed corporations under a separate schedule on their earning power; and distributed the revenue from the tax as follows: To the county, 20 per cent.; to the village, town, or city, 70 per cent.; and to the State for administrative purposes, 10 per cent. In 1912 about two-thirds of the yield came from 5535 corporations. Of these corporations about 72 per cent. were assessed at 6 per cent., the highest rate authorized by the law.

TELEPHONY. A notable telephonic achievement in 1913 was the demonstration by actual test of the feasibility of transcontinental transmission of speech. The Bell company announced its intention of furnishing regular service of this nature at the time of the San Francisco exposition in 1915, and had done much of the construction of the final link in the transmission lines between Denver and San Francisco. Twin circuits of No. 8 wire were being installed, each loaded with Pupin coils. These two circuits were used jointly to constitute a third or phantom circuit, which was of very high transmission efficiency. Important changes in long-distance service were expected to follow the concessions made by the Bell interests whereby the latter propose to give up the control of the Western Union Telegraph Company, to refrain from seeking domination over competing lines and to open their lines to connection with those of independent companies. This policy was believed by many to be a concession to the active campaign of agitation in favor of the governmental ownership of long-distance lines. A bill authorizing such action was introduced into Congress by Representative Lewis.

The broadening field of telephony was evidenced in the great growth of private systems, many of them on a very large scale. Telephony was rapidly replacing telegraphy in train dispatching. Among its great advantages were the quickness with which any or all stations may be called and the fact that station men need not be expert telegraph operators. The St. Louis and San Francisco Railroad, anticipating a strike of 1100 operators, converted 400 stations for telephonic dispatching in practically a single day. A dispatching line 110 miles in length was installed along the reconstructed Erie Canal and greatly facilitates the movement and locking of boats. Over 4000 miles of telephone line was built by the United States Forest Service to assist in fire protection. Recently-built steamships and railroad trains of the highest grade were equipped with private systems and make outside connections at wharves and stations.

Automatic and semi-automatic telephony continued to make its chief advances in the government-owned systems of Europe. American engineers generally held to the opinion that human intelligence was necessary to the best handling of traffic. Many American exchanges were equipped with automatic switches which distribute incoming calls among the operators. In other cases the switchboards were equipped with multiple answering jacks to permit any one of numerous operators to handle any incoming call. Notable European installations of semi-automatic systems were made in Amsterdam, Posen, and Zürich, the latter for 8000 lines. Notable installations of automatic equip-

ment were made at Marseilles, Nice, The Hague, Rome, and Munich, the last for 10,000 lines.

The year 1912 was marked by the completion of the last link in the notable underground system between Washington, D. C., and Boston. The total cost of the system was over \$5,000,000, and the total weight of the cable laid 8700 tons. (See also WIRELESS TELEGRAPHY AND TELEPHONY.)

TELESCOPES. See ASTRONOMY.

TEMPERANCE ACT, SCOTTISH. See GREAT BRITAIN.

TENNESSEE. POPULATION. The population of the State in 1910 was 2,184,789. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 2,238,128.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

		Acres	Prod. Bu.	Value
Corn	1913	3,350,000	68,675,000	\$52,880,000
	1912	3,332,000	88,298,000	53,862,000
Wheat	1913	700,000	8,400,000	8,232,000
	1912	674,000	7,077,000	7,077,000
Oats	1913	300,000	6,300,000	3,339,000
	1912	258,000	5,599,000	2,632,000
Rye	1913	17,000	204,000	202,000
	1912	17,000	196,000	192,000
Potatoes ...	1913	38,000	2,432,000	2,359,000
	1912	38,000	3,344,000	2,341,000
Hay	1913	900,000	21,089,000	17,642,000
	1912	888,000	1,154,000	18,233,000
Tobacco ...	1913	90,000	664,800,000	5,443,000
	1912	110,000	72,600,000	5,155,000
Cotton	1913	872,000	c 375,000	22,803,000
	1912	783,000	276,000	16,416,000

a Tons. b Pounds. c Bales.

MINERAL PRODUCTION. The total value of the mineral products of the State in 1912 was \$19,362,209, compared with \$17,899,882 in 1911. Tennessee produces copper in important quantities. The production of blister copper in 1912 was 18,395,256 pounds, a small reduction from the production of 1911, which was 18,965,143 pounds. The entire output of the State is from the Ducktown district, located in the extreme southeastern part of Polk County. This district was one of the earliest large producers in the country. At the close of 1912 the total output of the district had been approximately 249,055,000 pounds.

The production of iron ore in the State in 1912 was 416,885 long tons, compared with 463,835 in 1911. The production of pig iron in the State in 1912 was 338,238 long tons, compared with 324,648 in 1911.

The production of coal in the State in 1913 is estimated by the United States Geological Survey at from 3 to 5 per cent. greater than in 1912. The total coal production of the State in 1912 was 6,473,228 short tons, valued at \$7,379,903. This was an insignificant increase over the production of 1911, which was 6,433,156 tons. The coal mines of the State gave employment to 10,309 men for an average of 234 days in 1912, getting 10,703 men for 232 days in 1911. In 1912 the quantity of coal made into coke by the mines was 447,413 short tons, which included 390,994 tons of washed coal. The coal mines were practically free from labor troubles in 1912. There were 18 fatalities in coal mining in 1912, of which 17 occurred un-

derground. Of these 14 were caused by falls of roof and coal. In 1911 115 men lost their lives, 84 by explosions. The total value of clay products in the State in 1912 was \$1,501,016, an increase of \$115,116 over 1911. The principal clay product is common brick.

Drilling for petroleum was active in many parts of the State during 1912, and indications were favorable for obtaining it in the neighborhood of Franklin.

TRANSPORTATION. On January 10, 1913, there were 45,026 miles of steam railway in the State. The electric and interurban railway mileage was 367.

EDUCATION. The total school population of the State on June 30, 1913, was 597,718. Of these 484,238 were white, and 113,480 colored. The total enrollment in the county schools of the State was 439,854, of whom 371,948 were white, and 78,222 colored. In the city schools there was an increase of 95,847, of whom 69,399 were white, and 26,448 colored. The total expenditure for educational purposes during the year was \$5,866,870.

FINANCE. The report of the State treasurer for the biennial period 1910-12 shows a balance at the beginning of the period of \$317,270. The receipts amounted to \$8,735,768, and the expenditures to \$8,267,218, leaving a balance for 1912 of \$785,120. The bonded debt of the State on September 20, 1912, amounted to \$15,218,600.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State include the Tennessee Industrial School, at Nashville; the Old Soldiers' Home, at Nashville; Tennessee School for the Blind; Tennessee Reformatory for Boys, at Nashville; the Deaf and Dumb School, at Knoxville; the Central Hospital for the Insane, at Nashville; Western Hospital for the Insane, at Bolivar; and the Eastern Hospital for the Insane, Knoxville.

POLITICS AND GOVERNMENT. There were one regular and two special sessions of the legislature in 1913. The measures enacted at the regular session will be found in the paragraph *Legislation* below. Special sessions were called for the purpose of considering bills for the enforcement of the prohibition law in the State. The incidents and results connected with these sessions will be found discussed at some length in the article *LIQUOR REGULATION*. The legislature on April 1 ratified the amendment for the popular election of United States senators. There was no election for State offices in 1913, as the term of Governor Hooper does not expire until January 1, 1915. The next election will be held on November 3, 1914. The legislature on January 23 elected John Knight Shields, Democrat, of Bean Station, United States senator to succeed Senator Robert L. Taylor, who died early in 1912. On January 24 the legislature elected Prof. W. R. Webb, Democrat, to fill out the term which expired March 4, to which Hon. Newell Sanders, Republican, had been appointed by Governor Hooper. The election of Shields resulted only after a deadlock in the legislature which lasted for several weeks. On the last ballot he received sixty-six votes and Charles T. Gates, Jr., sixty-four. Owing to the condition of the finances of the State because of a failure to provide for refunding the State debt, it was necessary to issue short term notes to provide for State expenses. Bills providing for such

issues were passed on June 20, and notes were payable on July 1. Owing to the condition of the money market, it was necessary to pay nearly 7 per cent. interest on these notes. There were violence and disorder accompanying the attempt to pass measures for liquor law enforcement at the special session held in September. It was necessary to station armed guards in the Capitol, and on September 24 a riot nearly resulted from a clash of the partisans. The law enforcement bills were finally passed.

LEGISLATION. The legislature met in 1913 and enacted several important measures. Among these were the following: An act providing for the parole of convicts, a measure creating a department of workshop and factory inspection, and a measure removing the disabilities of married women on account of coverture, a vital statistics act, and an act giving a railroad commission authority to regulate telephone rates. See also **LIQUOR REGULATION.**

STATE GOVERNMENT. Governor, Benjamin W. Hooper, Rep.; Secretary of State, R. R. Sneed, Dem.; Treasurer, W. P. Hickerson, Dem.; Commissioner of Agriculture, T. F. Peck, Rep.; Superintendent of Education, S. H. Thompson, Dem.; Comptroller, George P. Woollen, Dem.; Adjutant-General, Frank Maloney, Rep.; Attorney-General, F. M. Thompson, Dem.; Commissioner of Insurance, J. William Taylor, Rep.

JUDICIARY. Supreme Court: Chief Justice, M. M. Neil, Dem.; Justices, A. S. Buchanan, Grafton Green, S. C. Williams, and D. Lansden; Clerk, Joe J. Roach—all Democrats.

STATE LEGISLATURE, 1913. Democrats: Senate, 18; House, 52; joint ballot, 70. Republicans: Senate, 6; House, 27; joint ballot, 33. Independents: Senate, 9; House, 20; joint ballot, 29. Democratic majority: Senate, 3; House, 5; joint ballot, 8.

The names of senators and representatives to Congress will be found in the article, **UNITED STATES, section Congress.**

TENNESSEE, UNIVERSITY OF. A State university of higher learning, at Nashville, Tenn., founded in 1874. The number of students enrolled in the several departments in the autumn of 1913 was as follows: College of medicine, 320; college of dentistry, 42; college of pharmacy, 14; college of liberal arts, 508; college of law, 31. The faculty numbered 164. In 1913 the chairs of history and economics were separated, and a professorship of economics was added. The productive funds of the university amount to about \$425,000, and the income in 1912-13 to \$238,888.

TETANUS. The *Journal of the American Medical Association's* eleventh annual summary of Fourth of July injuries indicated a still further reduction in the number of fatalities in the country as a whole, there being only thirty-two deaths from fireworks in 1913, as against forty-one in 1912, and only 3 of these were due to tetanus, as compared with 6 last year. This is in remarkable contrast to the 125 deaths from tetanus in 1909, and the 406 in 1903. The total number of casualties, however, was somewhat greater in 1913, viz., 1163, as compared with 988 last year. It was interesting to note, however, that over 40 per cent. of all casualties occurred in Pennsylvania, which reported 491 injuries, including nine deaths; and that of this total 340 or nearly 70 per cent. occurred in the city of Philadelphia, although

during the last few years a vigorous campaign against the use of fireworks had been waged by some of the city's most progressive citizens. In Philadelphia the celebration of Independence Day had degenerated, according to the *Journal*, into a "disgraceful demonstration of lawlessness and disorder." Outside of Pennsylvania there were only 672 casualties, and only one other State (New York) reported more than one hundred injuries.

TEXAS. POPULATION. The population of the State in 1910 was 3,896,542. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 4,171,997.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1913	6,800,000	163,200,000	\$133,824,000
	1912	7,300,000	153,300,000	98,112,000
Wheat ...	1913	780,000	13,650,000	12,831,000
	1912	735,000	11,025,000	10,253,000
Oats	1913	1,000,000	32,500,000	16,575,000
	1912	865,000	31,140,000	13,390,000
Rye	1913	2,000	30,000	30,000
	1912	2,000	33,000	36,000
Rice	1913	303,000,000	9,696,000	8,339,000
	1912	265,600	9,429,000	8,863,000
Potatoes...	1913	45,000	2,340,000	2,621,000
	1912	50,000	2,850,000	3,591,000
Hay	1913	400,000	4,464,000	5,475,000
	1912	387,000	5,422,000	5,637,000
Tobacco...	1913	200	120,000	26,000
	1912	200	140,000	24,000
Cotton.....	1913	12,072,000	68,930,000	216,574,000
	1912	11,338,000	4,880,000	268,883,000

c Tons. b Pounds. c Bales.

MINERAL PRODUCTION. The total value of the mineral products of the State in 1912 was \$22,797,015, compared with \$18,798,837 in 1911.

The total coal production in 1912 was 2,188,612 short tons, valued at \$3,655,744. Of the coal produced, about 1,000,000 tons is lignite. The production of 1912 was the maximum both in tonnage and value, compared with 1911, which shows an increase of 214,019 short tons. The number of men employed in the coal and lignite mines of the State in 1912 was 5127, compared with 5333 in 1911. In 1912 each man worked an average of 230 days, compared with 226 days in 1911. The coal mines of the State were practically free from labor troubles in 1912. There were no fatal accidents underground in the coal or lignite mines in Texas in 1912, though one man was killed in the shaft, and one on the surface. The death rate was the lowest in the country with the exception of North Dakota.

The value of the clay product in the State in 1912 was \$2,886,068, an increase of \$226,149 over 1911. The principal product was common brick.

PETROLEUM. Texas oil fields comprise a part of the Gulf oil fields, which include the fields of Texas and Louisiana. The production in Texas in 1912 was 11,735,057 barrels, compared with 9,526,474 barrels in 1911; an increase of over 23 per cent. Of the production of 1912, 6,459,528 barrels came from the coastal fields, and 5,275,529 barrels from the northern fields. The interest centred in 1912 in the high-grade oils found in the Electra fields in Wichita

County, and the Petrolia field in Clay County on the northern edge of the State.

TRANSPORTATION. The mileage of steam railroads in the State on June 30, 1913, including main lines, branches, and spurs, amounted to 15,283 miles, compared with 14,940 miles on the same date in 1912.

EDUCATION. The total number of children of school age in the State on September 1, 1912, numbered 1,017,133, of whom 812,896 were white and 204,237 were colored. There were 79,491 Mexican children and 29,345 Germans.

FINANCE. The report of the State treasurer for the fiscal year ending August 31, 1912, showed a cash balance at the beginning of the year of \$413,124. The receipts for the fiscal year amounted to \$18,119,072, and the disbursements to \$17,963,122, leaving a balance on hand on September 1, 1912, of \$793,417. The chief sources of revenue are from taxation and the chief expenditures are for education and the support of State institutions.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions under the control of the State include the State Blind Institute, the State Deaf and Dumb Institute, the State Lunatic Asylum, the Southwestern Insane Asylum, at San Antonio; the North Texas Insane Sanitarium, at Terrell; the Confederate Home, at Austin; the Deaf, Dumb, and Blind Institute, at Austin; the Epileptic Colony at Abilene; the State Orphans' Home, at Corsicana, Texas; the State Industrial School for Boys, at Gatesville; the Confederate Women's Home, at Austin; and the State Tuberculosis Sanitarium, at Carlsbad.

POLITICS AND GOVERNMENT. The legislature met in 1913 and the most important measures enacted will be found in the paragraph *Legislation* below. There was no election for State officers during the year as the term of Governor Colquitt does not expire until January 1, 1915. The next State election will be held November 3, 1914. The resignation of Senator Bailey, in December, 1912, made it necessary to delay the appointing of a successor until the legislature should take action. The governor on January 4 appointed R. M. Johnston, editor of the *Houston Post*, to fill out the unexpired term. On January 29 Morris Sheppard was elected United States senator. The legislature, on February 8, ratified the constitutional amendment providing for the direct election of senators. There was great uneasiness along the border of the State during the year as a result of conditions in Mexico. Incidents connected with this situation are mentioned in the article *MEXICO*. There were heavy floods in the State in October and December. On October 2 a flood in the southern part of the State caused the death of 12 persons and damaged property and crops to an estimated amount of more than \$50,000,000. In December, river floods due to heavy rains caused much loss of life and property. Many hundreds of persons were drowned, and there was a property loss of over \$6,000,000. It was estimated that 20,000 persons lost their homes. The Trinity, Brazos, and Colorado rivers rose above their banks, and many smaller streams were swollen. In a district 200 miles long and 100 miles wide all the lowlands were under water. At Fort Worth a levee was destroyed by dynamite to save a bridge. Many lives were saved by the action of telephone girls who re-

fused to leave their switchboards, although menaced by the rising waters.

LEGISLATION. Among the important measures passed were the following: Laws for suspended and indeterminate sentences for criminal cases, and parole of convicted persons; amendments to the community property law; a measure providing for presidential primaries in the State; an act creating a bureau of child and animal protection; an eight-hour day for workmen on public works; a law incorporating a rural credit association; a measure providing a 10-hour day and 54-hour week for women in certain employments; several laws relating to tuberculosis; a measure permitting cities of less than 5000 inhabitants to adopt a commission form of government; and an act providing for the submission to the people of a constitutional amendment providing for the initiative and referendum. See also *LIQUOR REGULATION*.

STATE GOVERNMENT. Governor, Oscar B. Colquitt; Lieutenant-Governor, Will H. Mayes; Secretary of State, F. C. Weinert; Attorney-General, Benjamin F. Looney; State Treasurer, J. M. Edwards; Comptroller, W. P. Lane; Superintendent of Public Instruction, W. F. Doughty; Land Commissioner, J. T. Robinson; Commissioner of Agriculture, Edward R. Kone—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, Thomas J. Brown; Associate Justices, N. Phillips and W. E. Hawkins; Clerk, F. T. Connerly—all Democrats.

STATE LEGISLATURE, 1913. Democrats: Senate, 30; House, 108; joint ballot, 138. Republicans: Senate, 1; House, 1; joint ballot, 2. Democratic majority: Senate, 29; House, 107; joint ballot, 136.

The names of senators and representatives to Congress will be found in the article *UNITED STATES*, section *Congress*.

TEXAS, UNIVERSITY OF. A State institution for higher education, founded at Austin, Tex., in 1883. The total enrollment in all departments of the university in 1912-13 was 2250. The faculty numbered 130, which does not include tutors and student assistants. There were no noteworthy changes in the faculty during the year and no important benefactions were received. The institution is supported almost entirely by State appropriations. The productive funds amount to about \$2,000,000, and the total income to about \$625,509. The library contains about 80,000 bound volumes and about 30,000 pamphlets.

TEXAS FEVER. See *VETERINARY SCIENCE*.

TEXTILE MANUFACTURING. The various textile industries managed to hold their own during the year 1913 despite the agitation of the tariff and business disquiet. The tariff on wool was to come into effect January 1, 1914, reducing the duty materially. (See *TARIFF*.) While the American mills manufacturing wool and worsteds had been able to supply the market for 1913 and 1914, yet some fear was manifested whether this could be continued, and many manufacturers were making careful examinations of their plants and providing new and improved equipment in order to reduce the cost to the lowest possible point and thus compete with European manufacturers. In the cotton industry it was the consensus of opinion that Americans could hold their own without difficulty except in the highest grade of goods.

According to the annual statistics of new mill construction the *Textile World Record* of Boston reported a construction for 1913 of 277 new plants, as compared with 265 in 1912.

In the cotton industry the tendency during the year was toward strengthening existing organizations and extending and improving old established plants rather than toward launching new enterprises. The location of new cotton mills in 1913 was characterized by a wider distribution of the industry, and this was welcomed as indicating a tendency that should be encouraged in order to check the evils of industrial concentration. This is shown in the accompanying table:

NEW COTTON MILLS			
	No.	Spindles	Looms
New England States:			
Maine	1	75,000	2,000
Massachusetts	3	6
New Hampshire.....	1	50
Rhode Island.....	2
Total	7	75,000	2,056
Southern States:			
Alabama	3	45,000	1,200
Georgia	1	20,160	700
North Carolina.....	8	90,600	1,280
South Carolina.....	1	20,000	500
Virginia	1	75,000	2,200
Total	14	250,760	5,880
Middle States:			
Arkansas	1	7,000	104
Pennsylvania	5	72
Total	6	7,000	176
Grand total.....	27	332,700	8,112

New woolen and worsted mills constructed in 1913 totaled 24, as compared with 23 in 1912 and 17 in 1911. These were distributed as follows:

New woolen and worsted mills, 1913—New England: Connecticut, 1; Maine, 1; Massachusetts, 4; Rhode Island, 1; Vermont, 1. Middle States: New York, 2; Pennsylvania, 11; Indiana, 1. Western States: California, 1; Wisconsin, 1. Total, 24.

The number of new knitting mills was the largest on record and was largely due to the substitution of knitted articles of outer apparel for the products of clothing manufacturers. The total for 1913—142 new mills—may be compared with 112 in 1912, and 113 in 1911.

New knitting mills, 1913—New England: Connecticut, 2; Massachusetts, 4; New Hampshire, 1. Middle States: Maryland, 1; New Jersey, 8; New York, 18; Pennsylvania, 59. Western States: California, 4; Illinois, 3; Indiana, 3; Michigan, 3; Ohio, 3; Michigan, 3; Ohio, 3; Oklahoma, 1; Oregon, 1; Utah, 2; Wisconsin, 4. Southern States: North Carolina, 17; South Carolina, 1; Tennessee, 6. Total, 142.

In the silk industry 54 new mills were reported in 1913, as compared with 47 in 1912, and 38 in 1911. The distribution by States and products follows:

New silk mills, 1913—Connecticut, broad silks, 1; braids, 1; Illinois, neckwear, 1; Massachusetts, braids, 1; New Hampshire, ribbon, 1; New Jersey, broad silks, 10; throwings, 6; ribbons, 5; New York, broad, 2; trimmings, 5; Pennsylvania, broad, 5; ribbon, 7; throwing, 5;

raw, 3; Rhode Island, broad silks, 2; Virginia, broad silks, 2; West Virginia, throwing, 1. Total, 54.

THOMAS, CHARLES SPALDING. An American public official elected in 1913 United States senator (Democrat) from Colorado. He was born in Darien, Ga., in 1849, but early in his boyhood removed to Michigan. He studied law in the University of Michigan, receiving his degree in 1871. In the same year he began the practice of law in Denver, where he continued until 1879, when he removed to Leadville, remaining until 1885. In that year he returned to Denver, where he became senior member of the law firm of Thomas, Bryant, and Lee. From 1884-96 he was a member of the Democratic national committee. In 1899 he was elected governor of Colorado and served in this office until 1901.

THOMPSON, WILLIAM HOWARD. United States senator (Democrat) from Kansas. He was born in Crawfordsville, Ind., in 1871. In 1880 he removed to Kansas and settled in Nemaha County. He has been active in the affairs of the State from early manhood, and has filled various positions of honor. He is the author of a number of legal articles on judicial reform. He was elected district judge at the age of thirty-four years, and held this position when he was elected senator.

THUREAU-DANGIN, PAUL MARIE PIERRE. A French historian, died February 24, 1913. He was born in Paris in 1837. He received his early education in Paris and practiced law in that city for several years. He first became known as a writer through his contributions to *Le Français*. His first historical book was a treatise on Poland. This was followed by more important works which treat of the periods of the Revolution, the Restoration, and the reign of Louis Philippe. As a historian he was a conservative and a monarchist. In 1893 he was made a member of the French Academy, and the last of his works, *History of the July Monarchy*, was twice awarded the Gobert prize by the Academy, as the various parts of the work, which is in several volumes, appeared. He was elected perpetual secretary of the Academy. In addition to the works already mentioned, he wrote: *Paris During the French Revolution* (1872); *Royalists and Republicans* (1874); *The Church and State under the July Monarchy* (1879); *The Liberal Party under the Restoration* (1876).

THWAITES, REUBEN GOLD. An American historian and educator, died October 22, 1913. He was born in Dorchester, Mass., in 1853, and was educated in the common and high schools of that city. He took post-graduate courses at Yale University in 1874-75. In 1876 he became managing editor of the *Wisconsin State Journal*, holding that position until 1886. From the latter year until his death he was secretary and superintendent of the State Historical

Society of Wisconsin. He devoted part of his historical researches to the periods of the settlement of the Middle West and of the French discoveries. He edited in seventy-three volumes a monumental work, *The Jesuit Relations*, and *Early Western Travels* in twenty volumes. These compilations contain material of the greatest value to the historian. In addition to his editorial work he organized the great historical library at Madison, Wis. He was the author of: *Down Historic Waterways* (1888); *The Story of Wisconsin* (1890); *The Colonies, 1492-1750* (1891); *On the Storied Ohio* (1897); *Father Marquette* (1902); *Daniel Boone* (1902); *France in America* (1905); and numerous monographs on the history of new France and the Middle West. He edited in addition to books named above: *The Wisconsin Historical Collections* (from vol. xi. to vol. xix., 1888-1911); *Chronicles of Border Warfare* (1895); *Original Journals of Lewis and Clark* (1905); *Revolution on the Upper Ohio* (1908); *Frontier Defenses on the Upper Ohio* (1911).

THYROID EXTRACT. See EPILEPSY.

TIBET. A Chinese dependency in central Asia. The area is estimated at 756,000 square miles and the population at 2,000,000. Lhasa, with an estimated population of from fifteen to twenty thousand, is the capital and the home of Buddhism. Tibet imports from India cotton and woolen goods and grain, in exchange for borax, salt, and musk; wool and ponies are important exports. Total trade, 1912-13, about £281,000. Gold is said to exist in workable quantities. The country has been the object of numerous conventions between Great Britain and China, Tibet, and Russia. The Dalai Lama returned in June, 1912, to Lhasa after an absence of a year in India, during which time he had been declared deposed by China. Great Britain interfered with the expedition of Chinese troops to reduce the Tibetans to subjection, and the British minister at Peking protested against Chinese interference in the internal administration of Tibetan affairs. The Chinese garrison stationed at Lhasa was withdrawn, and by March, 1913, all Chinese officials had left Tibet. The future character of Chinese-Tibetan relations was the subject of a conference between representatives of the British, Chinese, and Tibetan governments, who met at Simla in October, 1913.

TICK, CATTLE. See VETERINARY SCIENCE under *Texas Fever* and *Cattle Tick*.

TIME, STANDARD. See ASTRONOMY, under section so entitled.

TIME SIGNALS. See WIRELESS TELEGRAPHY.

TIMOR. The largest island of the Lesser Sunda group, divided between Portugal and the Netherlands. The estimated area is 12,593 square miles, of which 7330 belong to Portugal; population, 400,000, of whom 200,000 are Portuguese subjects. Acting governor of Portuguese Timor, Capt. Pimenta de Castro, with headquarters at Dilli.

TINWORTH, GEORGE. An English artist, died September 12, 1913. He was born in 1843 in Berkshire. In 1861 he entered the Lambeth School, and the academy in 1864. In 1866 he entered the Lambeth pottery, and became widely known as a modeler in terra cotta, receiving many medals for his work, and a grand prize at the St. Louis Exposition in 1904. Among

his best-known productions were panels made for churches and other buildings. He wrote *From Sunset to Sunset* (1907).

TITANIC. See SAFETY AT SEA.

TOBACCO. The tobacco crop of 1913 was the most valuable one ever raised in the United States, exceeding by 30 per cent. the average value of the five preceding years. The average farm price of the crop, 12.8 cents per pound, was the highest since 1864. The quantity of production, however, was slightly under the five-year average and had been exceeded by three former crops. The final estimate of the United States Department of Agriculture placed the production at 953,734,000 pounds, as compared with 962,855,000 pounds in 1912. The estimated value was \$122,481,000, as compared with \$104,063,000 in 1912. Kentucky, North Carolina, and Virginia, in the order named, led in the production of cigar tobacco. In Georgia and Florida the yield per acre was better than in 1912 and the quality the best for several years. In all the other districts the yield per acre was less than in the previous year and the quality not up to the usual standard of a good crop, except in the Miami Valley of Ohio. The New England crop gave a smaller percentage of wrapper than usual. The total production of cigar tobacco was estimated at 183,350,000 pounds, valued at \$24,075,000, both the quantity and the value being less than in 1912.

The estimated total production of chewing, smoking, export tobacco, and snuff was 763,124,000 pounds, having a value of \$97,466,000, an increase of 4 per cent. in amount and of 28.4 per cent. in value. The largest increase was in the bright districts of Virginia, North Carolina, and South Carolina. The burley district had a smaller production with poorer quality than the 1912. The sun-cured district of Virginia produced a fine crop, which was much reduced in quality and value by mould in the barns.

During the fiscal year 1913 the internal revenue collections from manufactured cigars, tobacco, etc., amounted to \$76,789,424, as compared with \$70,590,151.60 in 1912, which was the largest ever received to that date. The commissioner's report showed a steady growth in the manufacture of tobacco products. Tax was collected on 7,699,037,543 cigars, an increase of nearly a half million in number over 1912; on 1,033,778,160 little cigars, a decrease of about 60 millions; on 14,294,895,471 cigarettes, an increase of over 3 billion; on 33,209,468 pounds of snuff, an increase of over 3 million pounds; and on 404,362,620 pounds of chewing and smoking tobacco, an increase of over 10½ million pounds. The above figures include 164,871,400 cigars from Porto Rico and nearly 6 million cigarettes, and from the Philippines over 100 million cigars and over 14 million cigarettes. The phenomenal number of cigarettes manufactured in the fiscal year 1912 was more than maintained in 1913. The quantity of leaf tobacco used in the production of tobacco, snuff, cigars, and cigarettes was 547,357,134 pounds. There was exported during the fiscal year 4,478,657 pounds of manufactured tobacco and snuff.

The net receipts from the tobacco tax in the German empire increased from \$16,630,000 in 1906-07 to \$35,866,000 in 1910-11. The *per capita* duties and taxes on tobacco increased 105 per cent. in that time and still further in

1911-12. On the other hand, the consumption decreased. In the fiscal year 1911-12 9,382,400 cigarettes were manufactured, more than half being made in Saxony. A tobacco combine was formed in Russia with a capital of \$12,000,000. The company was an English one, in which Russian, French, and English capital was interested.

A treatise on *Tobacco Marketing in the United States*, by E. H. Mathewson, was published by the United States Department of Agriculture during the year 1913.

TOGO. A German west African protectorate occupying an area estimated at 87,200 square kilometers (33,668 square miles) between Dahomey and the Gold Coast. Capital and chief port, Lome. The population is estimated at 1,000,000 natives; whites, January 1, 1912, 372. Imports, 1911, 9,620,000 marks (Germany, 3,814,000); 1910, 11,466,000. Exports, 1911, 9,318,000 marks (Germany, 6,076,000); 1910, 7,222,000. Chief articles of export, values in thousands of marks for 1911: Palm kernels, 3578; palm oil, 1688; rubber, 833; cotton, 554; animals, 311; cacao, 174; corn, 174. Vessels entered, 275, of 567,000 tons. Railways in operation at the end of 1912, 323 kilometers (201 miles)—Lome-Anecho (Little Popo), 44 kilometers; Lome-Polime, 119; Lome-Atakpame, 160. The budget for 1913-14 balanced at 4,057,136; for 1912-13 at 3,175,510. Governor in 1913, Duke Adolf Friedrich of Mecklenburg-Schwerin.

TOKUGAWA, PRINCE KEIKI. Fifteenth and last of the Shoguns of Japan, died November 21, 1913. He was born in 1837, the seventh son of Nariaki, Prince of Mito. He inherited the authority which had been gained for the Tokugawa family by the first Shogun of that branch, Iyeyasu, who reigned from 1603 to 1605. The power of the family began to crumble after the abdication of Iyenari, the eleventh Shogun of the house, in 1837. He had reigned for fifty years and was succeeded by his son Iyeyashi, who was followed by his brother Iyesada (1853-58). When the latter died, the prince of Mito put forward his son Tokugawa Keiki for the vacant Shogunate, but another and much younger member of the ruling house was preferred. During the rule of this Shogun Iyemochi, Keiki, his unsuccessful rival, became minister of justice and later commander-in-chief. In 1866 he came into the succession as the fifteenth Tokugawa Shogun. Having been adopted by the Hitotsubashi family and assuming a new name on becoming Shogun, he was often known as Hitotsubashi Yoshinobu. Shortly after his accession, Kemei, the 120th emperor, died, and was succeeded by the late Emperor Mutsuhito. The time was a critical one in the history of Japan. The influence of the court of Kyoto was steadily increasing, and that of the Shogun's government as steadily decreasing. The latter's authority had been successfully defied by the Choshin clan. Keiki, who had from the first shown great reluctance to accept the position of Shogun, was by temperament and character ill fitted to play the part of a ruler in stormy times, and soon after his accession, on account of opposition to his government and the defection of several clans, he declined to continue the struggle, and in the autumn of 1869 resigned. The action of the ruling clans at Kyoto led to the withdrawal of

his resignation, and an open rupture between the two governments took place. The civil war which followed was of short duration. The Shogun submitted to the Mikado's troops in the spring of 1868, and was allowed to settle in the town of Shidzuoka. In later years he was restored to imperial favor, and received the title of prince in the new order of nobility. A residence in Tokyo was assigned to him, and there he lived quietly until his death, taking no part in public affairs.

TONGA (or FRIENDLY) ISLANDS. A group of islands in the south Pacific, constituting a British protectorate. Area, 390 square miles. As estimated in 1910 the population was 21,695, including about 600 whites; at the end of 1912, natives numbered 22,527. Nukualofa, on Tongatabu, is the capital. Imports and exports of merchandise in 1910 were valued at £160,543 and £245,646; in 1911, £182,122 and £239,404. Revenue and expenditure in 1911-12, £50,856 and £50,012. Native king, George Tubou II. (since 1893). British agent and consul, Henry Eugene Walter Grant (since 1912).

TONGKING. A state (the northernmost) of the French colony of Indo-China (q.v.), lying between China and Annam. The country near the coast is low, flat, and fertile; to the north and east are mountains and high plateaus. Innumerable streams furnish water and transportation facilities. The railway which connects Yunnan with the sea and the navigable Song-koi (Red River) are the main commercial avenues. The climate, though not unhealthy on the whole, is excessively hot during the wet season; typhoons are frequent. The principal productions are rice (two crops annually), silk (the principal native manufacture and a main article of export), corn, cotton, sugar-cane, coffee, jute, indigo, rubber, cinnamon, gum lac, etc. The forests yield valuable timbers and essences; the mines are unimportant, though rich minerals are believed to exist in the mountains. The European manufactures are cotton mills, distilleries, brick works, tobacco and match factories. The trade is included with that of French Indo-China. The local budget for 1912 balanced at 8,341,017 piasters. The French resident in 1913 was M. Destenay. Hanoi is the capital, as well as the capital of French Indo-China.

TOBNEY, GEORGE HENRY. An American surgeon and public official, died December 27, 1913. Born in Baltimore in 1850, he was educated at Carroll College, and studied medicine at the University of Virginia, taking his degree in 1870. In the following year he was appointed assistant surgeon in the United States navy, but resigned in 1895 to accept an appointment as first lieutenant assistant surgeon in the United States army, where he rose to be colonel of the medical corps in 1908, and surgeon-general in 1909, which position he held until his death. He was particularly well known for his campaign against typhoid fever in army camps.

TOWN PLANNING. See CITY PLANNING.

TOWNSEND, JAMES MULFORD. An American lawyer and educator, died October 31, 1913. Born in New Haven, Conn., in 1852, and graduated from Yale College in 1874, he took the degree of LL.B. in 1876 at Columbia University. In the same year he engaged in prac-

tice in New York City. He was one of the best-known authorities on corporation law, and was lecturer on the transfer of monetary securities at the Yale law school from 1887 to the year of his death.

TRADE UNIONS. Recent years have been full of events of great interest for organized labor. There has been a notable amount of radicalism in the labor movement. The doctrines of Syndicalism (q.v.), represented in the United States by the Industrial Workers of the World (q.v.), continued to be preached and caused revolutionary activities in both Europe and America. The movement toward industrial unionism was a chief characteristic of the developments of 1913. Particularly in Germany and Great Britain was there evidence that all the different unions engaged in related trades were drawing closer together. General strikes, while not frequent, were therefore rendered more probable and more threatening. (See **STRIKES** and **LOCKOUTS**.) At the Trade Union Congress held at Manchester, England, and attended by 557 delegates representing 2,232,446 members, it was estimated that the total number of trade unionists in Great Britain was 3,010,000; Germany, 3,061,000; France, 1,029,000; Belgium, 199,000; Holland, 154,000; Norway, 54,000; Denmark, 128,000; and United States, 2,500,000.

The principal trade union organization of the United States is the American Federation of Labor, for which see **LABOR**, **AMERICAN FEDERATION OF**. In that article is also described the progress of the famous contempt case growing out of an injunction issued in the *Buck's Stove and Range* case against officers of the federation. For the outcome of the case against the United Hatters, known as *Loewe vs. Lawler*, see **BOYCOTT**. Below is a description of the efforts to exempt trade unions from the operation of the anti-trust law, and a statement of the developments in the dynamite cases which caused such agitation in 1912 and 1913.

EXEMPTION OF TRADE UNIONS AND FARMERS' ORGANIZATIONS. A piece of legislation calling forth quite opposite but often impassioned opinions was the inclusion in the sundry civil appropriation bill of a proviso, whereby no part of the sum of \$300,000 appropriated for the enforcement of anti-trust laws was to be used to prosecute "any organization or individual for entering into any combination or agreement having in view the increasing of wages, shortening of hours, or bettering the conditions of labor, or for any act done in furtherance thereof, not in itself unlawful"; moreover, no part of this sum could be used to prosecute "associations of farmers who co-operate and organize in an effort to and for the purpose to obtain and maintain a fair and reasonable price for their products."

A provision similar to this had been included in an appropriation bill sent to President Taft in the last days of his administration. He sent to Congress a veto message on March 4, in which he severely condemned the provision as "class legislation of the most vicious sort." He pointed out that the section was subtly worded so that, though ostensibly designed to permit beneficent activities, it also permitted "conspiracy to destroy by force, violence, or unfair means any employer or employee who failed to conform with organization

requirements." He pointed out that a similar provision had failed to pass the Sixty-first Congress, it being condemned as an attempt to legalize the secondary boycott.

But on April 13 President Wilson was reported to have urged the repassage of the vetoed proviso. It was stated that he did "not believe that the anti-trust act should be enforced against labor unions or coöperative associations of farmers." Immediately upon the reintroduction of the bill containing this "rider" a storm of protest arose from newspapers and chambers of commerce. Former Senator Edmunds and others called attention to the history of the efforts to secure exemption of labor and agricultural associations from the Sherman act. Even at the time this law was under discussion in Congress preceding its enactment an amendment exempting these associations was introduced in the Senate and, after spirited debate, was rejected. On the other hand there was a considerable body of popular feeling that the anti-trust law had not been intended to apply to labor or farmer organizations. This was based historically on the fact that the original act passed the Senate with an amendment offered by Senator Sherman himself and supported by Senator Hoar, exempting labor and farmer organizations. But the bill was later reported out of the committee on the judiciary without this amendment, and thus enacted.

The rider proviso passed Congress with large majorities and some weeks later, on June 23, was signed by President Wilson. The President, however, stated at the time that, had he been able to separate this item from the remainder of the bill, he would have vetoed it "because it places upon the expenditures a limitation which is in my opinion unjustifiable in character and principle." He also pointed out that other appropriations to the Department of Justice were sufficient to enable it to enforce the anti-trust law as in the impartial judgment of that department its true and just meaning demanded.

Somewhat later it was made evident that a strong effort would be made by the American Federation of Labor to have the exemption made permanent by amending the anti-trust law, and that the manufacturers' organization would make a strenuous fight against such action.

The trade unions had been strongly moved to secure this exemption because of the decisions of the courts in the famous *Danbury Hatters' case* or *Loewe vs. Lawlor*. (See **BOYCOTT**.) The situation thus confronting American unions was similar to that confronting English unions following the *Taff Vale* case, in which union funds were made liable for damages done by unions during trade disputes. The English unions likewise secured exemption from Parliament. Another cause of anxiety on the part of the unions was the suit against nineteen officials of the United Mine Workers for \$750,000 growing out of a West Virginia strike. These men were charged with conspiring with coal operators in other unionized fields to force the West Virginia operators to unionize their mines. The indictment was brought by the local Federal attorney without the knowledge of the Attorney-General.

STRUCTURAL BRIDGE AND IRONWORKERS'

UNION. After a three months' trial at Indianapolis the officers of this union were convicted late in December, 1912, of conspiracies to transport dynamite and nitro-glycerine on passenger trains from one State to another, and of aiding in the destruction of life and property thereby. In the trial there were 40 defendants; 38 were found guilty, and of these all but two were officers, members of the executive board, or business agents of this union. The president of the union, Frank M. Ryan, was sentenced to seven years in the Federal penitentiary at Leavenworth; eight others to six years; two to four years; twelve to three years; four to two years; six to one year and one day; and five were released under suspended sentences. This trial was the culmination of a seven-years' warfare of the union upon employers and contractors of the National Erectors' Association who refused to institute a closed shop. From 1905 to 1911 there occurred in erection work 102 cases of actual or attempted destruction of bridges and other buildings under construction; and from December, 1905, to June, 1912, there were 96 assaults on foremen and men in non-union shops. The country was aroused in October, 1911, by the destruction of the *Los Angeles Times*, when twenty-one were killed. Following the incarceration of the guilty, the trade unions of the country undertook to raise a sum approximating a million dollars to bail them out. Many of them were thus released. Among these was President Ryan, who, in March, was reelected president at the union's convention in Indianapolis. This act was widely condemned. At the time of the trial it had been continually reiterated throughout the country that the union as such was not at the bar of justice, but only criminal officials; but Ryan's reelection transferred much of the odium to the 12,000 members. All of the guilty, except Herbert S. Hockin, who had greatly assisted Detective Burns in the McNamara case, and one other appealed to the Circuit Court of Appeals of the United States. On January 6, 1914, the sentences were affirmed by that court in the cases of 24 of the convicted; in 6 cases the convicted were remanded for another trial.

On October 2 George E. Davis, an ironworker, was arrested in New York on the charge of being a party to a dynamite conspiracy. He confessed that he was responsible for several explosions on non-union structural work and declared that he had been assisted by Harry Jones; the secretary-treasurer of the Structural Ironworkers' Union. Jones was arrested and released on \$10,000 bail. On December 16 at Indianapolis Davis pleaded guilty to a charge of having conspired to transport explosives illegally; Jones pleaded not guilty, but his lawyer asked permission to withdraw the plea later if deemed advisable.

GREAT BRITAIN. The principal features of the trade-union movement in Great Britain in 1913 were the tendency toward the formation of larger associations, the increasing demand for an eight-hour day, and the great frequency with which both organized and unorganized labor put forward demands for the establishment of minimum-wage rules. Perhaps the most significant amalgamation was the fusion of three of the four great railway unions into the National Union of Railway Men, with a

membership of 180,000. The locomotive engineers and firemen did not join this amalgamation. The National Union set forth as its immediate programme a minimum wage of \$7.50 for all railway workers and an eight-hour working day. Another very considerable amalgamation was that in the dyeing trades. Some fifteen separate unions were brought together into one large organization embracing the dyeing, calico printing, bleaching, and finishing trades.

The tendency toward the union of all workers of an industry was emphasized at the annual council of the National Transportation Workers' Federation. President Harry Gosling declared that if the federation was to be responsible it must control all transport workers. This would require a single national executive council with a substantial central fund. The importance of such amalgamation was shown by the demands of the British seamen, which were supported by the transport workers. The seamen demanded a national conciliation board to fix wages and conditions, a new manning scale, and the exclusion of Chinese seamen from British ships. The affiliation of seamen and transport workers lent great force to these demands.

The question of an eight-hour day for all workers was actively discussed as a practical proposition at several trade-union conferences. The parliamentary committee of Trade Union Congress presented various alternative proposals bearing on the question to its constituent organizations. It was proposed by a leading official that the active movement to enforce the demand should include "direct action," whereby union men would cease work at the end of eight hours, instead of continuing for nine and ten. In January the Labor party endorsed a bill limiting to eight the hours in the cotton industry; later, bills were presented in Parliament limiting to eight the hours on railways and in bakeries; and in all the industries in general.

The United Kingdom Employers' Defense Union was formed by employers to protect themselves against strikes and the losses attendant thereto. It proposed to raise \$250,000,000 as a defense fund. It was reported in December that large subscriptions were being made with the understanding that actual payments by members will be made *pro rata* and will not exceed 7.5 per cent. of the subscription in any one year. The union was registered as a trade union in order to secure legal advantages.

GERMANY. There are three principal groups of trade unions in Germany, the General Federation, the Christian, and the Hirsch-Duncker. Besides these there are Roman Catholic and Protestant unions with approximately 200,000 members, patriotic unions, and yellow unions. These last two are numerically small. The General Federation had, on January 1, 1913, 2,559,781 members, an increase of 6.7 per cent. over the preceding year. The groups reporting more than 100,000 members each were the following: Metal, 596,839; building, 463,375; transport and retail trade, 247,518; woodworking, 213,761; factory workers (general), 207,597; textile, 142,634; food, drink, and tobacco, 124,513; clothing, 114,132; mining, 114,062; and printing, 100,345. The Christian Trade Union Fed-

eration had at the same time a membership of 350,930; while the Hirsch-Duncker membership numbered approximately 110,000. The movement toward industrial unionism, which has been very marked in Anglo-Saxon countries during recent years, manifested itself in Germany during the year by great growth of the General Building Trades Union, the Metal Workers' Union, and the Tobacco Workers' Union, all three of which are on the industrial basis. Several other amalgamations were in process or in contemplation.

The financial condition of the General Federation was most excellent. The total income, excluding the unions of domestic servants and of agricultural laborers, was \$19,103,000 in the year 1912. Of this, 94 per cent. came from membership dues, assessments, and initiation fees. Total expenditures were \$14,549,000. Although income increased nearly \$2,000,000, expenditures increased only \$250,000. The aggregate reserve funds available on June 1, 1913, were \$19,238,000. The principal item of expenditure was labor disputes, for which \$3,276,000 were expended in 1912. Other items of expense were as follows: Sick benefit, \$2,723,000; unemployment benefit, \$1,843,000; traveling benefit, \$281,000; death benefit, \$281,000; invalidity benefit, \$126,000; distress benefit, \$123,000; and removal benefit, \$97,000. Not all of these benefits are paid by all of the unions. Thus, while unemployment, sick, death, and distress benefits are paid by practically all, the invalidity benefit is paid only by the printers and lithographers. As among the English trade unions, there has been in Germany a movement for fusion into industrial unions. The Metal Workers' Union is the largest of the German industrial bodies, comprising on January 1, 1913, a total membership of 561,547. Its income in 1912 was \$4,270,000 and its expenditures \$3,010,000; the funds on hand were \$2,730,000. In 1912 it paid \$2,000,000 in benefits, including strike and lockout, victimization, traveling, removal, unemployment, sick, death, and some other minor ones.

The Buildings Trades Union is the second largest industrial union, having on January 1, 331,165 members, including bricklayers and masons, hod carriers and building laborers, plasterers, excavation, cement, and concrete workers, tire layers, and terrazzo workers. Its net income in 1912 was \$2,253,000; expenditures, \$1,059,000; and funds on hand, \$3,713,000. Other large industrial organizations were the Woodworkers' Union, with 196,810 members; and the Union of Brewery Workers and Millers, with 50,739 members.

SWITZERLAND. The Swiss Trade Union Congress met at Zürich September 13-15. The programme throws considerable light upon the problems of current interest in Switzerland, and at the same time reveals the great similarity in the trade union and labor problems of all western nations. Following a discussion of the state of the trade-union movement in Switzerland, the sessions took up the following topics: The organization of badly paid or down-trodden workers in unorganized trades; unemployment insurance through trade unions; trade-union attitude toward juvenile organizations; the relation of the trade-union movement to tariff agreements; attitude toward general strikes; and the attitude of the unions toward pending

legislation. See also **INDUSTRIAL WORKERS OF THE WORLD.**

TRADE UNIONS BILL. See **GREAT BRITAIN, Work of Parliament.**

TRANSMISSION OF ELECTRIC POWER. See **ELECTRIC POWER, TRANSMISSION OF.**

TRANSVAAL. One of the four original provinces of the Union of South Africa (q.v.). Pretoria, the capital of the union, is also the seat of the provincial government. Population of Pretoria (census of May 7, 1911), 48,607 (with suburbs, 57,674); Johannesburg, 237,104; Krugersdorp, 55,144; Germiston, 54,325; Boksburg, 43,628; Benoni, 32,560; Premier, 12,608. During the year three railway lines, aggregating 243 miles, were opened. Administrator (1913), J. Rissik. See **SOUTH AFRICA, UNION OF**, for area, population, etc.

TRAVEL. See **LITERATURE, ENGLISH AND AMERICAN; FRENCH LITERATURE; and GERMAN LITERATURE.**

TRENGANNU. A native state under British protection on the east coast of the Malay Peninsula. Area (estimated), 6000 sq. miles; population (1911), 154,073, of whom 149,379 were Malays. Capital, Kuala Trengannu (13,991 inhabitants). Imports (from Singapore, 1911), SS\$706,737; exports, SS\$1,811,420. British agent (1913), W. D. Scott.

TRINIDAD AND TOBAGO. A British colony composed of two islands—Trinidad, 1754 sq. miles; and Tobago, 114 sq. miles. Total population (1911), 333,552, of whom 86,373 were East Indians. East Indian immigration is conducted under the control of the government (3120 in 1911-12). Imports in 1911, £5,018,848 (£3,343,011 in 1910); exports, £4,769,486 (£3,467,588). Revenue, 1911-12, £950,744 (£948,383 in 1910-11); expenditure, £959,551 (£927,633). Debt (March 31, 1912), £1,047,793. Miles of railway (all government-owned), 81½. Extensions were begun September 30, 1911 (Tabaquite-Poole), and February 26, 1912 (San Fernando to Siparia). The capital is Port of Spain (59,658 inhabitants). Governor in 1913, S. W. Knaggs (acting).

TRINITY COLLEGE. An institution for higher education founded at Hartford, Conn., in 1883. The enrollment in the college in the autumn of 1913 was 250. The faculty numbered 28. During the year Stanley L. Galpin, Ph. D., was appointed professor of romance languages, and Frederick W. Carpenter, Ph. D., was appointed professor of biology. The most notable gift of the year was the library and administration building from J. Pierpont Morgan. The productive funds of the college amounted at the end of the year 1912-13 to \$1,125,849, and the income to \$87,770. The library contains 70,122 volumes, and 44,601 pamphlets. The president is F. L. Luther, LL. D.

TRIPOLI. A province (since November 5, 1911) of Italy, on the Mediterranean coast of Africa, bordered on the west by Tunis and Algeria, on the east by Egypt, on the southeast and south by the Sahara. Together with Cyrenaica (or Bengazi, or Barca), Tripoli was taken from Turkey in the Turco-Italian War. Together Tripoli and Cyrenaica now are called Libya. They cover an area estimated at 405,800 square miles, carrying a population of about a million. Tripoli (50,000 inhabitants) is the capital of Tripoli, Bengazi (30,000) of Bengazi.

No rivers flow through the country and the rainfall is frequently inadequate; only once in three or four years can a good harvest be looked for. The products and exports are ostrich feathers, ivory, skins, sponges, hides, esparto, and live animals. The imports, besides metals, manufactures, tea, beads, wines, and spirits, include articles for barter in Wadai, Bornu, and the western Sudan. A large Sudanese trade reaches the sea by caravan routes across the Sahara to Tripoli and Bengazi. Imports in 1912, 27,781,985 lire; exports, 4,028,520. Railways in operation, 87 kilometers; under construction, 230 kilometers. The branch railway to Suari-Beni-Aden was completed during the year.

The revenue is generally derived from tithes and from taxes on individual wealth. Lieutenant-General V. Garioni has been appointed governor for Tripoli, General Ameglio for Bengazi.

HISTORY. "The Treaty of Lausanne, signed on October 15, 1912, by delegates of Turkey and Italy, provided," to quote the 1912 YEAR BOOK, "for complete Italian sovereignty in Libya (i.e., Tripoli and Cyrenalca) without formal recognition by Turkey; for the caliph's retention of free religious authority; for the reestablishment of former diplomatic relations, etc." Some of the Turkish troops were withdrawn, in accordance with the treaty; yet others, disowned by the Ottoman government, remained to assist the fierce and fanatical Mohammedan tribesmen of the hinterland in their persistent attempts to resist and harass the Italians. The resistance was strongest in the highlands of Cyrenalca and heavy fighting took place in the vicinity of Derna. On May 16, 1913, a battle at Sidi Garba, near Derna, cost the Italians 79 killed and 284 wounded. On June 19 another sharp engagement was fought at Attangi. In September an offensive campaign was inaugurated against the Arabs of the Merg highlands. The Arabs were defeated, but the victory cost the Italian force 30 men, including General Torelli, who was in command. General Bricola, who had hitherto directed the military occupation of Cyrenalca, was succeeded in October by General Ameglio, who had shown great vigor in his administration of the Aegean islands in Italian hands.

The work of pacification proved less difficult in the western part of Libya than in the east. An insurrection of Berber tribesmen under Soliman-el-Baroni collapsed before the advance of General Leguio's troops and offered little obstruction to the expeditionary armies. A force of 1000 men left Tripoli (city) in April, and on April 28 reached Ghadames, where many sheikhs voluntarily took oaths of allegiance to the Italian government. Leaving a garrison at Ghadames, the column proceeded towards the oases of Ghat and Murzuk in the Fezzan. Brak, Aggar, and Megar were also occupied in December. Military operations in the interior of Libya were so much more extensive and expensive than had been anticipated, that not a few complaints were heard in Italy. The works of peace were also expensive. Breakwaters to improve the harbor at Tripoli were to cost almost \$3,000,000, and harbor improvements at Bengazi another \$1,500,000.

TROPICAL DISEASES. Endemic tropical dysphagia, or *mal de engasgo*, is an affection endemic in certain parts of Brazil, which is

characterized by difficulty in swallowing, so constantly recurring that the individual finally dies of starvation. It seems to have receded before improved hygienic conditions, so that now it is encountered only in the remoter districts. The dysphagia occurs spasmodically; in the intervals all is apparently normal. The trouble seems to be a spasm of the cardia (the lower end of the œsophagus). Paranhos, who described the disease, was inclined to think that flour used almost exclusively in the regions where *mal de engasgo* was prevalent was the cause. This flour is made from the manioc, or cassava, of the euphorbia family, the root of which contains a juice which Boutron and Henry say is identical with hydrocyanic acid. Ingestion of the juice induces motor disturbances, dysphagia, convulsions, weakness of the heart, and arrest of the respiration. Roasting the root to make the flour expels all the juice, but when this is not properly done, this form of dysphagia is liable to follow. When other food was used no further cases developed. The American Society of Tropical Medicine began in July the publication of an official journal, called the *American Journal of Tropical Diseases and Preventive Medicine*. The journal is issued from New Orleans in connection with the School of Tropical Medicine of Tulane University, Dr. Creighton Wellman being editor-in-chief. Harvard University established a school of tropical medicine, the course of which was planned to extend over a period of six months, with Dr. Richard P. Strong in charge. See BERIBERI; LEPROSY; PLAGUE; SLEEPING SICKNESS; VITAL STATISTICS.

TRUST COMPANIES. These companies have experienced a very notable growth in recent years. According to the reports of the Comptroller of the Currency they numbered only 683 in 1905; but they increased to 1091 in 1910, and to 1515 in 1913. Their banking resources on June 4 of the latter year aggregated \$5,124,920,000, or nearly double the amount of five years earlier. Their loans and discounts totaled \$2,767,000,000, or slightly more than those of the 14,011 State banks, and nearly half as much as those of the 7473 national banks of the same date. Their resources also included \$1,191,000,000 bonds and other securities. They have attracted immense individual deposits because of their great liberality in interest thereon, the aggregate in 1913 being \$3,571,000,000. Loan and trust companies were distributed among the States as follows: Eastern, 513; Middle Western, 352; Southern, 318; New England, 195; Western, 69; Pacific, 68.

TRUSTS. In 1913, as during the immediately preceding years, marked attention was given to the solution of the trust problem in the United States. While there were no cases brought to conclusion of such importance as the Tobacco and Standard Oil cases of earlier years, cases involving as great financial and popular interest were under prosecution. Investigations by the Bureau of Corporations (q.v.) continued. The change of administration from Republican to Democratic brought no change in the effort to enforce the existing law. The new administration made it plain by various general utterances that it would attempt to deal by effective legislation with the concentration of financial and industrial control, but owing to the tariff and banking legislation it was not able to take up the trust problem

before the close of the year. It was anticipated that the administration's legislation would follow in the main the lines laid down in the New Jersey anti-trust (Seven Sisters) laws, passed early in the year. There was also the general statement in the Democratic platform of 1912 demanding a "vigorous enforcement of the criminal law against trust officials." That platform in addition declared against holding companies, interlocking directorates, stock watering, and price discriminations. In his annual message President Wilson declared that the trust problem would be made the subject of a special message. He made it plain that no war on the trusts was contemplated; that obedience to the law was all that was desired, and this would be sought with the least possible disturbance of business. Following the voluntary separation of the American Telephone and Telegraph Company from the Western Union (see below) the President stated that the administration desired to aid in upbuilding all lawful business. Moreover, at the same time the American Sugar Refining Company, the New Haven Railroad, and other combinations opened negotiations to determine a basis for bringing their organizations within the law. As a result of these events a more optimistic tone was developed in business and financial circles.

For material of interest in connection with trusts other than the following, see **BOYCOTT**; **BUREAU OF CORPORATIONS**; **FINANCIAL REVIEW**; and **TRADE UNIONS**.

NEW JERSEY LAWS. The legislation attracting the widest attention during the year was the passage of the so-called "Seven Sisters acts" by the New Jersey legislature in February. These acts were believed to represent the views of President Woodrow Wilson. They defined a trust as an agreement between corporations, firms, or persons for the creation of trade restrictions or the acquisition of monopoly, for the limitation of production or raising of prices. They enforce the personal responsibility of directors, officers, and agents. They forbid differences in prices in different sections, allowance being made for qualities of goods and costs of handling, when such differences have the effect or intent of creating monopoly or hindering competition. They prohibit the purchase, acquisition, or holding of the stock of other corporations, except for the payment of debt, for temporary investment of surplus funds in non-competing corporations, for the investment of benefit or insurance funds, or for depreciation or rebuilding purposes; rights previously acquired, however, are not affected by this provision. Future mergers must be approved by the board of public utility commissioners and filed with the Secretary of State.

PROSECUTIONS. The amount of prosecution under the Sherman anti-trust law has been very extensive. On March 4, when the Wilson administration assumed control, there were pending fifty-two cases, thirty-five civil, sixteen criminal, and one contempt proceeding. From that date until the issue of the annual report of the Attorney-General December 1, eight new cases were instituted, five civil and three criminal. During this time eight civil, eight criminal, and one contempt proceeding had been concluded, leaving forty-three cases pending.

Some of these cases were of sufficient importance to warrant a special notice found else-

where in this article. The status of other cases may be briefly noted. The case against the Great Lakes Towing Company, et al., for monopolizing towing facilities of important lake ports, was decided, February 11, by the district court in favor of the government. At the close of the year plans for dissolution had been submitted to the court. In the case against the American Sugar Refining Company, et al., the government had concluded the presentation of its testimony in chief. The so-called Coffee Trust or Coffee Valorization case, or Herman Sielcken, et al., was dismissed in May, owing to the sale by the Brazilian government of all the coffee which had been withheld from the market. The Bath-tub case, or the civil suit against the Sanitary Manufacturing Company, et al., had been decided in November, 1912, in the government's favor. Although the trust dissolved, criminal cases regarding which the jury had failed to agree early in 1912 were retried in February, 1913. A verdict of guilty was rendered and fines aggregating \$51,000 were paid. Testimony was being taken in the suits against the Hamburg-American Packet Company, et al., Prince Line Company (Ltd.), et al., and the American-Asiatic Steamship Company, et al. In December, 1912, a civil suit against a combination of soft-coal-carrying roads in Ohio and West Virginia had been decided in favor of the government. In November, 1913, a supplementary decision regarding the relief to be granted was rendered, whereupon the roads involved set to work upon plans of dissolution. In February the three remaining indictments in the beef trust case were not pressed, they being little different from one on which the defendants had been acquitted. The United States Shoe Machinery Company had been charged with criminal conspiracy in restraint of trade; and although the district court at Boston had dismissed all five accounts the case was taken to the Supreme Court in December, 1912. On February 3 that court declared that an indictment charging an agreement to combine the businesses of manufacturing patented machines used in making different parts of shoes, which businesses were not competitive, did not constitute a case under the anti-trust law. Nevertheless the government continued to prosecute the civil suit against that corporation and those associated with it. Testimony was being taken at the close of the year. Moreover, criminal suits against the same defendants were being deferred until the civil suit should be concluded. The United Shoe Machinery Company of New Jersey, et al., was also being prosecuted for restraint of trade in respect of "inseam trimming machines." On February 6 at Detroit, the shoe-last trust was dissolved, the court holding that a combination of patented and unpatented articles, so as to fix the price of the latter, is an unlawful restraint of trade. Decision was awaited in the case against the Chicago Butter and Egg Board. The New Departure Manufacturing Company, et al., manufacturers of bicycle and motorcycle parts and coaster brakes, was the occasion of both civil and criminal cases. In the criminal suit some defendants pleaded guilty and others entered pleas of *nolo contendere*, total fines of \$81,500 being imposed. In May the defendants agreed to a decree satisfactory to the government. The suit against the Keystone Watch Case Company, et al., was

ready for final hearing. In the Paving Brick case, or that against Purrington, et al., in which an alleged conspiracy in restraint of trade in paving bricks in northern Illinois was charged, was concluded in June by a *nolle prosequi* entered by the government. In the criminal case against the North Pacific Wharves and Trading Company, the jury failed to agree. The Supreme Court having overruled a demurrer to the indictment against the Pacific and Arctic Navigation Company, et al., that case was being prepared for trial. The two preceding are known as the Alaska Transportation cases. The Hunter Milling Company, et al., having been charged with restraint of trade in wheat products, was found guilty in May and fined \$2000. In the notable case in the Motion Pictures Patents Company, et al., in which was charged a combination in restraint of interstate and foreign trade in machines, appliances, and apparatus relating to motion pictures, the government's testimony had been taken and that of the defendants was being taken. In February fifteen individuals, acting through the Produce Merchants' Exchange of Portland, were charged with illegal control of the purchase and distribution of about 90 per cent. of the fruit and vegetables shipped into the State of Oregon. They pleaded guilty and paid fines aggregating \$8450. The Krentler-Arnold Hinge Last Company, et al., constituting a combination to control the price of shoe and boot lasts, patented and unpatented, entered a consent decree in February granting the relief asked. The one contempt proceeding was that against the Southern Wholesale Grocers' Association, et al., in the northern district of Alabama, charged with violation of decree of October, 1911. The association and three individuals were adjudged guilty of contempt and in July were fined \$5500. On February 13 a petition was filed charging the Lackawanna (D. L. and W.) Railroad Company with transporting anthracite coal in violation of the commodities clause, and with entering into an unlawful contract with the D. L. and W. Coal Company, whereby a monopoly of the sale of such coal along the road's lines was created. The taking of the government's testimony was nearly completed. The Burrough's Adding Machine Company, et al., having been enjoined from combining to monopolize interstate trade, in adding machines, consented to a decree on March 3, at the same time the petition for injunction was filed. The Central West Publishing Company, et al., were enjoined in the northern district of Illinois from combining to restrain trade in plate and ready-print matter. Relief was granted by a consent decree in August. Petition to enjoin the American Coal Products Company, et al., with reference to the trade in tarred roofing-felts, coal-tar, pitch, and other coal-tar products, was granted by a consent decree. The Standard Oil Company was permanently ousted from Missouri by a decree of the State Supreme Court. In April a bill designed to supersede the ouster and permit the company to do business was vetoed by the governor, but in June the Supreme Court of the State suspended its own ouster decree, being satisfied that the Standard no longer had a monopoly of the oil business in that State. This same company, with others, was prosecuted by Texas for violating the State anti-trust law. The suit was settled in July when the Standard Oil Company of New Jersey

agreed to pay \$500,000 and to transfer nine-tenths of the stock of the Magnolia Company to a trustee as surety for maintaining competition. On November 29 suit was begun at Baltimore against the American Can Company and various other concerns. One of the most important suits was that against the United States Steel Corporation, testimony in which was being taken. The American Naval Stores Company was attacked by both civil and criminal suits. It was convicted; fines aggregating \$17,500 were imposed; and two officers were sentenced to jail for three months each; but this judgment was reversed by the Supreme Court on June 9, owing to defects in the lower court's charge to the jury. The civil suit was abandoned because the company suspended business in March.

Among other cases which had been begun were the following: The Master Horse Shoers' National Protection Association, et al., was charged with restraining trade in the United States and Canada in drilled horse shoes, adjustable calks, and rubber hoof pads. The Elgin Board of Trade, et al., was charged with combining to restrain in butter and butter fat, and arbitrarily to fix their prices. Charles S. Melin, et al. (New Haven case), was indicted, charging a combination to prevent the construction, by or in the interest of the Grand Trunk Railway Company, of various incoming lines in New England, thus forestalling threatened competition. The Kellogg Toasted Cornflakes Company, et al., was sued to enjoin the fixing of the retail price of Kellogg's Cornflakes. The board of trade of the city of Chicago, et al., was prosecuted to enjoin rule 33 of that board whereby the price of grain arriving in Chicago when the board is not in session is arbitrarily determined. Petition was filed in February to enjoin the Cleveland Stone Company, et al., from continuing an alleged monopoly of the manufacture, and sale of building, paving, curbing, and grind stones. The government sought to enjoin the McCaskey Register Company, et al., from the monopolization of the manufacture and sale of account registers and appliances. The Corn Products Refining Company, et al., was charged with combination to restrain and monopolize trade in corn products. The American Thread Company, J. and P. Coates, et al., were similarly charged with combining to restrain and monopolize interstate commerce in thread. A petition was filed in March to enjoin the Terminal Railroad Association of St. Louis, et al., from suppressing competition in the transportation of soft coal from Illinois to St. Louis. On June 19 members of the United Mineworkers of America were indicted for alleged conspiracy to interfere with interstate commerce in West Virginia coal. (See below.) Petition was filed on June 9 to enjoin the Eastman Kodak Company, et al., from restraining and monopolizing the manufacture, sale, and distribution of photographic supplies. The government sought to enjoin the Quaker Oats Company, et al., from restraining trade in oatmeal products and by-products. In September the Reading Company and other roads and coal companies constituting an anthracite coal combination were charged with restraining trade in anthracite coal: this suit, like that against the D. L. and W., previously mentioned, represents a new attack on the anthracite coal mo-

nopoly, and follows the Supreme Court decision in the Temple Iron Company case in December, 1912.

HARVESTER TRUST. On April 11, 1912, suit was begun against the International Harvester Company, seven corporations and eighteen individuals for constituting an illegal combination. The government charged that the defendant companies controlled 90 per cent. of the trade in harvester machines, 75 per cent. of the trade in mowing machines, and monopolistic power in the production of other kinds of agricultural implements. Early in the year Attorney-General Wickersham gave the company an opportunity to dissolve voluntarily. The company, however, refused this proposition. Attorney-General McReynolds then sought to bring about a dissolution in fact as well as in theory, having in mind the rise in prices and other evidences of concerted actions following the dissolutions of the Standard Oil and Tobacco Trusts. He declared that the formation of the Harvester combine was not a necessary development of business, but a purposeful effort to destroy competition and enforce monopoly. He showed that in 1903, the year following its formation, the company did a total business of \$53,000,000; in 1912 its business amounted to \$125,000,000. Meanwhile its capitalization increased from \$120,000,000 to \$163,000,000. Yet in the first year of its activity the company controlled the following proportion of business in different lines: 98 per cent. of the binders, 95 per cent. of corn binders, 92 per cent. of mowers, 85 per cent. of rakes, and 40 per cent. of twine.

In rebuttal, the defense contended that monopoly was not achieved; and that the proportion of a business controlled is no proof of violation of the anti-trust law. It contended that the ordinary results of unlawful combination, such as unreasonable prices, reduction of wages, overcapitalization, excessive profits, oppressive trade methods, closed and dismantled plants, limitation of production, or deterioration of quality had followed the company's formation. On the contrary the trust claimed that its resources enabled it to build better machines, and to sell them throughout the world at lower cost. It claimed that it had advanced wages 27 per cent., had paid 25 per cent. more for materials, and raised prices only 2 per cent. Moreover, it had sold abroad about \$160,000,000 worth of its products, thus increasing the prestige of the United States in the markets of the world.

AMERICAN TELEPHONE AND TELEGRAPH COMPANY. This company was being actively prosecuted in the Federal Court at Chicago, when about the middle of December it voluntarily entered into negotiations designed to make unnecessary a contemplated suit against it under the anti-trust law. President Wilson and Attorney-General McReynolds accepted a plan of reorganization whereby the company agreed to dispose of all its stock of the Western Union Telegraph Company, to refrain in future from acquiring control over any other competitive system, and to make arrangements so that all other telephone companies might obtain for their subscribers service over the lines of the Bell system. The proposition submitted by the American company included in addition various detailed conditions, according to which connections between the Bell and independent lines would be made. President Wilson expressed

himself as highly gratified at the spirit shown by the company, and declared his belief that a restoration of conditions of competition would put the business of the country on a sound and permanent basis. The plan by which the Western Union stock would be distributed was not determined.

The Bell system had come to comprise a large part of the telephone lines of the country. Thus, while almost the sole line in many Eastern communities, it had been charged on July 24 in the United States District Court of the eastern district of Oregon with monopolizing telephonic communication in certain far Western States. In 1895 the system comprised 675,415 miles of wire and had 14,517 employees; in 1900 it had 1,961,801 miles of wire and 37,067 employees; by 1905 the mileage had risen to 5,779,918 and the employees to 89,661; in 1910 the mileage was double that of 1905; and in 1912 it was 14,610,813 and the employees numbered 140,789. Its authorized capital is \$500,000,000, of which \$334,805,700 was outstanding January 1, 1913. The funded debt was \$105,002,000. The dividends paid and surplus earned in 1912 were respectively \$29,463,215 and \$13,221,110.

UNION PACIFIC—SOUTHERN PACIFIC. On December 2, 1912, the Supreme Court had declared the combination of these two railroads to be in violation of the anti-trust law. The combination had been effected by the acquisition of 46 per cent. of the stock of the Southern Pacific Company by the Union Pacific Railway. Considerable difficulty was experienced in working out a satisfactory scheme for the dissolution of the combination. The Union Pacific authorities proposed that their company's holdings of Southern Pacific shares be distributed *pro rata* to Union Pacific stock holders. The Attorney-General rejected this proposal, and was sustained by the Supreme Court on the ground that such distribution would not be compliance in good faith with the law. The California Railroad Commission rejected a plan whereby control of the Central Pacific was to be transferred to the Union Pacific. An agreement was finally reached (June 28) whereby the Union Pacific, which owned \$126,650,000 par value of Southern Pacific Company shares, sold \$88,000,000 of it through a trustee under certain restrictions, and exchanged the remaining \$38,650,000 of it for \$42,000,000 of Baltimore and Ohio stock held by the Pennsylvania Railroad.

MONEY TRUST. In February, 1912, the House of Representatives ordered its committee on currency and banking to investigate the charge that there was a money trust. A sub-committee under the chairmanship of Representative Pujo, with Mr. Samuel Untermyer of New York as chief counsel, held hearings from April until mid-summer, 1912, and during the months of December, 1912, and January, 1913. Its attention was concentrated first upon the New York Clearing House Association, and then upon the system of interlocking directorates centring about the great banking houses, such as J. P. Morgan and Company. It elicited a great quantity of interesting, striking, and more or less valuable testimony. The main result of the entire inquiry was probably the development of a somewhat more intelligent public opinion due to the publicity given the results, and the consequent stimulation to the movement for

remedial legislation by Congress. In the final recommendations of the committee were included the following with respect to clearing houses: That all clearing house associations admitting national banks be required to incorporate themselves; that every bank and trust company which is solvent and properly managed, shall be allowed membership in its proper association; that the association itself institute regular periodical examinations of its members; that clearing house certificates be issued only to pay balances at the clearing house; that the associations be prohibited from requiring members to charge prescribed rates for collecting out-of-town checks; and that they likewise be prohibited from prescribing rates of interest on discounts, rates of interest on deposits, or rates of exchange.

With reference to the concentration of banking power the committee made the following recommendations: That two or more banks should not be permitted to consolidate except upon the approval of the Comptroller of the Currency; that no person should be permitted to be a director in more than one national bank in the same community; that no stock of a national bank should be owned or held by any other bank, trust company, or holding company, and that no bank should be permitted to own or hold directly or indirectly any part of the stock of any other bank or trust company; that "voting trusts" should be expressly prohibited; that minority representation in banking directories be secured by a system of cumulative voting; that security holding companies as adjuncts to banks be not permitted; that no interstate corporation should constitute any bank or trust company its sole fiscal agent; that interstate corporations should not deposit their funds with unsupervised private bankers who do not disclose their condition, and who keep no reserve; that national banks should be prohibited from engaging in any promotion, guaranty, or underwriting, involving the transfer of the securities of any corporation; that national banks be authorized to invest one-fourth of their capital and surplus in public bonds and corporation mortgage bonds on which the interest has been regularly paid for five years.

There were in addition a considerable number of recommendations dealing with the New York Stock Exchange. The investigation and regulation of this exchange, however, was taken up by the New York legislature.

COTTON CORNER. The provisions of the Sherman law were extended to a new kind of case in the decision of the United States Supreme Court, January 6, 1913, in the so-called Patten cotton corner case. The court declared through Justice Vandevanter that "it was a conspiracy to run a corner in the market. The commodity to be cornered was cotton, a product of the Southern States, largely used and consumed in the Northern States. It was a subject of interstate trade. The corner was to be conducted on the Cotton Exchange in New York City, but by means which would enable the conspirators to obtain control of the available supply and to enhance the price to all buyers in every market of the country. Bearing in mind that such was the nature, object, and scope of the conspiracy here regarded, it is altogether plain that by its necessary operation it would directly and materially impede and burden the due course of trade and

commerce among the States, and therefore inflict upon the public the injuries which the anti-trust act is designed to prevent." This decision implied that whether the persons involved in a conspiracy intended to restrain interstate trade or not, or whether they were producers of the articles in question or not, or whether they actually handled the articles or not makes no difference. The result achieved by the conspiracy is the ground upon which judicial judgment of the nature of the conspiracy must be determined. On February 4, Mr. James A. Patten pleaded guilty to the charge of the above conspiracy and was fined \$4000. Other defendants demurred; they were overruled by the Supreme Court and in December entered pleas of *nolo contendere* to a modified indictment and were fined \$4000 each.

NATIONAL CASH REGISTER COMPANY. Both civil and criminal suits were brought against this concern, not on the ground of combination, but because of monopoly power and unfair business methods. The taking of testimony in the civil suit was announced to begin early in 1914. The criminal suit was terminated February 13, when 29 out of 30 indicted officials were convicted at Cincinnati. Fines aggregating \$135,000, and jail sentences ranging from three months to one year, were imposed. This concern was convicted of most execrable business methods, and was roundly denounced by the press of the country for insatiable greed. It had increased its control of the cash register business from 80 per cent. to 95 per cent. by bribing employees of express and railway companies; by otherwise maintaining espionage of its rivals' business; by preventing extension of credit to rivals; by requiring its agents to interfere with the sales of other registers, even by gross misrepresentation and the wrecking of other makes in actual use; by resorting to unfair price-cutting to defeat sales of competing concerns; by bringing suits for infringement of patents for sole purpose of financially embarrassing rivals; by setting up dummy competitors; and by inducing agents of rivals to enter its employ.

PUBLISHERS' ASSOCIATION. This was an association of book publishers by means of which certain rules governing the sale of books to the retail trade and the regulation of retail book prices were effected. R. H. Macy and Company, a New York department store, sold books at prices less than those stipulated by the association. The association then endeavored to cut off from Macy and Company its supply of books, by refusing to furnish books to any dealer known to sell to that department store. Macy and Company then, in 1902, brought suit to prevent the boycotting of their firm. The case was put through the New York State courts and finally decided by the United States Supreme Court about December 1. The opinion of the court declared illegal any combination to control the retail price not only of uncopyrighted books, but also of copyrighted books. The right of the retailer to sell any books at any price he chooses was guaranteed.

HAMMERSTEIN-METROPOLITAN SUIT. A unique decision was handed down early in December by Justice Pendleton of the New York Supreme Court, in a case whereby Oscar Hammerstein sought to break an agreement made a few years previously with the Metropolitan Opera Com-

pany. Mr. Hammerstein had in April, 1910, sold his Manhattan Opera House and equipment to the Metropolitan Opera Company, and entered into an agreement not to engage again in the production of opera for a period of ten years. He nevertheless, in 1912, made plans to give performances in English. He contended that his agreement of 1910 constituted a violation of the Sherman act; and that this act had been further violated by the Metropolitan Company in preventing him from giving opera in Boston, Philadelphia, and Chicago, as well as New York. The court held that the production of opera is not interstate commerce, and therefore the Sherman act does not apply to it. An injunction was therefore issued; but Mr. Hammerstein nevertheless declared his intention of opening his opera season in January, 1914, at his new American Grand Opera House.

TRADE BLACKLISTS. One of the most unique cases yet prosecuted under the anti-trust law was that of wholesale lumber dealers against the Eastern States Retail Lumber Dealers' Association. This association was charged with restraint of trade within the meaning of that law because it circulated an official list giving the names of the wholesalers who carried on at the same time both a wholesale and a retail business. The retailers' complaint was that these wholesalers would sell to one of their number and at the same time endeavor to secure retail business. The Federal district court sitting in New York issued an injunction restraining the association from publishing or circulating this official blacklist. The association itself was, however, not attacked. The Retail Lumber Dealers' Association appealed the case on the ground that the actual restraint of the trade was exerted not by them but by the wholesalers.

TSUMEBITE. See MINERALOGY.

TUBERCULOSIS. THE FRIEDMANN EPISODE. Dr. Friedrich Franz Friedmann, a German bacteriologist, read a paper in November, 1912, before the Berlin Medical Society, announcing a new method of curing tuberculosis, but giving meager details of the method. The paper was not well received by the German physicians, but sensational reports appeared in the American newspapers immediately thereafter, as to the wonderful efficiency of the new cure. Early in 1913 Dr. Friedmann came to New York, nation-wide publicity being given to his arrival, and to the reputed value of his serum. Refusal to divulge the exact nature of the serum aroused the distrust both of the city and national authorities, but he was invited to treat a large number of cases in New York City and other places, and after some negotiation disposed of the rights to his remedy to a firm of drug manufacturers. Thereafter the serum was found to be an emulsion of normal saline solution and living tubercle bacilli isolated from a turtle. It was used by injection into the muscular tissues or into the veins of the patient. By the end of September the treatment was thoroughly discredited and its administration barred by the New York City health department. The cases which had received injections of the Friedmann serum in the New York, Canadian, and Rhode Island hospitals were reported as not benefited, and many of them were made worse. At the great International Tuberculosis Congress in Berlin, in

1913, Friedmann's alleged cure was not mentioned in any contribution.

STATISTICS. L. Hoffman stated that a considerable amount of trustworthy statistical evidence was available to sustain the conclusion that the mortality from tuberculosis of the lungs had actually, as well as relatively, diminished in the United States during the last thirty years, and that on the basis of rates for the registration area, the saving of lives due to the campaign against this disease during the decade ending 1910 alone had amounted to nearly 200,000. The death-rate in this decade has diminished from 174.5 to 139.7 per hundred thousand of population.

A study of the combined mortality from tuberculosis of the cities of New York, Philadelphia, and Boston for 100 years, commencing with 1912, showed that the death-rate from the disease had persistently diminished, from 418.7 per hundred thousand in the population in the first decade of this period to 213.9 in the last decade. Furthermore, this tabulation showed that there had been a much more decided tendency toward a reduction of the death-rate since 1882. The mortality, which was 389.1 in 1881, had declined to 180.1 in 1902. These figures present the most conclusive evidence on record that the deliberate, intelligent, and nation-wide campaign against tuberculosis on the principle of its being an infectious disease and transmissible from man to man, has been successful.

Another study of fifty large American cities for the four years' period beginning 1871, showed that the death-rate in this group had declined from 335 per hundred thousand in 1881 to 166 in 1911. This decline in northern and western cities was from 325 to 160 per hundred thousand, or 50.8 per cent. In the white population of southern cities the rate declined from 301 to 150, or 50.2 per cent., while the colored population of southern cities showed a reduction of from 668 to 423, or 36.7 per cent. See HELIOTHERAPY; VETERINARY SCIENCE.

TUFTS COLLEGE. An institution for higher education, founded at Medford, Mass., in 1852. The total number of students enrolled in the several departments in the autumn of 1913 was 1064. The faculty numbered 242. There were no notable changes in the faculty during the year. The important benefactions received included \$350,000 from the Braker endowment, and \$29,500 from the Cummings estate. The productive funds of the college amount to about \$1,817,000, and the income to about \$54,000. The library contains 70,000 volumes. The acting president is William L. Hooper, Ph.D.

TUKE, SIR JOHN BATTY. An English alienist, died October 13, 1913. He was born in Beverley, Yorkshire, in 1835, and was educated at Edinburgh Academy and University. As soon as he had taken his medical degree he went to New Zealand. At the outbreak of the Maori War in 1860 he was senior medical officer to the colonial troops, and served nearly to the end of the war. On his return to Scotland in 1863, he began practice of medicine in Edinburgh. In 1873 he became associated in the management of Saughton Hall Asylum, which he continued to direct until a few years before his death. In 1895 he was elected president of the Royal College of Physicians at Edinburgh, and in 1898 was knighted. Elected to Parliament in 1900

and again in 1906, he retired from it in 1910. His published writings include: *Morison Lectures* (1874); and *The Insanity of Over-exertion of the Brain* (1894).

TULANE UNIVERSITY. An institution of higher learning, founded at New Orleans, in 1834. The total enrollment in all departments on November 1, 1913, was 2524. The faculty numbered 296. In 1913, Robert Sharp, A. M., Ph.D., was appointed president of the university, and C. S. Williamson was appointed professor of industrial and sugar chemistry. A gift to the school of dentistry was made in the will of Dr. Watson Woodward. The library contains about 56,000 volumes.

TUNGSTEN LAMPS. See **ELECTRIC LIGHTING.**

TUNIS. A French north African protectorate lying between Algeria and Tripoli and covering 167,400 square kilometers (64,600 square miles). The population was estimated in 1911 as 1,929,003—1,730,144 indigenous Arabs, Berbers, Moors, etc.; 50,383 Jews, 148,476 Europeans (46,044 French, 88,082 Italians, 11,300 British and Maltese, 696 Greeks, 587 Spaniards, 1767 other). Tunis, with 164,608 inhabitants (69,475 Europeans), is the capital.

PRODUCTION. Agriculture in the low regions, grazing in the fertile mountain valleys are the principal industries. Area under main crops and yield for two years (1913 provisional) are given below, with average quintals yielded per hectare in 1912:

	Hectares		Quintals		Qs. ha.
	1912	1913	1912	1913	
Wheat	570,680	500,000	1,050,000	1,500,000	1.8
Barley	480,830	400,000	670,000	1,400,000	1.4
Oats	54,360	54,000	360,000	600,000	6.6
Corn	20,000	11,000	81,947	35,000	4.1
Vines *	10,000	14,000	290,000	300,000	29.0

* Productive area; yield in hectoliters of wine.

There were reported at end of 1911 to be 39,441 horses, 80,951 donkeys, 13,289 mules and hinnies, 110,707 camels, 191,450 cattle, 686,730 sheep, 408,828 goats, and 17,898 swine.

The mining industry has developed in recent years; copper, lead, zinc, phosphates, and iron are raised. The fisheries are valuable. Wool spinning and weaving, with the manufacture of carpets, slippers, saddles, and pottery, are the principal indoor industries.

COMMERCE, ETC. The trade in the table below is in thousands of francs for four years:

	1909	1910	1911	1912
Imports.....	114,447	105,497	121,683	156,294
Exports.....	109,166	120,401	143,681	154,655

The principal articles of exports for 1912 follow, values in thousands of francs—phosphates 47,755, cereals 24,892, olive oil 20,552, live animals 9104, lead 8788, iron 6393, wine 5341, zinc ore 5265, esparto 4201, sponges 3350, woolens 3129, hides 2130, fish 1903, cork 1606. France contributed exports valued at 8,265,000 francs and received exports, 67,773,000 francs; Algeria, 17,835,000 and 7,738,000; United Kingdom, 14,544,000 and 13,752,000; Italy, 8,972,000 and 25,256,000; etc. Vessels entered, 12,964, of 4,744,010 tons. Merchant marine, 2 steamers, of 36 tons net, and 13,868 sail, of 145,666. Rail-

ways (1912), 1626 kilometers; telegraph lines, 4604 kilometers (wires 16,101); stations, 216; post offices, 431.

FINANCE AND GOVERNMENT. The 1913 budget estimated the revenue and expenditure at 85,012,400 and 85,002,322 francs respectively; 1911, 108,832,148 and 108,821,131.

The reigning bey is Sidi-Mohammed en Nasser (born 1855, succeeded 1906). A French resident-general (G. F. Alapetite since 1907) administers the country under the control of the foreign office.

TUNNELS. **UNITED STATES.** Tunnel construction in the States during 1913 was connected more with various rapid transit enterprises than with large railway schemes. An interesting plan, proposed by John F. O'Rourke, was for the elimination of timber by using interlocking concrete blocks, with the aim of affording protection against falling roof and of facilitating the progress of the work. Among the notable tunnels completed during the year was the Sand Patch tunnel, a 400-foot double track tunnel at Sand Patch, Somerset County, on the Connellsville division of the Baltimore and Ohio. This tunnel was driven to carry the main line from Cumberland, Md., to Pittsburgh through the summit of the Allegheny Mountains. During the year two important tunnels were under construction on the Louisville and Nashville Railroad, at Blount and Hayden Mountain, the former being 1000 feet in length and the latter 2100 feet.

To provide for the conveying of gas, manufactured at the Astoria plant of the Consolidated Gas Company of New York City, there was constructed during the year a tunnel under the East River between Astoria and the Bronx in order to accommodate the growing population of that district. It is 4662 feet long from centre to centre of shafts, the Astoria shaft being 34 feet 6 inches in diameter and 276 feet 9 inches deep, and the Bronx shaft 26 feet in diameter and 233 feet deep, giving a down grade toward the Astoria shaft. It is of D shaped cross section designed to carry in a concrete saddle two 72-inch gas mains with accommodations for two similar mains in the future. The tunnel is lined with concrete and was practically completed at the end of the year. The gas mains of cast iron 72 inches in diameter to be used for this tunnel are the largest ever constructed, with a 2½-inch thickness of wall, each section weighing 13 tons. It should be completed in 1915.

CANADA. The three-mile tunnel being built under Mount Royal at Montreal, Canada, was holed through on December 9, and the following day a train, electrically operated, was sent through the tunnel. The average progress in the construction of this work was 420 feet per month, with a gross average progress of 1100 feet per month. The operation was greatly facilitated by the installation of the muck-handling drill carriage. The Canadian Pacific Railway also had under way some notable tunnel construction in the Selkirk Mountains.

AFRICA. On February 22, 1913, two headings for the longest tunnel in South Africa, at Stockton, in Natal, met. The tunnel is 2586 feet in length and was built from headings nine by nine feet started at either end in May, 1912.

EUROPEAN RAILWAY TUNNELS. In Europe a considerable tunnel construction was in progress

during the year. The Lötschberg, which has been described in previous issues of the *YEAR BOOK*, was opened for international traffic on June 15. Work was in progress on the second gallery of the Simplon tunnel, which had been undertaken by the Swiss government to meet the needs of increased traffic. On October 10 the Mont d'Or Tunnel between France and Switzerland was holed through, and during the remainder of the year the work of completion was pushed so that it could be opened for traffic early in 1914. This new tunnel is $3\frac{3}{4}$ miles in length and pierces the Jura Mountains from Frasse to Vallorbe, saving a seven-mile detour.

CHANNEL TUNNEL. The committee of imperial defense of Great Britain was directed during the year to consider special reports from the Admiralty, the war office and the board of trade on the project of tunneling the English Channel, an enterprise in which interest was revived during the year. Whenever this scheme had been projected before in England, much opposition, largely of a sentimental and military nature, had been manifested, but in 1913 this was far less than in previous years, and it was thought that an engineering achievement, comparable with the construction of the Panama Canal, might eventually be accomplished. The Channel Tunnel Company, basing their opinions on the results of the Hawkshaw and Brunlees operations of some forty years previous, as well as on new borings of their own, became convinced that the project was feasible, and accordingly proposed that should they receive the sanction of Parliament they would proceed to construct twin and independent tubes so that with trains moving entirely in one direction there would be adequate ventilation, as in the case of the London tubes. On the French side a company, which had received legal powers, was to undertake the construction of the continental half of the scheme; and here, too, no serious difficulties were anticipated. On the English side two distinct sets of bores will be constructed, one a drainage heading starting at 350 feet below sea level at Dover and rising by a grade of one in 500 to about six miles from the shore where it will meet the main railway tubes which descend in easy grades to this point. Thence the tubes will rise by a grade of one in 1000 to the summit at mid-channel where the French work will be met, and similar construction, doubtless, will be followed on the south side of the work. It was thought likely that the drainage heading twenty-four miles in length would be put through before the main tubes were constructed, and would be used not only for drainage and the removal of excavated materials, but as supplemental to the main system of ventilation. The main tunnels will consist of two single-track tubes each of 18 feet interior diameter, so that the largest rolling stock of the British and French main lines can be accommodated. Electric locomotives will be employed, and the total length of the twin tubes and the approaches will be about thirty-one miles. The tubes will be placed 32 feet apart from centre to centre, and will be lined throughout with cast-iron segments of ample strength to resist any possible pressure, and will be grouted on the outside in the usual manner of underground tube construction. At frequent intervals cross-passages will be constructed and fitted with air-tight doors. All the

construction work, as well as the operation when finished will be carried on by electricity, and an elaborate ventilating system is planned. Most of the construction will be in chalk and the preliminary surveys and plans have been made with this idea in view. It is estimated that the total cost of the undertaking will be \$40,000,000 for the English portion, and for the French half approximately the same sum. The engineering difficulties in view of modern methods of tunneling construction were in no way considered insurmountable. See **AQUEDUCTS**, and **RAPID TRANSIT**.

TURBINES. See **INTERNAL COMBUSTION ENGINES**.

TURKEY, or the **OTTOMAN EMPIRE**. Formerly a vast empire comprehending extensive possessions in Europe, Asia, and Africa, but greatly reduced by wars in 1911-13 with Italy and the Balkan States. Constantinople is the capital.

AREA AND POPULATION. *European Turkey.* Previous to the wars in the Balkans, Turkey in Europe covered 169,300 square kilometers. (65,367 square miles) carrying a population estimated at 6,130,200. This territory was made up of seven vilayets and one mutessarifat as follows: Constantinople, 3900 square kilometers, and 1,203,000 inhabitants; Tchataldja (mutessarifat), 1900 square kilometers and 600,000 inhabitants; Adrianople, 38,400 and 1,028,200; Salonika, 35,000 and 1,130,800; Monastir, 28,500 and 849,000; Kossovo, 32,900 and 1,038,100; Scutari, 10,800 and 294,100; Yanina, 17,900 and 527,100. After the first war in the Balkans the Treaty of London (May 30, 1913) fixed the northwest boundary of Turkey by a line running through Adrianople vilayet from Enos (Ægean Sea) to Midia (Black Sea); but during the second war Turkey reoccupied the city of Adrianople and with the city recovered more of Adrianople vilayet. This territory was conceded to her by the Treaty of Bucharest (August 10, 1913), and, with Constantinople and Tchataldja, is all that remains to Turkey of her European domains. Constantinople (city) has, with suburbs, 1,200,000 inhabitants; Adrianople, 123,000.

Asiatic Turkey. Turkey in Asia is divided into Asia Minor, Armenia and Kurdistan, Syria and Mesopotamia, and Arabia; these divisions are subdivided into vilayets and mutessarifats as follows:

	Sq. kms.	Pop.
Archipelago	6,900	322,300
Ismid *	8,100	222,700
Bigha *	6,600	129,500
Brussa	65,800	1,626,800
Smyrna	55,900	1,396,500
Konia	102,100	1,069,000
Adana	39,900	422,400
Angora	70,900	932,800
Kastamuni	50,700	961,200
Sivas	62,100	1,057,500
Trebizond	32,400	948,500
Total Asia Minor.....	501,400	9,089,200
Erzerum	49,700	645,700
Mamuret-ul-Aziz	32,900	576,200
Bitlis	27,100	398,700
Diarbekr	37,500	471,500
Van	39,300	379,800
Total Armenia and Kurd....	186,500	2,470,900

	Sq. kms.	Pop.
Aleppo	88,800	995,800
Beirut	16,000	533,500
Lebanon *	3,100	200,000
Jerusalem *	17,100	341,800
Syria	96,900	719,500
Zor *	78,000	100,000
Bagdad	111,300	614,000
Mosul	91,000	351,200
Basra	138,800	433,000
Total Syria & Mesopotamia.	637,800	4,288,600
Hejaz	250,000	300,000
Yemen	191,100	750,000
Total Arabia	441,100	1,050,000

* Mutesarrifat.

Asir, Nejd, and El Hasa and El Katr, in Arabia, are regarded as belonging to Turkey; but are inhabited by tribes whose subjection is merely nominal. Anatolia is another name for Asia Minor. No official census having been taken, the population of the following cities, all in Asiatic Turkey, must be regarded as estimates: Damascus, 250,000; Smyrna, 250,000; Aleppo, 200,000; Beirut, 140,000; Bagdad, 125,000; Erzerum, 120,000; Afum, 95,000; Manissa, 90,000; Jerusalem, 84,000; Aidin, 80,000; Brussa, 80,000; Diarbekr, 80,000; Mosul, 80,000; Sivas, 78,000; Urfa, 72,000; Aintab, 70,000; Mecca, 70,000; Basra, 60,000; Trebizond, 60,000; Adana, 50,000; Homs, 50,000; Hodeida, 49,000; Medina, 49,000; Angora, 38,000; Tripoli, 32,000.

Turkey in Africa. By the terms of the treaty of Lausanne (October 15, 1912), which closed the Turco-Italian War, Tripoli and Benghazi were lost to Turkey. Egypt (q.v.) alone remains, and the suzerainty of Turkey over Egypt is merely nominal.

SOCIAL CONDITIONS. The population is made up of Turks, Greeks, Arabs, Albanians, Bulgarians, Servians, Vlachs, Kurds, Armenians, Jews, Syrians, Circassians, and other races. Mohammedans are in the majority. Gregorians predominate in Armenia. There are also Roman Catholics, Jews, Nestorians, etc. Primary education is provided by the Mohammedan priesthood attached to the principal mosques, and consists chiefly in the reading of the Koran. Secular education in the western sense is almost entirely lacking, except in non-Moslem institutions, which meet with no opposition or restraint. Secondary schools are few and special schools almost unknown. The fundamental laws are based upon the Koran. Mohammedan priests are estimated to number about 11,600 and are subject to the sheikh-ul-Islam, who is appointed by the sultan: their priestly office is, however, hereditary. The private ecclesiastical revenues amount to about 20,000,000 piasters per annum. The state pays to the sheikh-ul-Islam 7,031,520 piasters annually, and to the naibs and muftis 7,876,646. The condition of the peasant class is most miserable, the tithe and customs system effectually crippling incentive and breeding chronic poverty, uncertainty, and fear.

PRODUCTION. The soil is generally fertile and agriculture by primitive methods is practiced. The farmer, however, makes no attempt to progress, or to produce in quantities beyond his immediate need: the method of levying a government tax in kind upon all produce serves as an effectual check to enterprise, and an addi-

tional tax is laid upon all produce exported from one vilayet or subdivision into another. Moreover, the labor problem is acute throughout the empire. No reliable statistics of areas under cultivation nor of production exist. An attempt to estimate the output of cereals from twenty-nine districts and provinces (so-called) in 1910 resulted as follows: 44,845,000 quintals of wheat, 4,773,000 of rye, 29,005,000 of barley, 4,478,000 of oats, 11,246,000 of corn, 1,019,000 of rice. The area under tobacco in the empire in 1909 was estimated at 107,368 acres, yielding 74,445,244 pounds. Tobacco is a government monopoly which will lapse in 1914, when the production is expected to increase. The amount exported in 1911 was placed at 54,468,034 pounds. The annual output of olive oil has been estimated at about 750,000 quintals, of which 150,000 quintals are exported, 150,000 are consumed by the soap factories, and the remainder by the home markets. The increased cost, however, has led to the substitution of animal fats and other oils. The opium yield in 1909-10 was about 10,000 cases, of extra quality. The world's supply of true Mocha coffee comes from Yemen; it is all grown for export, as the Yemen Arab never himself uses it. Cotton is raised in increasing quantities. Other products are figs (from Smyrna), raisins, wine, nuts, valonia, canary seed, and linseed. Large areas are under forest. Sheep-raising is practiced, and the fisheries products are valuable. Wool and mohair are exported.

The abundant mineral wealth of the empire is undeveloped. Transportation facilities are inadequate, and labor is lacking. Salt is a government monopoly. Coal is mined to some extent; also phosphate of lime, copper, zinc, iron, silver, gold, antimony, etc. The manufactures include silk, carpets and shawls, leather, firearms, brassware, etc. Flour, cotton, and woolen mills produce goods for home consumption and also for export. But manufacturing interests meet with the labor problem, which so far has proved insurmountable for large enterprises.

COMMERCE. Figures for the trade of the Ottoman empire are incomplete and far from reliable. The returns from countries of origin and destination all differ widely when compared with Turkish returns, the Turkish export figures being much too low. As reported for years ending February 28, 1910 and 1911, the trade by great classes is shown below in thousands of piasters:

	Imports		Exports	
	1910	1911	1910	1911
Raw materials	212,278	225,372	542,012	908,461
Foodstuffs	1,277,513	1,189,038	685,910	938,651
Indust. prods.	1,952,028	2,375,809	540,850	206,507
Other	151,784	222,255	61,155	140,170
Total	3,593,603	4,012,574	1,829,927	2,193,789

The main articles of import are cottons, sugar, cereals, linen, yarns, woollens, rice, petroleum, etc.; exports, raw silk and cocoons, raisins, cereals and derivatives, mohair, figs, coffee, opium, skins, valonia, vegetables, minerals, fruits, carpets, etc. The principal countries of origin and destination follow, with values in thousands of pounds Turkish, for 1910-11, compared with 1908-9:

	Imports		Exports	
	1908-9	1910-11	1908-9	1910-11
United Kingdom....	9,413	8,206	6,137	5,355
Austria-Hungary....	4,075	7,558	2,478	2,169
France	3,371	3,832	3,634	4,395
Germany	1,936	3,291	1,150	1,309
Italy	51	3,635	1,007	1,478
Russia	2,494	2,738	5,749	911
Bulgaria	1,356	1,037	568	743
British India.....	1,932	255
Belgium	870	1,456	174	613
Egypt	1,163	1,144	1,657	1,565
Rumania	1,262	1,068	384	529
Netherlands	634	795	251	334
Persia	554	691	94	45
United States.....	411	634	703	1,007
Servia	603	460	99	301
Greece	396	237	436	382

Vessels entered (1910) at Constantinople, 20,268, of 19,153,951 tons, of which 11,684 steamers, of 18,554,116; at Smyrna, 6655, of 2,477,733 tons, of which 2661 steamers, of 2,400,333. Merchant marine (1911), 120 steamers, of 66,878 tons, and 963 sail, of 205,641.

COMMUNICATIONS. Railway statistics for 1911 included 1994 kilometers in Europe, 2372 in Asia Minor, and 2294 in Syria and Arabia. Italian capitalists during the year, through Count Nogara, signed a contract with the Ottoman government for the construction of a network of railways in the southwest of Asia Minor with a terminus at Adalia. The Kish-tah-Karapouna section of the Bagdad railway was opened early in the year, and the Osmania-Muslimuyeh and Konia-Dorak sections were in progress. The difficult portion through the Taurus Mountains to Konia made little progress. The Aleppo-Jherabis section was completed, while the branch line, Taprak-Kale to Alexandretta, was opened on November 1. The Juffa-Tabriz section in Persia was in progress, while in Syria the Jerusalem to Mount Carmel (Afulah) was under construction. In connection with the harbor improvement at Jaffa, a new railroad connection with Jerusalem formed the subject of a concession to a French company. A line was to be built from Rayak on the Beirut-Damascus line to Lydda on the Jaffa-Jerusalem line. This would make possible, not only the commercial development of the rich plains of Esdraelon and Sharon, but an all-rail journey to Jerusalem from Constantinople, via the Aleppo branch of the Bagdad line. Telegraph lines (1911) include European and are given as 48,026, wires 80,304. Post offices, 1632.

FINANCE. The monetary unit is the Turkish pound of 100 piasters; its par value is \$4.39642. The revised budget for 1912-13 is given in detail below:

Revenue	£T	Expenditure	£T
Direct taxes...	14,870,381	Finance, debt...	15,790,933
Indirect " ..	5,692,728	War	21,601,458

* And worship.

Including £T5,231,424 at 4 per cent. loaned for the Bagdad Railway, and a loan in 1911 of £T11,479,050, the total debt stood at the end of 1912 at £T131,839,978.

ARMY. In 1913, as in 1912, the Turkish army was concerned more with active problems than with such matters of organization as could be recorded in available statistics. The shortcomings of the previous system of organization and recruitment were obvious in the war and new methods of instruction and new instructors were to be looked for. Military observers and critics confined themselves to a discussion of the problems of the Turkish army in conflict rather than to any proposed schemes of organization, so that at the end of the year there was little positive information available as to recent progress, while earlier issues of the YEAR BOOK have discussed in full the organization of the Turkish army previous to the conflict in 1912.

NAVY. The effective fleet included in 1913, two protected cruisers, 2 torpedo craft, 15 gunboats, 8 torpedo destroyers, and 16 torpedo boats. Building is one battleship of the super-dreadnought type, of 23,000 tons displacement, 21 knots speed, and a main armament of ten 13.5-inch guns, besides sixteen 6-inch guns and five torpedo tubes. She was ordered from the Vickers firm at Barrow and was launched September 3, 1913. Personnel, 13,000 of all ranks. Rear-Admiral A. H. Limpus succeeded Rear-Admiral H. P. Williams as naval adviser to the Turkish government, April, 1912.

GOVERNMENT. Turkey is a constitutional hereditary monarchy of which the sultan is both temporal and spiritual head. The succession rests in the senior male descendant of the house of Osman, sprung from the imperial harem. The sultan does not marry; but all children born in the harem, whether of free or slave women, are counted legitimate and of equal lineage. A grand vizier appointed by the sultan forms the cabinet; the sheikh-ul-Islam is, under the sultan, the director of ecclesiastical affairs. For administrative purposes the empire is divided into vilayets, sanjaks, kazas, nahies, and karies. The legislative body is composed of a senate and a chamber of deputies. The constitution of December 23, 1876, abolished in 1877, was reestablished July 23, 1908. Mohammed V., born 1844, emperor of the Ottomans, khalif of the Mussulmans, thirty-sixth sovereign of the house of Osman and twenty-ninth since the taking of Constantinople, is the third son of Abdul Mejid. He succeeded his brother Abdul Hamid, deposed April 27, 1909; Abdul Hamid had succeeded his eldest brother Mohammed Murad (deposed August 31, 1876), who had succeeded his uncle Abdul Aziz (deposed May 30, 1876), who had succeeded the father of the present sultan deceased June 25, 1861. The oldest son of the sultan succeeds only when there are no surviving uncles or cousins older than himself. Heir-presumptive, Yussuf Izzedin (born 1857), son of Abdul Aziz.

HISTORY

INTRODUCTION. The chief interest in Turkey during 1913 centred in the conduct and outcome of the Balkan War, which is fully discussed under the title TURKEY AND THE BALKAN PEOPLES. The present article deals only with the internal affairs of the empire.

POLITICAL CRISES. The Young Turk party

and their powerful agent, the committee of union and progress, which had named or at least dominated the government practically from the Revolution of 1908 until the autumn of 1912, were very generally blamed for the military reverses that brought the country in 1913 almost to the brink of ruin. Their absorbing patriotism had expressed itself in a ruthless policy of Ottomanizing the empire—attempting to substitute uniform, national law for long-established local customs and usages—with the result that enemies had arisen on all sides, from Basra on the Persian Gulf and from far-away Arabia, throughout Syria and Armenia, to the fierce Christian fighters of Macedonia and Albania. On the other hand, their absorption in political affairs had caused the Young Turks to neglect the army, the one weapon against their numerous opponents; army officers gave more heed to politics than to their commands; discipline was undermined; and Turkey was unprepared to resist the onset of the Balkan allies. Under these circumstances the Young Turks had been discredited and late in October, 1912, had lost control of the cabinet. In November, when the swift advance of the Bulgarians had thrown Constantinople into a panic, it was easy for Kiamil Pasha, the grand vizier, to defy the committee of union and progress and to imprison several of its leaders. There seemed to be little real opposition to Kiamil's attempts speedily to terminate the disastrous war, and a Grand Council of Notables, convened in January, expressed its unreserved approbation of the ministerial programme and unanimously accepted the mediation of the powers.

The Young Turk leaders, however, who had been released from prison on December 8, stigmatized the proposal to surrender Adrianople and the Aegean Islands as cowardly. With "save the national honor or perish in the attempt" as a slogan, the committee of union and progress stirred up a great popular demonstration against the government. On January 23, the day following the Grand Council's acquiescence in the terms of peace, a small company of mounted officers, headed by Djemal Bey, vali of Adana, rode into the Porte. Their arrival was the signal for a concerted rush on the part of various groups that had been watching close by. Enver Bey and Halil Bey then appeared, and, with Djemal Bey, entered the Porte and asked to see the grand vizier. They were followed by other members of the committee of union and progress. Nazim Pasha, minister of war, came out of the council chamber and was at once shot and killed by a member of the advancing group. In the ensuing *mêlée*, two other persons were murdered. Enver Bey then entered the council chamber and informed Kiamil Pasha that he must either resign or swear to continue the war. The grand vizier chose the former course, and, armed with his resignation, the conspirators proceeded to the palace, where they secured the sultan's assent to the appointment of their old leader, Mahmud Shevket Pasha, as grand vizier. This dramatic *coup d'état* brought in the following Young Turk ministry: Grand vizier and war, Mahmud Shevket Pasha; president of the council, Prince Said Halim; foreign affairs, Mukhtar Bey; interior, Hadji Adil Bey; marine, Tahuruk Sula Mahmud; justice, Ibrahim Pasha; finance, Ri-

faat Bey; public works, Batzarla Effendi; pious foundations (*Evkaf*), Hairei Bey; agriculture, Djelal Bey; posts and telegraphs, Oskian Effendi; and education, Shukri Bey. Though accepting no office, Enver Bey and Talaat Bey were known to possess great influence with the new government.

Despite the energetic efforts of Enver Bey and of the cabinet, the Turks were unable, upon the resumption of hostilities, to stem the tide of defeat, and by the end of April they were obliged to confess that the Balkan allies were in complete possession of all European Turkey except Constantinople and its environs. Then it was that even the Young Turks consented to open negotiations for peace, and, instead of dying in the attempt to "save the national honor," the ministry accepted the Treaty of London (May 30), which established peace on a far less desirable basis than that proposed by Kiamil Pasha. Naturally, the bitterness of the army party increased, and on June 11 Mahmud Shevket Pasha, the grand vizier and minister of war, was assassinated in the streets of Stamboul. The Young Turk government survived the shock, however. As a stern warning to malcontents, twelve persons were publicly hanged for suspected complicity in the assassination plot, and the committee of union and progress utilized the conspiracy as an excuse for exiling some three hundred of its political opponents. The ministry was reorganized soon after the assassination of Mahmud Shevket Pasha: Prince Said Halim, a wealthy Egypto-Turk, but an enemy of the khedive, being a nephew of Ismail Pasha and therefore in line of succession to the khedivate, but for Ismail's compact with the Porte, and an ardent Young Turk withal, became grand vizier and minister of foreign affairs; the former ministers of justice, finance, pious foundations (*Evkaf*), posts and telegraphs, and education, retained their portfolios; the following new appointments were made: President of the council, Halil Bey; sheikh-ul-Islam, Mehmed Essad Pasha; interior, Talaat Bey; war, Izzet Pasha; marine, Mahmud Pasha; commerce and agriculture, Suleiman el Buxtani; and public works, Osman Nizami Pasha.

The position of the Young Turk ministry was materially strengthened in July by the circumstances of the quarrels among the Balkan allies over the division of the spoils and the consequent second phase of the Balkan War, in which Turkey, as one of the assailants of Bulgaria, was enabled to reoccupy Adrianople on July 22. Hadji Adil Bey, former minister of the interior, was at once appointed vali of Adrianople, and a complete Turkish civil administration was restored. Thus the Young Turks appeared to have been successful after all in their endeavor to "save the national honor." Rumors of friction between Enver Bey and the ministry on the question of the permanent retention of Adrianople, regardless of the treaty of London, were discredited as soon as it became known that the treaty of Constantinople (September 29) between Bulgaria and the Porte secured definitely to the Ottoman Empire not only Adrianople, but Demotika and Kirk-kilisse also. This astonishing diplomatic victory inspired the ministry with renewed confidence, despite the fact that in order to defray the expenses of the July war, additional for-

oreign loans were required. At the autumn congress of the committee of union and progress, the intention was announced of transforming the committee into an ordinary parliamentary party which, while still stressing a policy of "Ottomanizing" the empire, would henceforth direct its chief activity towards the encouragement of education, commerce, and national industry.

OUTCOME OF THE WAR. The conclusion of the Balkan War found Turkey shorn of the bulk of her European possessions. And a heavy price she paid for her defeat. Not only were Albania, Macedonia, the Aegean Islands, Crete, and a part of Thrace lost to her, but thousands of Mussulman refugees from the sacrificed districts had to be provided for in the Asiatic provinces, and economic depression combined with political unrest to distract the whole empire. Moreover, the military losses were very heavy. It was officially reported before the July war that the Turkish losses in the struggle worked out at 60,000 in southern Macedonia, 20,000 in central Macedonia, and in Thrace, 10,000 at Kirk-kilis, 35,000 at Lule Burgas, and 3500 at Tchataldja. Out of some 180,000 troops who had borne the brunt of the fighting, at least one-third were permanently lost, killed, or disabled, and about 50,000 had been captured. Finally, the war added materially to the country's indebtedness, and failure to conclude a loan agreement with the foreign powers in 1913 left the Turkish exchequer in a parlous condition. In the meantime, temporary relief was secured by the sale of treasury bonds to the amount of 100,000,000 francs to the French firm of Perrier and Company. These bonds were described as the balance of 120,000,000 francs of treasury bonds bearing 5 per cent. interest, the emission of which was authorized by the law of February 2. It was arranged that the revenue accruing from the war tax on real estate, whereby these bonds were guaranteed, should be handed over to the agencies of the public debt administration as they were encashed. In what financial straits Turkey found herself is eloquently witnessed by the fact that the French firm took the bonds at 80 with interest of 12½ per cent.

THE ARMENIAN QUESTION. One of the distressing accompaniments of the Balkan War was a recurrence of the difficulties between the Armenians and their Moslem neighbors. Although there was no uprising on the part of the Armenians against Turkish sovereignty, but rather a tendency to serve in the army as loyal defenders of the empire, nevertheless they were distrusted as Christian sympathizers with the triumphs of the Balkan peoples, and several Armenians were massacred at Rodosto in European Turkey. Then, too, the Armenians of the Asiatic provinces complained bitterly against the general lawlessness and spasmodic attacks of their hereditary foes, the fanatical Kurds, and against a proposal of the Turkish government to settle Mohammedan refugees from Macedonia and Thrace in the Armenian districts. Owing to their failure to secure any alleviation of the condition of their people, the Armenian patriarch and the lay council tendered their resignation. At an extraordinary meeting of the Armenian National Council in May, however, it was decided not to accept these resignations, but to appoint five persons, rep-

resenting the five political parties into which the Armenians of Turkey are divided, to assist the mixed council in inquiring into Armenian grievances. Subsequently a deputation waited on the grand vizier, who explained that the war had prevented the introduction of reforms, but now that this was virtually over the government as a first step was sending gendarmes to Anatolia; he assured the deputation that the rumors that the government proposed to send Macedonian refugees to Armenian districts as colonists were false. When the war was finally ended and no other steps had been taken to redress Armenian grievances, the Armenians increased their clamor for a larger measure of local self-government in the six vilayets which they largely inhabited: Erzerum, Van, Bitlis, Sivas, Memurel-el-Aziz (Kharput), and Diarbekr. As a protest against the indifference of the authorities, the patriarch again resigned in August and was succeeded by Mgr. Zaven, archbishop of Diarbekr. Under the leadership of the new patriarch, the Armenian committee demanded proportional representation of the two million Armenians in Turkey in the imperial parliament and extensive autonomy for the six vilayets under a national council. The first of these demands was peremptorily rejected as contrary to the terms of the constitution, although Talaat Bey was despatched to investigate the situation in the Armenian districts; the answer to the second demand was deferred until reform proposals of Russia and Germany had been considered by the government. At a discussion on December 25, between the grand vizier and the German and Russian ambassadors, the principle of reform in the six vilayets was accepted by the Porte, but difficulty was experienced in agreeing upon the details of the scheme. One of the chief outstanding problems was the representation of Moslems and non-Moslems in the general assembly, as the Porte was reluctant to allow equal representation to the two sections.

THE OTHER ASIATIC PROVINCES. It was not only in the six Armenian vilayets that a strong reaction set in against the Ottomanizing tendencies of the Young Turk party and in favor of larger measures of local autonomy. In May, great opposition was reported from Basra, near the Persian Gulf, to new laws recently promulgated for the administration of that vilayet. The Arabs felt that too much power was entrusted to the vali, that there was too much centralization. These protests were offset with vague promises of reform, and meanwhile troops were sent to Basra from Bagdad.

It was in the vilayets of Beirut, Syria, and Aleppo that the Arabs were loudest in demands for "home rule." The suppression of the Syrian decentralization league of Beirut by the Young Turks incited no little unrest in those districts throughout the spring months, and the Arab congress, sitting in Paris in July, made vehement protest against the government at Constantinople. About the same time, a petition, signed by 1700 representative citizens of Beirut, was addressed to the grand vizier requesting (1) repeal of the vilayet's law, (2) acceptance of former programmes of reforms; (3) reopening of the decentralization league's club-house. The Young Turk ministry soon indicated a willingness to conciliate and compromise. In August a formal agreement between

Turks and Arabs was reported from Beirut, involving the selection of Arab-speaking officials for the Arab vilayets, the appointment of at least three Arab ministers and at least five Arab valis, the use of Arabic as an official language in the Arab provinces and the control of expenditure on public works by the provincial councils. The new vali of Beirut, Samy Bekir Bey, appointed in November, was very friendly to the Arabs.

Meanwhile, in July, a new scheme was announced by the Turkish ministry for the division of the Asiatic vilayets into a group of inspectorates-general. According to the plan, which was described as a compromise between the Young Turks and the decentralizers, there would be two Armenian inspectorates-general, comprising the vilayets of Adana, Sivas, Kharput, Diarbekir, Bitlis, Van, and Erzerum. The other groups would be Yemen, Syria, Irak, and Anatolia. At the head of each such division would be an inspector-general, appointed for five years, assisted by foreign advisers, and entrusted with extensive powers. The powers of the valis would remain unchanged, but any vali might be dismissed by his inspector-general without reference to the minister of the interior at Constantinople.

FOREIGN CONCESSIONS IN THE ASIATIC PROVINCES. Work on the construction of the great Bagdad Railway was quickened during 1913 as a result of the conclusion of protracted negotiations among several great powers which were interested in securing concessions from Turkey. It will be remembered that this particular undertaking was primarily Germany's: Russia so recognized it by an agreement signed at Potsdam in 1911, and then both Great Britain and France acquiesced. According to the Franco-German agreement, the Ottoman bank will hand over to the Deutsche bank its financial interest in the Bagdad Railway; the Deutsche bank will buy this stock and will renounce in favor of interested French parties other railway concessions on the Black Sea coast and in Syria; the result will be that Germany will obtain absolute liberty of action as regards the Bagdad Railway and that France will be guaranteed against German competition in other regions.

In September, as a result of several weeks' negotiation in Paris, another important agreement was reached between the French and Turkish governments, by which France gets the right to extend the Aleppo-Homs Railway from Rakjak, its southern terminus, to Lydda on the line connecting Jaffa and Jerusalem, and also the right to construct railways in Armenia, from Samsun to Sivas and Kharput, and from Trebizond to Sivas. In return, the French government promised to support, after the signing of definite treaties of peace between the Porte and all the Balkan states, the issue of a Turkish loan of 700,000,000 francs in France and to consent, if other powers agree, to a four per cent. customs increase and an income tax on foreigners resident in Turkey. The importance of French interests in Turkey was expressed by M. Doumergue, the French premier, late in December, who reminded his hearers that French capital invested in Turkey, almost entirely in Ottoman government bonds, amounted in round figures to 3,000,000,000 francs, and went on to say that by recent agreement various measures had been

taken to promote French culture in Syria, such as the foundation of a school of law and a school of arts and crafts at Beirut, the contemporary establishment of a "professional" school at Damascus, the introduction of some useful administrative reforms for the benefit of the population of the Lebanon, and the opening of the port of Junieh to the north of Beirut.

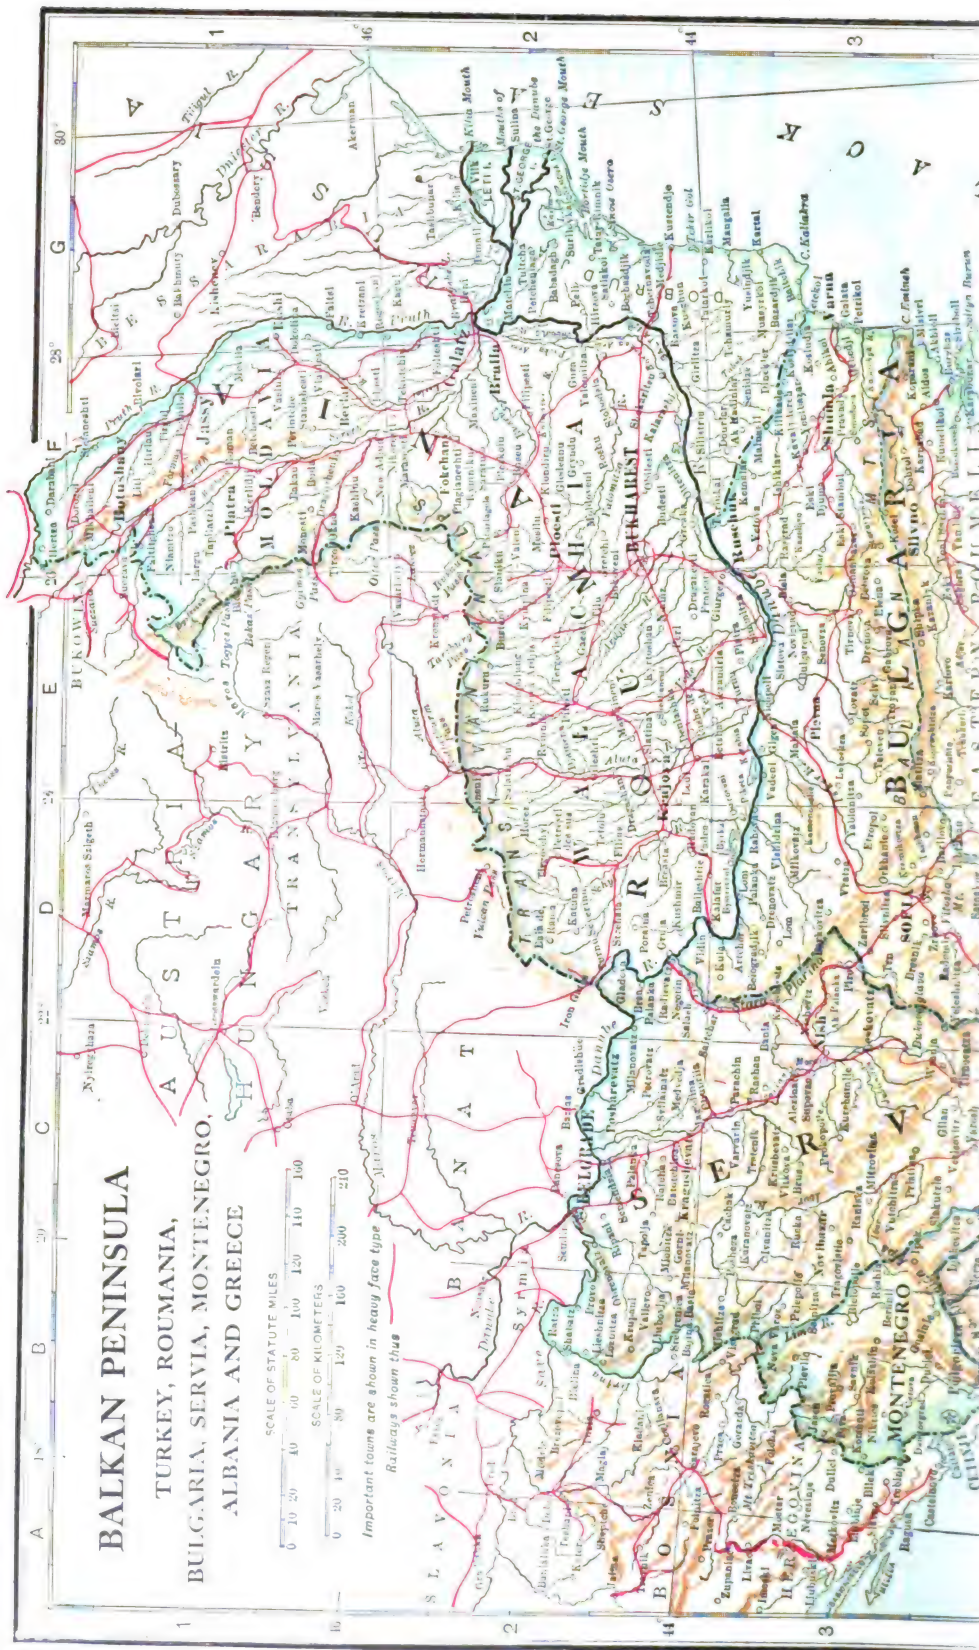

British diplomacy was especially directed toward the grant of concessions in Asia Minor and about the Persian Gulf. Provision was made in the summer (1) for the recognition by Great Britain of the suzerainty of the Porte over Koweit, which is to be an autonomous *kaza* of the Ottoman Empire; (2) for a pledge on the part of the Porte not to interfere in the internal affairs of Koweit or in the question of succession, and for the recognition of the conventions concluded between the sheikh of Koweit and the British government; (3) for the abandonment by the Porte of all its pretensions to suzerainty over the peninsula of El Katr, the Bahrein Islands, Muscat, and the territory of the trucial chiefs; (4) for the recognition by the Porte of the right of Great Britain to undertake the duty of lighting, buoying, and policing the Persian Gulf. Great Britain declined to allow the extension of the German Bagdad Railway to Koweit. Turco-British negotiations dragged on throughout the year over the navigation of the Tigris, Euphrates, and the Shatt-el-Arab, and the frontier between Turkey and Persia.

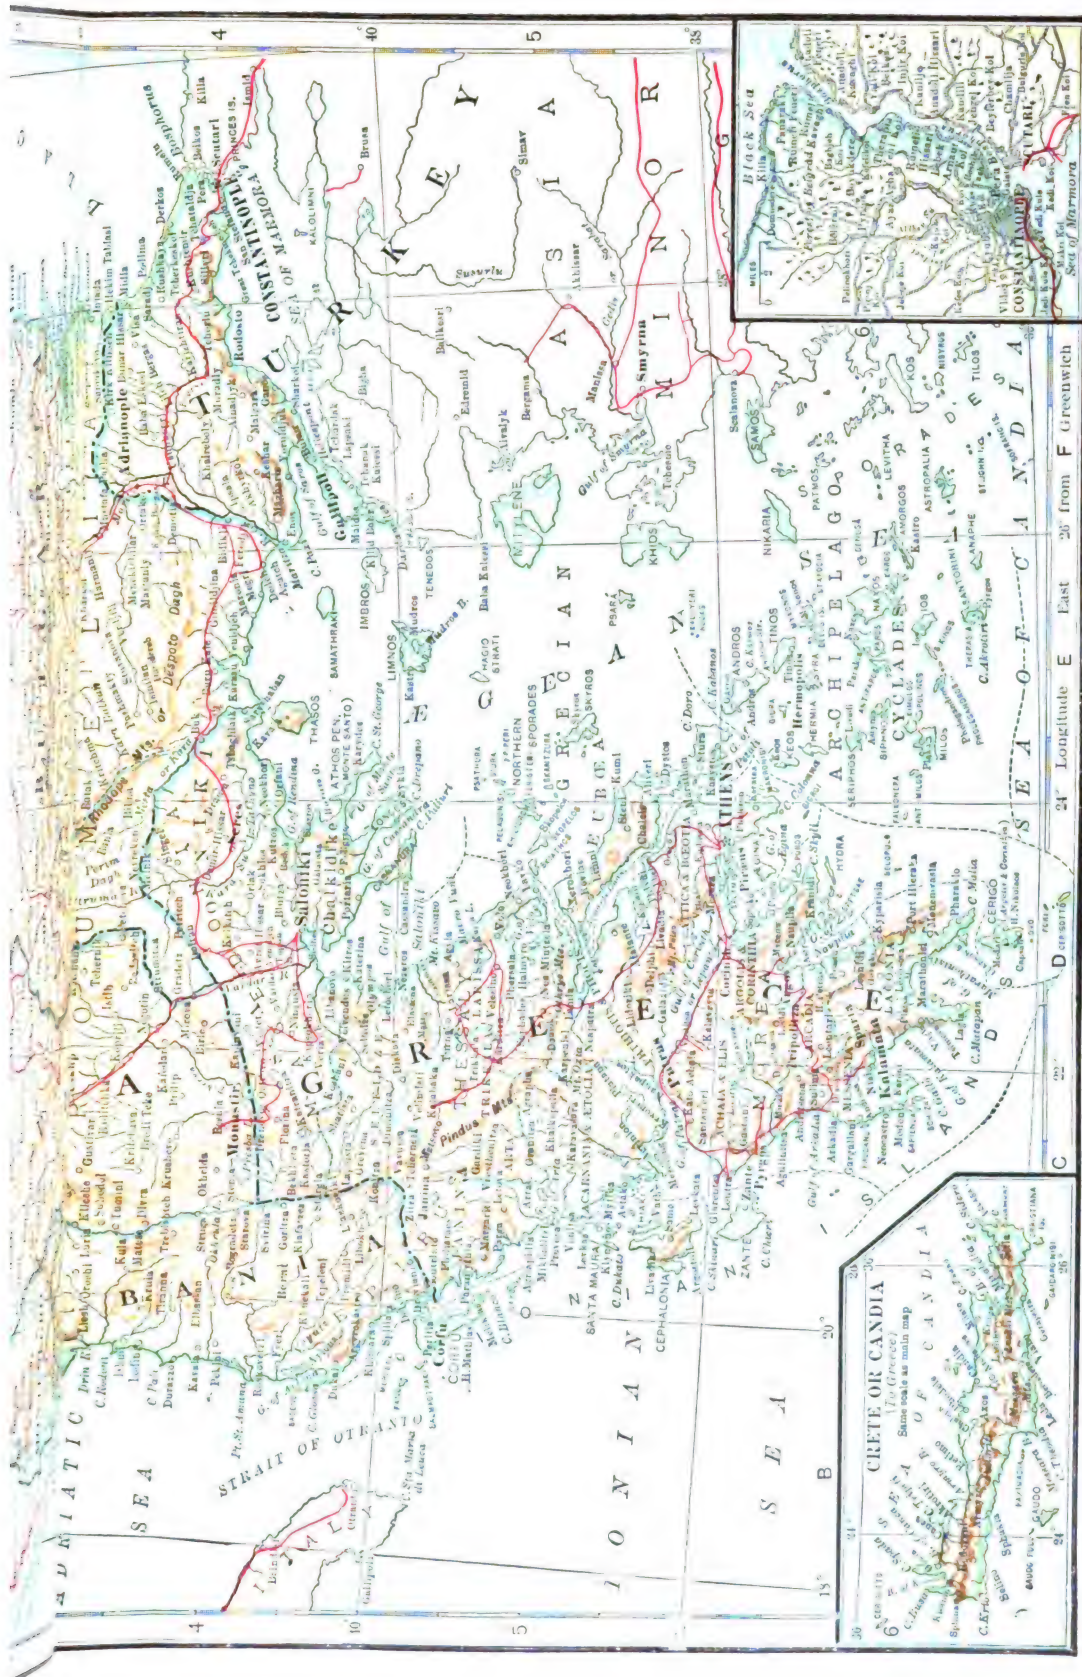

Along with Germany, France, and Great Britain, Italy was vying for commercial privileges in Turkey. Her prolonged occupation of the twelve Aegean Islands which she had captured in the course of the Turco-Italian War of 1911-1912, afforded her a strategic centre in the Near East, and it was frequently rumored that she was retaining the islands in order to wring from Turkey valuable railway concessions in Asia Minor and in Syria. In this policy, Italy naturally encountered opposition not only from Turkey and Greece, but also from France and Great Britain.

MISCELLANEOUS. Following the conclusion of the Balkan War, elaborate plans were perfected for the construction of a new Turkish navy, and late in December the purchase of a superdreadnought from Brazil was rumored. It is not unimportant to record, on account of his great political, as well as religious, influence over the Orthodox Christians within the Ottoman Empire, that a successor was elected on February 10 to Joachim III., Orthodox patriarch of Constantinople, who died on November 26, 1912. The new patriarch was Germanos Kavakopoulos, born in 1835, in Stamboul, educated at Jerusalem and Athens, made metropolitan of Kos in 1864, and transferred to the see of Chalcedon in 1897. He assumed the title of Germanos V.

TURKEY AND THE BALKAN PEOPLES.

The most important events of 1913 in south-eastern Europe were connected with two more or less distinct wars: (1) that begun in October, 1912, and concluded in May, 1913, between Turkey on one side and the Balkan allies—i.e. Bulgaria, Servia, Greece, and Montenegro—on the other; and (2) that in July, 1913, between Bulgaria on one side and her former allies together with Rumania and Turkey on the other. These two conflicts can be conveniently

treated together as the "Balkan War," the course of which as well as the international aspects and immediate results of which will concern us in the present article. The genesis and early history of the war are discussed at some length in the 1912 YEAR BOOK, *TURKEY AND THE BALKAN PEOPLES*. See also in this volume ALBANIA, BULGARIA, CRETE, GREECE, MONTENEGRO, RUMANIA, SERBIA, and TURKEY.

FIRST LONDON PEACE CONFERENCE. Negotiations for peace between Turkey and the Balkan allies, opened in London on December 16, 1912, were deadlocked by absolutely contradictory views on three weighty matters. In the first place, both Bulgaria and Turkey maintained that Adrianople was essential to their national safety. Secondly, Greece demanded the cession by Turkey of all the *Ægean* Islands, which are populated almost exclusively by Greeks, while Turkey insisted that the retention of some of them (e.g. Imbros, Tenedos, and Lemnos) was necessary to her for the protection of the Dardanelles, and of others (e.g. Chios and Mytilene) for the defense of the vilayets of Asia Minor. Finally, the allies not only opposed the assumption of any share of the Ottoman debt, but also urged the payment by Turkey of a war indemnity: to yield to this claim would totally destroy Turkish credit. The Turkish diplomats, therefore, rejected the victors' terms of peace, and on January 6 the allies suspended the conference. Ten days later, the great powers, fearful of a resumption of hostilities in the Balkans, advised the Porte, in a collective note, to yield on the question of the surrender and cession of Adrianople and to leave the other unsettled problems to the powers for adjudication. For a few days it was believed the Porte would act favorably upon the collective note, and a council of notables, assembled at Constantinople on January 22, gave its assent, but on the next day a *coup d'état* in the Turkish capital overthrew the conciliatory ministry of Kiamil Pasha and put in its place a "no surrender," Young Turk cabinet, headed by Mahmud Shevket Pasha and inspired by the patriotic Enver Bey (see *TURKEY, Political Crises*). The only concession which the new government would propose was one for the division of Adrianople and the grant of autonomy to the *Ægean* Islands: this was, of course, unacceptable to the Balkan allies, and thus the first London conference came to naught.

RESUMPTION OF HOSTILITIES. Hostilities were resumed between the belligerents on February 3. Although the Bulgarians were unable to carry the fortifications at Tchataldja and press on to the capture of Constantinople, they successfully combated every effort of the Turks to advance from their strong entrenchments. A determined attempt of Enver Bey to turn the Bulgarian right flank by means of an advance from the Gallipoli peninsula toward Rodosto was thwarted after several weeks' rather desultory fighting. Meanwhile the sieges of Adrianople, Janina, and Scutari—the only positions west of Tchataldja still held by the Turks—were vigorously pushed by the allies. On March 6 Janina surrendered to the Greeks. The Bulgarians with Servian help repeatedly stormed Adrianople; two forts were taken on March 9, and on the twenty-sixth the whole eastern line of defenses was carried and Shukri Pasha was compelled to capitulate with some

30,000 men. The allies who victoriously entered Adrianople found a city whose buildings had suffered from cannon and fire and whose population were on the verge of starvation. Outside of Constantinople and a small stretch of adjacent territory, only Scutari was left to the Turks of all European Turkey. The fate of Scutari, involved as it was in a thorny international problem, will be discussed later under *The Albanian Question*.

THE GREEK NAVY. Before the close of 1912, the small but efficient Greek navy had already distinguished itself by seizing practically all the *Ægean* Islands not actually occupied by Italy. Thus landings had been effected on Lemnos on October 21; Thasos, Imbros, and Strati on October 31; Psara on November 5; Tenedos, November 6; Nikaria, November 17; Mytilene, November 21; and Samos and Chios, November 24. Some fighting occurred on Chios, Samos, and Mytilene, but by the middle of January the Turkish troops had surrendered or been dispersed. Throughout February and March Greek warships performed valuable service in preventing the Turks from reoccupying any of the islands or from transporting reinforcements from the Asiatic provinces to Macedonia and Thrace to the embarrassment of the Bulgarians. One result of the activity of the Greek fleet was that Turkish shipping was almost at a standstill in the *Ægean*. On the whole, Turkish warships proved quite ineffective, although the *Hamidieh* made several long cruises through the *Ægean* and to Egypt, and once into the Adriatic, managing to elude the Greek fleet and to terrify Greek merchant vessels.

THE ALBANIAN QUESTION. From the very beginning of the Balkan War, great fear was felt lest the spark kindled in southeastern Europe should be communicated to the great powers and set the whole continent ablaze. It was about the disposition of Albania that the greatest danger existed at all times. Not only did Montenegro aspire to annex Scutari, but Greece and Servia desired to divide the larger part of Albania between them. Servia, in particular, cut off for many years from the Adriatic by Turkey and Austria-Hungary and now from the *Ægean* by the Greek occupation of Salonika, felt she had a wonderful opportunity to secure Durazzo or some other Albanian port which would give her territorial and commercial access to the Mediterranean, and with this Servian ambition Russia was known actively to sympathize. On the other hand, both Austria-Hungary and Italy had important economic and political interests in Albania and no desire to encounter Servian competition on the Adriatic; neither Austria-Hungary nor Italy would allow the other to possess the country; and both stood together, therefore, in insisting that Albania, since it manifestly could not remain Turkish, should be erected into an autonomous principality. The state of European alliances caused Germany to champion the policy of Italy and Austria-Hungary and brought France and Great Britain to the support of Russia. Only the earnest endeavors of all the foreign offices of Europe succeeded in effecting a compromise of the conflicting purposes and thus preventing a general war.

As early as November 28, 1912, the matter had reached its first acute stage by the capture of Durazzo by the Servians. This was settled,

however, by an agreement among the powers, announced at London on December 20, accepting the principle of Albanian autonomy and likewise of the commercial access of Serbia to the Adriatic. With this understanding, Serbia evacuated Durazzo.

The next difficult stage in the negotiations was the determination of the boundaries of the proposed principality. In deference to the strenuous representations of Austria-Hungary, though only after protracted debate and in the face of bitter protests from Montenegro, the powers at length agreed to incorporate Scutari in the new state, but repeated their promise that Serbia should be given commercial access to the Adriatic over a neutral railway. In return, Russia and her allies obtained the consent of Austria-Hungary and Italy that the almost exclusively Albanian towns of Ipek, Djakova, Priserend, and Dibra, on or near the River Drin, should go to the Serbs. The northern and eastern frontiers of the Albanian state were accordingly agreed upon by the powers on March 26. The immediate result was a relaxation of tension among the powers and the simultaneous withdrawal of the Russian and Austro-Hungarian troops from the Galician frontier.

Serbia acquiesced in the arrangement, but Montenegro proved so obstinate that another crisis was soon precipitated. On April 1 King Nicholas was notified that the powers had unanimously agreed to blockade his coast if he did not raise the siege of Scutari. His answer was that the proposed action of the powers was a breach of neutrality and that Montenegro would not alter her attitude until she had signed a treaty of peace. At once the warships of all the powers except Russia, which had none in the Mediterranean, blockaded Antivari. On April 15, owing to the pressure of the powers, the Serbian troops were recalled from Scutari. Nevertheless, the Montenegrins persisted alone and on April 22 compelled Essad Pasha to surrender Scutari. Two days later the Austro-Hungarian government demanded that vigorous action be undertaken by the powers to put independent Albania in possession of Scutari according to the agreement of March 26. At once the greatest excitement prevailed throughout Russia; Pan-Slavic demonstrations against the Austro-Hungarian policy were held in many of the large cities. In Austria-Hungary military preparations were renewed on a large scale, and on May 1 the Dual Monarchy gave notice that it would undertake individual action should Montenegro not agree to the ultimatum. Italy, unwilling to permit Austria-Hungary individual action in Albania, announced that she would support her ally. As the result of all the pressure brought to bear upon him, King Nicholas on May 5 yielded and placed Scutari in the hands of the powers, just in time, as Sir Edward Grey informed the House of Commons, to prevent an outbreak of hostilities between Austria-Hungary and Russia. On May 14 the sailors from the international fleet occupied Scutari in the name of the principality of Albania. Subsequent international complications in connection with the Albanian question are noted in a paragraph below, *International Aspects of the Situation*.

RENEWED PEACE NEGOTIATIONS. Already, on March 1, the powers had offered to mediate be-

tween Turkey and the Balkan allies. The Porte at once consented, and two weeks later the allies were willing to avail themselves of mediation on condition that the western boundary of Turkey be the Rodosto-Malatra line, that Crete and the Aegean Islands be ceded, and that an indemnity be paid by Turkey. The powers, unwilling to afford Bulgaria a foothold on the Dardanelles, insisted on a line from Enos to Midia by way of the Maritza and Ergene rivers; and, as Italian interests especially opposed the union of the Aegean Islands with Greece, the powers proposed to determine later their status. On April 1 the Porte was ready to accept a direct line from Enos to Midia, and the allies were finally induced to agree to these preliminaries: (1) The Enos-Midia line was accepted as a basis for a boundary; (2) the powers reserved absolutely the status of the Aegean Islands for future settlement; (3) the question of a war indemnity and the Ottoman debt would be settled by a financial commission sitting at a later date in Paris; (4) the delimitation of the Albanian boundaries would be determined by the powers. An armistice to this effect was signed at Bulair on April 19 by all the belligerents except Montenegro, which, as has been already noted, was still vigorously prosecuting the siege of Scutari.

SECOND LONDON PEACE CONFERENCE. The capture of Scutari by the Montenegrins on April 26 made the truce general, and as soon as King Nicholas had submitted to the powers and surrendered Scutari on May 14 to the international naval force, delegates of all the Balkan allies and of Turkey again set out for London, where, on May 21, they opened their second conference for the discussion of the terms of a general peace. Warned by Sir Edward Grey, the British secretary for foreign affairs, that the powers would not tolerate protracted deliberations, such as had wrecked the first London conference, the Balkan diplomats proceeded promptly with their task, and on May 30 the Treaty of London was signed by representatives of all the belligerents. Its principal provisions were those already suggested by the powers:

- (1) The boundary between Turkey and the allies to be a line drawn from Midia to Enos, to be delimited by an international commission;
- (2) The boundaries of Albania to be determined by the powers;
- (3) Turkey to cede Crete to Greece;
- (4) The powers to decide the status of the Aegean Islands;
- (5) The settlement of all the financial questions arising out of the war to be left to an international commission to meet at Paris.

DISRUPTION OF THE BALKAN ALLIES.* The Treaty of London was a solemn witness to the fact that within eight months the Ottoman Empire had been shorn of all her European possessions except Constantinople and a small tract of adjacent land east of the Maritza River. That this had been done was due mainly to the union and harmony that had characterized the Balkan allies. But the surprising rapidity and ease with which the result had been achieved

* The two following sections are taken, in part, from an article by Mr. S. P. Duggan, "The Balkan Adjustment," in the *Political Science Quarterly*, vol. 28, pp. 627-45.

only served in the long run to whet the ambition of each of the Balkan states to secure the bulk of the spoils. Even before the conclusion of the Treaty of London, evidences were not lacking of a bitter rivalry and lamentable disunion among the victorious allies which were to lead, as the event proved, straight to another armed conflict. To understand the genesis of the second phase of the Balkan War, it is necessary to consider the validity of the claims advanced by the various states.

When the secret treaty of alliance between Bulgaria and Servia against Turkey was signed in March, 1912, a division of the territory that might possibly fall to them in case of war was agreed upon. Neither Bulgaria nor Servia ever officially published the treaty in full, but from the version printed in *Le Matin* (Paris) in November, 1913, we know what the division was to be. A line running from a point just east of Kumanova to the head of Lake Ochrida was to divide the conquered territory between Bulgaria and Servia. This would give Monastir, Koprili, Ochrida, Prilip, and Istib to the Bulgarians—a great concession on the part of Servia. Certain disputed towns near the proposed line were to be left to the arbitrament of the czar of Russia. The chief aim of this division was that Servia should obtain a seaboard upon the Adriatic, and Bulgaria upon the Ægean. Incidentally Bulgaria would obtain western Thrace and the greater part of Macedonia, and Servia would secure the greater part of Albania. These schemes had been entirely upset by the course of events. "Bulgaria's share had been considerably increased by the unexpected conquest of eastern Thrace, including Adrianople, whereas Servia's portion had been greatly diminished by the creation of an independent Albania out of her share. Moreover, M. Pashitch, the Servian prime minister, maintained that whereas by the treaty of alliance Bulgaria was to send detachments to assist the Servian armies operating in the Vardar valley, the reverse had been found necessary and Adrianople had been taken only with the help of 60,000 Servians and by means of the Servian siege guns. Equity demanded that the new conditions which had arisen and which had entirely altered the situation should be given consideration and that Bulgaria should not expect the preliminary engagements to be carried out." The answer of Dr. Daneff, the Bulgarian foreign minister, "was that Bulgaria bore the brunt of the fight; that, had she not kept the main Turkish force occupied, Servia and Greece would have been crushed; that a treaty is a treaty, and that the additional gain of eastern Thrace in no way invalidated the old agreement."

The recriminations between Greeks and Bulgarians were quite as bitter. The treaty of alliance between them, signed in September, 1912, contained no provision for any division of conquered territory, and this fact enabled each to indulge in the most extravagant claims. The main bone of contention was the possession of the fine port of Salonika. At the very beginning of the Balkan War both states pushed forward troops to occupy that city. The Greeks arrived first, and their garrison was still much stronger numerically. Moreover, they maintained that, except for the Jews, the population, trade, and education in Salonika are chiefly Greek. "M. Venezelos, the Greek prime minister, insisted

also that the erection of an independent Albania deprived Greece of a large part of northern Epirus, as it had deprived Servia of a great part of Old Servia, and Montenegro of Scutari. In fact, he asserted, Bulgaria alone would retain everything she hoped for, securing nearly three-fifths of the conquered territory and leaving only two-fifths to be divided among her three allies; and this, despite the fact that but for the activity of the Greek navy in preventing the convoy of Turkey's best troops from Asia, Bulgaria would never have had her rapid success at the beginning of the war. Finally, he strenuously objected to the whole seaboard of Macedonia going to Bulgaria, as the population where it was not Moslem was largely Greek." The answer of Dr. Daneff to the Greek contention "was to the effect that Greece already had several good ports on the Mediterranean, while Bulgaria had none, and that Bulgaria would have to spend immense sums on either Kavala or Dedea-gatch to make them of any great value. Moreover, as a result of the war, Greece would get Crete, at least part of the Ægean Islands, and a good slice of the mainland. She had suffered least in the war and was really being overpaid for her services."

Behind all these formal apologies were the conflicting ambitions and the racial hatreds which had existed from time immemorial and which no discussion could effectually resolve. It had been a source of surprise that the Christian peoples of the Balkans were able to unite in 1912 on any terms; it was a greater surprise that they had remained united long enough to wage an eight-months' war against Turkey; it surprised no one that now, over such rich booty, they should fall to quarreling. The normal atmosphere of the Balkans was restored.

PREPARATIONS FOR A SECOND WAR. Even before the surrender of Adrianople by the Turks, on March 26, military conflicts had taken place between Bulgarians and Servians and between Bulgarians and Greeks. On March 12 a pitched battle occurred between the latter at Nigrita; and though a mixed commission at once drew up a code of regulations for use in towns occupied by joint armies, very little attention was subsequently paid to it. The Servians shortly afterwards expelled the manager of the branch of the National Bulgarian Bank at Monastir, a step which elicited emphatic protests from Sofia against the policy of Serbizing districts in anticipation of the final settlement. On April 17 M. Pashitch informed the Servian Skupschtina that his government would refuse to be bound by the terms of the treaty of alliance of March, 1912. From that date until the signing of the Treaty of London on May 30 the recent allies carried on an unofficial war, which consisted chiefly of combats of extermination marked by inhuman cruelty. After that event each of the combatants strained every nerve to press forward its armies and to occupy new territories, while each continued to accuse the other of violating every principle of international law. The ambassadors of the powers at the capitals of the Balkan states made urgent representations to the respective governments to restrain their armies, but without effect. On June 10 the Servian government dispatched a note to Sofia demanding a categorical answer to the Servian request for a revision of the treaty of alliance. On June 11 the czar tele-

graphed to King Peter and King Ferdinand appealing to them to avoid a fratricidal war, reminding them of his position as arbitrator under the former treaty, and warning them that he would hold responsible whichever state appealed to force. "The state which begins war will be responsible before the Slav cause." This well-meant action had an effect the opposite of that hoped for. In Vienna it was looked upon as an indirect assertion of moral guardianship of Russia over the Slav world. The Austrian press insisted that the Balkan states were of age and could take care of themselves; if not, it was for Europe, not for Russia, to control them. The political horizon grew still darker when one week later Dr. Daneff answered the Servian note in the negative. This resulted in the Servian minister withdrawing from Sofia on June 22.

Bulgarian troops had already been set in motion westward from their entrenched positions at Tchataldja and Adrianople. The general plan of the war office at Sofia was to send one force to operate against the Greeks along the line of the Salonika-Seres railway and to surprise the Servians by dispatching masses of Bulgarian troops into the home country of Servia by way of the passes leading directly from Sofia through the western mountains. Such a plan would separate the Greek and Servian forces, and at the same time would cut off the Servian armies operating in Macedonia from their base of supplies and require their immediate recall for the defense of the home territory. Against combined Servia, Greece, and Montenegro, Bulgaria could oppose at least equal forces; if that were to be the only alignment in the impending war, Bulgaria stood an excellent chance of appropriating the lion's share of Macedonia. But just at this juncture diplomatic relations between Bulgaria and Rumania reached a breaking point; and Rumania was the decisive factor in the second war.

THE ATTITUDE OF RUMANIA. It had astonished many students of international politics that Rumania, throughout the first phase of the Balkan War, had maintained a strict neutrality. Ever since the Russo-Turkish War of 1877, when she had won her independence and at the same time been deprived by Russia of her valuable province of Bessarabia, Rumania had directed her foreign policy in harmony with that of Austria-Hungary and had, therefore, been considered a true friend of the Triple Alliance. Certainly Austria-Hungary had repeatedly used Rumania as a counterpoise to Servia and Bulgaria; thus, in 1903, when the Macedonian question was particularly acute and it then seemed that action would be taken by Bulgaria and Servia against Turkey, Rumania declared that she would not tolerate an alteration of the *status quo*, and with this declaration Austria-Hungary fully sympathized. Quite aside from Austro-Hungarian support, however, there had long been three important reasons why Rumania would be interested in any projected change in the Balkan situation. In the first place, scattered throughout Macedonia as well as Greece were many colonies of Rumanians—the so-called Kutzo-Vlachs; their national customs and institutions, long recognized and respected under the old régime, must be guaranteed and maintained under a new. Rumania would hardly allow people of her nationality

to be Bulgarized, Serbized, or Hellenized. Secondly, Rumania viewed with jealousy and fear the steady growth of her neighbor, Bulgaria, in power and strength. Crowded in between the military empires of Russia and Austria-Hungary, she naturally looked upon the development upon her southern border of another military state as a menace to her national existence. Finally, against her southern neighbor, Rumania had the weakest kind of frontier; the heights of Silistria, which the delimitation commission of 1878 put in the possession of Bulgaria, commanded absolutely the Rumanian territory opposite and the whole Dobrudja. The rectification of her southern boundary had, therefore, always been one of Rumania's chief aims.

Under these circumstances it was surprising that Rumania had not entered the war at the outset as an ally of Turkey. The only explanations seemed to be that she thought the war was undertaken as one of liberation, that the Kutzo-Vlachs would profit, along with other Christian nationalities of Macedonia, in being freed from Turkish rule, and that she hoped to secure some territorial compensation from Bulgaria as the price of her neutrality. As soon as the first month's campaign of the allies demonstrated that the war was not merely one of liberation, but also one of conquest, Rumania formally demanded of Bulgaria the cession of Silistria and of a small slice of the Black Sea coast sufficient to satisfy strategic military needs. In December, 1912, M. Take Jonsco, Rumanian minister of the interior, was sent to the First London Peace Conference to secure pledges from Dr. Daneff, the Bulgarian envoy, in regard to his government's demand, but he could get no satisfaction. When that conference failed and hostilities were resumed between Turkey and the allies, the relations between Bulgaria and Rumania became very critical. However, in February, at the czar's suggestion, both countries agreed to refer the dispute to an ambassadorial conference at St. Petersburg. As a result mainly of the skillful diplomacy of the French ambassador, M. Delcassé, in reconciling the divergent views of the powers, a protocol was published in May providing for the cession to Rumania of the town of Silistria, together with all the land three kilometers around it, but forbidding either country to erect fortifications in the neighborhood. This award, which transferred no part of the seaboard, was extremely unpopular in Rumania, and the government anxiously awaited some favorable opportunity to denounce it.

Rumania had not long to wait. Early in June it was obvious that Bulgaria was preparing to attack Servia and Greece. At this juncture M. Majoresco, the Rumanian prime minister, notified Bulgaria that his government would not maintain neutrality in a second war without further compensation so as to insure the maintenance of the existing balance of power in the Balkans. The hesitation of Bulgaria in granting this request made Rumania an interested ally of Greece, Servia, and Montenegro against Bulgaria.

THE JULY WAR. Direct responsibility for the Second Balkan War must rest with the Bulgarian government. Undoubtedly Dr. Daneff, the newly appointed premier, was in a most trying position. On one hand were all the

Balkan states demanding what appeared to be ruinous concessions, and on the other were the Bulgarian people clamoring for war. Dr. Daneff threw in his lot with his own nation. He was inspired with a false confidence in the prowess of his army and possibly encouraged by various Russian and Austro-Hungarian machinations, rumors of which have since passed current but the full import of which are still unknown. Dr. Daneff was unwilling to make sufficient concession to detach any of the other Balkan states from their alliance; and, as events proved, he was unable by diplomacy to secure any great power as an ally; the result was that Bulgaria entered the struggle isolated and unfriended. It was a remarkable fact that General Savoff, the hero of the past campaign against the Turks, opposed the truculent attitude of Dr. Daneff's government and took no part in the second war.

Bulgarian troops took the offensive against the Greeks in the Panghaion district and engaged the Servians in a fiercely contested three-days' battle at Slatovo. The new war, thus begun on a large scale on June 30, was not formally recognized until July 5-6, when Bulgaria completed the diplomatic rupture with Greece and Serbia, and Montenegro, as the special friend of Serbia, declared war on Bulgaria. On July 10 Rumania, whose mobilization was then complete, proclaimed hostilities. Against these overwhelming odds the Bulgarian armies contended in vain. On the north the Rumanians quickly occupied Turtukai and Balchik and, encountering little or no resistance, dispatched a column to threaten Sofia. On the southwest the advance of the Greeks was more stubbornly opposed, but within three weeks the armies of King Constantine had possessed themselves of all the important towns along the railway between Doiran and Dedeagatch and were advancing up the Struma River toward the Bulgarian boundary and the city of Sofia. Meanwhile on the west the Servians, with Montenegrin aid, had repulsed Bulgarian attacks and closed in upon Kotchana and were preparing to descend through the Osogovska Pass upon the Bulgarian town of Kustendil and thence converge with their other allies upon Sofia.

This was not all of the bitter cup which Bulgaria had to drain. The Young Turk ministry at Constantinople had expected that discord among their late enemies would enable Turkey to tear up the Treaty of London; the opportunity came even sooner than they anticipated. On July 5 the Porte modestly but tormentingly requested the withdrawal of all Bulgarian troops south of the Enos-Midia line. Ten days later, the Turkish government, "moved by the unnatural war," and taking advantage of the evacuation of Tchataldja by the Bulgarian army, dispatched Enver Bey with a large force to recapture Adrianople. This was done with ease on July 22. Thence the Turks advanced on Mustapha Pasha, close to the old Bulgarian boundary.

During the rapid July war many civilians were wantonly slaughtered by the soldiers, and other barbarous outrages committed; and it was especially charged by King Constantine that the Bulgarians had been guilty of the most inhuman atrocities in their treatment of Macedonian villagers. These allegations were vigorously denied by King Ferdinand, who added recriminations against the Greeks and Serbs.

Meanwhile the Rumanians had penetrated to within twenty miles of Sofia, and the artillery of the Greeks and Servians could be heard in the Bulgarian capital. On July 21 King Ferdinand telegraphed to King Charles of Rumania asking him to intercede with the monarchs of Greece, Serbia, and Montenegro. A favorable reply was received, and as a result all the belligerents, except Turkey, which was not consulted, agreed to send peace delegates to Bucharest. They assembled in the Rumanian capital on July 29 and at once concluded an armistice.

THE BUCHAREST PEACE CONFERENCE. Each of the Balkan states was represented at Bucharest by a distinguished statesman: Greece by M. Venezelos, Rumania by M. Jonesco, Serbia by M. Pashitch, Montenegro by M. Milanovitch, and Bulgaria chiefly by General Fitcheff. After pointed debates, in which the Rumanian delegate often took a decisive part, the Treaty of Bucharest was signed on August 10. Rumania of course secured an extension of her southeastern frontier to a line drawn so as to include Turtukai on the Danube and Balchik on the Black Sea and also special privileges for the Kutzo-Vlachs in the other countries. Bulgaria was obliged to abandon Kotchana, Ishtib, and Radovishta to Serbia, and Salonika, Doiran, Demir-hissar, Seres, Drama, and Kavala to Greece. In making this cession, Bulgaria retained the town of Strumnitza in Macedonia and some seventy miles of sea-coast on the Ægean between the mouths of the Mesta and Maritza. The Serbo-Greek boundary was so drawn that Monastir became Servian, and Vodena and Florina fell to Greece. Subsequently, Montenegro received from Serbia, as compensation for assistance in the two wars, a large slice of the sanjak of Novibazar, including Plevlye, Byelopolye, Ipek, and Djakova. For a brief period it was believed that the Treaty of Bucharest, concluded without much regard to the nationalities of the people in the distributed territories, would be revised by Russia or by Austria-Hungary. The new arrangement, however, was upheld by France and Germany, and the Dual Monarchy could hardly demand a change after the German emperor had congratulated Rumania and Greece upon the settlement.

THE TURCO-BULGARIAN SETTLEMENT. Now that Bulgaria had settled with the Christian states of the Balkans her new northern and western boundaries, it remained for her once more to determine with the Turks the status of Adrianople. Bulgaria had counted upon the powers to enforce the provisions of the Treaty of London; in fact, on August 7, the representatives of the powers at Constantinople had called collectively upon the Porte and demanded that it respect that treaty. But as time went on, the Turks strengthened their hold on eastern Thrace and were able thereby to convince Bulgaria that most of the powers did not mean what they said—that they were willing to acquiesce in the retention of Adrianople by the Turks in return for economic and political concessions to themselves. Bulgaria was hardly in shape for a third war with the Turks, and nothing therefore remained for her but to yield. On September 3 General Savoff and M. Tontcheff left for Constantinople in order to negotiate a new treaty. By this time the Turks were not content even with the Maritza River as the boundary, but, making the most of their enemy's

weakness, they compelled the Bulgarian envoys to renounce Bulgarian claims to Demotika and Kirk-kilisse. By the Treaty of Constantinople, signed September 29, the Turco-Bulgarian line was traced up the Maritza River from its mouth to a point near Mandra and thence, passing west of Demotika, left both that town and Adrianople to Turkey; close to Mustapha Pasha the line bent eastward, and, passing north of Kirk-kilisse and south of Malko Tirmovo terminated on the Black Sea at Sveti Stefan. Thus the territories in Europe allotted to Turkey by the Treaty of London were practically doubled in extent by the Treaty of Constantinople.

The main provisions of this treaty, other than those dealing with boundaries, were as follows:

(1) The *Eckaf* domains (for the support of the Mohammedan religion) in ceded districts to be regarded as private property, and any necessary expropriation to be effected in accordance with Bulgarian law;

(2) A Moslem mufti-in-chief to be elected by the muftis of Bulgaria, his appointment to be subject to the approval of the Turkish sheikh-ul-Islam; he will reside at Sofia and will be paid, as the other muftis are, by the Bulgarian government;

(3) Bulgaria, in regard to the cost of maintaining some 80,000 Turkish prisoners of war, will receive from the Porte only the sum actually disbursed in the form of pay to Turkish officers;

(4) The existing convention of commerce and navigation of February 19, 1911, to be renewed for one year, during which period a new commercial treaty will be negotiated;

(5) Bulgaria to have free use of the Turkish railway between Mustapha Pasha and Mandra, so as to afford direct communication with De-deagatch;

(6) Disputed points to be referred to The Hague Tribunal.

GRÆCO-TURKISH RELATIONS. No sooner had Turkey reached an agreement with Bulgaria than rumors of a Græco-Turkish crisis received credence. The Porte's success in recovering Adrianople and a large slice of Thrace made it eager to undo the Treaty of London in another particular and to secure the renunciation by Greece of all claim to the *Ægean* Islands. The Turkish envoy who had been sent to Athens in September to negotiate the final religious, racial, and financial settlement in Grecian Thrace and Macedonia, persisted in injecting the question of the *Ægean* Islands into the discussion, and was eventually recalled before reaching an agreement. Reports at once spread that Bulgaria, in a spirit of revenge against Greece, had formed a secret treaty of alliance with Turkey, or at least would permit the passage of Turkish troops across Bulgarian Thrace in order to attack Greece. In October reservist Anatolian conscripts were called to the colors by the Turkish government, and, on the other side, the headquarters of the Greek army were moved to Kavala, the easternmost point of Grecian Thrace. A new war was clearly threatened between Turkey and Greece; late in October, however, Rumania declared that she would actively support the latter, and at the same time it became evident that Servia and Montenegro were in league with Rumania and Greece to guarantee the Treaty of Bucharest. Under these circumstances the military tension was lessened and direct

diplomatic negotiations were resumed between Turkey and Greece. The result was the Treaty of Athens, signed on November 27 and embodying the following chief provisions:

(1) Amnesty granted to all persons compromised by the war;

(2) Inhabitants of ceded territories to become Greek subjects if within three years they do not express a preference for Ottoman nationality and the transference of their domicile outside Greece;

(3) Private properties of the sultan to be maintained intact, while the question of private holdings in the former Turkish crown lands is referred to arbitration at The Hague;

(4) Cost of maintaining private soldiers who were prisoners of war also to be referred to The Hague, but Greece to pay officers;

(5) Property held under the *Eckaf* (Mohammedan foundations) to be respected, but Moslem titles to be abolished;

(6) If, however, Mohammedan convents, mosques, and seminaries find themselves no longer self-supporting, the Greek government to render them financial assistance.

INTERNATIONAL ASPECTS OF THE SITUATION. Three important matters had been referred by the Treaty of London (May 30) to the adjudication of the powers: (1) The financial adjustments, (2) the delimitation of the boundaries of, and the provision of a permanent government for, the new principality of Albania; (3) the disposition of the *Ægean* Islands. To determine the first of these matters, an international financial commission was opened at Paris on June 4, under the honorary presidency of M. Pichon, and slowly continued its labors throughout the year. Of the two other matters, some explanation must be attempted.

The northern and eastern frontiers of Albania had been designated by the powers on March 26. On August 11 the ambassadors' conference at London in a general way settled the southern boundary so that it would run from a point south of Cape Stylos to Lake Ochrida, incorporating the *kaza* of Koritza into the new state. Some details as to the subsequent exact delimitation of these boundaries, as well as an account of the provisional governmental arrangements in Albania, are given in the article *ALBANIA, History*. The final settlement was not entirely satisfactory to any party. Austria-Hungary and Italy, in whose behalf the new principality had been erected, bewailed its restricted extent. Montenegro complained that she had been robbed of Scutari; on the other hand, the Albanians of the Hoti and Gruda tribes, from their repugnance to Montenegrin sovereignty, waged guerrilla warfare along the northern border. Then, too, Servia nursed her grievance, especially against Austria-Hungary, in being deprived of a seaboard on the Adriatic, and when Albanian raiders on September 22 captured Dibra, which had been awarded to Servia, and extended their incursions as far north as Prisrend, another serious crisis between Servia and Austria-Hungary was precipitated. The Servians at once put a large army in the field, recovered the assailed territory, and early in October took prisoner Issa Boletinatz, the leader of the Albanian marauders. Ostensibly for police protection in the future, Servia pressed her advantage by occupying Albanian lands west of the River Drin. Austria-Hungary at once presented an ultima-

tum at Belgrade, demanding the prompt withdrawal of Serbian troops from Albania. The Servian government signified its acquiescence on October 20. The Græco-Albanian frontier, determined on December 18 on the proposal of Great Britain, was in the nature of an arbitrary compromise between the conflicting pretensions of Austria-Hungary, Italy, and Albania on one side and Greece on the other, and naturally aroused the liveliest opposition of all concerned. It was reported that veritable anarchy reigned throughout southern Albania. Late in December Great Britain proposed that Greece be given one month in which to withdraw her troops from the principality.

Second only to the clash of interests in Albania was that in the Ægean Islands. The population of all these islands was overwhelmingly Greek and loudly in favor of annexation to the Hellenic kingdom. Armed forces of Greece were in actual possession of all the Ægean Islands except the twelve Sporades, which Italy had seized in the course of the Turco-Italian War and still retained. Greece was insistent upon their retention. On the other hand, Turkey demanded their return as essential to the protection of the Dardanelles and the defense of Asia Minor. Despite repeated official disclaimers, it was generally believed that Italy cherished a desire to secure permanent possession of several of the islands; in any event, it was certain that, if all the islands were ceded to Greece, Italian hegemony in the eastern Mediterranean would receive a serious rebuff commercially and strategically. After several months' discussion the powers seemed to have reached an agreement late in December to the effect that Greece should retain all the islands except those occupied by Italy and except Imbros and Tenedos, which should be surrendered to Turkey for the defense of the Dardanelles, with the additional proviso that Greece should erect no fortifications on Chios or Mytilene. Greece promptly protested against the exception of the islands occupied by Italy, while the Turkish government declared that it would not be bound by such an award but would employ force, if necessary, to regain Chios and Mytilene. No final settlement of this thorny question had been reached at the close of the year 1913.

CONCLUSION. At the beginning of the year Bulgaria, Greece, Servia, and Montenegro were in alliance waging war against Turkey. At the close of the year formal peace reigned, but a new alignment of states portended trouble in the future. A new and unruly state—Albania—had appeared on the map at the behest of Austria-Hungary and Italy and to the bitter disappointment of Servia, Montenegro, and Greece. The former Balkan alliance had been dissolved, and in its place Turkey and Bulgaria were arrayed against Rumania, Greece, Servia, and Montenegro, for, whatever might remain of bitterness between Bulgarians and Turks, it was as nothing compared to the rancor that now prevailed between Bulgarians and Greeks and between Bulgarians and Serbs. The Balkan War of 1912-1913 was epochal in the history of the Near Eastern question: it all but expelled Turkey from Europe; it partitioned Macedonia and the greater part of Thrace among the other Balkan states; and it solved the Cretan problem. That such a significant war, fraught as it was with many serious international complica-

tions, did not engulf all Europe in a vast armed conflict is a tribute to the growth, in recent times, of a pacific spirit.

Towards the close of the year all the Balkan states were engaged in bringing some order out of the general chaos which characterized their newly acquired territories. Bulgaria faced the greatest problems, for she emerged from the struggle discredited and deprived not only of Adrianople but also of the control of railway connections with Dedeagatch, her single port on the Ægean; and she also encountered no little difficulty in clearing her Thracian conquests of irregular troops who were aiming at the establishment of an autonomous Thrace. But in dealing with this, as with other questions raised by the war, progress was being made. The delimitation of the new frontier between Servia and Montenegro was settled in November (see paragraph, above, *The Bucharest Peace Conference*). About the same time the result of the demarcation of the new Bulgaro-Rumanian frontier was announced, and a joint commission started to delimit the boundary between Servia and Bulgaria. Negotiations were opened at Constantinople on November 27 for a commercial treaty between Bulgaria and Turkey. The definite treaty of peace between Servia and Turkey, signed at Belgrade on December 21, followed in general the principles sanctioned by the Treaty of Athens (see paragraph, above, *Græco-Turkish Relations*). The last stage in the withdrawal of Turkish rule from the Balkans might be said to be the removal from Constantinople to Sofia on December 10 of the exarch, or head, of the Bulgarian Orthodox Church.

The following estimates as to what the Balkan War cost are taken from the *Corriere della Sera*:

FIRST CAMPAIGN, OCTOBER, 1912-MAY, 1913

	Mobilized	Killed	Public Cost
Bulgaria..	350,000 men...	80,000 men...	\$300,000,000
Servia.....	250,000 " ...	30,000 " ...	180,000,000
Greece.....	150,000 " ...	10,000 " ...	75,000,000
Monte'gro.	30,000 " ...	8,000 " ...	5,000,000
Turkey....	450,000 " ...	100,000 " ...	400,000,000

SECOND CAMPAIGN, JULY, 1913

	Killed	Public Cost
Bulgaria	60,000 men.....	\$180,000,000
Servia	40,000 "	100,000,000
Greece	20,000 "	50,000,000
Rumania	120,000,000

The total loss of life, including those who perished from cholera, must have been close to 400,000, and the public expenditure for the two campaigns and for maintaining armies on a war footing between the campaigns must have cost upwards of one and one-half billions of dollars.

TURKS AND CAICOS ISLANDS. British West Indian islands dependent upon Jamaica. Area, 169 sq. miles; population, 5615 (1911). Imports (1911), £24,722; exports, £23,703; revenue, £8318; expenditure, £7695. There is no debt, and surplus funds invested amount to £5186. Grand Turk is the seat of government. F. H. Watkins was commissioner in 1913.

TURNER, SIR GEORGE, M. D. See LEPROSY.
TUSKEGEE NORMAL AND INDUSTRIAL INSTITUTE. An institution for the industrial and higher education of negroes, founded at Tuskegee, Ala., in 1881, by Booker

T. Washington. The students enrolled in the several departments of the institute in the autumn of 1913 numbered 1451. There were 190 members in the faculty. There were no noteworthy changes in the faculty during the year and no notable benefactions were received. The productive funds of the institute amount to about \$2,000,000 and the income to about \$118,000. The library contains 21,000 volumes. The president is Booker T. Washington, LL.D.

TYPHOID FEVER. A study of the typhoid mortality in the large cities in the United States showed a gratifying fall in the number of deaths. Some cities approximated to the rate in certain European cities, long regarded as models. A comparison of the mortality during 1912 with that of the average death rate in the period 1906-10 shows a decrease in most instances of over one-half. In cities of over 500,000 the deaths from typhoid per 100,000 of the population were as follows: Cleveland, 5.9; Chicago, 7.5; Boston, 8.1; New York, 9.8; St. Louis, 10.4; Philadelphia, 12.5; Pittsburgh, 12.7; Baltimore, 23.9. In cities having a population of 300,000 to 500,000 the typhoid mortality rate was as follows: Newark, N. J., 7.1; Cincinnati, 7.5; Buffalo, 11.4; Minneapolis, 11.5; New Orleans, 14.0; San Francisco, 14.1; Los Angeles, 14.6; Detroit, 17.1; Washington, D. C., 21.2; Milwaukee, Wis., 25.3. In cities having a population from 200,000 to 300,000 the deaths from typhoid were: Seattle, Wash., 7.4; Jersey City, N. J., 7.5; St. Paul, Minn., 10.2; Providence, R. I., 10.3; Rochester, N. Y., 11.8; Kansas City, Mo., 12.8; Denver, 13.0; Portland, Ore., 16.9; Indianapolis, 18.3; Louisville, Ky., 18.9. In cities having a population from 125,000 to 200,000 the figures were: Paterson, N. J., 4.6; Worcester, Mass., 6.6; Scranton, Pa., 8.7; Oakland, Cal., 9.0; Richmond, Va., 16.2; Syracuse, N. Y., 16.8; Columbus, O., 20.2; New Haven, Conn., 24.5; Toledo, O., 33.0; Atlanta, Ga., 35.2; Memphis, Tenn., 56.2. In cities having a population from 100,000 to 125,000 the rate was as follows: Cambridge, Mass., 2.8; Bridgeport, Conn., 7.4; Lowell, Mass., 9.2; Hartford, Conn., 12.7; Omaha, Neb., 13.2; Spokane, Wash., 16.9; Albany, N. Y., 17.7; Fall River, Mass., 18.8; Nashville, Tenn., 30.1; Grand Rapids, Mich., 34.0. Exceptions to this good showing are Detroit and Milwaukee, where the death rate continues to be high. Memphis has the highest typhoid death rate of any large city in the United States, for the past two years. In Syracuse, New Haven, and Toledo the rate has remained practically unchanged. The generally bettered condition is directly traceable to an improved water supply. In nearly every city in which the drinking water had been good, typhoid was steadily declining, and the cumulative decrease in the number of carriers, and through them food contamination, was resulting in an ever-narrowing circle of infection. It was not only in Europe and the United States that typhoid infection was becoming less. Civilized countries everywhere seemed to be experiencing a progressive and remarkable decline in this serious and widespread disease. Purdy recently dwelt on the reduction of typhoid in Australasia in the past thirty years. In the cities of Australia the typhoid death rate (stated in deaths per hundred thousand) fell in Sydney from 51.3 in 1885-90 to 13.2 in 1901-10; Melbourne from 83.8 in 1885-90 to 11 in 1901-10, and in Bris-

bane from 30.6 in 1885-1900 to 17.6 in 1901-10. In Hobart, the capital of Tasmania, the rate averaged 100.5 in 1885-90, but had fallen to 24.7 in 1901-10. In New Zealand it had diminished to 6.6 for the decade ending 1910, a rate that compares favorably with the typhoid death rate in any European country. Purdy was inclined to attribute this great typhoid decrease chiefly to the introduction of modern sewerage systems.

UGANDA PROTECTORATE. A British east African possession, with an area estimated at 117,681 sq. miles (exclusive of lakes) and an estimated population of 2,843,325 (2,840,469 Africans). Native capital, Mengo; British capital, Entebbe. The products include cotton, coffee, rubber, and cacao. Cattle are raised. The country is practically unfit for inhabitation by whites. Imports (1911), £24,722 (£27,916 in 1910); exports, £23,703 (£24,461); revenue, £8318 (£8645); expenditure, £7695 (£6827). Tonnage entered and cleared, 338,112 (280,735). For the Uganda Railway (so-called) see **EAST AFRICA PROTECTORATE**. Sir F. J. Jackson was governor and commander-in-chief in 1913.

UHLEGITE. See **MINERALOGY**.

UHLER, PHILIP REESE. An American scientist and educator, died October 21, 1913. He was born in Baltimore in 1835 and was educated at Jones's Latin School and under private tutors. He spent nearly three years at Harvard University as librarian and assistant to Professor Louis Agassiz in the latter's museum of comparative zoölogy, and afterwards explored for Professor Agassiz parts of the island of Haiti. In 1862 he became connected with the Peabody Library at Baltimore, and was afterwards its librarian.

ULSTER PROVISIONAL GOVERNMENT, ETC. See **GREAT BRITAIN, Home Rule Bill, and War or Conference**.

UNCINARIASIS. See **HOOKWORM DISEASE**.

UNION COLLEGE. An institution of higher learning at Schenectady, founded in 1795. The enrollment in all the departments of the college in the autumn of 1913 was 402. The faculty numbered 33. In 1913 Dr. E. J. Burg was called from the University of Illinois to head the department of electrical engineering. Dr. C. B. Steinruck became professor of electrical physics. During the year, \$14,000 was received for additional scholarship endowments, and \$20,000 for general purposes. The productive funds amount to about \$850,000, and the income to about \$120,000. The library contains about 45,000 volumes.

UNITARIANS. The administrative body of this denomination is the American Unitarian Association, whose headquarters are in Boston. No recent figures for the number of communicants are available. Dr. H. K. Carroll, in his compilation of religious statistics in 1913, uses the figures of the United States census of 1906, which gives to this denomination 70,542 communicants, 477 churches, and 531 ministers. The denomination is active in distributing its literature and in organizing conferences for the promulgation of Unitarian thought. It has considerable strength in Great Britain. Divinity schools are maintained at Cambridge, Mass., Meadville, Pa., and Berkeley, Cal. Missionary work is carried on at many points among Icelandic, Norwegian, and Swedish immigrants of the United States. Among the publications of the denomination are the *Christian Register*, published in Boston; the *Unitarian Advance*, published in New York; and the *Pacific Unitarian*.

rian, published in San Francisco. The president of the American Unitarian Association is the Rev. Samuel A. Eliot, and the secretary the Rev. Lewis G. Wilson.

UNITED BRETHREN. See MORAVIANS.

UNITED KINGDOM. See GREAT BRITAIN.

UNITED KINGDOM EMPLOYERS' DEFENSE UNION. See TRADE UNIONS, *Great Britain*.

UNITED PRESBYTERIAN CHURCH OF NORTH AMERICA. This denomination was founded in 1853 by a union of associate and associate reformed churches. For several years negotiations leading to a union of this denomination with the Presbyterian Church in the United States have been under way. The denomination in 1913 included 142,071 communicants, 994 churches, and 990 ministers. There are 13 synods and 72 presbyteries. Missions are maintained in India, Egypt, and the Sudan.

UNITED STATES. POPULATION. The population of continental United States in 1910 was 91,972,266. It was estimated that on July 1, 1913, the population was 95,545,336. The populations of the several States and territorial possessions will be found in the articles dealing with them.

AGRICULTURE. Statistics of agriculture for the United States and its dependencies will be found in the articles dealing with agriculture and agricultural products. See also section *Agriculture* in each State article; and for foreign agricultural statistics, see agricultural section under various countries. Consult, too, the articles **AGRICULTURE** and **IRRIGATION**.

MANUFACTURES. Statistics relating to the chief industries will be found in the articles dealing with them, as cotton, textiles, wool, etc.

MINERAL PRODUCTION. For mineral production, see the general article **MINERAL PRODUCTION OF THE UNITED STATES**, and also, for the individual States, see the section *Mineral Production* under each State. Consult, too, articles on various minerals.

EDUCATION. For information in regard to educational matters in the United States in 1912, consult the article **EDUCATION IN THE UNITED STATES**. For notes on higher and professional education, see **UNIVERSITIES AND COLLEGES**. For notes on educational conditions and progress in the different States and territorial possessions, see the paragraphs *Education* under them.

RELIGION. For information regarding the year's history of the various religious denominations, see the articles on the respective denominations. A general summary of religious conditions and events for the year is given in the article **RELIGIOUS DENOMINATIONS AND MOVEMENTS**.

FOREIGN COMMERCE. Of the accompanying tables, Table I. is a summary for the calendar year 1913, given in detail by countries, and also a comparison with the corresponding figures for the calendar year 1912; Table II. is a general summary of the foreign commerce for the fiscal years 1912 and 1913; Tables III. and IV. give, respectively, the chief articles of import and export for the calendar years 1912 and 1913.

From the figures in Table I. it will be noted that Europe is far in the lead among the grand divisions both in selling to and buying from the United States. The imports from Europe in 1913 were \$864,986,250, or \$34,017,694 less than

in 1912. They form practically one-half the total imports. The exports to Europe in 1913 amounted to \$1,499,572,363, or \$32,120,529 more than in 1912. They form almost three-fifths of the total exports. The balance of trade with European countries in favor of the United States amounted in 1913 to \$634,586,113, as compared with \$567,447,890 in 1912. North America is second of the grand divisions in importance in exports and imports. There were imported from North American countries in 1913 goods valued at \$389,951,176, while the exports aggregated \$601,476,159. The imports from North America increased \$16,141,260, as compared with 1912, and the exports \$28,177,596; the trade balance in favor of the United States increased from \$199,488,647 in 1912 to \$211,524,983 in 1913. Asia, South America, Oceania, and Africa follow in the order named in imports. In exports South America ranks third, Asia next, followed by Oceania and Africa. With all four of these grand divisions the balance of trade is against the United States, but the total balance of trade for the four divisions amounted in 1913 to only \$154,839,147.

Great Britain is by far the most important country in regard to both imports and exports. The total trade of the United Kingdom decreased from \$919,957,572 in 1912 to \$862,687,385 in 1913. Of this decrease of \$57,270,187, \$16,242,569 was in exports to the United Kingdom, and \$41,027,618 was in imports from the United Kingdom, thus showing an increase of \$24,785,049 in the balance of trade in favor of the United States.

Canada, which was third in 1912 with a total trade of \$495,965,094, was second in 1913 with trade amounting to \$545,619,374. Although there was an increase in the value of both imports and exports, the greater increase was in exports to Canada, and the balance of trade favoring the United States was larger in 1913 than in 1912.

In 1913 Germany dropped from second to third place with a total trade of \$536,141,893. This was in spite of the fact that the total trade increased from \$516,493,474 in 1912. The trade balance increased in favor of the United States in 1913. The growth in exports was greater than the growth in total trade, and there was a slight decrease in imports from Germany.

France continued in fourth position with an aggregate trade in 1913 of \$292,856,409, compared with \$289,146,154 in 1912.

From figures prepared by the Department of Commerce the following comparison is made of figures of the import trade of the United States during the decade 1903-1913. From this comparison several notable changes in the conditions of commerce and industry are apparent. In the record of imports it is noted that certain articles, which ten years ago were imported in large quantities, show greatly diminished shipments in recent years; others have remained practically stationary; while still others, chiefly foodstuffs, which a few years ago were produced in sufficient quantities to meet the home demand and furnish a surplus for exportation, are now important factors in the \$1,750,000,000 worth of merchandise imported during the calendar year 1913. In order of magnitude, measured by value, the ten leading articles or classes imported in 1913 were hides and skins, coffee, chemicals, drugs, sugar, raw silks, rubber, gutta

TABLE I.

Vegetable oils	24,753,849	21,033,089
Wood, and manufactures of	105,840,015	114,777,513

* Not including corn oil cake.

percha, manufactured fibres, cotton manufactures, lumber and other forms of wood, and copper manufactures. Cotton manufactures increased barely 20 per cent. during the decade; chemicals, sugar, and coffee, each decreased about 50 per cent.; hides, silk, rubber, fibre manufactures, and lumber, each decreased more than 100 per cent.; and copper, over 200 per cent.

Foodstuffs showed a remarkable increase in imports during the decade, and especially in the closing months of 1913. Breadstuffs and meats each quadrupled their imports from 1903 to 1913, the former increasing from 6 to 26 million, and the latter from 5 to 20 million dollars. Imports of fruits and nuts rose from 25 to nearly 50 million; cocoa, crude and prepared, from 10 to 20 million; and coffee from 61 to 105 million dollars. The quantity of coffee, however, fell from 974 million to 852 million pounds during the decade, the larger value in 1913 being the result of higher valuation per pound, which advanced from 6 cents in 1903 to practically 12 cents in 1913.

The manufactures showing decreased imports during the decade include many articles, the most important being iron and steel, silk, and wool. Manufactures of iron and steel fell from 41 to 34 million; silk goods from 34 to 32 million; and wool manufactures from 19 to 17 million dollars during the period under review. A similar tendency is strikingly exemplified by sulphur, the imports of which fell from 188,888 tons in 1903 to 14,646 tons in 1913. The rapidly growing production in Louisiana and Texas, which began about ten years ago, has not only supplanted almost entirely the former large imports from Italy and Japan, but has become an article of exportation to the extent of nearly 90,000 tons in 1913.

On the other hand, imports of certain crude materials have grown rapidly during the ten years under review. In addition to the great factory materials already mentioned, crude oil shows a large increase, this article coming chiefly from Mexico. Ten years ago its imports were practically nothing. In 1913 they aggregated 713,000,000 gallons. Imports of fertilizers in 1913 were about six times as great as those of 1903, and the 20 million dollars' worth imported in 1913 are an indication of improved methods, and therefore of more extensive cultivation of the soil on the part of American farmers. Imported art works show a remarkable advance in the decade. From \$3,000,000 in 1903, they amounted to \$35,000,000 in 1913, while certain great art collections imported in 1912 brought the total of the year to about \$60,000,000 in value.

Exports of merchandise from the United States in the decade 1903 to 1913 made a greater advance than in the thirty years from 1873 to 1903. In 1873 the total exports were valued at \$568,000,000; in 1903, \$1,485,000,000; and 1913 \$2,484,000,000, a gain of \$917,000,000 in the thirty years from 1873 to 1903, and approximately one billion dollars in the ten years ended with December, 1913. To this gain of practically one billion dollars of foreign sales in American products during the decade, raw cotton and miscellaneous manufactures, chiefly of iron and steel, copper, wood and mineral oil were the largest contributors, the five classes named representing about one-half of the total increase during the period.

The ten leading classes of articles exported from the United States in 1913, arranged in order of magnitude, are raw cotton, iron and steel, breadstuffs, meat and dairy products, mineral oils, copper, wood manufactures, coal and coke, leather and leather goods, and raw and manufactured tobacco. When to this group are added cars and carriages, cotton goods, agricultural implements and machinery, fruits and nuts, electrical machinery and appliances, chemicals, drugs and medicines, naval stores, vegetable oils, paper and manufactures thereof, India rubber manufactures, and fertilizers—about 90 per cent. of the aggregate exportation in 1913 has been accounted for. Raw cotton easily maintains its leading position in the list of American exports during the decade. On the other hand, breadstuffs fell from second position in 1903 to third in 1913, and meat and dairy products from third position to fourth, each of these groups having been passed in the meantime by iron and steel, which advanced from fourth to second place during the decade.

Comparing the figures of 1913 with those of 1903, raw cotton exports gained \$196,000,000, or 52 per cent., this being a natural result of the world's increasing consumption of cotton goods for the manufacture of which the United States supplies over two-thirds of the raw material. Iron and steel manufactures gained \$195,000,000, or about 200 per cent., machinery and engines being the largest factors. Mineral oils made an advance of \$76,000,000, or over 100 per cent.; copper manufactures \$101,000,000, or 200 per cent., and wood and manufactures thereof, \$52,000,000, or about 90 per cent.

Exports of iron and steel manufactures from the United States have increased more rapidly during the past decade than those of Germany or the United Kingdom, while in the production in this branch of industry, the United States led its chief competitors. In 1903 the production of pig iron in the United States was a little less, while in 1912 it actually exceeded, by over three million tons, the combined output in the United Kingdom and Germany. The pig iron production of the United States increased from 18 million tons in 1903 to 30 million in 1912, and that of Germany from 10 to 17½ million; while that of the United Kingdom remained practically stationary at about 9 million tons per annum during the decade. In 1903 the United Kingdom was first, Germany second, and the United States third in the exportation of iron and steel products. The same relative positions were maintained in 1908; but during the past few years Germany has wrested first place from the United Kingdom, and the United States has also gained materially on that country. Figures compiled from official sources by the Bureau of Foreign and Domestic Commerce of the Department of Commerce show that exports of iron and steel (including agricultural implements but excluding electrical machinery and apparatus and ships sold abroad) increased, in the case of the United Kingdom, from 265 million dollars in 1903 to 467 million in 1913, or 76 per cent.; in the case of Germany, from 202 to 484 million, or 140 per cent.; and in the case of the United States, from 117 to 330 million, or 182 per cent. About 85 per cent. of the domestic production of iron and steel is consumed in the United States, thus leaving less than 15 per cent. available for

PRESIDENT WILSON AND CABINET, 1913

Left to right around the table : PRESIDENT WILSON ; W. G. McADOO, Secretary of Treasury ; J. C. McREYNOLDS, Attorney-General ; JOSEPHUS DANIELS, Secretary of Navy ; D. F. HOUSTON, Secretary of Agriculture ; W. B. WILSON, Secretary of Labor ; W. C. REDFIELD, Secretary of Commerce ; FRANKLIN K. LANE, Secretary of Interior ; A. S. BURLESON, Postmaster General ; L. M. GARRISON, Secretary of War ; and W. J. BRYAN, Secretary of State

export. According to the census of 1910 the value of iron and steel manufactures produced in the United States was \$1,377,000,000, while the net exports of like articles were \$155,000,000, making the home consumption in that year approximately one and one quarter billion dollars. Nevertheless, our iron and steel factories contribute on an average about \$1,000,000 worth of products to foreign markets for each business day of the year, the total exports of iron and steel, including agricultural machinery, during the seven months ending with January last having been \$173,000,000, or nearly three times as much as in the corresponding period a decade earlier.

In nearly all parts of the civilized world American manufactures of iron and steel are being sold in increasing volume and variety. Last year's exports included not only the lower forms of manufacture but many articles of a highly finished and complicated character. Thus, in addition to 612 million pounds of steel bars and rods, 426 million of wire, 1 billion of sheets and plates, 676 million of pipes and fittings, and 141 million of nails and pikes, there were exported 51 million pounds of bolts and nuts, 56,776 cash registers, 43,558 gasoline engines, 2059 steam engines, 8437 safes, 12,321 bathtubs, \$12,000,000 worth of sewing machines, \$11,000,000 of typewriters, \$16,000,000 worth of metal-working machinery and other miscellaneous machinery sufficient to bring the total up to \$128,000,000.

COMMERCE WITH NON-CONTIGUOUS TERRITORIES. The exports from the United States to Alaska in the calendar year 1913 amounted to \$21,097,040, compared with \$21,322,536 in 1912. Of the total value, manufactures ready for consumption were valued at \$11,490,131 in 1913, compared with \$11,734,092 in 1912. The imports from Alaska to the United States in the calendar year 1913 amounted to \$20,601,413, compared with \$23,385,437 in 1912. The exports to Hawaii were valued in 1913 at \$29,753,357, compared with \$28,020,240 in 1912. The imports from Hawaii were valued at \$40,143,953 in 1913, compared with \$50,356,841 in 1912. The exports to Porto Rico in 1913 were valued at \$32,866,652 in 1913, compared with \$33,991,622 in 1912. The imports from Porto Rico to the United States were valued in 1913 at \$39,637,332, compared with \$41,183,009 in 1912. The exports to the Philippine Islands in 1913 were of a value of \$27,870,293, compared with \$24,659,150 in 1912. The imports from the Philippines were valued in 1913 at \$17,750,415, compared with \$22,355,310 in 1912.

RECEIPTS AND DISBURSEMENTS. The following table, compiled from figures given by the Secretary of the Treasury, shows the receipts and disbursements of the Federal government for the fiscal years 1912 and 1913:

	Receipts 1912	1913
Customs	\$311,321,672.22	\$ 318,891,395.86
Internal revenue:		
Ordinary	293,028,895.93	309,410,665.81
Corporation tax....	28,583,303.78	35,006,299.84
Sales of public lands	5,392,796.76	2,910,204.69
Miscellaneous	53,451,796.74	57,892,663.64
Ordinary receipts.	691,778,465.37	724,111,229.84
Panama Canal receipts *	83,189,104.15

Receipts—(Cont.)		
	1912	1913
Public debt receipts	20,537,645.00	23,400,850.00
Total, exclusive of postal	745,505,214.52	747,512,079.84
Postal revenue.....	246,744,015.88	266,619,525.65
Total, including postal	\$992,249,230.40	\$1,014,131,605.49
Disbursements

Total, including postal	\$965,273,677.54	\$1,010,812,448.78
Excess of receipts.	\$ 26,975,552.86	\$ 3,319,156.71

* Proceeds of bonds.

The receipts and disbursements for the fiscal year ending June 30, 1914, are estimated by the Secretary of the Treasury in his annual reports as follows:

Receipts	
Customs	\$270,000,000
Internal revenue	\$12,000,000
Corporation and income tax.....	95,000,000
Miscellaneous	59,000,000
Total ordinary receipts.....	\$736,000,000
Disbursements	
Civil establishment	\$177,000,000
War Department	170,000,000
Navy Department	136,000,000
Indian service	21,000,000
Pensions	175,000,000
Interest on the public debt.....	22,900,000
Total ordinary disbursements.....	\$701,900,000
Surplus for 1912 in ordinary receipts...	\$34,100,000
Panama Canal disbursements.....	41,000,000
Miscellaneous redemptions of the public debt
Total estimated deficit.....	\$ 6,900,000

COINAGE. The coinage executed at the mints of the United States during the calendar year 1913 was as follows:

Denomination	Pieces	Value
Double eagles.....	596,338	\$11,926,760.00
Eagles	508,071	5,080,710.00
Half eagles.....	1,324,099	6,620,495.00
Quarter eagles.....	722,165	1,805,412.50
Total gold.....	3,150,673	25,433,377.50
Half dollars.....	1,326,627	663,313.50
Quarter dollars.....	1,975,413	493,853.25
Dimes	20,270,622	2,027,062.20
Total silver.....	23,572,662	3,184,228.95

Denomination	Pieces	Value
Five cents.....	73,659,239	3,682,961.95
One cent.....	98,437,352	984,373.52
Total minor.....	172,096,591	4,667,335.47

Total coinage..... 198,819,926 \$33,284,941.92

For Philippine Islands government:

20 centavos.....	948,565	189,713.00 pesos
10 centavos.....	1,360,693	136,069.30 "
1 centavo.....	5,000,000	5,000.00 "

NATIONAL DEBT. The amount and classification of the United States national debt at the end of the calendar years 1911, 1912, and 1913 were as follows:

	Dec. 31, 1911	Dec. 31, 1912
Interest-bearing debt at from 2 to 4 per cent. and redeemable from 1908 to 1961, inclusive.....	\$ 963,359,390	\$ 964,631,630.00
Debt on which interest has ceased since maturity..	1,821,830	1,695,070.26
Debt bearing no interest.....	379,794,799	374,733,081.90
Gross debt.....	1,344,976,020	1,341,059,782.16
Cash balance in general fund....	126,925,992	143,576,381.22
Net debt.....	\$1,218,050,138	\$1,197,483,400.94

	Dec. 31, 1913
Interest-bearing debt.....	\$ 966,823,490.00
Debt on which interest has ceased.....	1,641,720.26
Debt bearing no interest.....	370,797,255.40
Aggregate.....	1,339,262,465.66
Certificates and Treasury notes....	1,607,771,969.00
Gross debt.....	2,947,034,434.66

Cash in Treasury:	
Currency trust funds.....	1,607,711,969.00
Gold reserve fund.....	150,000,000.00
Net balance, general fund....	111,854,317.93

National bank notes: Redemption fund (included in public debt under requirement of act of Congress, July 14, 1890)	17,209,286.00
--	---------------

Total \$1,886,835,552.93

Net debt..... \$1,060,198,881.73

The circulation statement, given in the accompanying table so entitled, is from figures compiled by the Treasury Department, and published January 2, 1914.

ARMY

STRENGTH OF THE ARMY. The authorized strength of the regular army on July 1, 1913, was 4763 officers and 84,810 enlisted men, a decrease of 49 officers and an increase of 3401 enlisted men over the preceding year. In addition, the authorized strength of the Philippine Scouts was 180 officers and 5732 enlisted men, the same as in 1912. The actual strength of the army, on July 1, 1913, was 4665 officers and 75,321 enlisted men, an increase of 195 officers and a decrease of 2514 enlisted men from June 30, 1912. The actual strength of the Philippine Scouts on June 30, 1913, was 180 officers and 5403 enlisted men. On the date given, the army was distributed geographically as follows:

	Officers	Enlisted men	Total
In the United States.....	3,680	54,626	58,306
In Alaska.....	53	1,052	1,105
In the Philippines:			
Regular army.....	446	10,297	10,743
Philippine Scouts.....	180	5,403	5,583
In China.....	41	1,166	1,207
In Porto Rico.....	33	585	618
In Hawaii.....	271	6,418	6,689
In the Isthmian Canal Zone.....	51	835	886
Troops en route and officers at other foreign stations.....	90	342	432
Total.....	4,845	80,724	85,569

On June 30, 1913, there were 9489 vacancies in the enlisted strength of the army, and there were 98 vacancies in the authorized strength of the officers of the army.

Officers. Of the 4655 commissioned officers on the active list of the regular army on June 30, 1913, 1227, including 66 chaplains, were general officers or officers of the staff corps and departments, and 3438 belonged to the line.

Population of continental United States January 2, 1914, estimated at 98,181,000; circulation per capita, \$35.11.

a This statement of money held in the Treasury as assets of the government does not include deposits of public money in national bank depositaries to the credit of the Treasurer of the United States, amounting to \$85,202,390.26. For a full statement of assets, see Public Debt statement.

b For redemption of outstanding certificates an exact equivalent in amount of the appropriate kinds of money is held in the Treasury, and is not included in the account of money held as assets of the government.

There were 1065 general and staff officers, and 2617 line officers present for duty on that date, and 162 general and staff officers and 821 line officers absent from commands. Of the 983 officers absent, 750 were on attached duty. During the fiscal year 327 second lieutenants were appointed in the army—187 from the United States Military Academy, 28 from among the enlisted men, and 112 from civil life. These appointments left only two vacancies of second lieutenantcies in the line of the army, both in the Coast Artillery Corps. During the fiscal year 73 officers were placed on the retired list. The total number of this list on June 30, 1913, was 1030, compared with 1017 on the corresponding date of the previous year. Of the number retired in 1913, 34 were retired for disability, 22 on their own application, 16 by operation of law, having reached the age limit, 3 by authority of law, having reached 62 years of age, and 2 under special acts of Congress.

Enlisted Men. The actual enlisted strength of the entire military establishment on June 30, 1913, was about 11.2 per cent. below its authorized strength, as compared with 4.5 per cent. on June 30, 1912. Of the 127,827 applicants for enlistment and reenlistment, only about 20 per cent. were accepted.

There was an increase of desertions from the army during the year, the number aggregating 4451, or 4.15 per cent. of the whole number of enlistment contracts in force during the year. This percentage, though larger than the percentage of the three preceding years, is yet smaller than the percentage for any other preceding year since the percentage of 1901. The regiments serving in the United States which had the least percentages of desertions were the Tenth and Ninth Cavalry (colored), and the Fifth Infantry. The regiments with the highest percentages of desertions were the Twentieth and Twenty-first Infantry, Second Cavalry, and the Fourth Field Artillery.

MILITARY OPERATIONS. The most important military operations in 1913 were concerned with patrolling the Mexican border as the result of the disorders in that country. An extensive border control was maintained continuously from the Gulf of Mexico to Sasabe, 31 miles west of Nogales, Ariz., a distance of about 1600 miles. Throughout this stretch of territory, United States troops have protected the border from incursions by individuals or small raiding parties from Mexico, have been continually on the alert to prevent violations of the neutrality laws, and have acted in conjunction with the civil authorities to prevent illegal importations of arms and ammunition into Mexico in violation of the executive proclamation of March 4, 1912. For a discussion of the incidents connected with the revolution in Mexico, see *MEXICO, History*. For the military operations in the Philippines during the year, see *PHILIPPINES*.

HEALTH AND SANITATION. During 1913, the general health of the army was better than ever before. Typhoid fever has practically disappeared, and the appearance of malarial fevers among the troops of the United States is gradually diminishing. As a consequence of the compulsory immunization of the army by the typhoid prophylactic, only 18 cases of typhoid fever in 1912, and in 1913, one case, that of a recruit, were reported in the entire military es-

tablishment. As a result of the improved sanitation and of the care with which applicants for admission are examined, the rate for tuberculosis is gradually diminishing. A marked decrease has also been noted in alcoholism. It was demonstrated in the camps at Texas City and Galveston that with the present system of camp sanitation, troops properly protected by vaccination against small-pox and typhoid fever can live in camps suitably located for an indefinite length of time without increased mortality.

DOMESTIC SERVICE OF THE ARMY. The army in 1913 did good service during or following several national calamities. These included the floods in the Ohio and Mississippi valleys, the tornado at Omaha, the Carmel Valley fire, the Lower Peach Tree, Alabama, cyclone, and forest fires in the Adirondacks.

ARMY CAMPS. During the summer of 1913, two experimental military camps of instruction were held, one at the Gettysburg National Park, Gettysburg, Pa., and the other at the Presidio of Monterey, Cal., each camp lasting for a period of six weeks. The opportunity to participate in these camps was thrown open to all students over 17 years of age who were physically qualified and properly recommended. At the Gettysburg camp 63 universities and colleges were represented by 160 students. At Monterey 85 students from 27 educational institutions on the Pacific coast attended the camp. The experiment was very successful, and promises to lead to excellent results.

For an account of the development of military aeronautics, see the article *AERONAUTICS*, and for notes on militia, see *MILITIA*. See also *MILITARY PROGRESS*.

NAVY

The strength of the navy of the United States in 1913 will be found tabulated in the article *NAVAL PROGRESS*, where it may be compared with the relative strength of other nations. There were on the active list of the navy on June 30, 1913, 3635 officers, of whom 342 were officers of the marine corps, 51,500 enlisted men, and 9921 marines. The navy was maintained as in previous years in three main fleets and a reserve fleet. The three main fleets are the Atlantic, Pacific, and Asiatic. An account of their details and movements during the year is given below.

ATLANTIC FLEET. On January 4, 1913, Rear-Admiral Charles J. Badger assumed command of the fleet, succeeding Rear-Admiral Hugo Osterhaus. During the summer, drills and exercises were conducted, with Narragansett Bay as the fleet base. There was a carefully-prepared schedule of movements and drills involving alternate weeks at sea and at port. From January to March, combined fleet exercises were conducted from Guantanamo, the usual winter base; and for the first time a division of submarines and the aviation detachment were present, thus permitting more varied and more valued operations than heretofore. Following the outbreak in the City of Mexico in February, 1913, it was found necessary to maintain a fleet of warships in the waters bordering that country both on the Atlantic and Pacific coasts. At the end of the year 26 vessels were stationed off the harbor of Vera Cruz and other ports of Mexico. For an account of incidents connected

with this fleet in regard to conditions in Mexico, see article MEXICO, *History*.

PACIFIC FLEET. This fleet, consisting of four armored cruisers, one supply ship, and the torpedo flotilla of destroyers and submarines, had an active year's work under the command of Rear-Admiral W. H. H. Southerland until April 8, 1913, when he was succeeded by Rear-Admiral W. C. Cowles. Conditions in Mexico made it necessary to dispatch a portion of this fleet to the western coast of that country, and in consequence there was during the year very little opportunity for fleet training. In spite of enforced separation of the vessels of this command, nearly all forms of target practice were held, although not under as desirable conditions as would otherwise have been possible. The destroyers and submarines on the Pacific coast were assigned permanently to the Pacific fleet in June, 1913, thus making this practice uniform among all the fleets.

ASIATIC FLEET. This fleet during the year was engaged in the usual operations incident to safeguarding American interests in the Far East and in making friendly visits at various ports on the station.

RESERVE FLEETS. The Atlantic and Pacific reserve fleets, based respectively at the navy yards at Philadelphia and Puget Sound, were administered during the year in continuing development of the principle upon which they were inaugurated. All available ships not required for active service had been assembled in these two commands. Frequently short cruises had been made and satisfactory progress accomplished toward keeping all vessels in the highest condition of efficiency and material upkeep that their reduced complements would permit. Shortage of personnel rendered it necessary to place in ordinary in April and May, 1913, the six old battleships *Kearsarge*, *Kentucky*, *Iowa*, *Indiana*, *Oregon*, and *Massachusetts*, but they remain attached to the reserve fleets for purposes of care and preservation, although not required to be kept in readiness for use on short notice.

SPECIAL SERVICE. During the year there were the usual number of vessels in active service in protecting American interests in the disturbed districts of Mexico, Central America, and the West Indies. In November, 1912, the *Tennessee* and *Montana* were ordered to the Mediterranean and formed a special service squadron for the protection of American interests on the coast of Asiatic Turkey, in case disturbances resulting from the Balkan War should have spread to that region. No occasion arose for any action for either of the ships, and they returned to the United States in May, 1913.

MEDITERRANEAN CRUISE. On October 25, 1913, nine battleships of the Atlantic fleet sailed from Hampton Roads for various ports in the Mediterranean for a visit of about three weeks. The cruise was arranged largely for the educational advantages to be derived by officers and enlisted men from an opportunity to visit foreign ports and travel in foreign countries. During the year work on the machinery for the battleship *New York* proceeded in a satisfactory manner at the New York navy yard, and its installation was in progress at the end of the fiscal year.

BUILDING PROGRAMME. The Secretary of the Navy in his annual report for 1913 recommends the authorization by Congress of a building

programme which shall include 2 dreadnoughts, 8 destroyers, and 3 submarines. There were at the end of the year 6 battleships of the largest and most approved type under construction. These included the *Texas*, which is practically completed, the *New York*, which will be commissioned in the spring of 1914, the *Pennsylvania*, *Oklahoma*, *Nevada*, and a battleship known as No. 39. Completion of these vessels, together with the smaller ships under construction, will, in the opinion of the Secretary of the Navy, make the American navy one of strength and power fit to protect American shores and American interests. Of smaller craft there were under construction during the year 17 destroyers, 1 destroyer tender, 21 submarines, 2 submarine tenders, 2 fuel ships, 3 gunboats, 1 transport, and 1 supply ship.

The Secretary of the Navy recommended that armor, guns, and powder for the navy should be made under the auspices of the Navy Department in order that the department should be freed from excessive prices charged by private manufacturers of armor-plate, guns, gun-forgings, etc. He declared that the prices charged for these by private firms was much too high, and he recommended appropriations for the establishment of an armor-plate factory and an increase in the gun factory, powder factory, and the torpedo works. He also recommended the immediate consideration of the question of providing fuel oil for the navy at reasonable rates, and the passage of legislation that will enable the government to refine its own oil from its own oil wells, and thus relieve itself from the necessity of purchasing what seems fair to become the principal fuel of the navy in the future, at exorbitant and ever-increasing prices, from the private companies that now completely control the supply.

The secretary expresses himself heartily in favor of a suspension of naval construction on the part of the great powers, and recommends that the United States government take the initiative to bring about an international conference to decrease the cost of armies and navies.

NAVAL SCHOOLS. There was established on board the *Des Moines*, in 1913, a school for academic, vocational, and technical instruction of enlisted men. The experiment met with such success that it was proposed to install these schools generally upon the ships and at the shore stations of the navy. Already four training schools for recruits are in existence at Newport, Norfolk, Chicago, and San Francisco, and eleven technical schools are maintained by the government. These are the machinists' school at Charleston, S. C., the electricians' school at New York and Mare Island, the seaman gunners' school at Washington, the artificers' school at Norfolk, the musicians' schools at Norfolk and San Francisco, and the yeomen's schools at Newport and San Francisco. These schools are converting raw recruits into skilled men in the various trades required by the naval service. For the development of aviation as related to the navy, see the article AERONAUTICS.

The organized naval militia increased both in numbers and efficiency during 1913. Practical experience was gained by cruising in vessels loaned by the government.

ENLISTMENTS. As a result of the campaign of publicity undertaken by the naval officers, the number of enlistments for the five months

ending October 31 was unprecedented. The enlistments in this period numbered 8448, compared with 6102 for a similar period in 1909, 6005 in 1910, 7170 in 1911, and 7190 in 1912. This increase in numbers has been coincident with the policy of raising the standard for admission. There has been a rigid exclusion of those not morally or physically fit, and in more than one instance men who enlisted to escape prosecution for crime were expelled from the ships, and notice given that the navy was the place only for young men of character and merit, and no others would be retained. The appropriations for the support of the navy for the fiscal year 1914 amounted to \$140,736,536. Estimates for the fiscal year 1915 amount to \$144,417,453.

POST OFFICE

The postal service for the fiscal year ending June 30, 1913, amounted to \$266,619,525, an increase over the revenues of 1912 by more than 8 per cent. The amount of increase is to be attributed to the operation of the parcel post system, which was inaugurated on January 1, 1913. The expenses for the year amounted to \$262,067,541, leaving an excess of revenues over expenses of \$4,510,850. This, however, is not taken to be the actual surplus of receipts over expenditures, because it does not include obligations which were incurred but not paid during the year. The estimated actual surplus for the year 1913 was \$3,841,906. This is the first actual postal surplus in thirty years.

PARCEL POST. The operation of the parcel post system begun on January 1, 1913, was in all respects successful. The capacity of the postal organization to conduct this important public utility was amply proved by its rapid development and effective service. The growth of the business of parcel post during the year was phenomenal. During the first six months of its operation, approximately 300,000,000 parcels were handled. The percentage of loss and damage was relatively small, as were the number of complaints of delay or unsatisfactory service. When the service was first inaugurated an issue of distinctive stamps was prescribed for the payment of postage on parcel post mail; these stamps were not accepted for postage on other than fourth-class matter, and the stamps used for other classes of mail were not accepted for postage on parcels. This restriction resulted in great confusion and annoyance to the public, and the mandatory use of this special issue was therefore discontinued. The use of ordinary stamps on parcel post packages was permitted and the use of parcel post stamps on other classes of mail was also allowed.

The parcel post law provided for the indemnification of shippers, for articles injured or lost, by insurance; and accordingly the registration privilege was withdrawn from fourth-class mail, and the insurance privilege substituted. Six months' experience demonstrated that the uniform charge for insurance regardless of the amount of the risk worked against the usefulness of the system, and accordingly on July 1, the regulation was amended so that a mailable parcel on which the postage is fully prepaid may be insured against loss in an amount equivalent to its value, but not exceeding \$25, on a payment of a fee of five cents;

and in an amount equivalent to its actual value in excess of \$25, but not to exceed \$50, on a payment of a fee of ten cents. During the six months' operation of the system at the close of the fiscal year more than 25,000,000 parcels were insured against loss.

In view of the increase of postal revenues due to the operation of the parcel post system, it was determined shortly after the close of the fiscal year to give to the people the benefit of this earning power in the form of reduced rates, and on August 15 the rates for the first and second zones were reduced and the weight limit increased from 11 to 20 pounds. The increase in the weight limit met with such successful results that the Post Office Department submitted to the Interstate Commerce Commission a recommendation for increasing the weight limit in the first and second zones from 20 to 50 pounds, and in the remaining zones from 11 to 20 pounds, and for substantially reducing the rates of postage in all zones except the first and second, which had already been revised, and the seventh and eighth, in which any reduction was held to be not justified at the present time. The recommendation was approved by the commission, to go into effect on January 1, 1914.

The increased burden forced upon the railroads as a result of these increases in weight limit, made it necessary to consider the matter of increased compensation for this extra service, and during the latter part of the year the Post Office Department was engaged in gathering statistical data necessary for ascertaining a correct basis for fixing a just, fair, and adequate compensation for the service rendered.

POSTAL TELEGRAPHS AND TELEPHONES. The Postmaster-General in his annual report for 1913 expressed conviction that the Post Office Department should have control over all means of communication of intelligence, including telegraphs and telephones. He declared that the successful operation of the parcel post had demonstrated the capacity of the government to conduct the public utilities which fall properly within the postal provision of the Constitution. Beginning in June, 1913, an investigation was begun to determine the desirability and practicability of extending the ownership and control of means of communication, with a view to the acquisition by the government of the telegraph and telephone facilities, to be operated as an adjunct to the postal service.

AERIAL MAIL SERVICE. Experimental aerial mail service was first authorized in 1911, and since that date permission has been given for carrying mail by this method in fifty-four instances. An item was included in the estimates for 1915 for \$50,000 to provide for an experimental service. It is believed that there are sections of the country where, because of topographical conditions, this class of service might be advantageously employed in some cases.

POSTAL SAVINGS SYSTEM. From the time of its inauguration as a branch of the postal service until May 1, 1913, the postal savings system was conducted as an independent office under the immediate supervision of the Postmaster-General. On the latter date the business of the system was transferred to the bureau of the Third Assistant Postmaster-General, and the business methods were reorganized. On June 30, 1913, the postal savings system was in operation at 12,158 offices, of which 8227 were of

presidential grade and 3931 of the fourth class. Savings facilities were also extended to 662 branches and stations, making a total of 12,820 depositories in operation on that date. From June 30 to the end of the year the service was extended to 210 additional presidential offices. The number of savings depositors on June 30, 1913, was 331,006, and the amount of deposit to their credit was \$33,818,870. Postal savings bonds to the value of \$3,508,000 had been issued to depositors. Banks to the number of 6226 were qualified to receive postal savings funds. These included 3786 national banks, 2405 State banks, 337 savings banks, 609 trust companies, and 49 organized private banks subject to State supervision.

SECOND-CLASS MATTER. The mailings of newspapers and periodicals as second-class matter at the cent-a-pound rate and free in the county of publication, during the fiscal year 1912, were greater than any previous year, and for the first time in the history of the postal service exceeded a billion pounds. Although second-class matter constituted approximately 62 per cent. of the aggregate weight of the domestic revenue-producing mail, it produced only 4.98 per cent. of the postage derived from such mail. A joint committee of Congress was engaged in examining into the question of second-class rates, and with the understanding that it would report not later than March 4, 1914, as provided by law.

APPOINTMENT OF POSTMASTERS. Early in President Wilson's administration announcement was made that all presidential postmasters appointed by the preceding administration would be permitted to serve out their terms, and that no removals except for improper conduct or incapacity would be made. This policy was scrupulously adhered to during the year. Announcement was made at the same time that the department would require every postmaster to give to the office his individual attention for eight hours daily, and this requirement was rigidly enforced during the year. All fourth-class postmasterships, except those in Alaska, Guam, Hawaii, Porto Rico, and Samoa, are now classified civil-service positions, but the classified status accorded to the present incumbents by an executive order, issued on October 15, 1912, by President Taft, was withdrawn by the executive order of May 7, 1913, and these positions will be filled as the result of competitive examinations conducted by the civil service commission.

RECOMMENDATIONS FOR LEGISLATION. The Postmaster-General in his annual report makes important recommendations for legislation affecting the postal service. These include proposals for the readjustment of postmasters' salaries, for compensatory time for Sunday service, for compensation to injured postal employees, and for the extension of the system of transporting periodicals in fast freight trains.

PENSIONS

The total number of pensioners of all kinds on the rolls on June 30, 1913, was 820,200, compared with 860,294 on the same date in 1912, or a net decrease of 40,094. The losses by death were 57,459, and the gains by original allowances and by restoration and renewal allowances were 19,758. At the beginning of the fiscal year there were 497,263 survivors of the Civil

War on the roll, and at its close 462,379, a net decrease of 34,884. Losses by death among the Civil War survivors in 1913 were 36,064. Of the total number (820,200) of pensioners on the rolls at the close of the year, 503,633 were persons who rendered service in the army or navy of the United States. The remaining 316,567 were pensioned as widows and dependents. The number of individuals who served in the army and navy of the United States during the Civil War is estimated at 2,213,365. There were on June 30, 1912, 199 widows of the War of 1812, 1142 survivors; and 5123 widows of the war with Mexico, 1096 survivors; and 2330 widows of the Indian wars. The amount disbursed for pensions during the fiscal year was \$174,171,660. The total amount paid to pensioners from 1790 to 1913 was \$4,557,539,824. An act of May 11, 1912, granted pensions, according to the length of service, to persons who had served 90 days or more in the military or naval service of the United States who were honorably discharged and who had reached certain ages. It also granted pensions at the maximum rate of \$30 per month, without regard to age or length of service, to persons who served in the military or naval service during the Civil War and who received honorable discharges, and who were wounded in battle or in line of duty and are now unfit for manual labor by reason thereof, or who from disease or other causes incurred in line of duty resulting in their disabilities are now unable to perform manual labor. From the date of the approval of this act to the close of the fiscal year June 30, 1913, 504,438 applications for pensions or for increase of pension had been received under it, and during that time 429,369 certificates were issued. Only 894 of these were original allowances, or pensions granted to persons never before on the roll under other laws.

PATENTS

There were received during the fiscal year ended June 30, 1913, 67,936 applications for mechanical patents, and there were granted 38,704 patents. The number of patents that expired was 21,427. These statistics show a slight decrease in the volume of business during the year. The Secretary of the Interior in his annual report points out the urgent and ever-growing need of a new building for the Patent Office. Plans for the accomplishment of this took definite form when an appropriation of \$5000 was made by the Sixty-second Congress to be expended for the preparation of plans. A commission was appointed consisting of the Secretary of the Interior, the commissioner of patents, and the supervising architect of the Treasury, for the purpose of investigations as to available sites and other matters. On April 1, 1913, the convention of the International Union for the Protection of Industrial Property became effective. This convention, which was amendatory to the Paris convention of 1883, was signed at Washington on June 2, 1911. Ratifications have been made by the following governments: Germany, Austria, Dominican Republic, Spain, United States, France, Great Britain, Italy, Japan, Mexico, Norway, Netherlands, Portugal, Switzerland, and Tunis.

BUREAU OF MINES

A new organic act for this bureau was passed by Congress and approved February 25, 1913. This greatly extended the scope of the work of the bureau and made it more nearly commensurate with the importance of the mining and metallurgical industries of the country. Under this act the work of the bureau includes not only investigations and inquiries looking to the prevention of mine accidents, but also improvements in the general health and safety conditions, the practical conservation of resources through the prevention of waste, the increase of efficiency and economy, and improvements in the economic conditions relative to the mining, metallurgical, and miscellaneous mineral industries of the country.

Two chief features of the work of the bureau during 1913 relate to mine explosions and the prevention of unnecessary waste in the mining and metallurgical industries. Investigations into the causes and method of preventing mine explosions were carried on in the laboratories at Pittsburgh and in the experimental coal mine opened up ten miles south of that city. Six mine-rescue stations were maintained during the year and 8 mine-rescue cars were operated by the bureau. Over 6900 miners were trained in first-aid and mine-rescue work, and 32,000 miners attended first-aid and rescue demonstrations given by the employees of the bureau in connection with the work of these cars. The bureau also collected information about such mining laws relating to health and safety as are in force in different countries, besides a large amount of data concerning the accidents and health conditions in the metallurgical and metallurgical plants of this country.

During 1913 Congress authorized for the first time inquiries and investigations concerning the waste of resources in the mining and metallurgical operations of the country. The bureau under this authorization extended its inquiries to all the more important branches of the industry, and it proved that there were wastes in the mining and extraction of coal, oil, natural gas, copper, lead, zinc, and other mineral substances which constitute a serious, and in many cases a permanent and national, loss. The work of the bureau in saving human life has been of the utmost importance. During the year previous to the beginning of its investigations 30 per cent. of the coal-mine fatalities were caused by mine explosions. During 1913, chiefly as a result of the work of the bureau, the percentage was reduced to about 13. Before the bureau began its work the number of men killed per 10,000 was 48; during 1912 it was 32. The work of the bureau has thus far, by force of circumstances, been limited chiefly to investigations of explosions in coal mines. Investigations, however, will in future take also other and various directions.

DIPLOMATIC SERVICE

In no department of the administration of President Wilson during its first year was criticism so free and severe as in its relation to the diplomatic service. It was assumed that changes would be made in the list of diplomatic representatives in accordance with the custom observed in the change of administration, but the character of these changes in certain cases

provoked criticism and comment even among those favorable to the administration. It was generally assumed without, however, any real basis of fact, that President Wilson had retained for himself the appointment of ambassadors, while to Mr. Bryan he had left the selection of ministers and the minor officers of legations.

The ambassadors at the beginning of President Wilson's administration were as follows: Richard C. Kerens, Austria-Hungary; Edwin V. Morgan, Brazil; Myron T. Herrick, France; John G. A. Leishman, Germany; Thomas J. O'Brien, Italy; Larz Anderson, Japan; Henry L. Wilson, Mexico; Curtis Guild (resigned in 1913), Russia; and W. W. Rockhill, Turkey. The office of ambassador to Great Britain was vacant on account of the death of Whitelaw Reid on December 5, 1912. The embassy to Mexico became vacant on the resignation of Henry L. Wilson, and relations with Mexico prevented the filling of the office.

One of President Wilson's first appointments was that of Walter H. Page, the editor of the *World's Work*, as ambassador to Great Britain. The appointment was generally considered to be an excellent one, although it met with some opposition in the Senate on account of certain writings of Mr. Page relating to the South. Thomas Nelson Page, the well-known novelist, was appointed ambassador to Italy. This appointment also was well received. James W. Gerard, whom Mr. Wilson appointed ambassador to Germany to succeed Mr. Leishman, was little known outside of New York City, where he had won reputation as an able jurist. Mr. Wilson appointed Frederic C. Penfield ambassador to Austria, to succeed Mr. Kerens. Mr. Penfield for many years was in the diplomatic service of the United States. He was vice-consul at London, and consul-general in Egypt under Mr. Cleveland. Henry Morgenthau, appointed ambassador to Turkey to succeed W. W. Rockhill, was treasurer of the Democratic national committee in the campaign of 1912. He had no previous diplomatic experience, and in this respect was in marked contrast to Mr. Rockhill, who, since 1884, had been constantly in the diplomatic service.

The appointment which caused the greatest amount of comment and criticism was that of Henry M. Pindell of Peoria, Ill., to be ambassador to Russia. Mr. Pindell is the editor of a newspaper, and previous to his appointment was nationally unknown. He was, however, for many years a warm friend and supporter of Mr. Bryan. Shortly after his appointment by President Wilson a letter reported to have been written to him by Senator Lewis was made public. In this letter Mr. Pindell was urged to take the post and was promised that his duties would be light, as it was proposed to undertake no important diplomatic negotiations with Russia during the year. He was also reminded of the advantages of the social position which Mr. Pindell would have as ambassador, and he was given the privilege of resigning, if he wished to do so, at the end of the year. It was claimed in the letter that this arrangement was made with the knowledge and consent of Mr. Bryan. Senator Lewis, on the publication of the letter, said that it was incorrect, and that he had written no such letter. He did not deny, however, that he had corre-

sponded with Mr. Pindell on the subject. At the end of the year the Senate had not confirmed the nomination, and it was generally assumed that Mr. Pindell would resign after such confirmation had been received. Spain was raised to an embassy in 1913, and Joseph E. Willard was appointed as the first ambassador. Mr. Herrick continued to be ambassador to France during 1913. The position had been offered by President Wilson to W. F. McCombs, who managed his campaign in 1912, but Mr. McCombs had not accepted at the end of the year. George W. Guthrie of Pittsburgh was appointed ambassador to Japan. Mr. Guthrie had served as mayor of Pittsburgh, and had for many years been well known in politics in Pennsylvania.

In the appointment of ministers, especially to Central and South America, many remarkable changes were made, and it was in these that the most severe criticism was directed against Mr. Bryan for the reason that he was held largely responsible for such changes. Arthur Beaupré, who had been in the diplomatic service since 1897 and had served as minister to several South American countries, was succeeded as minister to Cuba by William E. Gonzales, a well-known editor and politician of South Carolina. Montgomery Schuyler, Jr., was succeeded as minister to Ecuador by Charles S. Hartman of Montana. Mr. Schuyler had served in legations at St. Petersburg (twice), Siam, Rumania, Japan, and Mexico. He is well known as a scholar and linguist. As minister to Costa Rica, Lewis Einstein was succeeded by Edward J. Hale of North Carolina. Mr. Einstein had served in the diplomatic service since 1903. Mr. Hale was editor of a newspaper in North Carolina, and at the time of his appointment was 74 years of age. William W. Russell, who was succeeded as minister to San Domingo by James M. Sullivan of New York, had been in the diplomatic service since 1895, chiefly in South American countries. Mr. Sullivan was, prior to his appointment, a New York lawyer. As minister to Haiti, Madison R. Smith, a lawyer and editor of Wisconsin, was appointed to succeed Henry W. Furniss, who had been in the diplomatic service since 1898. H. Percival Dodge, who had served in the embassies at Berlin, and Tokyo, and as minister to several South American countries, was superseded as minister to Panama by William Jennings Price, a lawyer of Danville, Ky. Horace G. Knowles, minister to Bolivia, who had been in the diplomatic service for many years, was succeeded by John D. O'Rear, a lawyer of Mexico. Mo. Thaddeus A. Thomson, a ranch-owner of Austin, Texas, was appointed minister to Colombia to succeed James T. DuBois. The latter had been in the diplomatic consular service for many years.

George T. Weitzel was succeeded as minister to Nicaragua by Benjamin L. Jefferson, a physician of Colorado, hitherto unknown in politics. Mr. Weitzel had been in the diplomatic service since 1907. Charles D. White, who was succeeded as minister to Honduras by John Ewing of New Orleans, had served in the diplomatic service since 1904 and had held important positions. As minister to Peru, Benton McMillin, a prominent politician of Tennessee, was appointed to succeed Henry C. Howard. Robert S. R. Hitt, who was succeeded as minister to Guatemala by Rev. William H. Leavell, Mississippi, had served in various embassies as minister since 1901.

Almost without exception the previous ministers to the South American and Central American countries had held these offices for many years and were conversant with the difficult politics of the Latin American countries and familiar with the Spanish language. Ministers to European countries, it was generally conceded, were better types of diplomats than those appointed to Central and South American countries. The appointment of Dr. Henry Van Dyke as minister to Holland was generally praised, as was also the appointment of Pleasant A. Stovall, minister to Switzerland, to succeed Henry S. Boutell. The appointment of another writer was that of Brand Whitlock, former mayor of Toledo, Ohio, as minister to Belgium. George Fred Williams, for many years well known in politics, was appointed minister to Greece to succeed President Schurman of Cornell University. These are the more important appointments of ministers to European countries.

A complete list of the ambassadors, and ministers of the United States to foreign countries and of foreign countries to the United States is given in the table below.

Among the representatives of foreign countries to the United States there were few important changes during the year. The most notable was the retirement of James Bryce, ambassador from Great Britain and the appointment of Sir Cecil Arthur Spring-Rice as his successor. There were no other changes among the ambassadors. Spain was raised to an embassy during the year, making a total of 11 ambassadors from foreign countries to the United States. The new ministers were Dr. Pablo Desvernine from Cuba; Constantin Brun, Denmark; Dr. Don Francisco J. Peynado, Dominican Republic; Dr. Gonzalo S. Córdova, Ecuador; Ulrich Duvivier, Haiti; W. L. F. C. Van Rappard, Netherlands; Emiliano Chamorro, Nicaragua; Don Eusebius A. Morales, Panama; Hector Velazquez, Paraguay; Don Francisco Duenas, Salvador; and Phya Prabha Karavongse from Siam.

FEDERAL JUDICIARY

There were no changes in the membership of the United States Supreme Court during 1913. The judges of the court and the year of the appointment of each are given below. The other courts which make up the Federal judiciary and their membership in 1913 are also given.

SUPREME COURT. Chief Justice: Edward Douglass White of Louisiana (1910). Associate Justices: Joseph McKenna, California (1898); Oliver Wendell Holmes, Massachusetts (1902); William R. Day, Ohio (1903); Horace Harmon Lurton, Tennessee (1909); Charles Evans Hughes, New York (1910); Willis Van Devanter, Wyoming (1910); Joseph R. Lamar, Georgia (1910); Mahlon Pitney, New Jersey (1912).

COURT OF CLAIMS. Chief Justice: Edward Kernan Campbell; Associate Judges: Charles Bowen Howry, Fenton Whitlock Booth, Samuel Stebbins Barney, George Wesley Atkinson.

COURT OF CUSTOMS APPEALS. Presiding Judge: Robert M. Montgomery. Associate Judges: James F. Smith, Orion M. Barber, Marion De Vries, George E. Martin.

COMMERCE COURT. This court ceased to exist on December 31, 1913, by act of Congress approved October 22, 1913. The justices of the Commerce Court at the time of its abolishment follow. Presiding Judge: Martin A. Knapp. Associate Judges: William H. Hunt, John E. Carland, and Julian W. Mack. Robert W. Archbald, a judge of this court, was removed by impeachment January 19, 1913. These judges, with the exception of Judge Archbald, continued as members of the Circuit Courts.

CIRCUIT COURTS. The Circuit Courts comprise

nine judicial circuits, and each of the justices of the Supreme Court is in charge of one of these circuits. There are in addition other circuit judges for each of the circuits.

SUPREME COURT DECISIONS. The United States Supreme Court handed down many important decisions during 1913. The most interesting of these from a public point of view related to the railroad laws and matters connected with the anti-trust law. For a discussion of these see RAILWAYS and TRUSTS. On April 7 it was decided that corporations leasing land are exempt from the federal corporation tax. On May 12, in a decision handed down, the court upheld the right of the government to deport undesirable alien women regardless of the three-year limitation. The court on April 21 decided that federal appellate courts may no longer correct verdicts of juries when they believe insufficient evidence has been introduced to support them. The newspaper publicity law was upheld on June 9, and on the same day the right of the State of Minnesota to fix railroad rates was upheld. (See RAILWAYS.) The foreign corporation tax law was sustained as constitutional on November 3. During the year two bills providing for an increase in the membership of the court were introduced in Congress, but no action was taken on them.

DISTRICT OF COLUMBIA

Under the article entitled as above, will be found information concerning certain legislation of the year pertaining to the District of Columbia.

INAUGURATION OF PRESIDENT WILSON

President Wilson and Vice-President Marshall were inaugurated on March 4, 1913. The weather conditions were in great contrast to those prevailing at the time of President Taft's inauguration, when a great storm made the streets almost impassable. It is estimated that over half a million people were gathered in Washington to witness the inauguration ceremonies. The inaugural parade included some 30,000 men and is said to have been the longest parade since President Lincoln, in 1865, reviewed the returning Union troops. Notable in the parade were the representatives from Princeton University and a group of Indian chiefs from the Indian reservations.

As is the custom, the Senate chamber was the scene of the inauguration of the Vice-President, which precedes that of the President. Members of the other House of Congress and the ministers of foreign countries and of the Supreme Court filled the Senate chamber. The oath of office was administered by Senator Gallinger, president *pro tempore* of the Senate, and immediately the Sixty-second Congress adjourned and the Sixty-third Congress assembled.

As president of the Senate Mr. Marshall made a somewhat unusual address. It was earnest and original, but in some of its expressions was unconventional.

For the inauguration of President Wilson a grandstand holding 10,000 persons had been built at the east wing of the Capitol. This was stretched from wing to wing of the great building. To this stand proceeded President Taft, President-elect Wilson, members of the two houses of Congress, and officials and distinguished guests. Before the stand was assembled the largest multitude that had ever witnessed an inaugural ceremony. President Taft and Mr. Wilson were greeted with prolonged applause and the demonstration given to W. J. Bryan was notably warm. The oath of office was administered to Mr. Wilson by Chief Justice White. President Wilson's inaugural address followed. Its brevity permits of its inclusion here.

"There has been a change of government. It began two years ago, when the House of Representatives became Democratic by a decisive majority. It has now been completed. The Senate about to assemble will also be Democratic. The offices of President and Vice-President have been put into the hands of Democrats. What is the question that is uppermost in our minds today? That is the question I am going to try to answer, in order, if I may, to interpret the occasion.

"It means much more than the mere success of a party. The success of a party means little except when the Nation is using that party for a large and definite purpose. No one can mistake the purpose for which the Nation now seeks to use the Democratic party. It seeks to use it to interpret a change in its own plans and point of view. Some old things with which we had grown familiar and which had begun to creep into the very habit of our thought and of our lives have altered their aspect as we have latterly looked critically upon them with fresh, awakened eyes; have dropped their disguises and shown themselves alien and sinister. Some new things, as we look frankly upon them,

willing to comprehend their real character, have come to assume the aspect of things long believed in and familiar, stuff of our own convictions. We have been refreshed by a new insight into our own life.

"We see that in many ways that life is very great. It is incomparably great in its material aspects, in its body of wealth, in the diversity and sweep of its energy, in the industries which have been conceived and built up by the genius of individual men and the limitless enterprise of groups of men. It is great also, very great, in its moral force. Nowhere else in the world have noble men and women exhibited in more striking forms the beauty and the energy of sympathy and helpfulness and counsel in their efforts to rectify wrong, alleviate suffering, and set the weak in the way of strength and hope. We have built up, moreover, a great system of government, which has stood through a long age as in many respects a model for those who seek to set liberty upon foundations that will endure against fortuitous change, against storm and accident. Our life contains every great thing and contains it in rich abundance.

"But the evil has come with the good, and much fine gold has been corroded. With riches has come inexcusable waste. We have squandered a great part of what we might have used and have not stopped to conserve the exceeding bounty of nature, without which our genius for enterprise would have been worthless and impotent, scorning to be careful, shamefully prodigal as well as admirably efficient. We have been proud of our industrial achievements, but we have not hitherto stopped thoughtfully enough to count the human cost, the cost of lives snuffed out, of energies overtaxed and broken, the fearful physical and spiritual cost to the men and women and children upon whom the dead weight and burden of it all has fallen pitilessly the years through. The groans and agony of it all had not yet reached our ears, the solemn moving undertone of our life, coming up out of the mines and factories and out of every home where the struggle had its intimate and familiar seat. With the great government went many deep secret things which we too long delayed to look into and scrutinize with candid, fearless eyes. The great government we loved has too often been made use of for private and selfish purposes, and those who used it had forgotten the people.

"At last a vision has been vouchsafed us of our life as a whole. We see the bad with the good, the debased and decadent with the sound and vital. With this vision we approach new affairs. Our duty is to cleanse, to reconsider, to restore, to correct the evil without impairing the good, to purify and humanize every process of our common life without weakening or sentimentalizing it. There has been something crude and heartless and unfeeling in our haste to succeed and be great. Our thought has been 'Let every man look out for himself, let every generation look out for itself,' while we reared giant machinery which made it impossible that any but those who stood at the levers of control should have a chance to look out for themselves. We had not forgotten our morals. We remembered well enough that we had set up a policy which was meant to serve the humblest as well as the most powerful, with an eye single to the standards of justice and fair play, and

remembered it with pride. But we were very heedless and in a hurry to be great.

"We have come now to the sober second thought. The scales of heedlessness have fallen from our eyes. We have made up our minds to square every process of our national life again with the standards we so proudly set up at the beginning and have always carried in our hearts. Our work is a work of restoration.

"We have itemized with some degree of particularity the things that ought to be altered, and here are some of the chief items: A tariff which cuts us off from our proper part in the commerce of the world, violates the just principles of taxation, and makes the government a facile instrument in the hands of private interests; a banking and currency system based upon the necessity of the government to sell its bonds fifty years ago, and perfectly adapted to concentration of cash and restricting of credits; an industrial system which, take it on all its sides, financial as well as administrative, holds capital in leading-strings, restricts liberties, and limits the opportunities of labor, and exploits without renewing or conserving the natural resources of the country; a body of agricultural activities not yet given the efficiency of great business undertakings or served as it should be through the instrumentality of science taken directly to the farm or afforded the facilities of credit best suited to its practical needs; water-courses undeveloped, waste places unreclaimed, forests untended, fast disappearing without plan or prospect of renewal, unregarded waste heaps at every mine. We have studied, as perhaps no other nation has, the most effective means of production; but we have not studied cost or economy as we should, either as organizers of industry, as statesmen, or as individuals.

"Nor have we studied and perfected the means by which government may be put at the service of humanity in safeguarding the health of the Nation, the health of its men and its women and its children, as well as their rights in the struggle for existence. This is no sentimental duty. The firm basis of government is justice, not pity. These are matters of justice. There can be no equality of opportunity, the first essential of justice in the body politic, if men and women and children be not shielded in their lives, their very vitality, from the consequences of great industrial and social processes which they cannot alter, control, or singly cope with. Society must see to it that it does not itself crush or weaken or damage its own constituent parts. The first duty of law is to keep sound the society it serves. Sanitary laws, pure food laws, and laws determining conditions of labor which individuals are powerless to determine for themselves are intimate parts of the very business of justice and legal efficiency.

"These are some of the things we ought to do, and not leave the others undone, the old-fashioned, never-to-be-neglected, fundamental safeguarding of property and of individual right. This is the high enterprise of the new day: to lift everything that concerns our life as a nation to the light that shines from the hearth-fire of every man's conscience and vision of the right. It is inconceivable that we should do this as partisans; it is inconceivable we should do it in ignorance of the facts as they are or in blind haste. We shall restore, not destroy; we shall deal with our economic system as it is

and as it may be modified, not as it might be if we had a clean sheet of paper to write upon; and step by step we shall make it what it should be, in the spirit of those who question their own wisdom and seek counsel and knowledge, not shallow self-satisfaction or the excitement of excursions whither they cannot tell. Justice, and only justice, shall always be our motto.

"And yet it will be no cool process of mere science. The Nation has been deeply stirred, stirred by a solemn passion, stirred by the knowledge of wrong, of ideals lost, of government too often debauched and made an instrument of evil. The feelings with which we face this new age of right and opportunity sweep across our heart-strings like some air out of God's own presence, where justice and mercy are reconciled and the judge and the brother are one. We know our task is to be no mere task of politics, but a task which shall search us through and through, whether we shall be able to understand our time and the need of our people, whether we be indeed their spokesmen and interpreters, whether we have the pure heart to comprehend and the rectified will to choose our high cost of action.

"This is not a day of triumph; it is a day of dedication. Here muster, not the forces of party, but the forces of humanity. Men's hearts wait upon us; men's lives hang in the balance; men's hopes call upon us to say what we will do. Who shall live up to the great trust? Who dares fail to try? I summon all honest men, all patriotic, all forward-looking men, to my side. God helping me, I will not fail them, if they will but counsel and sustain me!"

PRESIDENT WILSON'S CABINET

The biographies of the members of President Wilson's cabinet will be found in their alphabetical order in this volume. In order to present the members as a whole they are, with the indications of the sections of the country from which they were chosen, given below.

William J. Bryan, Secretary of State, of Nebraska. His career is so familiar as to render an account of it unnecessary here.

William G. McAdoo, Secretary of the Treasury, was born in Georgia. He is a lawyer by profession, but is best known as the successful builder and operator of the Hudson tunnels and railways which connect New York City with New Jersey under the Hudson River.

The Secretary of War, Lindley M. Garrison, is also a lawyer, a native of New Jersey, where he had been a vice-chancellor since 1904.

The Secretary of the Navy, Josephus Daniels, is a native of North Carolina. He is a member of the bar, but never practiced his profession, having devoted himself chiefly to journalism and politics.

Franklin K. Lane, the Secretary of the Interior, was born on Prince Edward Island, Canada, but has been for many years a resident of California. His first work was on newspapers. He then studied law and was admitted to the bar. He held several offices in California and became widely known to the public as a member of the Interstate Commerce Commission in 1905. He became chairman of the commission in the autumn of 1912.

Albert Sidney Burleson, Postmaster-General,

is a native of Texas. For many years he was a member of the House of Representatives and obtained a high reputation in that body for efficient and painstaking work.

David Franklin Houston, Secretary of Agriculture, was born in North Carolina, but for many years has been a resident of Missouri. He was widely known as an educator, and was at one time president of the Texas College of Agriculture.

James C. McReynolds, the Attorney-General, was born in Kentucky. He was an assistant attorney-general under Mr. Wickersham, in President Taft's cabinet.

William C. Redfield, the Secretary of Commerce, was born in New York State and is a manufacturer in Brooklyn. He has written and spoken much in favor of industrial peace and the treatment of laboring men and women on the human basis. He was a member of the House of Representatives and made a high reputation for efficiency in that body.

William B. Wilson, the first incumbent of the new Department of Labor, was born in Scotland. When he came to the United States he settled in Pennsylvania and became a coal miner. He has occupied high offices in the coal miners' unions and served in Congress. He was defeated for reelection in the autumn of 1912.

It will be noted from this list that five of the members of this cabinet are to be credited to the South. These are: Secretary of the Treasury; Attorney-General; Postmaster-General; Secretary of the Navy; and Secretary of Agriculture. Of the Middle West Mr. Bryan is the only representative and of the Far West the only representative is the Secretary of the Interior. The Middle States are represented by the Secretary of Commerce, Secretary of War, and Secretary of Labor. For the first time in many years the New England States are without a representative in the cabinet.

DEPARTMENT OFFICERS

As the offices in the various departments of the government were, to a large extent, reorganized in 1913, it may be convenient for reference to include the names of the heads of the various bureaus and divisions in the administrative departments. These are given at the end of this article.

REPRESENTATION IN CONGRESS

At the end of this article will be found a list of the senators and representatives from the different States in the Sixty-third Congress.

ADMINISTRATION

No attempt will be made in this place to give a comprehensive survey of the principal events in the administration of President Wilson during 1913. These are fully treated elsewhere in this book—in other portions of the article UNITED STATES, in general articles covering the chief results of President Wilson's administrative policies, such as *TARIFF*, *FINANCIAL REVIEW*, *MEXICO*, and others. An account of the President's relation with Congress will be found in the section *Congress*, in this article. A history of the foreign relations of the United States under his direction will be found in the section *Foreign Relations*. The composition of the cabinet which he selected is described

in the section *Cabinet*. His administration of the diplomatic service under the supervision of Secretary Bryan, will be found noted in detail in the section *Diplomatic Service*.

The last months of the administration of President Taft were not marked by any incidents of special interest. Mr. Taft made several speeches and addresses, in most of which he defended his administration and in some cases made caustic criticism of the Progressive party. (See *POLITICAL PARTIES IN 1913*.) President Taft signed, however, several important measures passed at the last session of the Sixty-second Congress. These included a resolution for the Lincoln memorial; the Nicaraguan Canal treaty; the physical valuation of railroads bill; and the bill for creating a new department, that of labor. He vetoed the immigration bill. (See *IMMIGRATION*.) In February he sent two messages to Congress, one of which dealt with the atrocities in Peru, the other urging a budget plan. This was sent on February 26. He also vetoed the Webb liquor bill on constitutional grounds. This, however, was passed over his veto. The sundry civil bill, which contained a provision preventing the expenditure of money for the prosecution of labor unions, was vetoed by him on March 4.

On January 13 the presidential electors met in the capitals of their respective States and formally cast their ballots for President and Vice-President. The votes of the eight Republican electors of Utah and Vermont were cast for Nicholas Murray Butler for Vice-President, in place of James S. Sherman, deceased.

President Wilson remained governor of New Jersey until March 1, but during the two months preceding his inauguration he made several important addresses. Two of these were delivered in the early part of January. The first of these was before the Commercial Club at Chicago, on January 11, and the second before the New Jersey electors two days later. On December 28, 1912, he had made an address at Staunton, Va., on the occasion of the celebration of his birthday in that city. These three speeches bore close relation to one another, and were considered to have formed a statement of the President-elect's attitude toward the great question of business and commerce with which the government must deal during his administration. The speech at Staunton was in general a statement of the principle that one is entitled to reward only as one renders service, and the application of that principle to the relations between business and government at the present time. The speech in Chicago was in fact a statement of the principle that the very existence of business depends upon confidence, and the principle was applied in a practical way as an exhortation to business men to deserve and win the confidence of the people. The speech before the New Jersey electors was a statement of the principle that those who are called upon to serve the people must go in the direction in which the people are going, and that therefore as a representative of the people he was committed to the cause of progress, and that as President he would "pick out progressives and only progressives."

On January 26 he addressed the social welfare advocates on Land Labor, and his last public address delivered before his inauguration as President was made at the inauguration of

James F. Fielder as his successor as governor of New Jersey.

During this interval Mr. Wilson refused to give out the names of those whom he had selected for members of his cabinet. He declared that these names would be announced on the day following his inauguration.

EVENTS OF THE ADMINISTRATION. One of the first official acts of President Wilson was to issue a statement in regard to the attitude of his administration toward Central America. He promised the support of the United States to legitimate governments supported by the people, and strongly condemned intriguers and revolutionists. (See *Foreign Relations*.) Several days later the Department of State issued a statement in which it was announced that the United States would not be a party to the six-power banking group which had undertaken to finance railroad operations in China. (See *Foreign Relations*.) As a result of this action, Huntington Wilson, Assistant Secretary of State, who retained the position he held in President Taft's administration, resigned the office, and at the same time made public a severe criticism of President Wilson's attitude toward China. The greater portion of the time during these first months was devoted to preparations for the introduction of the Tariff bill in Congress, and to making appointments for the diplomatic service and other governmental offices. Much of the President's attention was also given to the difficulties with the legislature of California over the passage of a land-ownership bill. (See *CALIFORNIA*.) In the latter part of April he began to assist in drafting a currency bill. On August 17 he dismissed Professor Willis Luther Moore as chief of the Weather Bureau. Irregularities in the conduct of his office were charged against him. His participation in the political affairs of New Jersey in May is discussed in the article *NEW JERSEY*. On April 15 he intimated to Ambassador Bryce that settlement of the Panama toll question would be favorable to Great Britain. Several days later he declared that he would not reorganize the Canal Zone administration until after the completion of the canal. On January 23 he signed the sundry civil bill referred to above. (See *CIVIL SERVICE*.) President Wilson spent such time as he could spare from Washington at Cornish, N. H. He made several addresses in the autumn, including one at the dedication of the restored Congress Hall at Philadelphia, on October 25. He also made an important address in Mobile before the Commercial Congress on October 27. This address was devoted to the relations of the United States to Latin America. He declared that morality and not expediency should be the nation's guide in its foreign relations. On October 9 he sent a message of congratulation to Yuan Shih-kai on his election as president of China. By the pressure of an electric button at Washington he exploded the Gamboa dike in the Panama Canal on October 10. (See *PANAMA CANAL*.) On December 2 he delivered his message at the first regular session of the Sixty-third Congress. (See *CONGRESS*.) His failure to endorse the woman suffrage movement in his message was criticised by suffragist advocates. (See *WOMAN SUFFRAGE*.) Of the administration of President Wilson during his first ten months it may be said that in its accomplishments it was one

of the most remarkable in the history of the country. In the face of opposition which was none the less real because it was not publicly avowed, he put through Congress two of the most important measures ever enacted—the tariff bill and the currency bill. He did this almost entirely by the force of his personality.

The only criticisms of importance brought against the conduct of his administration related to his Mexican policy and certain appointments in the diplomatic service. For a discussion of the latter, see section *Diplomatic Service*; and for a discussion of the policy of the United States toward Mexico, see *MEXICO*.

CONGRESS

The sessions of Congress treated in this section include the third session of the Sixty-second Congress, and the special and first regular sessions of the Sixty-third. In order to make a consecutive narrative, a résumé is first given of the proceedings of the third session of the Sixty-second Congress, from December 3, 1912, when it first convened, to the holiday adjournment in 1912. President Taft, according to his custom, sent his regular message to Congress in installments. The first installment was sent on December 3 and dealt chiefly with foreign relations of the United States. He discussed his policy in connection with the diplomatic and consular offices, and the detailed reorganization of the State Department which had taken place under his direction. On December 6 he sent the second message, which was more in the nature of a general message than the first. His principal recommendations were for a plan of currency reform such as was outlined by the monetary commission; an amendment to the law to lessen the penalty when corporations inadvertently disobey the corporation tax law; congressional approval of the plan of army reorganization prepared by the war college; the passage of a military bill increasing compensation to militia in the field; citizenship without statehood for Porto Ricans; regulation of water-power grants so that navigable streams may be improved by water-power companies; elevation of Colonel G. W. Goethals to a generalship; a return to the policy of two battleships a year by the appropriation for three battleships in 1913; and authority to the United States Supreme Court to make rules of procedure in common law cases in federal courts to expedite and lessen the cost of litigation. The President emphatically disapproved the project for the immediate independence of the Philippines. On December 19 he sent a third message which was, in effect, a defense against the charge that he had been instigated by political motives in placing 36,000 fourth-class postmasters under the operation of civil service law. (See *CIVIL SERVICE*.) In the same message he advocated legislation permitting members of the cabinet to sit in Congress with the right of debate, but without votes. He also urged the adoption of a plan of the Postmaster-General for the readjustment of the compensation allowed railroads for carrying the mails, and he recommended the revision of the land laws to secure and regulate conservation and legislation affecting Alaska and a registry of mineral lands. He pointed out the necessity of further pure-food legislation, and requested Congress to make

provision for a government building at the San Francisco-Panama-Pacific International Exposition. The Senate was occupied during the greater part of the time preceding the Christmas vacation with the impeachment proceedings against Judge Archbald. In the House the committee on ways and means provided for hearing on the tariff provision to begin January 6, 1913. By a vote of 153 to 118 the House declared that Charles C. Bowman, representative of the Eleventh Pennsylvania district, was not entitled to be seated, and by vote of 181 to 118 it declined to seat his Democratic opponent, George R. McLean. Both seats were rejected on the ground of corrupt practices. Before the adjournment for the holidays the House passed by vote of 178 to 52 the Burnett bill for the regulation of immigration (see IMMIGRATION).

On the convening of Congress after the Christmas holidays the impeachment proceedings against Judge Archbald were continued, and on January 13 the vote was taken. There were 13 charges in the indictment, and when the Senate came to ballot after the hearing of the evidence, there was a vote for actual conviction on only five counts. On the first count, which declared that on or about March 31, 1911, Judge Archbald had entered into a partnership agreement with Edward J. Williams of Scranton, Pa., for the purchase of a culm dump in Lackawanna County, for the purpose of disposing of this property at a pecuniary profit to themselves, and that Judge Archbald had used his official position as a judge of the Commerce Court to induce the owners of this property to sell it at much less than its actual value, the vote was the strongest, namely, 68 for conviction and 5 for acquittal. There were eight counts on which acquittal was voted. The other articles on which conviction was obtained embodied charges similar to the first. The final count was in the nature of a summing up of the whole case in that it stated that Judge Archbald had sought to obtain credit from and through persons interested in the suits at his court; that he had carried on a general business in culm dumps for speculation and profit while he was a judge, and had unlawfully influenced railroad officials. In the vote applying to the penalty of removal from office, the Senate was unanimous, but in declaring him disqualified forever for any office of honor, trust, or profit, it was more evenly divided (39-35). The general opinion of the Senate was well expressed by Senator Root's explanation of his vote. "I have voted that the respondent is guilty under articles 1, 2, 3, 5, 6, and 13, because I find that he used power and influence in his vote as judge of the Court of Commerce to secure favors of money value for himself and his friends from railway companies, some of which were under the regulations of the Interstate Commerce Commission, subject to the review of the Court of Commerce. I consider this course of conduct, and each instance of it, to be a high crime and misdemeanor. I have voted not guilty upon the other articles, because, while most of them involved improper conduct, I do not consider that the acts proved are high crimes and misdemeanors."

The other measures acted upon in this final session of the Sixty-second Congress may be briefly summarized. On January 6 the ways

and means committee of the House began public hearings preparatory to framing the tariff-revision bills for the special session. The House on January 14 endorsed President Taft's order placing fourth-class postmasters in the civil service. See CIVIL SERVICE, and section *Post Office* in this article. On January 8 the conference committees of the House and Senate considered the proposed immigration bill. The chief point in dispute was the literacy test. This was agreed to by the Senate and House on January 12. A report was adopted by the House on January 18. It contained a clause in regard to penal certificates, which was rejected by the Senate on January 21. This clause was dropped by the conference committee two days following. The House passed a measure without the certificate clause on January 26, and it was adopted by the Senate on February 2. On February 4 to February 6 President Taft held conferences with those in favor of and those opposing the bill. He vetoed the bill on February 15. It was re-passed over his veto in the House, but failed to pass in the Senate. (See IMMIGRATION.) In the section above, entitled *Pensions*, will be found statistics and other information relative to the subject in question. It may be stated here, however, that a pension bill passed in this session of Congress carried over \$180,000,000, an increase of about \$15,000,000 over the estimates of 1912. This was a direct consequence of the new pension legislation passed by the Sixty-second Congress. The river and harbor appropriation bill carried sums amounting to over \$25,000,000, while the naval bill authorized two battleships besides minor vessels, an increase of about \$23,000,000 over the appropriation of 1912.

The Senate on February 1 unexpectedly adopted, by a vote of one more than the necessary two-thirds, a resolution to amend the Constitution so that the President should serve for six years instead of four, and be ineligible for reelection. The debates on this resolution seemed to indicate that the Senate did not take the proposition with great seriousness. The greater part of the time was taken up in discussing the question with regard to its effect upon the future of President Taft, of former President Roosevelt, and of Mr. Wilson, President-elect. The resolution, as passed by the Senate, provided that "the term of office of the President shall be six years; and no person who has held office by election, or discharged its powers or duties, or acted as President under the Constitution and laws made in pursuance thereof, shall be eligible to again hold office by election." In order that this resolution as passed by the Senate should be submitted to the States for their acceptance or rejection, it was necessary for it to be passed by a two-thirds vote of the House. This it failed to obtain.

A bill providing for a Department of Labor was signed by President Taft on March 4, which was practically his last official act. Both houses passed a measure approving the Lincoln Memorial, and, in the Senate, a bill was passed to make Senator Cullom commissioner.

The Webb liquor bill, forbidding the interstate shipment of liquor, was passed in the House on February 9 and in the Senate on February 11. The bill, as approved by the Senate, was passed on February 12. The bill was vetoed by President Taft, but was passed

over his veto in both houses. See LIQUOR REGULATION.

Several bills relating to the Panama Canal tolls were introduced in this session. On January 19 a bill to bar trust-owned ships from the Panama Canal was introduced in the House. A bill introduced by Senator Root in the Senate providing for a repeal of the free-toll provision was tabled by the committee on inter-oceanic canals on February 18. A bill providing for the immediate independence of the Philippine Islands was introduced in the House, but no action was taken upon it.

The campaign fund committee which investigated the relations of certain Standard Oil officials and others with campaign funds, continued the hearings during the first part of this session. Additional letters alleged to have been written by John D. Archbold of the Standard Oil Company to the various legislators were presented and read. An investigation into the manner in which these letters became public was carried on by the committee, and the charge was made that they had been purchased by William R. Hearst from employees of the Standard Oil Company, who had stolen them from the private files of Mr. Archbold. The hearing was ended on February 11.

The commission on efficiency and economy, appointed by President Taft in 1911, reported on the Adjutant-General's office. The President asked for an appropriation to continue the investigation, but this was refused.

The committee on privileges and elections in the Senate investigated charges made against Senators Chilton and Watson, of West Virginia. These charges alleged that the legislature which elected them had been improperly influenced. The charges were dropped on February 9.

SUMMARY OF LEGISLATION. The Sixty-second session of Congress adjourned on March 4, 1913. Among the most important enactments made in this session in its two years of existence may be mentioned the constitutional amendment providing for the direct election of senators; the Russian Treaty resolution; statehood bills for Arizona and New Mexico; Panama Canal bill; the Alaskan civil service bill; the white slave bill; the phosphorous match bill; the eight-hour government work bill; the Industrial Commission bill; the Department of Labor bill; the bird-protection bill; the wireless telegraph bill; the pension increase bill; the amendment to the food and drugs act; and the anti-prize-fight moving pictures bill. Important measures opposed and vetoed by President Taft were the tariff bills, the immigration bill, and the interstate liquor bill. The last named was passed over the President's veto.

Especially noteworthy events in the history of the Senate in this session were the expulsion of Senator Lorimer; the impeachment of Judge Archbold; the passage of a resolution amplifying the Monroe Doctrine; the failure of the so-called universal arbitration treaties; the extension of the arbitration treaty with France; and the passage of the fur-seal treaty and of the wireless telegraph treaty.

Perhaps the most notable feature in the life of this Congress was its sanction of certain measures intended primarily to advance home interests, such as the establishment of the Children's Bureau, the white slave bill, and the creation of a Department of Labor.

The Sixty-second Congress was especially liberal in the appropriation of money, and on this score was widely criticised. In its second session it added \$25,000,000 a year to the pension list, and in the third session it proposed a public building measure which was almost universally condemned. Several towns with a population of not over 1000 inhabitants received appropriations for the construction of public buildings to cost \$60,000 and more. This bill authorized a total expenditure of \$35,000,000. In spite of liberality in appropriating for such purposes, Congress refused to authorize more than one battleship, although three were called for by the Navy Department. Congress continued the tradition condemned by most of its numbers, placing "riders" upon appropriation bills, thus allowing by indirection the securing of legislation which it knew could not be secured by direct means. Several of these bills were vetoed by President Taft for the reason that they carried these "riders."

THE SIXTY-THIRD CONGRESS—SPECIAL SESSION. During the first month of President Wilson's administration the announcement was made that an extraordinary session of Congress would be called on April 7 for the purpose primarily of formulating a new tariff bill. The Democratic members of the House held a caucus on March 6 and renominated Champ Clark to be speaker and Oscar W. Underwood chairman of the committee on ways and means. Mr. Underwood's position at the head of this committee gave him the chief hand in forming the tariff bill and directing its passage through the House. One feature of the special session created unusual interest. This was the announcement by President Wilson that he would personally deliver before Congress his message, or, more properly, address. For such personal delivery of the presidential message, however, both President Washington and President Adams had established precedents. His own explanation was given in these words: "The reasons are very simple. I think it is the most dignified way for the President to address the houses on the opening of the session, instead of sending the address by messenger, and letting the clerk read it perfunctorily. I thought that the dignified and natural thing was to read it. It is a precedent which, it is true, has been discontinued a long time, but which is a very respectable precedent."

President Wilson's address, which was not long, is given in full below.

"I have called the Congress together in extraordinary session because a duty was laid upon the party now in power at the recent elections which it ought to perform promptly in order that the burden carried by the people under existing law may be lightened as soon as possible, and in order, also, that the business interests of the country may not be kept too long in suspense as to what the fiscal changes are to be to which they will be required to adjust themselves. It is clear to the whole country that the tariff duties must be altered. They must be changed to meet the radical alteration in the conditions of our economic life which the country has witnessed within the last generation.

"While the whole face and method of our industrial and commercial life were being changed beyond recognition, the tariff schedules have remained what they were before the change began, or have moved in the direction they were

given when no large circumstance of our industrial development was what it is to-day. Our task is to square them with the actual facts. The sooner that is done the sooner we shall escape from suffering from the facts, and the sooner our men of business will be free to thrive by the law of nature (the nature of free business) instead of by the law of legislation and artificial arrangement.

"We have seen the tariff legislation wander very far afield in our day—very far indeed from the field in which our prosperity might have had a normal growth and stimulation. No one who looks the facts squarely in the face or knows anything that lies beneath the surface of action can fail to perceive the principles upon which recent tariff legislation has been based. We long ago passed beyond the modest notion of 'protecting' the industries of the country, and moved boldly forward to the idea that they were entitled to the direct patronage of the government. For a long time—a time so long that the men now active in public policy hardly remember the conditions that preceded it—we have sought in our tariff schedules to give each group of manufacturers or producers what they themselves thought they needed in order to maintain a practically exclusive market as against the rest of the world. Consciously or unconsciously, we have built up a set of privileges and exemptions from competition behind which it was easy by any, even the crudest, forms of combination to organize monopoly; until at last nothing is normal, nothing is obliged to stand the tests of efficiency and economy, in our world of big business, but everything thrives by concerted arrangement. Our new principles of action will save us from a final hard crystallization of monopoly and a complete loss of the influences that quicken enterprise and keep independent energy alive.

"It is plain what those principles must be. We must abolish everything that bears even the semblance of privilege or of any kind of artificial advantage, and put our business men and producers under the stimulation of a constant necessity to be efficient, economical, and enterprising, masters of competitive supremacy, better workers and merchants than any in the world. Aside from the duties laid upon articles which we do not and probably cannot produce, therefore, and the duties laid upon luxuries and merely for the sake of the revenues they yield, the object of the tariff duties henceforth laid must be effective competition, the whetting of American wits by contest with the wits of the rest of the world.

"It would be unwise to move toward this end headlong, with reckless haste, or with strokes that cut at the very roots of what has grown up among us by long process and at our own invitation. It does not alter a thing to upset it and break it, deprive it of a chance to change. It destroys it. We must make changes in our fiscal laws, in our fiscal system, whose object is development, a more free and wholesome development, not revolution or upset or confusion. We must build up trade, especially foreign trade. We need the outlet and the enlarged field of energy more than we ever did before. We must build up industry as well, and must adopt freedom in the place of artificial stimulation only so far as it will build, not pull down.

"In dealing with the tariff the method by which this may be done will be a matter of judgment, exercised item by item. To some not accustomed to the excitements and responsibilities of greater freedom, our methods may in some respects and at some points seem heroic; but remedies may be heroic and yet remedial. It is our business to make sure that they are genuine remedies. Our object is clear. If our motive is above just challenge, and only an occasional error of judgment is chargeable against us, we shall be fortunate.

"We are called upon to render the country a great service in more matters than one. Our responsibility should be met and our methods should be thorough, as thorough as moderate and well considered, based upon the facts as they are, and not worked out as if we were beginners. We are to deal with the facts of our own day, with the facts of no other, and to make laws which square with those facts. It is best, indeed it is necessary, to begin with the tariff. I will urge nothing upon you now at the opening of your session which can obscure that first object or divert our energies from that clearly defined duty.

"At a later time I may take the liberty of calling your attention to reforms which should press close upon the heels of the tariff changes, if not accompanying them, of which the chief is the reform of our banking and currency laws; but just now I refrain. For the present I put these matters on one side and think only of this one thing—of the changes in our fiscal system which may best serve to open once more the free channels of prosperity to a great people whom we would serve to the utmost and throughout both rank and file."

The two houses of Congress at once made the necessary preparations for the active conduct of business. In the House Mr. Clark was reelected speaker and Mr. Underwood chairman of the ways and means committee, in accordance with the action of the caucus referred to above. The Democrats had held a caucus for the election of officers, and this body had elected James P. Clarke of Arkansas, president *pro tempore*. It had been generally conceded before the meeting of the caucus that Senator Bacon of Georgia, would be honored with the appointment, and the election of Senator Clarke created considerable ill-feeling. There was a certain amount of friction, too, on account of the election of Senator Martin of Virginia chairman of the committee on appropriations, in place of Senator Tillman of South Carolina, who would have had it on the ground of priority. The reason given for choosing Senator Martin was Senator Tillman's age and physical infirmity. A number of new senators took their seats in this session, most of them Democrats. The greater number of these had been elected by legislatures in 1913 to succeed senators whose terms had already expired. These senators included two from Colorado, Charles S. Thomas and John F. Shafroth; Joe T. Robinson from Arkansas; Willard Saulsbury from Delaware; Edwin C. Burleigh from Maine; LeBaron B. Colt from Rhode Island; Henry F. Hollis from New Hampshire; Ollie M. James from Kentucky; J. Hamilton Lewis and Lawrence Y. Sherman from Illinois; George W. Norris from Nebraska; Joseph E. Randell from Louisiana; Morris Sheppard from Texas; John K. Shields

from Tennessee; Thomas Sterling from South Dakota; William H. Thompson from Kansas; James K. Vardaman from Mississippi; Thomas J. Walsh from Montana; and John W. Weeks from Massachusetts. On the day following the convening of Congress, the Democratic members of the House of Representatives rejected the plan of an open caucus. The Republican members of the House, on the contrary, on April 11, voted for the first time in the history of the party for an open caucus.

The Tariff Bill. The tariff bill was the chief reason for the convening of the extraordinary session. It is discussed in full in the article **TARIFF**. There will be given here only a chronology of the passage of the bill through Congress. It was noted above that the ways and means committee of the House began hearings on the bill in January, and by the time Congress had convened it was practically ready to report a bill. President Wilson had been in constant communication with the members of the committee and had made many suggestions. A tentative draft of the bill was ready on April 5. This included free raw wool. The bill was presented to the Democratic caucus by Mr. Underwood on April 8. On April 10 Schedule A was adopted without amendment and part of Schedule B was approved the same day. On April 11 part of Schedule C, the metal schedule, was passed without amendment. Schedule D, dealing with wood, lumber, etc., was passed unchanged on April 12. The caucus passed the sugar provision without amendment, together with Schedule F, tobacco, on April 13. There was considerable discussion over Schedule G, agricultural products, and several amendments were offered. Schedule K, the wool schedule, was passed by the caucus without amendment, as was also the cotton schedule, on April 17. The wool, silk, pulp, and paper schedules were adopted without change on April 18. The income tax amendment was passed on April 19. On April 20 the caucus on the bill ended; on April 22 the bill was favorably reported in the House under the ways and means committee, and on the following day discussion began. Mr. Underwood spoke in support of the measure, and Mr. Gardner of Massachusetts, against it. There were five days of general debate, and, on April 29, the consideration of amendments was begun. On May 1 the House, by vote of 186 to 188, rejected the Republican proposal to strike from the bill the provisions placing sugar on the free list in three years. On May 2 an amendment to the cotton schedule was rejected, and, on May 3, by a vote of 193 to 74, the Republican substitute for the wool schedule was defeated. The provision placing raw wool on the free list was sustained on May 6. On the day following, consideration of the amendments was ended in the House, and, on May 8, the House by a vote of 281 to 139, passed the bill, including the income tax provisions. Five Democrats voted against the measure and two Republicans, four Progressives, and one Independent voted for it. The Senate received the tariff bill from the House on May 9, and on May 16 it was referred to the finance committee. A motion to instruct the committee to hold public hearings was rejected. The committee considered the bill until July 18, when it was reported to the Senate with a recommendation for passage. On

the following day debate was begun. Senator Simmons of North Carolina, chairman of the finance committee, analyzed and defended the measure, and Senator Cummins of Iowa criticized it as unjust and discriminating. The bill was also attacked on July 22 by Senator Smoot of Utah and Senator Burton of Ohio, and on the same date Senator Chamberlain, a Democrat, declared that he was not bound to support it. The debate continued in the Senate until September 9. The chief opposition was to the wool and sugar schedules. The provision for free sugar was bitterly attacked by senators from Louisiana and senators from other States in which the growing of beet-sugar is important. The bill passed by a vote of 44 to 37, and was at once given to the conference committee of the House and Senate. The conference report was completed on September 29, and on the following day the House adopted it by a vote of 254 to 103. The Senate on October 2 adopted the conference report by a vote of 36 to 17, after receding from its amendment placing the tariff on cotton futures. The bill was signed by President Wilson on October 3.

Banking and Currency Bill. The banking and currency bill, known as the Owen-Glass bill, passed in the Sixty-third Congress, is treated in detail in other portions of the **YEAR BOOK** in the article **BANKS AND BANKING**, and in the **FINANCIAL REVIEW**. As in the case of the tariff, there is given here only a chronological summary of the principal events connected with the bill and its passage through the houses of Congress. It was well known that President Wilson wished the passage of currency and banking bills during the special session of Congress, although prominent members of his party in both houses expressed the opinion that it was unwise to attempt any other legislation than the tariff bill at this session. Scarcely was the administration organized, however, when the actual formulation of the currency and banking law began. President Wilson took an important part in the preliminary work. He held frequent conferences with Mr. Glass, chairman of the banking committee of the House, and Senator Owen, chairman of the committee on banking in the Senate. On January 16 the outline of the first tentative draft of a bill was completed by the banking committee of the House. This included a provision for fifteen reserve associations, composed of the national and State banks. Several changes were made in this bill, at the suggestion of President Wilson, and a full text was published on June 19. It was called the Federal reserve act. Hearings were held by Senator Owen and Mr. Glass in various cities of the country, in answer to protests made by bankers against certain provisions of the bill. On January 23 President Wilson addressed Congress on the necessity of money legislation during that session of Congress, and on June 26 the bill was introduced by Senator Owen in the Senate, by Representative Glass in the House, and consideration was begun by the Democratic committee on banking, to which it was referred. The committee made several amendments, but in its general features the bill remained the same. On August 11 the bill was approved by President Wilson and was submitted to the Democratic caucus. A motion to have the caucus opened to the public was defeated. The gen-

eral debate in the caucus ended on August 20, and on August 28 the bill was adopted by the caucus. It was reintroduced into the House on the following day, and was reported by Representative Glass on September 9. It was severely attacked by Republican and Progressive representatives, and a few amendments were adopted. These were not of the first importance. The general debate closed on September 13, when the bill came up for amendments. It was passed in the House on September 18 by vote of 286 to 84. In the Senate consideration of the bill introduced by Senator Owen was refused until after the passage of the tariff bill. The Democratic caucus, however, on August 14 voted to discuss currency legislation without recess, and consideration of the bill in caucus was begun during the session. The committee on banks and banking held sessions at which bankers from all over the country were heard. Senator Owen and other members of the committee also made addresses in different parts of the country, explaining the bill. Action was delayed until the first part of October, when President Wilson expressed himself as dissatisfied with the slow progress of the bill on account of a prolonged hearing. The President's attitude of haste was resented by certain Democratic senators, including Senator O'Gorman of New York and Senator Reed of Missouri, who showed pronounced hostility to the bill as prepared by the committee. Differences in regard to certain provisions of the bill brought about a deadlock early in November. A Democratic caucus was called on November 12. The result was practically two bills prepared by two factions—one composed of all the Democratic senators except Senator Hitchcock, and the other Republican members of the committee with Senator Hitchcock. The committee decided to present these two bills to Congress separately, together with the original Owen-Glass bill, and the three drafts were reported on November 22. Senator Owen and five of his Democratic colleagues submitted a revised currency measure to Senator Hitchcock, Democrat, and five Republican members for a third bill. Senator Owen opened a debate on November 24 and offered his bill as a substitute for the House measure. On the following day Senator Hitchcock explained his currency bill to the Senate and criticised the Owen measure. The Democratic senators began the consideration of the bill in caucus on November 26. This continued throughout the remainder of the special session. On the convening of the first regular session of the Sixty-third Congress on December 1 the currency bill agreed upon by the Democratic caucus was introduced. The debate continued until the adjournment of Congress for the Christmas holidays. On December 13 Senator Root made a notable address in which he asserted that the bill as it stood at that time would cause an era of inflation and would result in catastrophe. As a result of criticism made by Senator Root, the Democratic senators held another caucus and increased the gold reserve provision and made other changes in the bill. On December 19 the bill passed the Senate by vote of 54 to 34, and was at once sent to conference. On December 22 the House adopted the conference report by a vote of 298 to 60. On December 23 the Senate did likewise, the vote being 43 to 25. On

the latter date it was signed by President Wilson.

Safety at Sea or Seamen's Servitude Bill. A discussion of this bill in its relation to the subject of safety at sea will be found in the article with that title. The bill, however, contains certain provisions which properly come beyond the scope of safety at sea and which are radical departures from the statutes now in existence.

The bill was entitled an act to promote the welfare of American seamen in the merchant marine of the United States; to abolish arrest and imprisonment as a penalty for desertion; and to secure the abrogation of treaty provisions in relation thereto; and to promote safety at sea. The measure was a substitute to the bill prepared by Senator Nelson of the Senate committee on commerce and was introduced by Senator La Follette. It was passed by the Senate on October 23, and was referred to the committee on merchant marine and fisheries in the House of Representatives, where it still remained at the end of the year.

The notable new features in this bill were briefly as follows: The first section amended the old law by regulating the hours of labor at sea by dividing the sailors into at least two and the firemen into at least three watches. Section II amended the old law which deals with when and how the seamen shall be paid, by increasing the penalty for its violation. The old law provided one day's pay for each day that the seaman was compelled to wait for his pay beyond the time set by law; the new measure two days. Section III struck out from the old law the following: "unless the contrary, be specially stipulated in the contract," and inserted in its place: "and all stipulations to the contrary shall be held void." The section thus amended gave the seaman the right to demand one-half of the wages due him in any port, notwithstanding any contract to the contrary, and extended its application to seamen on foreign vessels while in American harbors. Section IV amended the existing law so as to give a majority of the seamen, exclusive of the officers, a right to demand a survey of the vessel while in a foreign port to determine its seaworthiness. This is the existing law relative to vessels engaged in domestic trade.

Section V dealt with the quarters of the seamen. The section amended the existing law by striking out "not less than 72 cubic feet and not less than 12 square feet" for each seaman, and inserting "not less than 100 cubic feet and not less than 16 square feet" as fore-castle space allotted for each member of the crew and by providing for opportunity for cleanliness. Section VI gave seamen the same freedom as landmen when a vessel was in a safe harbor, and strengthened the enforcement of proper discipline at sea. Section VIII amended the old law relative to corporal punishment by enabling the seaman who has been thus punished to sue the vessel for damages, if the master permits the officer guilty of violation to escape. The old law permitted the master to be sued in such cases. Section IX amended the law to improve the legal rations so as to give one more quart of water and one more ounce of butter daily. Section X amended the existing law by prohibiting advances or allotments of seamen's wages except to near and dependent

relatives. This custom had been a most pernicious and effective means through which the crimp has kept the seaman under his power and defrauded him of his earnings.

Section XI amended the existing law so as to give men employed in deep-sea fisheries the same protection against garnishments of their wages which is now enjoyed by seamen on other merchant vessels. Section XII was the most radical of the changes in the existing law. It proposed a standard of skill in the able seaman of three years' service on deck at sea or on the Great Lakes in 40 per cent. of the deck crew, exclusive of licensed officers, in the first year after the passage of this act, and gradually increased the number of able seamen required until it reaches 65 per cent. in five years after the passage of the act. It also provides that no vessel shall be permitted to leave any port of the United States unless she has a crew on board not less than 75 per cent. of which, in each department thereof, are able to understand any order given by the officer of such vessel. Passenger vessels are not permitted to depart unless they shall have a sufficient crew to man each lifeboat, with not less than two men with the rating of able seaman or higher. The crew of a lifeboat is from five to nine men. With two actually skilled men, as herein provided, and such training of the others as may be had on the vessel, it ought to be feasible for lifeboats to be lowered and managed on a rough sea. Section XIV provides for the repeal of existing laws relative to the arrest, imprisonment, or delivering up of deserting seamen to the vessels from which they deserted and for abrogation of all treaties in conflict with the provisions of this act.

There was much criticism of certain provisions of the bill by representatives of steamship companies. The most severe criticism was in regard to Section XII which stipulates that 75 per cent. of the crew in each department must be able to understand any order given by the officers. It was claimed that this provision would in effect divert a large volume of commerce from American to Canadian ports on both the Atlantic and Pacific coasts. In the opinion of these critics the most onerous stipulation was the requirement that there shall be two able seamen for every lifeboat. It was claimed that this requirement was against the public's interest in that it practically restricts the work of life-saving to a single department of the crew instead of requiring drill for such service for men in all departments, as is the present practice. It is claimed that by this provision the firemen, stewards, storekeepers, and other members of the crew who form by far the greater number on board a modern steamer, are excluded from lifeboat service, although it has been shown in many instances that these men do as good or better work than the men in the deck department. It was claimed by these organizations that the provision for the summary abrogation of treaties now in effect with the other leading commercial nations of the world which conflict with the provisions of this bill, would result in ill will and injury to commercial relations of the United States with these nations.

A special committee of the representative oceanic steamship lines concluded its summary as follows: "The fundamental objections to

the proposed bill arise chiefly from the apparent ignorance of present-day conditions of ocean transportation on the part of the framers of the measure, and from the fact, obvious to anyone familiar with such conditions, that some of the features of the bill were instigated in the interest of a single class of workers, or rather the fractional part of that class represented by the Seamen's Union. Its practical effect, if not its deliberate purpose, would be to place the operations of steamships sailing from American ports at the mercy of this union without any regard to the interests of other classes of workers very much more numerous and whose welfare is equally important. It would tend to drive commerce away from American ports besides putting American manufacturers and exporters at a disadvantage in competing for foreign markets. By encouraging insubordination and placing a premium on desertion, it would decrease the efficiency of seamen and their ability to render useful service in time of emergency. Most serious of all, the bill as drawn will not accomplish what the Senate in passing it attempted to accomplish, namely, the assurance of adequate provision for safety under modern conditions of operation."

Lobby Investigations. On May 26 President Wilson, in a statement which was made public, declared that there was in existence in Washington a numerous, industrious, and insidious lobby working against certain measures in the proposed tariff bill. He said "newspapers are being filled with paid advertisements calculated to mislead not only the judgment of public men but also the public opinion of the country." To this assertion he added, "there is every evidence that money without limit is being spent to sustain this lobby and to create an appearance of a pressure of public opinion, antagonistic to some of the chief items of the tariff bill." The Senate several days later passed a resolution appointing a committee to investigate these charges. The first action of this committee was to summon before it each individual senator and question him as to his knowledge of the existence of a lobby, and as to his personal relations, if any, with lobbyists. Many of the senators embraced the opportunity to show that they had no private interests which would tend to make them favor such tariff privileges, and to deprecate the idea that there was in existence any such thing as a lobby in the improper sense of the word. Senator Penrose of Pennsylvania declared that the practice of lobbying in the old sense was practically dead, and that the number of lobbyists present in Washington during the discussion of the tariff bill was not half as great as those who attended Congress during the progress of the Payne-Aldrich bill. Senator Kenyon of Iowa, on the other hand, also a Republican, declared that President Wilson was quite right in the charges which he had made. He declared that while there might not be such attempts as formerly were made to influence senators in a direct manner, the methods employed were even more insidious, as they included flattery, social advancement, and entertainment. Senator Pittman of Nevada also endorsed President Wilson's assertion, and further claimed that there had been threats of intimidation as well as argument and flattery. Senator Smoot of Utah declared that false and misleading lit-

erature concerning labor conditions on beet-sugar farms had been issued by those opposed to the growing of beet sugar. Other senators criticised as unfair the methods of wool-growers' representatives. No senator admitted any direct connection with lobbyists. The sessions of the committee immediately succeeding were chiefly occupied with inquiries into the methods of the opponents of free sugar. Senator Townsend of Michigan created something of a sensation in the Senate by defining as a lobbyist a person whose business it is to promote or prevent legislation, and then cited President Wilson as the foremost representative of what the President had denounced as lobbying. He declared that the influence of the President had held several Democratic senators in line for the tariff bill, although it did not "coincide with their known publicly-expressed conviction." The evidence taken by the committee in relation to the steps of the sugar-growing interests to fight free sugar in the tariff bill, showed that money and effort had been spent with great freedom. No disclosures of dishonest methods, however, were made. One development of the testimony was a statement that thousands of copies of documents had been sent out by the opponents of free sugar under the franks of congressmen and senators, and that the text of these documents had been rewritten and changed at the expense of the sugar interests before they had been sent out as public documents from the government printing house.

The publication in a New York newspaper of matter furnished it by Martin L. Mulhall, formerly an agent of the National Association of Manufacturers, resulted in the calling of Mulhall before the committee to give testimony. He told a remarkable story of his alleged connection with representatives and senators in attempts to influence legislation. He began to give testimony on June 30, and continued on the stand at different times for two months following. He made detailed charges against certain senators and representatives, most of whom were dead, and against labor leaders, prominent manufacturers, and others. The charges were denied by the living persons against whom he had brought them. Following his appearance before the Senate committee he gave further testimony of the same nature before a similar committee appointed by the House. A still more sensational turn was given to the hearing of the Senate, when David Lamar, who had several years been known as a daring stock manipulator in New York City, testified early in July that he had in telephone messages to prominent financiers in New York urged them to employ Edward Lauterbach as counsel in the Union Pacific dissolution proceedings. In these conversations he impersonated Congressman Palmer and Congressman Riordan. He did this, he said, hoping that Lauterbach, who had previously done some work for the Morgan interests but had been dismissed by them, would be restored to favor. Lamar also charged that large sums had been taken by officers in dishonest transactions affecting the Union Pacific securities. Lamar before the committee also made charges against senators and congressmen. These were denied. Lamar was in September indicted for impersonation and was arrested. He was released on bail. Lamar offered to give testimony in regard to work as a lobbyist, but the Senate

committee refused to hear him, insisting that he present a written statement. This he refused to do. At the end of the year no tangible results had come from these investigations, although it was generally admitted that the charges made by President Wilson had been maintained.

Other Events in the Special Session. A bill providing for the utilization of a portion of the Hetch-Hetchy Valley was introduced early in this session, but was not finally passed until after the convening of the first regular session. (See CALIFORNIA.) On June 1 the immigration bill, known as the Burnett-Dillingham bill, vetoed by President Taft as passed by the Sixty-second Congress, was reintroduced in the Senate and in the House on June 13. No action was taken on the bill during this session. (See IMMIGRATION.) For an account of the President's signing of the sundry civil appropriation bill, which included a proviso that funds appropriated should not be used in prosecuting labor unions and farmers' associations, see CIVIL SERVICE; and for an account of the appointment by the Senate of a committee to investigate conditions in West Virginia, see STRIKES and WEST VIRGINIA. On April 22 Senator Chamberlain introduced a resolution abrogating the Hay-Pauncefote and Clayton-Bulwer treaties with Great Britain. No action was taken on this during the session. Consideration of the Alaska railroad bill was taken up by the House committee on territories on July 10. No action was taken on this bill during this session. A measure was passed raising the legation at Madrid to an embassy. (See section *Diplomatic Service* above.) On August 8 Senator Johnston of Alabama died. (See ALABAMA.) On October 18 the Senate passed a bill prohibiting the sending of campaign funds from one State to another. During the closing days of this session the Senate committee on elections was engaged in framing a bill providing for the direct election of senators where no provisions had been made by State legislatures.

SIXTY-THIRD CONGRESS—FIRST REGULAR SESSION. There was no interval between the special session and the first regular session of the Sixty-third Congress. In the Senate, on December 1, an announcement was made at the end of the special session, and this was immediately followed by the formal opening of the regular session. On December 2 the President read his annual message, which was brief, occupying only thirty minutes. He gave no formal review of the work of the departments, but referred seekers of information to the reports of these departments.

Speaking of international affairs, he said that there were many happy manifestations of a growing cordiality and community of interest among the nations, which more and more readily were showing their willingness to bind themselves by solemn treaty to the processes of peace. There was, he said, only one cloud on the horizon, and that was hanging over Mexico. He declared: "There can be no certain prospect of peace in America until General Huerta has surrendered his usurped authority in Mexico; until it is understood on all hands, indeed, that such pretended governments will not be countenanced or dealt with by the government of the United States. We

FOUR UNITED STATES SENATORS PROMINENT IN 1913

are the friends of constitutional government in America; we are more than its friends, we are its champions; because in no other way can our neighbors, to whom we would wish in every way to make proof of our friendship, work out their own development in peace and liberty. Mexico has no government. The attempt to maintain one at the City of Mexico has broken down, and a mere military despotism has been set up which has hardly more than the semblance of national authority."

He insisted that the condition of Mexico was such as to make it doubtful whether even the most elementary and fundamental rights, either of her own people or of the citizens of other countries resident within her territory, would long be safeguarded. He affirmed that even if Huerta had succeeded in his purpose, he would have set up nothing but a precarious and hateful power, whose eventual downfall would have left the country in a more deplorable condition than ever.

And he added: "But he has not succeeded. He has forfeited the respect and the moral support even of those who were at one time willing to see him succeed. Little by little he has been completely isolated. By a little every day his power and prestige are crumbling, and the collapse is not far away. We shall not, I believe, be obliged to alter our policy of watchful waiting. And then, when the end comes, we shall hope to see constitutional order restored in distressed Mexico by the concert and energy of such of her leaders as prefer the liberty of their people to their own ambitions."

Turning to domestic affairs, the President expressed a hope for the early enactment of the currency bill, but urged the necessity for special provision to facilitate the credits needed by farmers, and directed attention to the forthcoming report of the special commission which had studied the rural credit system of Europe. He dwelt upon the fact that the immediate service to be rendered to the business communities of the country was to prevent private monopoly more effectually than it had yet been prevented. His words were: "I think it will be easily agreed that we should let the Sherman anti-trust law stand, unaltered, as it is, with its debatable ground about it, but that we should as much as possible reduce the area of that debatable ground by further and more explicit legislation; and should also supplement that great act by legislation which will not only clarify it but also facilitate its administration and make it fairer to all concerned. It is of capital importance that the business men of this country should be relieved of all uncertainties of law with regard to their enterprises and investments and a clear path indicated which they can travel without anxiety. It is as important that they should be relieved of embarrassment and set free to prosper as that private monopoly should be destroyed. The ways of action should be thrown wide open."

This question, he said, would be the subject of a special message.

He then urged the prompt enactment of legislation for primary elections at which the voters might choose their nominees for the presidency without the intervention of nominating conventions. In his opinion, party conventions should be retained, but only for declaring and accepting the verdict of the pri-

maries and formulating platforms, and they should consist of nominees for Congress and the Senate, the senators holding office, the national committeemen, and the candidates for the presidency, in order that the platforms might be framed by those responsible to the people for carrying them into effect.

In regard to the outlying territories of the United States, he said that the government was trustee for Porto Rico, Hawaii, and the Philippines, and that these territories once regarded as mere possessions, were "no longer to be selfishly exploited, but must be administered for the people who live in them." He said: "We can satisfy the obligations of generous justice toward the people of Porto Rico by giving them the ample and familiar rights and privileges accorded our own citizens in our own territories, and our obligations toward the people of Hawaii by perfecting the provisions for self-government already granted them, but in the Philippines we must go further. We must hold steadily in view their ultimate independence, and we must move toward the time of that independence as steadily as the way can be cleared and the foundations thoughtfully and permanently laid."

He recommended a full territorial form of government for Alaska, and the construction of a system of railways which the government should build and administer, controlling ports and terminals. He declared that a policy for exploiting the mineral resources of Alaska must be worked out on lines of practical expediency. He urged the enactment of a fair and effective employers' liability act.

On December 3 the House passed the Hay volunteer army bill providing for the raising of a volunteer army at the time of actual or threatened war to number 242,000 men, exclusive of militia or regulars. On December 6 the Senate passed the Hetch-Hetchy bill by a vote of 43 to 25. It had already passed the House. The House on December 8, by a vote of 317 to 11, passed the so-called Henley resolution approving the proposal of Winston Churchill, first lord of the admiralty of Great Britain, that the powers abstain from naval construction for a year. Hearings were held in the Senate over the admission of Blair Lee who had been senator from Maryland, and Frank P. Glass, who had been appointed senator from Alabama to succeed Senator Johnston.

FOREIGN RELATIONS

The year 1913 was a troubled one for American diplomacy. The new administration was obliged to meet and cope with the situation in Mexico left as a legacy from the previous administration, and had in addition a delicate problem which arose from the passage by the California legislature of laws forbidding the owning of land in that State by aliens. This was objected to by the Japanese government on the grounds that it formed a breach of treaty obligations. The relations of the United States with Mexico will be found treated in detail in the article MEXICO. The alien land law situation is treated under CALIFORNIA and some comments on the international side are included in the latter part of this section.

President Wilson early in his administration issued a statement outlining the attitude of the

administration toward political conditions in Latin America. This statement, made public on March 11, was as follows:

"One of the chief objects of my administration will be to cultivate the friendship and deserve the confidence of our sister republics of Central and South America and to promote in every proper and honorable way the interests which are common to the peoples of the two continents.

"I earnestly desire the most cordial understanding and coöperation between the peoples and leaders of America and therefore deem it my duty to make this brief statement.

"Coöperation is possible only when supported at every turn by the orderly processes of just government based upon law, not upon arbitrary or irregular force. We hold, as I am sure all thoughtful leaders of republican government hold, that just government rests always upon the consent of the governed and that there can be no freedom without order based upon law and upon the public conscience and approval. We shall look to make these principles the basis of mutual intercourse, respect, and helpfulness between our sister republics and ourselves.

"We shall lend our influence of every kind to the realization of these principles in fact and practice, knowing that disorder, personal intrigue, and defiance of constitutional rights weaken and discredit government and injure none so much as the people who are unfortunate enough to have their common life and their common affairs so tainted and disturbed. We can have no sympathy with those who seek to seize the power of government to advance their own personal interests or ambition.

"We are the friends of peace, but we know that there can be no lasting or stable peace in such circumstances. As friends, therefore, we shall prefer those who act in the interests of peace and honor, who protect private rights, and respect the restraints of constitutional provisions. Mutual respect seems to us the indispensable foundation of friendship between states, as between individuals.

"The United States has nothing to seek in Central and South America except the lasting interests of the peoples of the two continents, the security of governments intended for the people and for no special group or interest, and the development of personal and trade relationships between the two continents which shall redound to the profit and advantage of both, and interferes with the rights and liberties of neither.

"From these principles may be read so much of the future policy of this government as it is necessary now to forecast, and in the spirit of these principles I may, I hope, be permitted with as much confidence as earnestness to extend to the governments of all the republics of America the hand of genuine disinterested friendship and to pledge my own honor and the honor of my colleagues to every enterprise of peace and amity that a fortunate future may disclose."

This statement of President Wilson as to the attitude of the United States and of his administration toward the other nations of the American continents, resulting in a measure from conditions in Mexico, Cuba, and Nicaragua, was received favorably both in the

United States and in the countries most intimately concerned. It was issued at a time when a word of warning and advice was most timely. It was known that revolutionary plots were fermenting in Central America in two or three of the small republics. While there was nothing in the President's statement that could be construed as a threat, the disposition of the government to discourage revolution and disorder was apparent.

Cuba. The influence that the United States had upon the powers of Cuba was shown by the history of the so-called amnesty bill which was passed by the Cuban Congress and was said to have been signed by President Gomez shortly before he relinquished his office to his successor, President Menocal. It was charged that this bill was intended to embarrass Mr. Menocal by protecting those who had been accused of robbing the treasury during the Gomez administration. The amnesty granted was very wide and loose in its terms. While it was intended chiefly to apply to those who were engaged in recent uprisings, it would have had the effect of setting free many hundreds of criminals convicted of ordinary offenses. One reason for granting an amnesty to such persons was said to have been that there was no money with which to buy food for the prisoners and that the release of a thousand or more of them was absolutely necessary. One of the first official acts of Secretary Bryan was to protest against this bill in vigorous terms. This protest was made on the ground that the United States government is responsible for the financial stability of Cuba, and that the government could not pass by with indifference an attack on the incoming administration which included pardon of looters of the Cuban treasury. The pardon of such criminals, Mr. Bryan said, would invite future depredations. As a result of this remonstrance, President Gomez expressed his willingness to take up the matter anew and to ask the Cuban Congress to pass a new bill which would be free from the objections brought against the original bill by the United States government. Such a bill was signed by President Gomez on April 28. A special mission was sent by the United States government to attend the inauguration of President Menocal on May 18.

Nicaragua. In the closing days of Mr. Taft's administration the State Department negotiated with Nicaragua a treaty, which gave the United States exclusive inter-oceanic rights on the Nicaragua canal route, a naval station on the Gulf of Fonseca, and several small islands for \$3,000,000. This agreement was so expanded by President Wilson and Mr. Bryan that it virtually provided for a protectorate over Nicaragua. To the original treaty was added in substance the clauses of the Platt amendment relating to Cuba. One of these clauses forbade Nicaragua to make with any foreign power any compact that would impair her independence, or permit any foreign power to obtain by colonization or for military or naval purposes, control over any part of her territory. Another clause restricted Nicaragua from contracting public debts. In a third, Nicaragua consented to the intervention of the United States for the preservation of her independence in the maintenance of good government. In return the United States guaranteed

Nicaragua's public debt. This treaty met with opposition in the Senate committee on foreign relations. It was opposed also by governors of several Central American countries. Honduras and Salvador refused to consider the formulation of similar treaties. On August 2 the treaty as proposed by the administration was rejected by the Senate committee on account of the feature providing for a practical protectorate. Mr. Bryan thereupon declared that he would not resubmit the treaty until the winter of 1914. President Wilson early in December made it known that he wished the terms of the Nicaraguan treaty extended to all Central American republics. On December 15 a protest against the Nicaragua treaty was sent to Congress by the Salvadorean committee of the National Central American Association.

Santo Domingo. A reported revolution in this country caused the United States government to send a cruiser for the protection of American citizens early in September. At the suggestion of the American minister, negotiations for a settlement of the difficulties were begun in the latter part of February. The minister set forth to General Vasquez, the provisional president of the revolutionists, and his associates, the policy of the United States government in regard to such revolutions. This was in substance that the United States would support the constitutional authorities and would not recognize any government established by force. The revolutionists were told that if they should be successful they could have no part in the customs revenue, which for some years has been collected under the supervision of an American officer. Of the present revenue the government of Santo Domingo receives about half, and the remainder is deposited for payment of the foreign debt of the country. As a result of these representations, the threatened outbreak was averted, and commissioners of the Dominican government and representatives of the United States government signed an agreement of peace in Washington on October 9. The Dominican commissioners were accompanied by the American minister and the American collector of customs. In addition the United States government also undertook to see that a fair election was held in December, and in accordance with this promise a number of American officials were sent to Santo Domingo to inspect the elections held on December 16. They reported that a fair election had been held.

Colombia. The relations with Colombia, which have been unsatisfactory since the events connected with the independence of Panama and the cession by that country to the United States of rights of the Panama Canal, continued unsettled during 1913. Proposals were made by the United States government for settlement of the disputed questions during the last months of President Taft's administration. These, however, were rejected by the Panama government and no further overtures were made by the Republican administration. Rejection of these proposals was supposed to be based on the hope of greater concessions from the Democratic administration. President Restrepo, in a message to the Colombian Congress on July 22, spoke of the desirability of an understanding with the United States, and expressed the hope that satisfactory terms for settlement

would be presented to Congress. Statements in regard to the rejection of the Herran-Hay treaty by the Colombian Congress were made in July and August by the minister from Colombia and others. It was claimed that the rejection of the treaty was due to the desire to preserve national honor, and that it had no connection with the hope for greater concessions in the United States. Rumors that a canal to rival the Panama Canal might be built with English capital found their way into the public press late in September. There was no definite proof that such an undertaking was seriously considered. The Colombian Senate adopted a resolution of protest against the observance of the tenth anniversary of the separation of Panama from Colombia November 6, and on November 28 the Colombian Congress protested to Cuba against the "plunder of Panama" by President Roosevelt. No definite action had been taken to bring an end to these disagreements at the end of the year. (See *COLOMBIA, History.*)

Other Latin-American Countries. Relations with other Latin-American countries were friendly during 1913. Dr. Lauro S. Muller visited the United States during May to repay officially the visit of Elihu Root to Brazil in 1911. Arbitration treaties were concluded with several South and Central American countries, including Honduras, Salvador, Guatemala, Panama, and Uruguay. (See *ARBITRATION, INTERNATIONAL.*)

Canada. The relations between Canada and the United States during the year were friendly. In December, President Wilson appointed Dr. Hugh M. Smith to arrange an agreement regarding regulations governing inland fisheries.

Great Britain. Diplomatic relations with Great Britain in 1913 were chiefly related to affairs in Mexico. These were delicate and complicated, but friendly understanding between the two countries remained unchanged during the year. (For an account of episodes connected with this situation see *MEXICO.*) It was announced in October that British warships would be sent to celebrate the opening of the Panama Canal. The decision of the British government that it would not take official part in the Panama Pacific Exposition was deeply regretted, but the hope was cherished that this decision would be reconsidered. (See *EXPOSITIONS.*) For notes on the renewal of the arbitration treaty between Great Britain and the United States, see *ARBITRATION, INTERNATIONAL.*

Russia. The commercial treaty between the United States and Russia, which was abrogated by the United States in 1911, lapsed on January 1, 1913. A *modus vivendi*, under which American consuls can act, was arranged between the two countries. No attempt was made to negotiate a new treaty during the year. A report that Russia had declined to make a new treaty was denied by Secretary Bryan. It was announced in October that the Russian government would send naval officers to celebrate the opening of the Panama Canal. For comment on the ritual murder trial and the relation of the United States to this, see *JUDAISM.*

Other European Countries. There were no matters of great importance in the relations of the United States with other European countries. There was some criticism of the administration of the tariff law in Germany,

France, and elsewhere. For the consideration of such matters, see the article **TARIFF**.

Japan. The passage of the anti-alien land ownership law by the California legislature is followed in detail in the article **CALIFORNIA**. Here only the international aspect of the case is in question. On April 4 the Japanese ambassador, Viscount Chinda, made an informal protest to Secretary Bryan against the proposed legislation on the ground that it violated treaty rights of Japan, and on April 12 the formal protest of the Japanese government was handed to the Secretary of State. In the days following the Japanese ambassador conferred with Secretary Bryan and expressed himself as pleased by the action taken by the administration to eliminate the objectionable phrasing of the bill. After the passage of the bill it was announced that Japan would seek redress either in the courts or by arbitration. The reply of the United States government to the Japanese protest was made on May 19. These communications were not made public, so that only inferences could be drawn as to their contents. It was reported, however, that the Japanese government was discontented with the reply of the United States. Counter-response to the United States' answer was handed to the Department of State on June 4, and two days later Viscount Chinda discussed the situation with President Wilson. A further argument against the bill was cabled to the Japanese embassy on July 1, and the contents of this were presented to Secretary Bryan as a supplementary note on the following day. Mr. Bryan conferred with Viscount Chinda several days later, and on July 16 a reply to this note was given him by Mr. Bryan. These communications were not made public, but, as report had it, they were not satisfactory to the Japanese government. A fourth note, said to be couched in a more friendly tone, was received by the State Department on August 26. It was said that an agreement was arrived at by which the anti-alien law might be tested in the courts. On September 30 a fifth note was sent to Washington, and in this situation negotiations remained at the end of the year. The arbitration treaty with Japan expired in 1913, and although a new treaty was signed by Secretary Bryan and the Japanese ambassador, it had not been ratified by the Senate at the end of the year.

China. On May 2, on the complete organization of the Chinese Parliament, the United States formally recognized the republic of China. The instructions of the State Department were carried out by Edward T. Williams, secretary of the American legation at Peking, temporarily in charge of American diplomatic affairs. The action of President Wilson in removing the governmental authority of the United States from the so-called six-power loan for the construction of railways in China is noted in the section **Administration**.

ELECTIONS OF NOVEMBER, 1913

The elections of November, 1913, were almost entirely limited to municipal officers. There were elections for governor in three States only—Massachusetts, New Jersey, and Virginia. There was an election for United States senator in Maryland, and four representatives were chosen to fill vacancies caused by death and resignation.

The more detailed accounts of the election in the various States will be found in the political notes in the articles on these States. This paragraph is intended to be only a general summing up of the leading results. In Massachusetts there were four candidates for governor. Governor Foss, who had been elected as a Democrat, decided to run independently on the ground of his decided opposition to the new tariff, and to the general policies of the administration. The Democratic candidate was Lieutenant-Governor Walsh, who was nominated as a strong supporter of President Wilson's administration. The Republican candidate, Congressman Augustus P. Gardner, represented direct and marked opposition to the party in power at Washington. The fourth and Progressive candidate was Charles S. Bird. Lieutenant-Governor David I. Walsh was elected, receiving 180,460 votes to 126,700 cast for Mr. Bird, 116,300 for Mr. Gardner, and 20,900 for Mr. Foss.

In New Jersey the Republican candidate was Edward C. Stokes. Governor James F. Fielder, who became governor on the resignation of Woodrow Wilson in 1912, was Democratic candidate. Everett Colby, who for many years has been an aggressive champion of reform measures in New Jersey, was Progressive candidate. Governor Fielder was elected with 173,148 votes, against 140,298 for Mr. Stokes and 41,132 for Mr. Colby.

The election in Maryland, which resulted in the popular choice of Blair Lee as United States senator, derived national interest from the fact that Mr. Lee is a Democrat of the progressive type, and made his canvass without the support of the organization of the Maryland Democracy. His Republican opponent was Thomas Parran. Mr. Lee was elected by a vote of 112,000, compared to 71,000 for Mr. Parran. This was the first popular election held under the provision of the Seventeenth Amendment, providing for direct election of senators. There was a Progressive candidate in the field, George Wellington, but he made little active canvass.

Perhaps the most significant election of all was that held in New York City, where John Purroy Mitchel, a fusion candidate, was elected mayor by a vote of approximately 356,000, against 235,000 for Edward E. McCall, who was the candidate for the Democratic party, represented and controlled by Tammany Hall. Mr. Mitchel's vote was nearly 50 per cent. greater than that of Mr. McCall's. Mr. Mitchel was at the head of the non-partisan citizens' ticket, which had been made by a large committee and subsequently ratified and accepted by the Republican party, Progressive party, and several groups of Independents, Democrats, and other elements. In addition to Mr. Mitchel, the fusion candidates for other important offices were elected. These included William A. Prendergast, comptroller; George A. McAneny, president of the board of aldermen; Marcus M. Marks, president of the Borough of Manhattan. These, with the presidents of other boroughs, make up the board of estimate and apportionment, which is the chief legislative body of the city government. The president of the Borough of Queens was the only Democratic candidate elected, and he will be the only representative of the Democratic party in the board. The election of Mr. Mitchel was due to a large extent to the break between Tammany Hall and

Governor Sulzer, an account of which will be found in detail in the political section of the article *NEW YORK*.

Other important municipal elections attracted considerable attention. In Philadelphia members of the Select and Common councils were elected. There was no election for mayor, as Mr. Blankenburg's term had not expired. The fusionists were unsuccessful in this election, as the old Republican machine came again into power with the election of a majority of Republican members of these councils. In Pittsburgh the Republicans supported James G. Armstrong, who was elected against the candidate supported by Independents and Progressives. Newton D. Baker was reelected mayor in Cleveland, and George J. Karb, Democrat, was reelected in Columbus. In Cincinnati the Republican organization succeeded in defeating Mayor Hunt, who was supported by Democrats and non-partisan municipal reformers. His successful opponent was Frederick S. Spiegel. The Socialist mayor of Schenectady, N. Y., George R. Lunn, was defeated, although he had a larger vote than in 1911. (See *SOCIALISM*.) Opposed to him was a fusion of Republicans, Democrats, and Progressives. In Indianapolis the Democratic candidate, Joseph E. Bell, was elected, and Louisville and Buffalo also elected Democratic mayors. In Toledo Brand Whitlock, who had been several times elected mayor on a reform platform, did not stand for reelection, and Charles H. Keller, Republican, was elected. Representatives in Congress elected were as follows: Calvin D. Paige, Republican, third Massachusetts district; George W. Loft, Democratic, thirteenth New York district; Jacob A. Canton, Democratic, twentieth New York district; and Charles P. Coady, Democratic, third Maryland district.

In general, supporters of all parties were able to derive some satisfaction from the result of the elections, and it was generally conceded that President Wilson had great reason for being gratified with the results in different States. While the Democrats were defeated in New York City, it is well known that President Wilson was in favor of the election of Mr. Mitchel, whom he had several months before appointed as collector of the port of New York. The Democrats were successful in the three State elections held, and the result in New Jersey was particularly gratifying to the President, as it indicated a support of the policies which he had inaugurated while he was governor of the State, and which had been supported by Mr. Fletcher during his incumbency of the office.

DEPARTMENT OFFICERS IN 1913

Below will be found a list of the heads of various bureaus and divisions of the administrative departments.

Department of State. Secretary of State, William Jennings Bryan; Counselor for the Department of State, John Bassett Moore; Solicitor, Joseph W. Folk; Assistant Secretary, John E. Osborne; Second Assistant Secretary, Alvey A. Adee; Chief of the Consular Service, Herbert C. Hengstler; Chief of the Diplomatic Service, Sydney I. Smith; Chief of the Division of Far Eastern Affairs, Ransford S. Miller; Chief of the Division of Latin-American Affairs,

Boaz W. Long; Chief of the Division of Near Eastern Affairs, Albert H. Putney.

Department of the Treasury. Secretary of the Treasury, William Gibbs McAdoo; Assistant Secretaries, Charles S. Hamlin, Byron R. Newton; Chief of the Secret-Service Division, William J. Flynn; General Superintendent of the Life-Saving Service, S. I. Kimball; Register of the Treasury, Gabe E. Parker; Treasurer of the United States, John Burke; Commissioner of Internal Revenue, William H. Osborn; Director of the Mint, George E. Roberts; Surgeon-General of the Bureau of Public Health, Rupert Blue; Commandant of the Revenue-Cutter Service, Captain Ellsworth P. Bertholf.

Department of War. Secretary of War, Lindley M. Garrison; Assistant Secretary of War, Henry S. Breckinridge; Chief of Staff, Major-General Leonard Wood; Chief of the Coast Artillery Division, Brigadier-General Erasmus M. Weaver; Chief of the Division of Militia Affairs, Brigadier-General Albert L. Mills; Adjutant-General, Brigadier-General George Andrews; Inspector-General, E. A. Garlington; Judge Advocate-General, Brigadier-General Enoch H. Crowder; Chief of the Quartermaster Corps, Major-General James B. Aleshire; Surgeon-General, Brigadier-General George H. Torney; Chief of Engineers, Brigadier-General Dan C. Kingman; Chief of Ordnance, Brigadier-General William Crozier; Chief Signal Officer, Brigadier-General George P. Scriven; Chief of the Bureau of Insular Affairs, Brigadier-General Frank McIntyre; Chief of the Board of Engineers for Rivers and Harbors, Colonel William M. Black.

Department of Justice. Attorney-General, James Clark McReynolds; Solicitor-General, John William Davies; Assistant Attorneys-General, Winfred T. Denison, Ernest Knaebel, Jesse C. Adkins, Samuel Huston Thompson, Jr., Samuel J. Graham, William Wallace, Jr.; Chief of the Division of Investigation, A. Bruce Bielaski.

Post Office Department. Postmaster-General, Albert Sidney Burleson; Chief Clerk, Merritt O. Chance; First Assistant Postmaster-General, Daniel C. Roper; Second Assistant Postmaster-General, Joseph Stewart; Third Assistant Postmaster-General, Alexander M. Dockery; Fourth Assistant Postmaster-General, James I. Blaklee.

Department of the Navy. Secretary of the Navy, Josephus Daniels; Assistant Secretary, Franklin D. Roosevelt; Admiral of the Navy, George Dewey; Chief of the Bureau of Investigation, Rear-Admiral Victor Blue; Chief of the Bureau of Yards and Docks, Civil Engineer H. R. Stanford; Chief of the Bureau of Ordnance, Rear-Admiral Joseph Strauss; Chief of the Bureau of Construction and Repair, Chief Constructor Richard Morgan Watt; Chief of the Bureau of Steam Engineering, Robert S. Griffin; Chief of the Bureau of Supplies and Accounts, Paymaster-General James J. Cowie; Chief of the Bureau of Medicine and Surgery, Surgeon-General C. F. Stokes; Judge Advocate-General, Captain Ridley McLean; Solicitor, Graham Egerton; General Board, President, Admiral George Dewey; Rear-Admirals C. E. Vreeland, W. H. H. Southerland, A. M. Knight, and B. A. Fiske; Captains, A. G. Winterhalter, T. S. Rodgers, H. S. Knapp, John Hood, and W. R.

Shoemaker; President of the Naval Examining Board, Rear-Admiral Thomas B. Howard.

Department of the Interior. Secretary of the Interior, Franklin Knight Lane; First Assistant Secretary, A. A. Jones; Commissioner of the General Land Office, Clay Tallman; Commissioner of Patents, Thomas Ewing; Commissioner of Pensions, Gaylord M. Saltzgaber; Commissioner of Indian Affairs, Cato Sells; Commissioner of Education, Philander P. Claxton; Director of the Geological Survey, George Otis Smith; Director of the Reclamation Service, Frederick H. Newell; Director of the Bureau of Mines, J. A. Holmes.

Department of Agriculture. Secretary of Agriculture, David Franklin Houston; Chief of the Weather Bureau, Charles F. Marvin; Chief of the Bureau of Animal Industry, A. D. Melvin; Chief of the Bureau of Plant Industry, William A. Taylor; Forester and Chief of the Forest Service, Henry S. Graves; Chief of the Bureau of Chemistry, Carl L. Alsberg; Chief of the Bureau of Soils, Milton Whitney; Chief of the Bureau of Entomology, L. O. Howard; Chief of the Bureau of Biological Survey, H. W. Henshaw; Chief of the Division of Publications, Joseph A. Arnold; Chief of the Bureau of Statistics, Leon M. Estabrook; Director of Public Roads, Logan Waller Page.

Department of Commerce. Secretary of Commerce, William Cox Redfield; Director of the Bureau of the Census, William J. Harris; Director of the Bureau of Corporations, Joseph E. Davies; Chief of the Bureau of Foreign and Domestic Commerce, Albertus H. Baldwin; Director of the Bureau of Standards, S. W. Stratton; Commissioner of the Bureau of Fisheries, Hugh M. Smith; Commissioner of the Bureau of Lighthouses, George R. Putnam; Superintendent of the Coast and Geodetic Survey, Otto H. Tittmann; Commissioner of the Bureau of Navigation, Eugene Tyler Chamberlain; Inspector-General of the Steamboat-Inspection Service, George Uhler.

Department of Labor. Secretary of Labor, William Bauchop Wilson; Commissioner-General of Immigration, Anthony Caminetti; Commissioner of Naturalization, Richard K. Campbell; Commissioner of Labor Statistics, Royal S. Meeker; Chief of the Children's Bureau, Julia C. Lathrop.

Other officers not connected with any particular department include the following: Director of the Pan-American Union, John Barrett; International Waterways Commission, Brig.-Gen. O. H. Ernst, George Clinton, and Prof. E. E. Haskell; International Joint Commission, Hon. James A. Tawney, Hon. George Turner, Hon. Obediah Gardner; Interstate Commerce Commission, Chairman, Edgar E. Clark; Commissioners, Judson C. Clements, Charles A. Prouty, James S. Harlan, Charles C. McChord; Civil Service Commission, John A. McIlhenny, Charles M. Galloway, Herman W. Craven.

REPRESENTATION IN THE SIXTY-THIRD CONGRESS

Following is a list of the senators and representatives from the different States in the Sixty-third Congress. There was one vacancy in the Senate at the beginning of the regular session, resulting from the death of Senator Johnston of Alabama. The vacancy had not been filled at the end of the year. From the table at the end of this list it will be noted that the total membership of the Senate at the

end of the year was 95, of whom 51 were Democrats, 43 Republicans, and 1 Progressive. The Progressive was Senator Poindexter of Washington. In the House, with a membership when full of 435, there was one vacancy. The political division in the House was as follows: Democrats, 290; Republicans, 123; Progressive Republicans, 5; Progressives, 15; Independent, 1.

The names of Democrats are in Roman type; of Republicans in italics; of Progressive Republicans in italics with *; of Progressives in small capitals; of Independents in capitals.

ALABAMA.—SENATORS: 1919, John H. Bankhead. REPRESENTATIVES (Democrats 10): At large, John W. Abercrombie; George W. Taylor, S. Hubert Dent, Jr., Henry D. Clayton, Fred L. Blackmon, J. Thomas Heflin, Richmond P. Hobson, John L. Burnett, William Richardson, Oscar W. Underwood.

ARIZONA.—SENATORS: 1917, Henry F. Ashurst; 1915, Marcus A. Smith. REPRESENTATIVE (Democrat 1): At large, Carl Hayden.

ARKANSAS.—SENATORS: 1915, James P. Clarke; 1919, Joe T. Robinson. REPRESENTATIVES (Democrats 7): Thaddeus H. Caraway, William A. Oldfield, John C. Floyd, Otis Wingo, H. M. Jacoway, Samuel M. Taylor, William S. Goodwin.

CALIFORNIA.—SENATORS: 1915, George C. Perkins; 1917, John D. Works. REPRESENTATIVES (Democrats 3, Republicans 4, Progressive Republicans 3, Independent 1): WILLIAM KENT, John E. Raker, Charles F. Curry, Julius Kahn, John I. Nolan,* Joseph R. Knowland, Denver S. Church, Everis A. Hayes, Charles W. Bell,* William D. Stephens,* William Kettner.

COLORADO.—SENATORS: 1915, Charles S. Thomas; 1919, John F. Shafroth. REPRESENTATIVES (Democrats 4): At large, Edward T. Taylor, Edward Keating; George J. Kindel, H. H. Seldomridge.

CONNECTICUT.—SENATORS: 1915, Frank B. Brandegee; 1917, George P. McLean. REPRESENTATIVES (Democrats 5): Augustine Lonergan, Bryan F. Mahan, Thomas L. Reilly, Jeremiah Donovan, William Kennedy.

DELAWARE.—SENATORS: 1917, Henry A. du Pont; 1919, Willard Saulsbury. REPRESENTATIVE (Democrat 1): At large, Franklin Brockson.

FLORIDA.—SENATORS: 1915, Duncan U. Fletcher; 1917, Nathan P. Bryan. REPRESENTATIVES (Democrats 4): At large, Claude L'Engle; Stephen M. Sparkman, Frank Clark, Emmett Wilson.

GEORGIA.—SENATORS: 1919, Augustus O. Bacon; 1915, Hoke Smith. REPRESENTATIVES (Democrats 12): Charles G. Edwards, Frank Park, Charles R. Crisp, William C. Adamson, William S. Howard, Charles L. Bartlett, Gordon Lee, Samuel J. Tribble, Thomas M. Bell, Thomas W. Hardwick, J. Randall Walker, Dudley M. Hughes.

IDAHO.—SENATORS: 1919, William E. Borah; 1915, James H. Brady. REPRESENTATIVES (Republicans 2): At large, Burton L. French, Addison T. Smith.

ILLINOIS.—SENATORS: 1919, J. Hamilton Lewis; 1915, Lawrence Y. Sherman. REPRESENTATIVES (Democrats 20, Republicans 4, Progressive Republican 1, Progressives 2): At large, Lawrence B. Stringer, William E. Williams; Martin B. Madden, James R. Mann, George E. Gorman, James T. McDermott, Adolph J. Sabath, James McAndrews, Frank Buchanan, Thomas Gallagher, Fred A. Britten, Chas. M. Thomson, Ira C. Copley,* Wm. H. HINEBAUGH, John C. McKenzie, Clyde H. Tavenner, Stephen A. Hoxworth, Claudius U. Stone, Louis FitzHenry, Frank T. O'Hair, Charles M. Borchers, Henry T. Rainey, James M. Graham, William N. Baltz, Martin D. Foster, H. Robert Fowler, Robert P. Hill.

INDIANA.—SENATORS: 1915, Benjamin F. Shively; 1917, John W. Kern. REPRESENTATIVES (Democrats 13): Charles Lieb, William A. Cullon, William E. Cox, Lincoln Dixon, Ralph W. Moss, Finly H. Gray, Charles A. Korbly, John A. M. Adair, Martin A. Morrison, John B. Peterson, George W. Rauch, Cyrus Cline, Henry A. Barnhart.

IOWA.—SENATORS: 1915, Albert B. Cummins; 1919, William S. Kenyon. REPRESENTATIVES (Democrats 3, Republicans 8): Charles A. Kennedy, I. S. Pepper, Maurice Connolly, Gilbert N. Haugen, James W. Good, Sanford Kirkpatrick, S. F. Prouty, Horace M. Towner, William R. Green, Frank P. Woods, George C. Scott.

KANSAS.—SENATORS: 1915, Joseph L. Bristow; 1919, William H. Thompson. REPRESENTATIVES (Democrats 5, Republicans 2, Progressive 1): Daniel R.

Anthony, Jr., Joseph Taggart, Philip P. Campbell, Dudley Doolittle, Guy T. Helvering, John R. Connelly, George A. Neely, Victor Murdock.

KENTUCKY.—SENATORS: 1915, *William O. Bradley*; 1919, *Ollie M. James*. REPRESENTATIVES (Democrats 9, Republicans 2): *Alben W. Barkley, Augustus O. Stanley, Robert Y. Thomas, Jr., Ben Johnson, Swagar Sherley, Arthur B. Rouse, J. Campbell Cantrell, Harvey Helm, W. J. Fields, John W. Langley, Caleb Powers.*

LOUISIANA.—SENATORS: 1915, *John R. Thornton*; 1919, *Joseph E. Ransdell*. REPRESENTATIVES (Democrats 8): *Albert Estopinal, H. Garland Dupré, Robert F. Broussard, John T. Watkins, Walter Elder, Lewis L. Morgan, Ladislas Lazaro, James B. Aswell.*

MAINE.—SENATORS: 1917, *Charles F. Johnson*; 1919, *Edwin C. Burleigh*. REPRESENTATIVES (Democrat 1, Republicans 3): *Asher C. Hinds, Daniel J. McGillicuddy, John A. Peters, Frank E. Guernsey.*

MARYLAND.—SENATORS: 1915, *John Walter Smith*; 1919, *Blair Lee*. REPRESENTATIVES (Democrats 6): *J. Harry Covington, J. Fred C. Talbot, Charles P. Coady, J. Charles Linthicum, Frank O. Smith, David J. Lewis.*

MASSACHUSETTS.—SENATORS: 1917, *Henry Cabot Lodge*; 1919, *John W. Weeks*. REPRESENTATIVES (Democrats 8, Republicans 8): *Allen T. Treadway, Frederick H. Gillett, Calvin D. Paige, Samuel E. Winslow, John J. Rogers, Augustus P. Gardner, M. F. Phelan, Frederick S. Deitrick, Ernest W. Roberts, William F. Murray, Andrew J. Peters, James M. Curley, John J. Mitchell, Edward Gilmore, William S. Greene, Thomas C. Thacher.*

MICHIGAN.—SENATORS: 1919, *William Alden Smith*; 1917, *Charles E. Townsend*. REPRESENTATIVES (Democrats 2, Republicans 9, Progressives 2): *At large, Patrick H. Kelley; Frank E. Doremus, Samuel W. Beakes, J. M. C. Smith, Edward L. Hamilton, Carl E. Mapes, Samuel W. Smith, Louis C. Cramton, Joseph W. Fordney, James C. McLaughlin, Roy O. Woodruff, Francis O. Lindquist, William J. MacDonald.*

MINNESOTA.—SENATORS: 1919, *Knute Nelson*; 1917, *Moses E. Clapp*. REPRESENTATIVES (Democrat 1, Republicans 9): *At large, James Manahan; Sydney Anderson, Winfield S. Hammond, Charles R. Davis, Frederick C. Stevens, George R. Smith, Charles A. Lindbergh, Andrew J. Volstead, Clarence B. Miller, Halvor Steenerson.*

MISSISSIPPI.—SENATORS: 1917, *John Sharp Williams*; 1919, *James K. Vardaman*. REPRESENTATIVES (Democrats 8): *Ezekiel S. Candler, Jr., Hubert D. Stephens, Benj. G. Humphreys, Thomas U. Sisson, S. A. Witherspoon, B. P. Harrison, Percy E. Quin, James W. Collier.*

MISSOURI.—SENATORS: 1915, *William J. Stone*; 1917, *James A. Reed*. REPRESENTATIVES (Democrats 14, Republicans 2): *James T. Lloyd, William W. Rucker, Joshua W. Alexander, Charles F. Booher, William P. Borland, Clement C. Dickinson, Courtney W. Hamlin, Dorsey W. Shackelford, Champ Clark, Richard Bartholdi, William L. Igoe, L. C. Dyer, Walter L. Hensley, Joseph J. Russell, Perl D. Decker, Thomas L. Rubey.*

MONTANA.—SENATORS: 1917, *Henry L. Myers*; 1919, *Thomas J. Walsh*. REPRESENTATIVES (Democrats 2): *At large, John M. Evans, Tom Stout.*

NEBRASKA.—SENATORS: 1917, *Gilbert M. Hitchcock*; 1919, *George W. Norris*. REPRESENTATIVES (Democrats 3, Republicans 3): *John A. Maguire, C. O. Lobeck, Dan V. Stephens, Charles H. Sloan, Silas R. Barton, Moses P. Kinkaid.*

NEVADA.—SENATORS: 1915, *Francis G. Newlands*; 1917, *Key Pittman*. REPRESENTATIVE (Republican 1): *At large, E. E. Roberts.*

NEW HAMPSHIRE.—SENATORS: 1915, *Jacob H. Gallinger*; 1919, *Henry F. Hollis*. REPRESENTATIVES (Democrats 2): *Eugene E. Reed, Raymond B. Stevens.*

NEW JERSEY.—SENATORS: 1917, *James E. Martine*; 1919, *William Hughes*. REPRESENTATIVES (Democrats 11, Republican 1): *William J. Browning, J. Thompson Baker, Thomas J. Scully, Allan B. Walsh, William E. Tuttle, Jr., Archibald C. Hart, Robert G. Bremner, Eugene F. Kinkead, Walter I. McCov, Edward W. Townsend, John J. Eagan, James A. Hamill.*

NEW MEXICO.—SENATORS: 1917, *Thomas B. Catron*; 1919, *Albert B. Fall*. REPRESENTATIVE (Democrat 1): *At large, H. B. Fergusson.*

NEW YORK.—SENATORS: 1915, *Elihu Root*; 1917, *James A. O'Gorman*. REPRESENTATIVES (Democrats 31, Republicans 11, Progressive 1): *Lathrop Brown, Denis O'Leary, Frank E. Wilson, Harry H. Dale, James P. Maher, William M. Calder, John J. Fitzgerald, Daniel J. Griffin, James H. O'Brien, Herman A. Metz, Daniel I. Riordan, Henry M. Goldfoele, George W. Loft, Jefferson M. Levv, Michael F. Conrv, Peter J. Dooling, John F. Carew, Thomas G. Patten, Walter M. Chandler, Jacob A. Cantor, Henry George, Jr., Henry Bruck-*

ner, Joseph A. Goulden, Woodson R. Oglesby, Benjamin I. Taylor, Edmund Platt, George McClellan, Peter G. Ten Eyck, James S. Parker, Samuel Wallin, E. A. Merritt, Jr., Luther W. Mott, Charles A. Talcott, George W. Fairchild, John R. Clancy, Serena E. Payne, Edwin S. Underhill, Thomas B. Dunn, Henry G. Danforth, Robert H. Gittins, Charles B. Smith, Daniel A. Driscoll, Charles M. Hamilton.

NORTH CAROLINA.—SENATORS: 1919, *F. M. Simmons*; 1915, *Lee S. Overman*. REPRESENTATIVES (Democrats 10): *John H. Small, Claude Kitchin, John M. Faison, Edward W. Pou, Charles M. Stedman, Hannibal L. Godwin, Robert N. Page, Robert L. Doughton, Edwin Y. Webb, James M. Gudger, Jr.*

NORTH DAKOTA.—SENATORS: 1917, *Porter J. McCumber*; 1915, *Asle J. Gronna*. REPRESENTATIVES (Republicans 3): *Henry T. Helgesen, George M. Young, Patrick D. Norton.*

OHIO.—SENATORS: 1915, *Theodore E. Burton*; 1917, *Atlee Pomerene*. REPRESENTATIVES (Democrats 19, Republicans 3): *At large, Robert Crosser; Stanley E. Bowdle, Alfred G. Allen, Warren Gard, J. H. Goeke, Timothy T. Ansberry, Simeon D. Fess, James D. Post, Frank B. Willis, Isaac R. Sherwood, Robert M. Switzer, Horatio C. Claypool, Clement Brumbaugh, John A. Key, William G. Sharp, George White, W. B. Francis, William A. Ashbrook, John J. Whitacre, E. R. Bathrick, William Gordon, Robert J. Bulkley.*

OKLAHOMA.—SENATORS: 1915, *Thomas P. Gore*; 1919, *Robert L. Owen*. REPRESENTATIVES (Democrats 6, Republicans 2): *At large, William H. Murray, Joseph B. Thompson, Claude Weaver; Bird McGuire, Dick T. Morgan, James S. Davenport, Charles D. Carter, Scott Ferris.*

OREGON.—SENATORS: 1915, *George E. Chamberlain*; 1919, *Harry Lane*. REPRESENTATIVES (Republicans 2, Progressive Republican 1): *Willis C. Hawley, Nicholas J. Sinnott, A. W. Lafferty.*

PENNSYLVANIA.—SENATORS: 1915, *Boies Penrose*; 1917, *George T. Oliver*. REPRESENTATIVES (Democrats 20, Republicans 18, Progressive Republican 1, Progressives 5): *At large, Fred E. Lewis, John M. Morin, Arthur R. Ruple, Anderson H. Walters; William S. Vore, George S. Graham, J. Hampton Moore, George W. Edmonds, Michael Donohoe, J. Washington Logue, Thomas S. Butler, Robert E. Difenderfer, William W. Griest, John R. Farr, John J. Casey, Robert E. Lee, John H. Rothermel, W. D. B. Ainey, Edgar R. Kiess, John V. Leshner, Frank L. Dershem, Aaron S. Kreider, Warren W. Bailey, Andrew R. Brodbeck, Charles E. Patton, Abraham L. Keister, Wooda N. Carr, Henry W. Temple, Milton W. Shreve, A. Mitchell Palmer, Jonathan N. Langham, Willis J. Hulings, Stephen G. Porter, M. Clyde Kelly, James Francis Burke, Andrew J. Barchfeld.*

RHODE ISLAND.—SENATORS: 1917, *Henry F. Lipitt*; 1919, *LeBaron B. Colt*. REPRESENTATIVES (Democrats 2, Republican 1): *George F. O'Shaunessy, Peter G. Gerry, Ambrose Kennedy.*

SOUTH CAROLINA.—SENATORS: 1919, *Benjamin R. Tillman*; 1915, *Ellison D. Smith*. REPRESENTATIVES (Democrats 7): *Richard S. Whaley, James F. Byrnes, Wyatt Aiken, Joseph T. Johnson, David E. Finley, J. Willard Ragsdale, Asbury F. Lever.*

SOUTH DAKOTA.—SENATORS: 1915, *Coe I. Crawford*; 1919, *Thomas Sterling*. REPRESENTATIVES (Republicans 3): *Charles H. Dillon, Charles H. Burke, Eben W. Martin.*

TENNESSEE.—SENATORS: 1917, *Luke Lea*; 1919, *John K. Shields*. REPRESENTATIVES (Democrats 8, Republicans 2): *Sam R. Sells, Richard W. Austin, John A. Moon, Cordell Hull, William C. Houston, Joseph W. Byrns, Lemuel P. Padgett, Thetus W. Sims, Finis J. Garrett, Kenneth D. McKellar.*

TEXAS.—SENATORS: 1917, *Charles A. Culberson*; 1919, *Morris Sheppard*. REPRESENTATIVES (Democrats 18): *At large, Daniel E. Garrett, Hutton W. Sumners; Horace W. Vaughan, Martin Dies, James Young, Sam Rayburn, Jack Beall, Rufus Hardy, A. W. Gregg, Joe H. Eagle, George F. Burgess, James P. Buchanan, Robert L. Henry, Oscar Callaway, John H. Stephens, James L. Slayden, John N. Garner, William R. Smith.*

UTAH.—SENATORS: 1915, *Reed Smoot*; 1917, *George Sutherland*. REPRESENTATIVES (Republicans 2): *At large, Joseph Howell, Jacob Johnson.*

VERMONT.—SENATORS: 1915, *William P. Dillingham*; 1917, *Carroll S. Page*. REPRESENTATIVES (Republicans 2): *Frank L. Greene, Frank Plumley.*

VIRGINIA.—SENATORS: 1919, *Thomas S. Martin*; 1917, *Claude A. Swanson*. REPRESENTATIVES (Democrats 9, Republican 1): *William A. Jones, E. E. Holland, Andrew J. Montague, Walter A. Watson, Edward W. Saunders, Carter Glass, James Hay, Charles C. Carlin, C. Bascom Slomp, Henry D. Flood.*

WASHINGTON.—SENATORS: 1915, *Wesley L. Jones*; 1917, *Miles Poindexter*. REPRESENTATIVES (Repub-

licans 3, Progressives 2): At large, *JAMES W. BRYAN*, *J. A. FALCONER*; *William E. Humphrey*, *Albert Johnson*, *William L. La Follette*.

WEST VIRGINIA.—SENATORS: 1917, *William E. Chilton*; 1919, *Nathan Goff*. REPRESENTATIVES (Democrats 2, Republicans 4): At large, *Howard Sutherland*; *M. M. Neely*, *William G. Brown, Jr.*, *Samuel B. Avis*, *Hunter H. Moss, Jr.*, *James A. Hughes*.

WISCONSIN.—SENATORS: 1917, *Robert M. La Follette*; 1915, *Isaac Stephenson*. REPRESENTATIVES (Democrats 3, Republicans 8): *Henry A. Cooper*, *Michael E. Burke*, *John M. Nelson*, *William J. Cary*, *William H. Stafford*, *Michael K. Reilly*, *John J. Esch*, *Edward E. Browne*, *Thomas F. Konop*, *James A. Frear*, *Irvine L. Lenroot*.

WYOMING.—SENATORS: 1917, *Clarence D. Clark*; 1919, *Francis E. Warren*. REPRESENTATIVE (Republican 1): At large, *Frank W. Mondell*.

ALASKA.—*JAMES WICKERSHAM*.

HAWAII.—*J. Kalanianaʻole*.

PHILIPPINES.—*Manuel L. Quezon*, *Manuel Earnshaw*.

PORTO RICO.—*Luis Muñoz Rivera*.

UNITED STATES CENSUS. The task of completing the Thirteenth Decennial Census and publishing its results was practically at an end at the close of 1913, and the Census Bureau was then ready to turn its attention to the numerous "intercensal" lines of work. This bureau, since its organization on a permanent basis in 1902, has come to be beyond question the greatest statistical office in the world. The first aim and purpose of the bureau is to issue its report promptly, but it endeavors at the same time to make the statistics more valuable to the general public as well as to experts and specialists. Following is the most important work which the Census Bureau purposes to undertake during the next three or four years. The work is divided into three classes—general reports which are for certain years, annual reports, and a series of special reports for which no specified date is set. The general reports and the years for taking statistics are as follows: Electrical industries, 1912; health, debt, and taxation, 1913; agriculture, 1915; religious bodies, 1916; water transportation, 1916. The following reports are issued annually: Mortality statistics, birth statistics, financial statistics of cities, cotton statistics, and tobacco statistics. Following is a list of special reports to be issued by the bureau: Racial classes of population; population of metropolitan districts; Indian population; negro population; occupations of adults and children; occupations of women; occupations of children; occupations of the foreign-born; unemployment; fecundity of women; general statistics of cities; statistical atlas; plantation work in the Southern States; age of the farmer in relation to tenure and size of farm; stability of farm population; inmates of institutions, including prisoners and juvenile delinquents, paupers in almshouses, the insane and feeble-minded, the blind and deaf. The bureau will also bring out a series of monographs.

The Census Bureau has been criticised because of the delay in the publication of its reports. Those making such criticisms have not always taken into account the fact that, as a rule, each census report represents a compila-

tion of statistics for the entire United States, and that time is required to make an actual canvass of the whole country and to publish the results. For example, in the census of manufactures, uniform reports must be secured from more than 270,000 establishments, and in the census of agriculture from more than 6,000,000 farms. In collecting statistics from manufacturers, farmers, electric light and power plants, electric railways, and other interests, it is necessary to allow a sufficient time to fill out the schedules so as not to interfere with the conduct of private business. In 1913 William J. Harris succeeded E. Dana Durand as director of the census.

INDEBTEDNESS OF THE STATES. A preliminary estimate of the indebtedness of the States of the Union on June 30, 1913, was issued by the Census Bureau. According to these investigations it appears that on June 30, 1913 (or the close of the fiscal year following within the twelve months preceding that date), the total State debt of the 48 States amounted to \$419,157,000. Of this debt about \$19,000,000 represented floating debt and nearly \$400,000,000 represented funded debt. Of the funded debt about \$359,000,000 were represented by bonds and \$41,000,000 were special debt obligations to public trust funds. As an offsetting item against the total debt, the 48 States reported \$77,032,000 in sinking fund assets, leaving the net debt \$342,251,000.

Various practices were found in different States with reference to the assumption of debt by the States, and some difficulty arises when an attempt is made to compare the debt of the different States. The only two States which call for special mention in this connection are Arizona and Massachusetts. In Arizona the State has assumed responsibility for a very large amount of county and municipal debt. It has issued State obligations to cover the same, holding the counties and municipalities responsible in turn. It may be noted, however, that the Arizona debt even under these circumstances amounts to only eight-tenths of one per cent. of the total of the United States. Massachusetts, on the other hand, has assumed liability for debts of metropolitan districts which in most States would probably be classed as local, county, or municipal debt. The total debt, less sinking fund assets, for Massachusetts represents 23.2 per cent. of the debt for all States in the United States. Iowa, Wyoming, and Oregon each have less than one-tenth of one per cent. of the debt of all States, while in the case of Pennsylvania the sinking fund assets exceed the total debt. Vermont, Nebraska, and Kansas each have only one-tenth of one per cent. of the debt of the 48 States; in contrast, New York has 25 per cent. of the total for the 48 States.

A study of the *per capita* debt shows that in Iowa the debt, less sinking fund assets, amounts to only 3 cents *per capita*, and in Oregon 4 cents *per capita*. In Arkansas, Florida, Illinois, Indiana, Iowa, Kansas, Minnesota, Nebraska, New Jersey, Oregon, Pennsylvania, South Dakota, Texas, West Virginia, Wisconsin, and Wyoming the *per capita* debt, less sinking fund assets, is less than \$1.00.

According to the census report of 1903, the indebtedness of the 48 States at that time amounted to \$234,909,000, as compared with

FOUR LEADING MEMBERS OF THE UNITED STATES HOUSE OF REPRESENTATIVES, 1913

\$342,251,000 in 1913. This is an increase in ten years of \$107,342,000, or nearly 50 per cent. in contrast with an increase of slightly more than 20 per cent. in the population of the country. In 1890 the indebtedness of the States and Territories amounted to \$211,210,000, while in 1880 it amounted to \$274,746,000. Thus between 1880 and 1902 the *per capita* indebtedness for the 48 States combined gradually decreased, while during the last ten years there has been a very noticeable increase. In 1880 the *per capita* indebtedness amounted to \$5.48; in 1890 it had been reduced to \$3.37, due to the increase in population and decrease in debt; in 1902 it amounted to \$2.99, due to the rapid increase in population and very slight increase in debt; in 1913 the *per capita* debt had gained an increase to \$3.52, the increase being due to a very rapid increase in debt in contrast with a much slower increase in population.

UNITED STATES DEPARTMENT OF AGRICULTURE. With the change of administration on March 4, 1913, Hon. James Wilson of Iowa retired from the office of Secretary of Agriculture, which he had held for sixteen years, and was succeeded by Dr. David Franklin Houston of Missouri, chancellor of Washington University, St. Louis, and former president of the University of Texas and the Texas Agricultural and Mechanical College. The assistant secretary, Prof. Willet M. Hays, was succeeded by Dr. Beverly T. Galloway, former chief of the Bureau of Plant Industry; Prof. Willis L. Moore, chief of the Weather Bureau, by Prof. Charles F. Marvin; Victor H. Olmstead, chief of the Bureau of Statistics, by Leon M. Estabrook. Dr. William A. Taylor has been made chief of the Bureau of Plant Industry.

The Weather Bureau was somewhat reorganized with a view to having its work wholly in the interests of agriculture, commerce, and navigation. Increased attention was to be given to special crop and flood warnings. The Bureau of Statistics was to confine its work to estimating crop prospects and production and it was proposed to change its name to Bureau of Agricultural Forecasts. Important crop forecasts were to be telegraphed to the central weather station of each State and distributed thence promptly to papers in the State. Soil surveys were to be carried on largely in cooperation with the State agricultural colleges, experiment stations and departments. A decision of the Attorney-General resulted in placing meat and meat products under the pure food law. This necessitated new machinery and some reorganization of the Bureau of Chemistry, together with close cooperation with the Bureau of Animal Industry. The general effect was to give the Federal government control over meat and meat products in interstate commerce and in all stages of transit instead of restricting its jurisdiction to the Federal inspected meat establishments. A closer cooperation with the States in the enforcement of laws for the control of foods and drugs was also being arranged. The Secretary asked Congress for authority to submit a plan for the general reorganization of the department. The plan proposed would largely do away with the bureau organization on the basis of the divisions of agriculture and agricultural science, and divide the department "into five or six groups, such as a research service, a rural organization service, a State

relations service, a weather service, a forest service, and a regulatory service."

The field of the department's operations was extended under the act of March 4, 1913, which gave it authority "to acquire and diffuse among the people of the United States useful information on subjects connected with the marketing and distribution of farm products." An office of markets was established under the direction of Charles J. Brand. This office was to study market conditions, methods of grading, packing, and shipping and the nature of the commercial transactions by means of which farm produce gets from the farm to the consumer. To provide for a broader study of questions relating to cooperation, rural credits, and other matters connected with the organization of rural communities, the department was cooperating with the general education board. A rural organization service with its headquarters at the department was established under the direction of Dr. T. N. Carver, professor of economics in Harvard University.

To make the department's work more helpful to the farm women, Congress was to be asked to give means and authority for extending the nutrition investigations to include studies of clothing and household equipment, and for experiments with labor-saving devices and methods, and for studying more completely the question of practical sanitation and hygienic protection for the farm family.

With a view to making the department's publications more effective means for the dissemination of useful information and securing a more economical expenditure of the limited printing fund, a new system of publications was adopted. This involved the drawing of a sharp line between scientific and popular publications and the abolition of the bureau series. Instead of 40 different series there were established only 4, as follows: (1) Departmental bulletins, containing popular and semi-technical results of investigations; (2) serial publications—the newly established *Journal of Agricultural Research* for original scientific papers and the *Experiment Station Record* for abstracts of the world's literature of agricultural science; (3) *Farmers' Bulletins*, reduced in size and "designed to give directions for doing things"; and (4) annual reports and other congressional publications, including the *Yearbook* and *Soil Surveys*. To give prompt and widespread distribution to information immediately useful, an office of information was established. This prepares popular statements in simple news form and gives them to the papers. This material is also issued in a weekly news letter which is sent to more than 50,000 crop correspondents and progressive farmers.

As the work of the department and the State agricultural colleges becomes broader and more complicated, the points of contact of these Federal and State agencies for the promotion of agriculture become more numerous. There is therefore need of more definite means for adjusting their relations from time to time. The department therefore entered into negotiations with the Association of American Agricultural Colleges and Experiment Stations and thus secured the formulation of a general policy governing their mutual relations. Permanent joint committees on general relations, projects and

correlation of research, and the publication of research literature were constituted.

The appropriations for the department for the fiscal year ended June 30, 1913, amounted to \$16,651,496 for ordinary expenses, in addition to which permanent annual appropriations, special appropriations, and balances from prior years amounting to \$8,303,412 were available, making a total of \$24,954,908. About \$2,500,000 was deposited in the Treasury from the sale of timber on the national forests, grazing permits, condemned property, etc. Fines aggregating \$23,463 were imposed in 596 cases for violation of the food and drugs act; \$27,764 in 436 cases of trespass on the national forests; \$61,695 for violations of the 28-hour law. The national forests were rapidly becoming self-supporting, many of them already returning more than the operating cost. The department was coöperating with the Postmaster-General in the improvement of selected mail-route roads for which Congress appropriated \$500,000, conditioned on the raising of double that amount by the States in which such roads are located. About three-fifths of the department's appropriation, or about \$15,000,000, was expended for regulatory work, and about \$9,000,000 for scientific research, experiments, and demonstrations directly affecting the farmer. The appropriations for ordinary expenses for the fiscal year ending June 30, 1914, amount to \$17,986,945.

There were 14,478 employees in the department on July 1, 1913, of whom 2924 were employed in Washington. Of the entire force, 1812 were engaged in scientific investigations and research, 1323 in demonstration and extension work, 687 in administrative and supervisory work, 6021 in regulatory and related work, and 4635 were clerks and employees below the grade of clerk.

UNITED STATES MILITARY ACADEMY. During the months of June, July, and August, 1913, 199 candidates were admitted as cadets of the academy, bringing the total strength of the corps on September 1 up to 613. There were no noteworthy changes in the faculty during the year. The superintendent in 1913 was Colonel Clarence Page Townsley, of the Coast Artillery Corps. The total number of graduates from 1802 to 1913, inclusive, was 5205.

UNITED STATES NATIONAL MUSEUM. The total number of specimens acquired during the fiscal year was approximately 302,132, of which 26,999 related to several subjects covered by the department of anthropology; 113,509 were zoölogical; 140,015 botanical; 5569 biological; and 14,716 paleontological. The others were paintings for the National Gallery of Art, textiles and useful plant products for the department of arts and industries. The additions in ethnology came chiefly from the Philippine Islands and other parts of the Far East, from South America, and from the middle and western United States. For some of its most important acquisitions to the department of biology the museum was indebted to several expeditions to distant regions, conducted at private expense. The most extensive of these was undertaken by Mr. Childs Frick, who was accompanied by Dr. E. A. Mearns and others. This expedition visited Abyssinia and British East Africa. The birds obtained, numbering over 5000, were deposited in the museum. The permanent additions to the Gallery of Art consisted

of twelve paintings, ten of which were gifts and two bequests. The museum forms a part of the Smithsonian Institution. The assistant secretary in charge is Richard Rathbun.

UNITED STATES NAVAL ACADEMY. The total number of midshipmen at the academy at the beginning of the academic year 1913-14 was 861, divided as follows: First-class, 156; second-class, 189; third-class, 211; fourth-class, 305. There were no notable changes in the faculty during the year and no events of unusual interest. The superintendent was Captain John H. Gibbons, and the commandant of midshipmen, G. W. Logan.

UNITED STATES STEEL CORPORATION. See WELFARE WORK under section so entitled.

UNIVERSALISTS. The most distinctive tenet of this denomination is the final salvation of all men. The estimated number of communicants in 1913 was 51,716, with 709 churches and 702 ministers. The Sunday schools have a membership of about 50,000, and the value of the church property is about \$12,800,000. The denomination carries on foreign missionary work in Japan and China, and sustains domestic missions in 15 churches. Its institutions of higher education include Tufts College, at Medford, Mass.; St. Lawrence University, at Canton, N. Y.; Buchtel College, at Akron, O.; and Lombard College, at Galesburg, Ill. The general conference of the denomination was held at Chicago in October, 1913.

UNIVERSE, THEORIES OF. See ASTRONOMY.

UNIVERSITIES AND COLLEGES, AMERICAN. ATTENDANCE. There were in the 586 institutions reporting to the Bureau of Education, 1911-12, 186,796 collegiate and 11,657 resident graduate students. About 27 per cent. of the collegiate and 32 per cent. of the graduate students are women; 71,851 of the collegiate and 3551 of the graduate students were in the 92 public institutions, the others being in 504 private universities, colleges, and technological schools; 18,922 degrees were conferred upon men and 10,727 upon women. These included 446 Ph. D. degrees for men and 63 for women. The attendance at summer schools shows a remarkable increase. In 1911 there were 477 summer schools enrolling 38,140 men and 80,167 women, a total of 118,307. In 1912 there were 569 schools, of which 217 gave courses accredited for degrees. The attendance in all the summer schools was 46,657 men and 95,560 women, making a total of 142,217.

CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING. The seventh annual report of the president and treasurer of the Carnegie Foundation covers the year ended September 30, 1912. It states that "the endowment in the hands of the trustees at that time amounted to approximately \$14,000,000, and the income for the year amounted to \$676,486, of which \$634,497 was expended. From its first pension payment in June, 1906, to the end of the fiscal year September 30, 1912, the foundation has distributed \$2,077,814 in retiring allowances to professors and \$238,590 in widows' pensions—a total of \$2,316,404. In all, 429 retiring allowances and 90 widows' pensions have been granted, of which 98 have terminated through death and 23 at the expiration of temporary grants, leaving 315 retiring allowances and 83 widows' pensions in force at the end of the

year." The report includes a careful statement of the whole question of pensions for teachers, for government employes, and for industrial employes. It points out the fact that the bills which have been introduced in the various legislatures almost invariably violate fundamental actuarial conditions, and have been framed without study of the essential conditions which must be fulfilled by any adequate pension system. President Pritchett urges a contributory system of pension.

The report called attention to the number of sham universities and showed that there are many of these which are conducted as commercial enterprises without endowment or facilities. These are, however, chartered as educational institutions and so enabled to appeal to the credulity of ignorant students throughout this and other countries under high-sounding names and under the shelter of charters granted by the general government. It calls attention to the bill then before Congress that aimed to correct this situation.

The foundation has established a division of educational inquiry. This was made possible by a gift of \$1,250,000 from Mr. Andrew Carnegie. The purpose of the division is set forth in the following quotation from Mr. Carnegie's letter to the trustees of the foundation. "It shall be the function of the division of educational inquiry to conduct studies and to make investigations concerning universities, colleges, professional schools, and systems of education generally, to investigate problems of education affecting the improvement of educational methods, the advancement of teaching, or betterment of educational standards, and in general to investigate and to report upon those educational agencies which undertake to deal with the intellectual, social, and moral progress of mankind and to publish such results as the trustees may consider of value."

The first work undertaken by this division was the investigation of education in Vermont on the invitation of the Vermont educational commission.

COORDINATION OF STATE INSTITUTIONS. Attention has been directed more and more to the wasteful duplication of work in colleges and universities, particularly as it affects the specialized and technical work in these institutions. The problem of coordinating the work has been approached from different directions. In Montana an "Association for the Creation of a Greater University of Montana" was organized. This body went before the State board of education with pleas for the consolidation of the State university, the agricultural college, the normal school, and the school of mines. The State board adopted a resolution recommending to the legislature that the consolidation be carried out. Bills to this effect were introduced, but failed to be enacted. The Iowa State board of education made a radical redistribution of work among the three institutions under its control. This created a great deal of dissatisfaction, not alone within the institutions but throughout the State. It is now generally understood that the new plans have been altered so as to return to the institutions much of the work that was taken from them. Vermont has undertaken to settle the difficulty by a legislative commission "which shall report at the earliest possible date on the several rights,

duties, and obligations of the University of Vermont and State Agricultural College, Middlebury College, and Norwich University, with such recommendations as will prevent unnecessary duplication and consequent financial waste." Although the three institutions mentioned are subsidized by the State, they are virtually independent institutions, for the State control is limited to appointing half of the board of trustees for the University of Vermont, and also a visiting board for Norwich University. The report of the commission briefly describes the condition as follows: "Beginning thirty years ago with a small appropriation to a single institution, first one and then another of these colleges has successfully applied to the legislature for a share in the State's revenue. The increase of the appropriation by the friends of one has been a signal for an increase in the appropriation for the others, and by a perfectly natural process the three institutions have been led into a rivalry alike harmful to them, to the State, and to education. The struggle for the college appropriations is more or less intimately connected with all other legislation. Many abuses have crept in to help out the plea for such appropriations or to justify it. The subsidizing of students by scholarships, some of them to be conferred by members of the Senate, is particularly to be regretted. Such subsidies to students are nearly always unwise, and if given at all, they ought to be open to students on some fair system of competition, and should entitle the holder to go not to a particular institution, but to any institution that he may choose. The subsidizing of students to go to college is at best of doubtful wisdom. The opportunities for education in this country are so numerous that the ambitious student with energy and courage can find his way through college by his own efforts. Whatever assistance is given should be under conditions carefully planned to safeguard the integrity and self-respect of the student. Scholarship aid should be a loan to be repaid, not a free gift. Any system of scholarships that selects a few beneficiaries and demands no return from them results inevitably in tempting into college youths who ought to find their life training elsewhere, a result alike harmful to the student and to the college. Such a system is a very different thing from the proper provision of free education for all of the people." It recommends that "The State Agricultural College receive a larger proportion of the generous annual appropriation of the State from the Federal government and be developed along lines calculated to make a fruitful connection between the Agricultural College and the industries of farming, dairying, gardening, stock and poultry raising, and fruit culture," and "That subsidies to higher education cease, the colleges being given a reasonable time in which to rearrange their budgets."

GIFTS AND ENDOWMENTS. The most important gifts of 1913 were connected with the endowments of medical schools. The largest of these was an amount of more than \$4,000,000 given to Cornell University for the medical school endowment by Colonel Oliver Hazard Paine. The general education board gave the Johns Hopkins Medical School an endowment of \$1,400,000, to be known as the William H. Welch fund in honor of Dr. Welch, who was

so largely responsible for the organization and development of the school. The secretary of the general education board states the object of the fund as follows: "Since the opening of the Johns Hopkins Medical School in the early nineties, it has been universally conceded that the teaching of the underlying medical sciences, namely, anatomy, physiology, pathology, and pharmacology, must be placed in the hands of men devoting their entire time to teaching and research in their subjects. As the clinical branches are more extensive and more complicated than the above-mentioned underlying sciences, the medical faculty of the Johns Hopkins University has become convinced that it is fully as important that the clinical subjects should be cultivated and taught by men freed from the distraction involved in earning their living through private practice. The trustees of the Johns Hopkins University and the Johns Hopkins Hospital and the medical faculty of the Johns Hopkins University united in requesting of the general education board funds that would enable them to reorganize the departments of medicine, surgery, and pediatrics so that the professors and their associates in the clinic and the laboratories should be able to devote their entire time to their work. In making the gift the general education board has placed absolutely no restriction upon the freedom of these men. They will henceforth be in a position to do any service that either science or humanity demands. They are free to see and treat anyone, whether inside or outside the hospital, but they will accept no personal fee for any such service. It is not expected that this radical innovation in medical teaching will deprive the Johns Hopkins Medical School of such advantages as are still to be gained from the services of other men who are practitioners of medicine and surgery. In the conduct of the dispensary, in the teaching of students, and in the cultivation of the specialties men simultaneously engaged in practice will to some extent continue to be utilized." The University of California received a gift of \$1,000,000 from Mrs. George William Hooper of San Francisco for the purpose of establishing an institute of medical research. Vanderbilt University received a pledge of \$1,000,000 from Mr. Andrew Carnegie for the development of its medical department.

Among the other important gifts are the following: \$200,000 raised by the Council of Hebrew Congregations for the Hebrew Union College; completion of \$1,000,000 endowment for Smith College; \$500,000 fund for Mt. Holyoke; \$1,000,000 endowment for Goucher College; \$475,000 from the estate of the late Dr. Francis Bacon for Yale University; \$300,000 given by Mr. LaVerne Noyes to the University of Chicago for a social centre and gymnasium for women; \$1,000,000 announced by the Washington and Lee University from the estate of Robert P. Doremus; \$1,000,000 endowment for Trinity College, North Carolina.

The aggregate of gifts and bequests, excluding grants by the United States, different States, and municipalities, reported for the year 1911-12 was \$24,783,090, an increase of \$1,819,945 over the amount reported for the preceding year. Fifty-four institutions reported gifts above \$100,000.

NEW INSTITUTIONS AND DEPARTMENTS. The

Graduate School of Princeton University was opened to students September 24, 1913. This school has received a great deal of attention because it is unique among the institutions of America. Its purpose, as stated by its dean, Dr. Andrew F. West, is as follows: "To create in America a valuable institution which does not yet exist, a residential college devoted solely to the higher liberal studies—a home of science and philosophy, of literature and history. Three elements compose the graduate college. First and foremost is a body of thoroughly first-rate professors, to be added to others now in the faculty—interesting men, scholars of high power, eminent in their subjects, and able to awaken young men. The second element is a company of students of high ability—not a big crowd, but a moderate number—living as a community in the buildings of the graduate college. . . . The important thing is that they shall make a student community of high type, sufficient in number to develop a society where every man may know his fellows, find the variety he needs, and not be lost in a crowd. . . . The third element is the buildings, the material home wherein this community shall find the realization of its desires. . . . Whatever may be true of other subjects, liberal studies at least take on new charm amid old associations, and find a natural home in the peace and sylvan beauty of rural life. It is intended to make the buildings beautiful. For this purpose the so-called collegiate Gothic has been chosen—not "modified" Gothic, nor hotel Gothic, but the exquisite perpendicular type so lovely in the few remaining examples in English colleges."

The school of commerce connected with New York University has established what is claimed to be the first university department for teaching advertising. The work includes six full-year courses of one night a week, each especially in the field of advertising, as well as a large number of allied courses in economics, salesmanship, correspondence, and trade conditions. The University of California has established a division of rural institutions. This department will "study and aid all the rural forces which have for their aim the making of life in the open country successful and satisfactory." Among the special topics to be considered are the following: Farm credits, irrigation and drainage institutions, coöperation, and all varied political, economic, educational, social, and religious institutions which affect rural life. The Harvard Graduate School of Business has instituted a course for the training of men to be secretaries of chambers of commerce and similar organizations. The work includes that of several older courses in the school and special training in secretarial work, supplemented by practical experience in the Boston Chamber of Commerce. The legislature of Pennsylvania has given to the University of Pennsylvania \$40,000 for the development of courses in education. The university has reorganized and gradually enlarged this department. A graduate school of education has been established at Bryn Mawr College. The legislature of New York State has enacted laws that will eventually give scholarships amounting to \$100 a year to three thousand students. The students are left to choose their own institution. In case the tuition fees are more than \$100 the State

FOUR EDUCATORS PROMINENT IN 1913

fund may be applied toward the payment of the fees. The colleges must be within the State and receive the approval of the department of education. Arrangements were made whereby the entire second-year class of advanced naval engineers were sent to Columbia University for the year 1913-14. A new institution of collegiate grade has been established at New London, Conn. It is a largely endowed institution that proposes to deal more directly with the training of women for the services of the home than does any institution now existing in our country. The president, Dr. Frederick H. Sykes, is now engaged in selecting a faculty and providing for the erection of suitable buildings.

NEW PRESIDENTS. Among the institutions that elected new presidents during 1913 were the following: Goucher College, Dr. William W. Guth; Hobart College, Dr. Lyman P. Powell; Wells College, Dr. Kerr D. Macmillan; Leland Stanford Jr. University, Dr. John Casper Branner; Miami University, Dr. Raymond M. Hughes; Washington and Lee University, Dr. Henry Louis Smith; University of Colorado, Dr. Livingston Farrand. The newly formed Connecticut College for Women at New London elected Dr. Frederick H. Sykes, formerly director of the school of practical arts, Teachers' College, Columbia University, as its first president.

The presidents of three of the larger institutions resigned during the year: Dr. David Starr Jordan of Leland Stanford Jr. University resigned the presidency and accepted the office of chancellor which was created for him. President James M. Taylor resigned from Vassar College after twenty-seven years of service. Dr. John H. Finley resigned the presidency of the College of the City of New York to accept the position of commissioner of education for New York State.

RESOURCES. The 596 universities, colleges, and technological schools reporting to the Bureau of Education had in 1911-12 an income of \$89,835,787, exclusive of endowment. More than a fourth of this amount was received by the following eight institutions: Columbia University, Cornell University, Harvard University, Yale University, University of California, University of Chicago, University of Minnesota, and University of Wisconsin. On the other hand, each of eighty-three other institutions had incomes of less than \$20,000. The endowments of the institutions were increased by \$14,678,308, and now amount to a total of \$357,048,919. The income from these funds is sufficient to meet about one-sixth of the current expenses of the institutions. More than one-third of the total amount of endowment reported is in six institutions, namely: Columbia University, \$29,348,920; Leland Stanford Jr. University, \$27,000,000; Harvard, \$25,757,062; University of Chicago, \$17,226,573; Yale, \$13,824,078; and Cornell University, \$9,523,405. One hundred and fifty of the institutions other than those supported by the State or cities had no endowment whatever. The States and cities contributed \$24,144,353 toward the income of the institutions, and \$28,792,318 was derived from student fees. A total of \$3,729,952 was received from private benefactions for current expenses. The presidents of Columbia and Princeton universities each made a plea for increased endowment a part of their annual report. Many institutions were considering the advisability of in-

creasing their tuition fees. At its regular November meeting the Yale corporation increased the tuition charges in two undergraduate departments and in the graduate school. Beginning in 1914 the normal tuition charge in the college will be \$160, instead of \$155; in the scientific school the charge will be raised from \$150 to \$180, and where required incidentals are included, from \$171 to about \$200.

UNIVERSITIES AND COLLEGES, ENGLISH. In connection with the universities and university colleges, not including Oxford and Cambridge, a notable feature has been that a federated scheme of superannuation for professors and other members of their staffs has been introduced with the advice of the board of education. The insured will have a choice of types of benefits and a choice of insurance companies, with a number of which contracts have been undertaken. The scheme is compulsory on those receiving salaries over £300 a year, and optional for those receiving from £200 to £300 a year, while those receiving less than £200 may insure with the consent of the institution to which they belong. The scheme is contributory and deductions of not more than 5 per cent. may be made from salary, the institution contributing a sum to bring the amount up to 10 per cent. of the salary.

The Royal Commission on the University of London has issued its reports and recommendations (Cd. 6717). The aim of the report is to establish in London a real teaching university, located in a distinct university quarter, as distinguished from a mere examining body. The constituent colleges to be admitted are to be under the financial and educational control of the university acting through a court as the legislative body and the Senate as the executive body. The faculty is to be the basis of the organization; the faculties will include arts, science, technology, economics, medicine, law, and theology. The teaching appointments will be made by the university and the examination for degrees will be common to students in all departments of the constituent bodies. The external examinations are for the present to be continued but only in the United Kingdom. Admission to the university is to be open to students over seventeen on presenting a certificate from a secondary school, and the university is to abandon entrance examinations except for external students. The first constituent colleges will be the Imperial College of Science and Technology, University College, King's College, Bedford College, and London School of Economics. The London Day Training College and King's College for Women are to be recognized for certain departments, and Birbeck College and East London College will also be admitted on complying with certain conditions. The two last institutions are attended largely by evening students, who will thus be able to qualify for degrees. Parliament is to be asked to pass an act embodying the recommendations of the commission.

In the universities and colleges receiving the board of education grant there were in 1912-13 9204 students; the grant amounted to £218,808. In addition there were at Oxford and Cambridge some 8000 students.

UNIVERSITY OF LONDON. See **UNIVERSITIES AND COLLEGES, ENGLISH.**

UPPER SENEGAL AND NIGER. A col-

ony of French West Africa (q.v.). The military territory of the Niger was separated from the colony by order of the governor-general for French West Africa dated June 22, 1910, and reorganized under a commandant; and by the same order Timbuktu was reorganized under a lieutenant-colonel whose duty is to centralize the affairs of this region and who is responsible to the lieutenant-governor of Upper Senegal and Niger. The colony has direct communication with the coast by way of the Senegal, which is navigable as far as Kayes at high water. About a million and a half of the population are Mussulmans (Moors, Tonaregs, Foulbés, etc.); the remainder are mixed fetishistic tribes of low type for the most part. Cotton textiles are manufactured by natives, and practically all agricultural and domestic implements are locally forged. The soil yields cotton, rice, millet, peanuts, manioc, etc., as well as rubber, gums, and other forest products. Grazing is generally followed. In 1911 the imports by the Senegal were valued at 17,000,000 francs, and the exports at 4,500,000; by way of the Sahel and the Sahara, 1,500,000 (chiefly salt) and 500,000 (grains, textiles, etc.); by southern routes (Senegal, Guinea, Ivory Coast, and Gold Coast), 4,000,000 and 8,000,000. The Kayes-Koulikoro Railway (553 kilometers) reaches the Niger at Bamako. A branch (12 kilometers) connects Kayes with Médine. The Ambidédi-Kayes section (44 kilometers) of the Thiès-Kayes line is in regular operation. Bamako, the capital, had (1911) 7052 inhabitants; Ouagougou 19,332, Kayes 8952, Ségou 8405, Timbuktu 6552. The lieutenant-governor in 1913 was J. Clozel.

URANIUM. See CHEMISTRY, INDUSTRIAL; and RADIUM, URANIUM, AND VANADIUM ORES.

URBAITE. See MINERALOGY.

URUGUAY. A republic of South America, on the Atlantic coast between Brazil and Argentina. The capital is Montevideo.

AREA AND POPULATION. The republic consists of 19 departments, whose aggregate area is stated at 186,925 square kilometers (72,172 square miles). A recent planimetric calculation places the area at 178,700 square kilometers (68,996 square miles). The census of October 12, 1908, returned a population of 1,042,686. The department of Montevideo, with only 664 square kilometers (256 square miles) had 309,231 inhabitants. Of the total, 861,464 (82.52 per cent.) were natives, and 180,722 (17.38 per cent.) were foreign-born. The foreigners included 62,357 Italians, 54,885 Spaniards, 27,789 Brazilians, 18,600 Argentines, and 8341 French. The population in 1912 was estimated at 1,225,914; Montevideo department, 348,488 (at end of 1912, 352,487.) The larger cities and towns, with population in 1908, are: Montevideo, 291,465; Paysandú, 20,953; Salto, 19,788; Mercedes, 15,667; Minas, 13,345; Melo, 12,355; San José, 12,297; Rocha, 12,200. Movement of the population in 1911 and 1912, respectively: Marriages, 6967 and 7541; births (including stillbirths), 37,530 and 39,171; deaths (including stillbirths), 16,552 and 16,745; stillbirths, 1367 and 1330; excess of births, 20,978 and 22,426; arrivals, 195,389 and 248,085; departures, 170,922 and 222,157. The immigration of farm laborers is encouraged. There were reported for 1911 934 public primary schools, with an enrollment of 82,441 pupils.

There are a number of secondary and special schools. The university at Montevideo had 112 teachers, 530 students, and 661 students in the secondary departments.

INDUSTRIES AND COMMERCE. Uruguay is notably a grazing country. The livestock census of 1908 returned 8,192,602 cattle, 26,286,296 sheep, 556,307 horses, 17,671 mules, 4428 asses, 180,099 swine, and 19,951 goats. Only a small proportion of the country is under cultivation. There were reported for the year 1911-12 323,244 hectares under wheat, yielding 2,383,230 quintals; corn, 239,118 ha., 2,022,830 qs.; flax, 57,698 ha., 223,167 qs. (of flaxseed); oats, 34,656 ha., 264,936 qs. Mining and manufacturing are little developed.

The special trade has been valued as follows, in thousands of pesos (gold):

	1907	1908	1909	1910	1911	1912
Imports..	37,471	38,730	37,157	40,814	44,798	49,380
Exports..	34,912	40,296	46,150	40,801	44,536	48,801

Classified exports in 1912: Livestock products: 44,039,624 pesos; agricultural products, 2,064,704; mining products, 2,242,995; hunting and fishery products, 224,576; provisions for ships, 228,845. In 1911 imports from the United Kingdom were valued at 12,162,000 pesos; Germany, 7,591,000; United States, 5,453,000; Argentina, 4,013,000; France, 3,800,000. Exports to France in 1912, 8,643,000 pesos; Germany, 7,602,000; Belgium, 7,596,000; Argentina, 7,068,000; United Kingdom, 6,294,000. In 1912 there entered at the ports 13,139 vessels, of 10,423,738 tons (steam 6665, of 9,181,988 tons), and cleared 12,917 vessels, of 10,278,332 tons (steam 6477, of 9,053,946 tons). Merchant marine in 1912: 42 steamers, of 29,562 tons net, and 165 sail, of 27,798 tons net.

COMMUNICATIONS. The length of railway reported in operation at the end of 1911 was 2512 kilometers (1561 miles); under construction, 610 kilometers (379 miles). Railway construction was continued during 1912 and 1913, but exact figures for the new lines are not available. At the end of the year it was reported that the government of the republic had signed a contract with the Uruguay Railway, an American corporation, that was a subsidiary of the European Farquhar syndicate, for the construction of a line 250 miles in length from Montevideo to Carmen in the department of Durazno and thence to a point where connection will be made with the Midland Railway. In addition a short line was to be constructed to connect the east coast of Uruguay Railway at Olmos with the new line to Carmen, and also a line from San Carlos to Rocha, fifty miles in length. The government was to pay the cost price of construction, plus a profit of ten per cent. to the contractor, paying in bonds bearing 5 per cent. interest, while the railway corporation agreed to construct not less than thirty-one miles of track every nine months, building the line between San Carlos and Rocha first. The Farquhar syndicate, in addition to controlling the Uruguay Railway, controlled the Midland system as far south as Santa Isabel in the department of Durazno and the east coast of Uruguay railway from Olmos to San Carlos. The new line provided for would give the Midland system an independent connection with Montevideo and especially a route along the

coast from Montevideo to Paloma. The state, as a part of the contract, agreed to buy from the Uruguay Railway the line under construction from Rocha to Paloma and the concession for a line from Rocha to Treinta y Tres was cancelled. The new contract also was to give preference to the company for the operation of the railways when they were completed. The Fray-Bonitos-Algorta Railway was under construction in 1913. Telegraphs (1912): 8600 kilometers of line, with 57 offices; wireless stations, 4, and 7 on board ship. Post offices (1912), 1129.

FINANCE. The standard of value is gold; the monetary unit is the peso, par value \$1.03424. For the fiscal year 1913 estimated revenue and expenditure were 35,142,360 and 35,133,812 pesos, respectively; for the fiscal year 1914 (according to the budget submitted to the Congress), 36,597,360 and 36,516,877. For the latter year estimated revenue included customs, 17,600,000 pesos; taxes on real estate, 4,330,000; licenses, 1,840,000; taxes on alcoholic liquors, tobacco, and matches, 1,757,000; earnings of the Bank of the Republic, 1,465,000; stamps, etc., 1,035,000; inheritance tax, 1,000,000. The larger estimated disbursements for the fiscal year 1914: Public debt, 18,360,042 pesos; war and marine, 4,895,162; interior, 3,371,621; public instruction, 3,193,132; finance, 2,524,850; industry, 1,886,879. Public debt December 31, 1912: Foreign consolidated, 120,564,512 pesos; international, 2,294,000; internal, 10,437,073; total, 133,295,145. Debt charges in 1912, 7,728,928 pesos.

ARMY. A small regular army is maintained. Liability to service is universal, but sufficient volunteers in the main can be found to recruit the various organizations and the regular army proper is made up largely of Indians and negroes. There is a national guard composed of young men who are supposed to assemble for drill on thirteen Sundays in the year. The regular army numbered 10,345 officers and men on a peace footing, while in addition there are a police force of 6000, a national guard, or militia, of about 45,000, local troops amounting to 25,000, and a territorial guard of 15,000, making in all a force of 100,000 men with 20 field guns and 115 machine guns.

NAVY. The navy includes one armored cruiser, of 2200 tons (the *Montevideo*, built in 1887); one torpedo cruiser, of 1500 tons (the *Uruguay*, 1910); one gunboat, of 300 tons (*18 de Julio*), one school-ship, of 300 tons; and three dispatch boats.

GOVERNMENT. The legislative power rests with the General Assembly, or Congress, consisting of the Senate (19 members, elected for six years by indirect vote), and the House of Representatives (90 members, elected for three years by direct vote). The president is elected for four years by the General Assembly and is not eligible for a consecutive term. He is assisted by a responsible ministry of seven members. The president for the term ending March 1, 1915, is José Batlle y Ordóñez. He was president in 1903-07.

HISTORY. Several new cabinet officials were appointed during the year: Pedro Cosío, minister of finance; Dr. José Ramasso, minister of industries; Dr. Julien de la Hoz, minister of justice and education; and Dr. Barbaroux, minister of foreign affairs. A progressive policy

was pursued by the ministry. In his message to Congress President Ordóñez elaborated a project for the organization of popular credit on a basis of coöperation and reciprocity; as soon as the paid-up capital of the Bank of the Republic had reached \$20,000,000, there was to be set aside \$500,000 for the development of coöperative credit, for the benefit of artisans, tradesmen, and small employers. Another enlightened measure was the eight-hour-day bill passed by the House of Representatives on June 1. At the same time there was under consideration a bill to prohibit the employment of children under fourteen years of age, to limit the working hours to four a day for those from 14 to 16 years old, and to six for those from 16 to 19, and to prohibit night work for children under 16 and for women. In order the more effectively to meet the needs of the country, the minister of finance ordered the labor office to compile statistics on the cost of living, the wages of the working classes, the supply of and demand for labor. Moreover, the government was carrying out a comprehensive programme of economic betterment. It encouraged afforestation, and colonization, exempted agricultural implements and seeds from customs duties, created an office of agricultural defense, engaged expert advisers, appointed Dr. Muñoz Ximenez to study American and European methods of meat-packing, and entertained at Montevideo the International Conference of Agricultural Defense, May 2-10. The new Montevideo Port Railway, opened May 16, was constructed as a result of the efforts of the minister of public works. Towards the improvement of Coronilla harbor \$350,000 was appropriated, this sum being destined to defray preliminary expenses.

The promotion of the country's welfare had a negative as well as a positive side. Unproductive expenditure on jewelry was penalized by a 5 per cent. *ad valorem* duty. In December the Chamber of Deputies approved in principle an anti-alcoholic bill. Deputy Toscano, in a speech for the adoption of the bill, made the astonishing statement that there are now in Montevideo 1900 saloons, and 1369 in the provinces, making a total of 3269, or about one to every 300 inhabitants.

An interesting movement for constitutional revision was on foot in the early part of the year. It was proposed to vest legislative and appointive power in a committee of nine, elected in rotation, each for nine years. In place of the president, there would be a chairman elected by the committee and subject to recall.

A foreign loan was contemplated in September, in accordance with recommendations made by the president. It was planned to borrow 25,000,000 pesos, to be used for public works and the consolidation of the debt. Difficulty was experienced in placing the loan, but in December it was reported that \$10,000,000 had been taken by an Anglo-French syndicate, and that the Uruguayan government intended to create a tobacco monopoly. The budget drawn up for 1913-14 placed the revenues at 36,597,360 pesos, and the expenditures at 36,516,876.98 pesos. As an act of neighborly courtesy, Uruguay sent a delegation to join in the patriotic festivities of Paraguay, May 14. Juan Pedro Castro was nominated to The Hague Permanent Court.

It was reported in December that the parlia-

mentary elections of November 30 had resulted in a majority for the *Colorado Party*.

UTAH. POPULATION. The population of the State in 1910 was 373,351. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 404,735.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1913	10,000	840,000	\$ 238,000
	1912	9,000	270,000	202,000
Wheat	1913	265,000	6,420,000	4,687,000
	1912	236,000	6,059,000	4,544,000
Oats	1913	90,000	4,140,000	1,656,000
	1912	91,000	4,222,000	2,069,000
Rye	1913	12,000	204,000	122,000
	1912	6,000	90,000	61,000
Potatoes	1913	20,000	3,600,000	2,088,000
	1912	19,000	3,515,000	1,722,000
Hay	1913	390,000	6,909,000	8,262,000
	1912	368,000	1,023,000	8,184,000

a Tons.

MINERAL PRODUCTION. The mines of the State in 1913 produced over 10,250,000 tons of ore, with recoverable gold, silver, copper, zinc, and lead at about \$43,000,000, according to the estimates of the United States Geological Survey. There was a decrease in the yield of copper due largely to the closing of the Mercur gold mine. The value of the gold produced was about \$3,581,900, which was about 16 per cent. less than that of 1912. The silver yield in 1913 was about 12,500,000 ounces, or about 9 per cent. less than in 1912. The copper mine output, which reached 158,200,000 in 1913, surpassed the previous yearly records—an increase of about 15 per cent. over the production of 1912. The lead output showed an increase of nearly 12 per cent. in 1913, which made a total of 156,670,000 pounds, compared with 140,311,035 in 1912. The production of zinc ore remained about the same as in 1912, yielding over 17,000,000 pounds of recoverable spelter. The total value of the mineral products of the State in 1912 was \$51,000,942, compared with \$43,774,331 in 1911.

The gold production of the State in 1912 was \$4,265,851, a decrease of \$431,147 over the production in 1911. The largest production was from Juab County, which yielded \$1,804,842 in 1912, against \$1,500,359 in 1911. The Bingham district in Salt Lake County, with its great output of copper ores, ranked second in the yield of gold in 1912 with the production of \$1,795,532. Nearly all the output of the State is from the deep mines.

The silver output of the State in 1912 was 13,835,503 fine ounces, compared with 12,473,787 in 1911.

Utah is an important producer of copper (q.v.). The production in 1912 was 132,150,052 pounds of blister copper, compared with 142,340,215 pounds in 1911. The decrease was due to labor troubles in the Bingham Camp, which resulted in the closing of the mines for some time during the latter part of the year. The total recorded output of the State to the close of 1912 is 929,194,840 pounds, and in the production for 1912 Utah ranks fourth among the copper producing States. The three districts in which nearly all the copper is produced are the Bingham district, the Tintic district, and the Frisco district.

The coal production in 1913 is estimated by the United States Geological Survey about 5 per cent. more than that of 1912, in which year it was 3,116,149 short tons, valued at \$5,146,451. This was an increase over the production in 1912 of 502,974 short tons, or 20 per cent. The increased production in 1912 is attributed to activity in metal mining in related industries, and to general prosperous conditions throughout the State. The total number of men employed in the coal mines in 1912 was 3328, compared with 3060 in 1911. The average working time increased from 236 days to 285. There were no strikes or other labor troubles in 1912. The fatal accidents in the coal mines of Utah in 1912 numbered 18, an increase of 4 over 1911. Of the 18 fatalities, 16 occurred underground and two on the surface.

TRANSPORTATION. The railway mileage of the State on January 1, 1913, was 2055.

EDUCATION. The latest report of the superintendent of public instruction is for the biennial period ending June 30, 1912. The school population of 1912 was 111,333. The average daily attendance was 92,129. There were 691 schools, with 702 male and 1935 female teachers. The average monthly salary of male teachers was \$82.98, and of females \$65.02. The total amount expended in 1912 was \$3,994,767.

FINANCE. The latest report of the treasurer is for the fiscal year 1912. The total receipts for the fiscal year amounted to \$3,668,004. There was a balance on hand at the beginning of the year of \$1,871,595. The disbursements amounted to \$3,877,898, leaving a balance on hand on November 30, 1912, of \$1,661,801. The chief receipts are from taxation, and the chief expenditures are for education, State officers, and State institutions.

CHARITIES AND CORRECTIONS. The State has no department of charities and corrections, and, previous to 1912, there was one organized charitable society in Salt Lake City. It was supported by private subscriptions. The State maintains a State Mental Hospital at Provo, which averages about 400 inmates; a State Industrial School at Ogden, with an average of about 100 to 125 inmates; and a School for the Deaf and Blind at Ogden, with an enrollment of from 100 to 125.

POLITICS AND GOVERNMENT. There was no State election during the year, as the term of Governor Spry does not expire until January, 1917. The next State election occurs in November, 1916. The legislature on February 5 voted against the constitutional amendment providing for the direct election of senators.

LEGISLATION. The legislature met in 1913 and passed three measures of importance. The first of these provided the indeterminate sentence for persons convicted of crime. The second was a provision against unfair competition and discrimination, and the third was a measure providing for mothers' pensions. See also LIQUOR REGULATION.

STATE GOVERNMENT. Governor, William Spry; Secretary of State, D. Mattson; Treasurer, J. D. Jewkes; Auditor, L. G. Kelly; Attorney-General, A. R. Barnes; Superintendent of Education, A. C. Nelson; Commissioner of Insurance, Willard Done—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, W. M. McCarty; Justices, J. E. Frick and Dan-

iel N. Straup; Clerk, H. W. Griffith—all Republicans.

STATE LEGISLATURE, 1913. Democrats: Senate, 2; House, 14; joint ballot, 16. Republicans: Senate, 16; House, 31; joint ballot, 47. Republican majority: Senate, 14; House, 17; joint ballot, 31.

The names of senators and representatives to Congress will be found in the article **UNITED STATES**, section *Congress*.

UTAH. UNIVERSITY OF. A State institution for higher education founded at Salt Lake City, Utah, in 1850. The total enrollment in all departments in December, 1913, was 1190. The faculty numbered 70. There were no noteworthy changes in the faculty during the year, and no notable benefactions were received. The university is supported almost entirely by the State. The library contains about 37,000 volumes. The president is J. T. Kingsbury, Ph. D., D. Sc.

VACCINATION. See **SMALL-POX AND VACCINATION**.

VACCINE THERAPY. A new vaccine against whooping cough was prepared from the Bordet-Gengou bacillus isolated from a case of whooping cough. Many favorable reports as to the curative value of this vaccine were made. See **DIPHTHERIA** and **SMALL-POX**.

VACUUM PUMP. See **PUMPING MACHINERY**.

VALPARAISO UNIVERSITY. An institution for higher education, founded at Valparaiso, Ind., in 1873. There were enrolled in all departments in the autumn of 1913, 5000 students. The faculty numbered 207. There were no notable changes in the faculty during the year, and no large benefactions were received. The productive funds of the university amount to about \$350,000. The library contains about 15,000 volumes. The president is Henry B. Brown, A.M.

VAMBERY, ARMINIUS. A Hungarian linguist and Orientalist, died September 15, 1913. He was born in Duna-Szerdahely, Hungary, of Jewish parents in 1832. After studying privately and at the University of Presburg, he went to Constantinople to study Turkish life and language. There he earned his living by reciting Turkish and Persian poems in the coffee houses, and by teaching languages. In time his abilities gained for him an entrance in the Ottoman society. His interest in languages led to a journey to Khiva, Bokhara, and Samarkand. He had already been made a corresponding member of the Hungarian Academy of Sciences, and in 1861 this body voted to him 1000 florins on condition that he should go into the interior of Asia and investigate the affinities of the Magyar tongue. The next few years were spent in Persia and other Oriental countries. On his return to Hungary he was received with a coolness which was due chiefly to his humble birth and the fact that he was a Jew. On account of this, he went to London in 1864. His account of his travels was a great success, and was afterwards translated into fourteen European and Oriental languages. On his appointment as professor of Oriental languages in the University of Budapest, he returned to Hungary and published a number of books on linguistic and Asiatic subjects. He made periodic visits to Constantinople, becoming in late years an adviser of the Sultan Abdul Hamid; and he made repeated visits to England, where

he lectured. He took a strong anti-Russian attitude toward the Far Eastern question, especially in reference to what he declared to be a steady advance of Russia toward the frontiers of India. His published writings include *Travels in Central Asia* (1864); *Sketches of Central Asia* (1867); *The Central Asia Question* (1874); *Arminius Vambery, his Life and Adventures* (1883); *The Coming Struggle for India* (1885); *The Story of My Struggles; Western Culture in Eastern Lands* (1906). Also several works relating to literature, ethnography, and the linguistics of Central Asia.

VANADIUM. See **CHEMISTRY, INDUSTRIAL**; and **RADIUM, URANIUM, and VANADIUM ORES**.

VANDERBILT UNIVERSITY. An institution for higher education founded in Nashville, Tenn., in 1872. The number of students enrolled in the several departments of the university in the autumn of 1913 was 1000. The faculty numbered 125. There were no noteworthy changes in the faculty during the year. The university received a gift of \$1,000,000 from Andrew Carnegie in May for a medical college. The productive funds of the university amount to about \$2,500,000, and the income to about \$245,000. The library contains about 2000 volumes. The president is J. H. Kirkland, LL.D., D. C. L.

VARDAMAN, JAMES K. United States senator (Democrat) from Mississippi. He was born in Jackson County, Miss., in 1861; spent his early years on a farm; and at the age of twenty removed to Carrollton, Miss., and began the study of law. In 1881 he began to practice at Winona, and in connection with his law practice edited the *Winona Advance*. He removed in 1884 to Greenwood, Miss., where he practiced law and became the owner and editor of the *Greenwood Enterprise*. He was one of the first men in the South to support W. J. Bryan. Elected to the State legislature in 1889, he was reelected in 1891; was speaker of the House of Representatives in 1894; in 1895 unsuccessful candidate for governor of the State; established and edited the *Greenwood Commonwealth* in 1896, and was its editor until his election as governor of the State in 1903. He served in the Spanish-American War, attaining the rank of major. Returning to Mississippi in 1899, he became a candidate for governor and was again defeated. Four years later, however, he was elected—the first governor nominated under the primary system. In 1907 he was an unsuccessful candidate for the United States Senate. In 1910 the death of Senator McLaurin caused a vacancy and he was again a candidate, to be again defeated. In 1911 he defeated Senator Percy for renomination by 60,000 votes in a total vote of 133,000. Senator Vardaman has attracted public attention by reason of his bitter speeches on the negro question and by the aggressive campaigns carried on by him in Mississippi.

VASSAR COLLEGE. An institution for the higher education of women, at Poughkeepsie, N. Y., founded in 1861. The enrollment in all departments of the college in 1913-14 was 1073. The faculty numbered 115. Emerson D. Fite and F. F. Thompson were added to the department of political science. Taylor Hall, a new art building, was begun in December, 1913. The Sutor Scholarships, of \$10,000 each, were established during the year. The income from all sources was about \$1,175,000. The library con-

tains about 80,000 volumes. James M. Taylor, D. D., LL. D., resigned the presidency in 1913, after a long tenure of that office.

VENEZUELA, UNITED STATES OF. A South American republic, on the northern coast east of Colombia. Capital, Caracas.

AREA AND POPULATION. Venezuela consists of twenty states, two territories, and a federal district. The total area is officially stated at 1,020,400 square kilometers (393,976 square miles); according to an unofficial planimetric calculation, it is 942,300 square kilometers (363,822 square miles). The population as estimated in 1913 was 2,755,685. Many regard this figure as much too large, some holding that it is even twice as large as the actual number of inhabitants. It is estimated that about seven-tenths of the people are mixed bloods, about one-tenth whites, and the remainder negroes and Indians. Movement of the population as reported for 1911 and 1912, respectively: Marriages, 8017 and 9365; births, 83,753 and 75,892; deaths, 54,428 and 65,729; immigrants, 9204 and 9672; emigrants, 7219 and 7991. The larger towns, with estimated population, are: Caracas (in Federal District), 73,000; Maracaibo (Zulia), 50,000; Valencia (Carabobo), 40,000; Barquisimeto (Lara), 32,000; Puerto Cabello (Carabobo), 14,000; La Guaira (Federal District), 12,000.

EDUCATION. Illiteracy is prevalent, probably three-fifths of the inhabitants being unable to read. In 1910 there were 1593 primary schools, with an enrollment of 51,047 pupils; of these schools, 136 were private, with 3917 pupils. Of the public primary schools, 1009 (with 47,130 pupils) were classed as national schools, 199 (with 5972 pupils) as federal schools, and 249 (with 8071 pupils) as municipal schools. For secondary instruction there are reported 34 national and 63 private colleges. There are a few institutions for special or technical instruction and, at Caracas and Mérida, two universities.

PRODUCTION AND COMMERCE. Agriculture and stock-raising are important. Large mineral resources exist, but, aside from some exploitation of gold, copper, and asphalt, they are little developed. There is little manufacturing. The crops include coffee, sugar cane, cacao, and cereals. Among important forest products are rubber, balata, copaiba, and vanilla.

Imports and exports in fiscal years ended June 30 have been valued as follows, in thousands of bolivars:

	1909	1910	1911	1912	1913
Imports	49,180	56,641	80,179	105,677	106,575
Exports	83,145	86,420	96,920	133,324	130,886

Leading imports include cotton goods, provisions, and hardware. Principal exports in the fiscal years 1912 and 1913, in thousands of bolivars:

	1912	1913		1912	1913
Coffee	79,314	78,702	Gold	5,252	6,131
Rubber and balata	11,631	12,344	Aligrettes	1,636	1,984
Cacao	15,936	12,010	Copper	1,663	1,642
Hides and skins	10,271	11,088	Asphalt	1,587	1,087
			Cattle	1,152	807
			Tonka beans	807

Trade by countries in the fiscal years 1912 and 1913, in thousands of bolivars:

	Imports		Exports	
	1912	1913	1912	1913
United States	32,309	35,403	43,387	51,367
United Kingdom	27,167	22,971	10,696	8,478
Germany	16,314	16,577	22,590	20,429
France	13,895	13,556	39,397	35,825
Netherlands	7,461	8,658	4,858	3,691
Spain	4,403	4,800	8,068	7,587
Italy	3,397	3,734	1,275	1,101
Other	731	876	3,053	2,408
Total	105,677	106,575	133,324	130,886

In the fiscal year 1913 there entered at the ports 1642 vessels, of 1,548,267 tons. Merchant marine (1911), 8 steamers, of 2046 tons net, and 15 sail, of 2432 tons net.

COMMUNICATIONS. The unsettled political conditions to which Venezuela has been subject have repelled the investment of foreign capital, and transportation facilities are very inadequate. Railways extend from coast towns into the interior, but they are not connected to form a system. In 1911 the length of railway in operation was 925 kilometers (575 miles). New railway construction of the year included the completion of the extension from Soapire to Santa Terasa, and work on the construction of the Tacheira Railway to Mazita, De Cara, and De Poro. There are many miles of navigable river. Reported length of telegraph lines, 7889 kilometers, with 183 offices. Post offices, 284.

FINANCE. The standard of value is gold; the monetary unit is the bolivar, whose par value is equivalent to that of the franc, 19.295 cents. In the year ended June 30, 1910, revenue and expenditure amounted to 48,552,857 and 52,337,125 bolivars, respectively; in the fiscal year 1911, 62,939,075 and 61,640,010. For the fiscal year 1914, see the accompanying table:

Budget for 1913-14:		Bolivars
Import duties	35,520,420.00
Liquor tax	3,200,000.00
Cigarettes	4,560,000.00
Wharves	4,000,000.00
Stamps	1,440,000.00
Sundries	3,507,510.00
Total revenue	52,227,930.00
Expenditures:		Bolivars
Interior	12,541,467.02
Foreign relations	1,339,573.79
Treasury	13,825,366.60
War	10,941,743.75
Fomento	4,443,928.00
Public Works	4,287,760.00
Education	4,338,460.00
Sundries	449,630.84
Total	52,217,930.00

The public debt declined from 226,654,480 bolivars at the end of 1907 to 189,370,424 at the end of 1911 and 181,612,182 at the end of 1912. On the last date, the foreign debt was 118,511,032 bolivars, and the internal debt 63,101,150.

ARMY. Nominally military service is obligatory for each citizen from 18 to 50 years, but in practice the army is recruited by voluntary enrollment or by force. On a peace basis there are 11,768 officers and 7600 men, there being a greater number of officers on account of the system of organization of cadres by which the skeleton units can be recruited up to any desired strength. On a war basis an army of 100,000 men has been made as the peace strength, but this is without any special basis of foundation.

GOVERNMENT. The constitution of August 9, 1909, vests the legislative power in a congress of two houses, the Senate (40 members) and the Chamber of Deputies. The executive authority is a president, elected for four years and assisted by a cabinet of seven members. The president in 1913 was General Juan Vicente Gómez, whose administration began April 19, 1910. President of Council, Dr. José Gil Fortoul; first vice-president, General Mariano García.

HISTORY. Congress met in Caracas, April 19, and elected Dr. José Gil Fortoul president of the Senate and Dr. J. Eugenio speaker of the House. On April 29 General Juan Vicente Gómez addressed his presidential message to Congress, reporting that he had been active in the development of communications, agriculture, stock-raising, and manufacturing, that amicable relations with France had been assured by a protocol signed at Caracas on February 11, 1913, and that the cruiser *Mariscal Sucre* had been added to the navy. On May 24 President Gómez promulgated a new naturalization law, just passed by congress. One year of residence was required before naturalization, except in the case of distinguished foreigners, husbands of Venezuelan women, and immigrants under contract. Naturalized citizens must take the oath of allegiance, must be over 21 years of age, and must agree that their minor children shall be Venezuelans. On July 1 a board of mines was established; it consisted of a technical inspector, a general inspector, and the director of the national laboratory. The mine owners were required to file elaborate reports of the quality and quantity of their output.

The Gómez government survived two rebellions in 1913. The first, an uprising in the state of Trujillo, was led by Juan Aranja as a protest against the alleged intention of General Gómez to declare himself for reelection in 1914. The insurrection was crushed, but there remained a strong party of *Nationalistas*, headed by General Hernandez, who strenuously opposed the suggested continuance of the present administration. The second revolution was opened by a manifesto of ex-President Cipriano Castro, dated July 27, and denouncing Gómez as a "monster." The president replied with a counter-proclamation on July 29, and on August 1, with the approbation of the federal council, he took advantage of article 82 of the constitution to suspend all limitation on his power, declare martial law, and march against the rebels, who had gathered in the southwest. The insurrectionary forces were easily dispersed and several leaders were captured, among them, General Torres Castro, a relative of Cipriano Castro.

The protocol referred to in the president's message to Congress was subsequently ratified by Congress and the government settled the claims of the Carenero Railway and Navigation Company, a French syndicate, by the payment of 300,000 bolivars.

VERMONT. POPULATION. The population of the State in 1910 was 355,956. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 359,957.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the

United States Department of Agriculture, and those for 1913 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1913	45,000	1,665,000	\$1,349,000
	1912	45,000	1,800,000	1,296,000
Wheat	1913	1,000	24,000	24,000
	1912	1,000	25,000	24,000
Oats	1913	79,000	3,018,000	1,602,000
	1912	77,000	3,311,000	1,589,000
Potatoes	1913	25,000	3,175,000	2,286,000
	1912	26,000	3,640,000	2,002,000
Hay	1913	1,000,000	61,280,000	18,560,000
	1912	1,010,000	1,515,000	21,210,000
Tobacco	1913	100	6 155,000	28,000
	1912	100	170,000	31,000

a Tons. b Pounds.

MINERAL PRODUCTION. The only important mineral products of the State are marble and granite. Vermont is the leading State in the production of both marble and granite, and second in the production of slate. The total production of stone, exclusive of slate, in 1912 was valued at \$6,581,203, of which \$3,494,253 was marble, and \$3,074,306 granite. Considerable development of asbestos property has been in progress in recent years, and this promises to be an important industry. Other mineral productions of some importance are clay products, feldspar, mineral paints, and sand and gravel. The total value of the mineral products in 1912 was \$9,213,912, compared with \$8,434,516 in 1911.

TRANSPORTATION. The total railway mileage of the State, including yards, tracks, and sidings in 1913, was 1461. The total number of miles by the main line and branches of steam roads was 1105.

EDUCATION. The total school population of the State in 1913 was 79,218. The total enrollment in public schools was 64,825. The average daily attendance was 51,563. The total number of teachers was 3079, of whom 227 were men and 2852 women. The average salary of all teachers, \$43 a month; for male teachers it was \$74.07, and for female teachers, \$40.79. The legislature of 1912 enacted several important measures. Among these was one providing for agricultural extension work in connection with the State Agricultural College, and the creation of a teachers' retirement fund. More adequate provision was made for teacher-training courses. The right of election of the superintendent of education was taken from the General Assembly and given to the board of education. See also EDUCATION IN THE UNITED STATES.

FINANCE. The total receipts for the fiscal year ending June 30, 1913, were \$3,332,520. The disbursements for the same period were \$3,019,579. At the beginning of the fiscal year there was on hand a balance of \$519,388, leaving a balance at the end of the fiscal year of \$313,002. The chief sources of income are the corporation and collateral inheritance taxes, and general taxation. The chief expenditures are for support of schools, maintenance of highways, and the expenses of State officers.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State include the State prison at Windsor, the House of Correction at Rutland, the Industrial School at Vergennes, the State Asylum for the Insane at Waterbury, the Soldiers' Home at Bennington, and the Vermont Sanatorium at Pittsford. There are also a number of hospitals under the control

of the State board and others privately controlled but partially supported by the State.

POLITICS AND GOVERNMENT. There was no election for State officers during the year, as the term of Governor Fletcher does not expire until January 1, 1915. The next State election occurs in November, 1914, the voters in connection with their annual town meetings having adopted the various constitutional amendments providing among other things for the abolishing of September elections, the assembling of the legislature in January instead of October, as formerly, the organization of corporations under a general law instead of under special acts, and an authorization for the legislature to pass a workmen's compensation law.

LEGISLATION. The legislature met in 1913 and passed a large number of important measures. These included a uniform negotiable-instruments act, a blue-sky law, a measure creating a State board of conciliation and arbitration for the adjustment of labor disputes, and another measure providing an eleven-hour day and a 58-hour week for women and minors in certain employments. The legislature provided for the submission to the people of an amendment to the constitution permitting the passing of a workmen's compensation law. A commission was created to investigate employers' liability laws. Electrocution was substituted for hanging as a form of capital punishment. A uniform warehouse receipts act was passed. A measure was enacted establishing the State teachers' retirement fund, and another act provided for the juvenile court. Measures were enacted regulating the licensing of pawn shops, and a commission was appointed to investigate tuberculosis. Provision was made for the submission to the people of the question whether they prefer a preferential primary system whereby voters may instruct their delegates to political conventions as to their preference for candidates, or a direct primary system whereby voters vote directly for candidates for State, congressional, and county officers. See also LIQUOR REGULATION.

STATE GOVERNMENT. Governor, Allan M. Fletcher; Lieutenant-Governor, F. E. Howe; Secretary of State, Guy W. Bailey; Treasurer, Edward H. Deavitt; Auditor, Horace F. Graham; Attorney-General, R. E. Brown; Adjutant-General, Lee S. Tillotson; Superintendent of Education, Mason S. Stone; Commissioners of Insurance, E. H. Deavitt, and Guy W. Bailey; Commissioner of Agriculture, E. S. Brigham—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, George M. Powers; Assistant Justices, Loveland Munson, John H. Watson, Seneca Haselton, William H. Taylor; Clerk, L. C. Moody—all Republicans, except Haselton.

STATE LEGISLATURE, 1913. Republicans: Senate, 27; House, 146; joint ballot, 173. Democrats: Senate, 3; House, 56; joint ballot, 59. Progressives: Senate, 0; House, 22; joint ballot, 22. Republican majority: Senate, 24; House, 68; joint ballot, 92.

The representation in Congress will be found in the article UNITED STATES, section *Congress*.

VERMONT, UNIVERSITY OF. A State institution for higher education, founded at Burlington, Vt., in 1791. The students enrolled in the several departments in the autumn of 1913 numbered 606. There were 105 members

of the faculty. During the year G. G. Groat, Ph.D., was appointed professor of economics, and W. H. Freedman was appointed professor of electrical engineering. The university received a fund of \$1000 to be known as the Calvin Peare Classical Fund. The permanent funds amounted at the end of the collegiate year 1912-13 to \$916,311, and the annual income to about \$208,000. The library contains about 87,500 volumes. The president is Guy Potter Benton, D.D.

VETERINARY ASSOCIATIONS AND SOCIETIES. See VETERINARY SCIENCE.

VETERINARY MEDICINE, SCHOOLS OF. See UNIVERSITIES AND COLLEGES.

VETERINARY SCIENCE. Among the notable events of the year was the holding of the fiftieth annual meeting of the American Veterinary Medical Association at New York from September 1 to 5, in which city it was organized a half century ago. In his presidential address Dr. J. R. Mohler, in discussing the importance of the work, pointed out that there is not less than 5 billion dollars invested in the various kinds of domesticated animals in the United States and Canada, and that government statistics for the previous year would show in the United States alone a loss of more than 6½ million swine, nearly 2 million cattle, over 2½ million sheep, and more than ¼ million horses and mules, the total value exceeding 200 million dollars. In the opinion of competent men a large proportion of this loss could be eliminated by judicious sanitary measures. The officers of the association elected for 1914 are: President, Dr. C. J. Marshall of Philadelphia; secretary, Dr. N. S. Mayo of Chicago; and treasurer, Dr. G. R. White of Nashville.

The United States Livestock Sanitary Association met in Chicago from December 2 to 4. This association includes all the leading Federal and State livestock sanitary officials. The tenth International Veterinary Congress will be held in London August 3-8, 1914.

One of the important events of the year was the appointment of Dr. Fred Torrance as veterinary director-general to the Canadian government, vice Dr. J. G. Rutherford, resigned.

The veterinary profession lost one of its leaders in the death of William Hunting, which took place in England on October 24, at the age of 69. Dr. Hunting was acknowledged to be the greatest authority on clinical glanders. He founded and edited *The Veterinary Record*, a weekly journal, and was a prolific writer to the veterinary press.

In the United States Congress authorized the Secretary of Agriculture to promulgate regulations applying to viruses, serums, toxins, and analogous products, intended for use in the treatment of domestic animals, when imported or shipped interstate, and appropriated \$25,000 for the enforcement of this law. Regulations were drawn up which became effective July 1. Laws regulating the sale of these products also were enacted by the States of Alabama, Georgia, and Pennsylvania. The embargo placed upon the importation of livestock from Great Britain, due to the outbreak of foot-and-mouth disease in 1911, was removed in March, following its supposed eradication from that country; but as the result of an outbreak among cattle it was replaced on November 12.

It is noteworthy that in the Federal meat in-

spection work, with a decrease from 1912 of nearly 2,700,000 hogs and of over 375,000 cattle slaughtered, the number of carcasses condemned was nearly 47,000 greater. The increase in condemnation was greater in hogs and due principally to hog cholera, but tuberculosis continued to be the greatest cause of condemnations. Infectious bulbar paralysis, also known as pseudorabies and Aujeszky's disease, was found to occur in several states in Brazil.

HOG CHOLERA. Government statistics show that there was a loss of more than 6½ million swine in the United States in 1913, something like nine-tenths being due to hog cholera. In Indiana there was a loss in 1912 of 562,542 hogs, valued at more than 3½ million dollars, cholera being by far the predominant factor in this loss. This disease, though not absolutely preventable, can be greatly reduced by the judicious application of serum, together with proper sanitary control. The last Congress appropriated the sum of \$75,000 for eradication work, and this was commenced in Iowa on July 1. Several bills were introduced in Congress during December asking for from \$250,000 to \$750,000 for investigation and eradication work, and the indications are that a large sum will be appropriated.

Investigations of the occurrence of micro-organisms in the blood and tissues of cholera hogs with improved apparatus, including the ultra-microscope and the ultrafilter, cast much light upon the subject. King and Hoffman found that a new spirochete, which occurs in the intestinal ulcers, crypts in the ceca, and external local lesions of animals suffering from the disease and which they have named *Spirochaeta suis*, was capable of producing typical hog cholera when injected into healthy hogs.

CONTAGIOUS ABORTION. Studies reported upon during the year indicated that both carbolic acid and methylene blue administered by mouth have considerable preventive and curative value when used against contagious abortion. Studies by Schroeder and Cotton showed that the udders of apparently healthy cows are the normal habitat of the abortion bacillus, that the bacillus may be eliminated for years from the udders, and that it cannot with certainty be excluded from the milk, no matter how much cleanliness and care may be used in its production. Investigations at the Kentucky experiment station led to the description of *Bacillus abortivus equinus* as the cause of the disease in the mare. Good and Corbett stated that in Kentucky in some seasons as many as 70 per cent. of the mares in some studs have aborted.

TUBERCULOSIS. In experiments carried on at the Virginia experiment station it was found that the Bang system of eradicating tuberculosis, which consists in isolating reacting animals, taking their calves away at birth, and feeding on pasteurized milk or with milk from healthy cows and with them building up a new herd, was impracticable, except possibly with very valuable pure-bred animals. Important studies of avian tuberculosis at the Wisconsin experiment station were reported upon. This disease of fowls has become of great economic importance and is widespread in its distribution.

TEXAS FEVER AND THE CATTLE TICK. The work of eradicating the cattle tick, which spreads the infection of Texas or splenic

fever of cattle, for which \$325,000 was appropriated by Congress to the United States Department of Agriculture, was continued in co-operation with the authorities of various southern States. During the fiscal year 1913 areas in eleven States aggregating 24,556 square miles were released from quarantine and on September 1, 9191 square miles were added, making a total of more than 193,000 square miles, out of the 741,555 square miles infested, that have been cleaned of the cattle tick and released from quarantine since the work started. The average market value of hides from tick-infested animals from many southern districts is three cents per pound less, on an average, than for hides not damaged.

DOURINE. This disease is now believed to be eradicated from Iowa. It was discovered in Montana in July, 1912, and has become more or less prevalent in the eastern section of that State and extends into the western portion of North and South Dakota.

EQUINE PIRIOPLASMOSIS. This disease was discovered to occur in the New World for the first time by Darling in Panama, where it appears to be endemic in the interior among native horses. The tropical horse-tick, *Dermacentor nitens*, is thought to be the means by which it is transmitted.

PARASITES. The studies of Ransom showed *Cysticercus ovis*, the intermediate stage of the dog tapeworm (*Tania ovis*), to be the cause of tapeworm cysts in mutton in the United States. This parasite is of considerable economic importance since it not infrequently causes the condemnation of carcasses, and because of the direct losses which occur among sheep as a result of its invasion. Over 17,000 of the sheep slaughtered under Federal supervisions in 1912 were found to be affected with measles. Important studies of Manson's eyeworm, a parasite in the eyes of chickens, were made by Wilcox and McClelland in Honolulu, where it is found in nearly every flock, and the number in an eye often reached a total of 50 or 60. The best treatment was found to consist in anesthetizing the eye with a 5 per cent. solution of cocaine, then lifting the nictitating membrane and dropping a 5 per cent. solution of creolin directly into the inner corner. Studies of trichinæ have shown that the larvæ in pork die after a brief exposure to a temperature of 127.4° to 131° F. *Habronema muscæ*, a parasite occurring in the stomach of the horse, was found by Ransom to be transmitted by the house fly. Investigations in the Philippines have shown the kidney worm *Stephanurus dentatus* to parasitize nearly 50 per cent. of the native hogs on the Island of Luzon. Studies by Blacklock and York in England indicate that the symptom-complex of the disease clinically known as dourine can be produced by more than one species of trypanosome. Rapid progress was made in the United States in the work of eradicating scabies in sheep, cattle, and horses.

BIBLIOGRAPHY. Among the works published were the following: J. Bayer and E. Fröhner, *Handbuch der Tierärztlichen Chirurgie und Geburtshilfe* (Vienna and Leipzig, 1913); E. G. Hastings and J. G. Halpin, *Avian Tuberculosis* (Wis. Agr. Expt. Sta. Research Bul. 28, 1913); E. W. Hoare, *A System of Veterinary Medicine*, vol. i. (Chicago, 1913); G. D. Lander, *Veterinary Toxicology* (Chicago, 1912); H. Leeney,

Udall, *Veterinarian's Handbook of Materia Medica and Therapeutics* (Ithaca, N. Y., 1912).

VICTORIA. A state of the commonwealth of Australia. Area, 87,884 square miles. Population (census of April 3, 1911), 1,315,551, exclusive of full-blooded aborigines. Melbourne is the capital and the temporary capital of the commonwealth. Population (1911), 38,292; population of the local government area, 103,593; with suburbs, 588,971. During the year ending June 30, 1913, a length of 25 miles of new railway was opened for traffic, and 242 miles was under construction. The total mileage opened was 3648. The railway construction was undertaken by the railway construction branch under the control of the board of land and works which was to transfer the railway to a board of three commissioners who have supreme control of administration and are free from political interference. All of the public railways, excepting a short length of 14 miles in 1913, were owned and controlled by the state. A 100-mile branch westward from the Ballarat-Ceelong line was opened during the year and 242 miles were put under construction, the most important element being the Bairnsdale and Orbost lines which eventually would tend towards a coast connection with the New South Wales Railway system. The governorship in 1913 was vacant, owing to the resignation of Sir J. M. Fleetwood Fuller. In July some 160 gold miners at the Bendigo mines went on strike with the purpose of forcing non-unionists to join the union. In December Premier W. A. Watt resigned and a new ministry was formed with: G. A. Elmslie as premier and treasurer; G. M. Prendergast, chief secretary; W. J. Evans, attorney-general and public health; John Lemmon, education and labor; W. Plain, lands; A. R. Outrim, mines; J. W. Billson, railways; A. McClellan, public works.

VIRGINIA. POPULATION. The population of the State in 1910 was 2,061,612. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 2,129,003.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

	Acreage	Prod. Bu.	Value
Corn	1913 1,980,000	51,480,000	\$39,125,000
	1912 1,980,000	47,520,000	33,739,000

	Acreage	Prod. Bu.	Value
Wheat	1913 780,000	10,608,000	10,184,000
	1912 714,000	8,596,000	8,682,000
Oats	1913 195,000	4,192,000	2,180,000
	1912 175,000	3,885,000	2,020,000
Rye	1913 58,000	713,000	578,000
	1912 48,000	600,000	510,000
Potatoes	1913 105,000	9,870,000	7,896,000
	1912 95,000	8,265,000	5,372,000
Hay	1913 750,000	9,952,000	14,750,000
	1912 741,000	889,000	13,513,000
Tobacco	1913 200,000	6154,000,000	21,406,000
	1912 187,000	112,200,000	13,464,000

a Tons. b Pounds.

MINERAL PRODUCTION. The total value of the mineral products of the State in 1912 was \$14,995,842, compared with \$13,713,566 in 1911.

The production of coal in the State in 1913 was estimated by the United States Geological Survey at from 5 to 10 per cent. in excess of that of 1912. The total coal production in 1912 was 7,846,638 short tons, valued at \$7,518,576. This was an increase of nearly 1,000,000 tons over the production of 1911. Over 75 per cent. of the total increase was made in Wise County. In 1912 8678 men were employed for an average of 251 days, compared with 7392 men for an average of 261 days in 1911. There were no labor troubles in 1912. The fatal accidents during the year numbered 75, of which 67 were underground, and 8 on the surface. Of the deaths underground, 33 were due to falls of roof and 10 to explosions or burns of gas. The production of iron ore in the State in 1912 was 446,305 long tons, compared with 614,023 in 1911. The production of pig iron in the State was 256,167 long tons in 1912, compared with 293,642 in 1911.

A small amount of copper is produced in the State. In 1912 this amounted to 96,753 pounds. It all came from mines in Prince William County.

The total value of clay products in the State in 1912 was \$1,874,174, an increase of \$134,274 over 1911. The principal clay product is common brick.

TRANSPORTATION. The railway mileage on January 1, 1912, was 4389.

EDUCATION. The school population of the State in 1911-12 was 616,168, and the enrollment was 409,397. The average daily attendance was 263,291. The total expenditure for schools was \$5,628,208.

FINANCE. The report of the State treasury for the fiscal year ending September 30, 1913, showed a balance on hand at the beginning of the year of \$224,396. The total receipts for the year were \$7,456,007, and the disbursements, \$7,062,448, leaving a balance on October 1, 1913, of \$627,955. The public debt on October 1, 1913, amounted to \$44,635,075.

CHARITIES AND CORRECTION. The State institutions include the penitentiary at Richmond; State farm at Lassiter post office; the Central State Hospital at Petersburg; the Eastern State Hospital at Williamsburg; the Southwestern State Hospital at Marion; Western State Hospital at Staunton; the Virginia Epileptic Colony at Madison Heights; the Catawba Sanatorium at Catawba; and the Virginia State School for the Colored Deaf and Blind at Newport News. In addition there are a number of other institutions supported by the State, but under the control of independent members and directors, as well as a number of private institutions which receive aid from the State.

POLITICS AND GOVERNMENT. The legislature did not meet in 1913, as the sessions are biennial and the last was held in 1912. Virginia was one of the few States in which elections for State officers were held during the year. On November 4 Henry C. Stuart, Democrat, was elected governor almost without opposition. The Republicans and Progressives were unable to agree on a candidate and made no nomination. The Socialist party and Socialist Labor party each made nominations for State officers, receiving votes returned from official ballot. The Republicans made no nominations, and according to custom, the Socialists will now become the minority party and have representation on electoral boards. Richmond began the operation of a commission form of government in part. The administrative board is the executive body for the city, having general charge of business affairs. The council makes its laws as usual. State Senator J. Randolph Tucker, Jr., of Bedford, resigned to accept a place on the Federal bench at Nome, Alaska. See also **LIQUOR REGULATION.**

STATE GOVERNMENT. Governor, Henry C. Stuart; Lieutenant-Governor, J. T. Ellyson; Secretary of Commonwealth, B. O. James; First Auditor, C. Lee Moore; Treasurer, A. W. Harman, Jr.; Superintendent of Instruction, R. C. Stearnes; Attorney-General, J. Garland Pollard; Adjutant-General, W. W. Sale; Commissioner of Agriculture, George W. Koiner; Commissioner of Insurance, Joseph Button—all Democrats.

JUDICIARY. Supreme Court of Appeals: President, James Keith; Justices, S. G. Whittle, John A. Buchanan, George M. Harrison, and Richard H. Cardwell; Clerk of the Court, H. Stewart Jones—all Democrats.

STATE LEGISLATURE, 1913. Democrats: Senate, 35; House, 92; joint ballot, 127. Independents and Republicans: Senate, 5; House, 8; joint ballot, 13. Democratic majority: Senate, 30; House, 84; joint ballot, 114.

The names of senators and representatives to Congress will be found in the article **UNITED STATES**, section *Congress*.

VIRGINIA, UNIVERSITY OF. A State university of higher learning, at Charlottesville, Va., founded in 1819. The enrollment by departments in December, 1913, was as follows: College, 403; law, 258; medicine, 104; graduate students, 47; engineering students, 102. The faculty numbered 93. Prof. A. H. Tuttle retired in 1913 on the Carnegie Foundation. Dr. S. A. Mitchell was elected full professor of astronomy. During the year 1912-13 the university received the sum of \$8172 under the will of the late Dr. C. G. Herndon, to endow two medical scholarships. This amount will be increased to about \$16,000, when the estate has finally been distributed. Mr. John T. Lupton of Chattanooga, Tenn., donated to the university \$1800 for the erection of a statue of George Washington. There were several other small benefactions. The productive funds of the university amounted to \$2,061,727 in 1912-13. The income from all sources amounted to \$294,294. The volumes in the library numbered about 100,000. The president is E. A. Alderman, D. C. L., LL. D.

VIRGIN ISLANDS. A presidency of the Leeward Islands (q.v.). Road Town, the capital, on the island of Tortola, has 410 inhabi-

tants. Fishing and sugar and cotton-raising are the chief industries. The majority of the trade is with the Danish West Indies. External trade (calendar years) and finance (fiscal years) statistics for the presidency follow:

	1908-9	1909-10	1910-11	1911-12
Imports	£8,629	£7,579	£8,717	£9,570
Exports	7,150	7,519	6,684	8,852
Revenue	2,278	2,371	6,091	8,200
Expenditure	2,251	2,334	5,964	6,446
Shipping *	14,422	12,853	12,770	12,631

* Tonnage entered and cleared.

Customs revenue (1911-12), £1316. There is no debt. The commissioner in 1913 was T. L. H. Jarvis. See **LEEWARD ISLANDS**.

VITAL STATISTICS. The New York State Health Department was collecting statistics regarding the mortality rates as connected with the marital condition during the past three years outside of Buffalo and New York City. The most obvious fact indicated by these statistics was that the death rate for husbands is much lower than for single men at each age group except the highest, where it is about the same. The percentage of difference is greatest at the ages 30-39 and 40-49, where the death rate of husbands is somewhat less than one-half that of bachelors. The table shows that the death rate of widowers and divorced men is considerably higher than that of husbands of the same age, and between 30 and 80 years not far different from the death rate of bachelors of the same age. The table shows further that the death rate of wives is lower than that of single women of the same age, the only exception being between ages of 20 and 29, which is perhaps in part due to the influence of child-bearing at those years and in part to the greater average age of wives in that group. The mortality of widows and divorced women is as a rule higher than that of spinsters. From the standpoint of mortality marriage is of less benefit to women than to men.

For the first time in its history the New York City Department of Health prepared a life table. A previous life table was prepared by Dr. John S. Billings under the direction of the Federal Census Bureau based on statistics for the triennium 1879 to 1881, while the 1913 table was based on the statistics of the years 1909 to 1911. The table shows the life expectancy of males and females at certain ages. The figures also show that the duration of life for a child between 5 and 10 years of age was forty-one years thirty years ago, while it is now five years longer than at that time. There has been an increase in the expectancy of life at all ages under 40 years, while at all ages after 40 years, in both males and females, there has been a decrease of expectancy varying from six months at 40 years to three years and three months at 85 years. The expectation of life is greater among females than among males up to 40 years of age; above 40 the reverse is true. It is pointed out that the lesson to be drawn from these figures is that the adult of the present generation is traveling at a pace too fast for his health, and that there is greater need from the standpoint of health for the practice of moderation in all things by the inhabitants of our cities.

Statistics of the population of France in 1912

were published in 1913. The excess of births over deaths was about 57,911, an average increase in population by 15 per ten thousand inhabitants, while in 1911 there was an excess of 34,869 deaths, or a diminution in the population of 9 per ten thousand. This improvement in the situation was due to a reduction in the number of deaths. These increased by only 8537. The number of births was 750,651, while for the five years preceding, 1907-11, the annual average was 770,186. To appreciate the advance of depopulation, it is only necessary to remark that before 1907, France never had less than eight hundred thousand births, before 1887 never less than nine hundred thousand, and before 1867 the figure approximated one million. As for deaths, there were in 1912, 692,740, which represents a diminution of 84,243 in comparison with the previous year. This diminution was due to a double cause. The summer of 1911 was excessively hot and dry, while the summer of 1912 was remarkably cool. In 1911 the intolerable heat killed many young children and a great number of valetudinarians, who except for this unusual season would have lived until the following year. The principal cause of the lower mortality in 1912, therefore, was the cool summer, which considerably lessened the mortality of infants in this year. Dr. Jacques Bertillon calls attention to the fact that Holland, with one-eighth the population of France, has had a larger absolute increase each year. In 1911 her population increased by 79,745. The only portions of French territory in which the birth rate was higher than the death rate were the regions of the north, Brittany, the frontiers of the east, Limousin and Corsica. The decrease in population becomes more marked each year in the basins of the Garonne and the Rhone. The number of marriages increased in 1912 to 311,929. Few countries have a larger rate in proportion to the population. The number of divorces was 14,579.

In Prussia during 1911 there were 1,225,091 births, 732,728 deaths (including 35,874 stillbirths), and 321,151 marriages. The excess of births was 492,363 or 12.1 per thousand of the average population. In 1912 there were born 1,219,867 children (including stillbirths), and there were 671,909 deaths. There were 328,415 marriages. According to this, the number of births was 5224 less than the previous year and the number of deaths 60,819 less. An especially striking feature of last year's statistics is the decreasing number of births with an increase in the number of marriages.

The following statistics as to contagious diseases throughout the world were compiled from the United States Marine Hospital Service reports. While in many instances incomplete and misleading, they were the best obtainable:

SMALL-POX. Algeria, 334 cases, 17 deaths; Arabia, 29 cases, 6 deaths; Argentina, 21 deaths; Australia, 1882 cases; Austria-Hungary, 166 cases, 4 deaths; British East Africa, 62 cases, 22 deaths; Canada, 646 cases, 5 deaths; Dutch East Indies, 2320 cases, 390 deaths; Egypt, 216 cases, 75 deaths; France, 117 cases, 31 deaths; Germany, 10 cases, 1 death; Gibraltar, 4 cases, 1 death; Great Britain, 38 cases, 1 death; India, 925 cases, 409 deaths; Italy, 58 cases, 2 deaths; Japan, 105 cases, 34 deaths; Mauritius, 1073 cases, 126

deaths; Mexico, 2558 cases, 553 deaths; Newfoundland, 63 cases; Peru, 241 cases, 1 death; Philippine Islands, 120 cases; Portugal, 146 cases; Russia, 677 cases, 176 deaths; Serbia, "epidemic," 16 cases, 3 deaths; Siam, 22 deaths; Spain, 849 deaths; Straits Settlements, 22 cases, 6 deaths; Sweden, 37 cases, 2 deaths; Switzerland, 135 cases, 1 death; Turkey in Asia, 343 cases, 239 deaths; Uruguay, 44 cases, 2 deaths; West Indies, 8 cases; Zanzibar, 22 cases, 3 deaths. See **SMALL-POX**.

CHOLERA. Arabia, 126 cases, 23 deaths; Austria-Hungary, 1778 cases, 335 deaths; Bulgaria, 191 cases, 46 deaths; Ceylon, 53 cases, 46 deaths; China, 262 cases, 94 deaths; Dutch East Indies, 2916 cases, 1972 deaths; Greece, 10 cases, 6 deaths; India, 118,004 deaths; Indo-China, 255 cases, 183 deaths; Japan, 156 cases, 44 deaths; Philippine Islands, 116 cases, 79 deaths; Rumania, 5340 cases, 2727 deaths; Russia, 286 cases, 111 deaths; Serbia, 4797 cases, 1928 deaths; Siam, 27 cases, 35 deaths; Straits Settlements, 57 cases, 45 deaths; Turkey in Asia, 1074 cases, 531 deaths; Turkey in Europe, 2334 cases, 1357 deaths; Zanzibar, 131 cases, 130 deaths.

YELLOW FEVER. Brazil, 109 cases, 89 deaths; British East Africa, 28 cases, 27 deaths; Ecuador, 369 cases, 206 deaths; Mexico, 32 cases, 10 deaths; Nigeria, "present"; Trinidad, "present"; Venezuela, 15 cases, 3 deaths.

PLAGUE. Afghanistan, September 1 to 30, 1913, 100 deaths daily; Arabia, 90 deaths; Argentina, 32 deaths; Brazil, 212 cases, 120 deaths; Canary Islands, 5 deaths; Chile, 70 cases, 50 deaths; China, 411 cases, 319 deaths; Dutch East Indies, 8909 cases, 8002 deaths; Ecuador, 535 cases, 207 deaths; Egypt, 647 cases, 306 deaths; Eritrea, 43 cases; German East Africa, 503 cases, 459 deaths; Greece, 9 cases, 2 deaths; Hawaii, 4 cases, 4 deaths; India, 194,208 cases, 163,249 deaths; Indo-China, 2745 cases, 2547 deaths; Japan, 208 cases, 147 deaths; Mauritius, 420 cases, 272 deaths; Morocco, 11 cases; New Caledonia, 62 cases, 32 deaths; Persia, 181 cases, 151 deaths; Peru, 568 cases, 217 deaths; Philippine Islands, 28 cases, 21 deaths; Russia, 198 cases, 181 deaths; Siam, 48 deaths; Turkey in Asia, 46 cases, 31 deaths. See **PLAGUE**.

See **CANCER**; **LEPROSY**; **TYPHOID FEVER**

VIVES Y TUTO, JOSÉ CALASANZIO. A Spanish Roman Catholic cardinal, died September 7, 1913. He was born in 1854 and was educated at Mattaro. At an early age he joined the Capuchins, being admitted in 1869 to the Capuchin Minors of the province of Guatemala, Central America. When General Barrios seized the power of Guatemala in 1872, the religious orders were obliged to leave the country. Vives y Tuto took refuge in Toulouse, where he remained for several years, becoming guardian of the Capuchin convent in Perpignan. In 1880 he returned to Spain and was appointed definitor for his own province. He was created cardinal-deacon of Sant' Adriano al Foro Romano by Leo XIII. in 1899.

VOCATIONAL EDUCATION. See **EDUCATION IN THE UNITED STATES**.

VODKA. See **LIQUORS**.

VOLCANOES. The single volcanic disaster of the year occurred on Ambim Island, in the New Hebrides group. An outburst on December 5 is reported to have killed 500 natives

and to have transformed the face of the island through the outpouring of lava and ash. Many of the Alaskan volcanoes were moderately active, notably those near Cook Inlet and along the Alaska Peninsula and its bordering islands. Katmai Volcano, across from Kodiak Island, shared in the eruptive display, but was not so destructively violent as in 1912, when it devastated a large area in its vicinity. For results of recent research in regard to volcanoes, see **GEOLOGY and MINERALOGY**.

WAGES. See **LABOR LEGISLATION; MINIMUM WAGE; ETC.**

WAIT, LUCIEN AUGUSTUS. An American mathematician and educator, died September 6, 1913. He was born in Highgate, Vt., in 1845, and graduated from Harvard College in 1870. From 1870-77 he was assistant professor of mathematics at Cornell University, but in 1873 he resigned these duties to serve as United States consul at Athens and Piræus. At the conclusion of this service he returned to Cornell University, where in 1877 he was appointed associate professor of mathematics. In 1895 he became head of the mathematical department, and served in that position until 1910, when he resigned.

WAKEMAN, THADDEUS BURE. An American author and advocate of free thought, died April 23, 1913. He was born at Greenfield Hill, Conn., in 1834; graduated from Princeton College in 1854, and in 1856 was admitted to the bar. He was president of the Liberal University of Kansas City until 1904, but on account of ill health, he was obliged to end his university work. He removed to Connecticut to engage in literary work. His published writings include: *An Epitome of Positive Philosophy and Religion; The Religion of Humanity; Liberty and Purity; The Age of Revision; and Evolution or Creation?* He made translations of Goethe's religious and other poems, and lectured on these and scientific subjects.

WALLACE, ALFRED RUSSELL. An English scientist, died November 7, 1913. He was born at Usk, in Monmouthshire, Wales, in 1823, and was educated at the Hertford Grammar School. In 1844, while a master at the Collegiate School at Leicester, he became acquainted with a naturalist, H. W. Bates, and as a result of the acquaintance, the two determined to make a natural history expedition to South America. On the return voyage the ship took fire and his notes and collections were burned. In 1853 he published an account of his expedition, entitled *Travels on the Amazon and Rio Negro*. In the following year he started for the Malay Archipelago with the object of obtaining specimens for his own collections and for those of museums and amateurs. He remained away from England for eight years, and during that time traveled over 14,000 miles in the East Indian Archipelago. Wallace was first introduced to Charles Darwin in 1854, the same year in which the former started on his East Indian journey. Nothing important seems to have come of this meeting, but it afterwards developed that the two scientists even at this time were engaged in the working out of theories, and practically came to the same conclusion in regard to the operation of the law of natural selection. In 1856 Darwin began to write out his views on the "tendency in organic beings de-

scended from the same stock to diverge in character as they became modified." Two years later he received from Wallace, who was then in the Moluccas, an essay on the "tendency of varieties to depart indefinitely from the original type." In this essay Darwin's own theory is clearly expressed. A result of this incident was that Darwin and Wallace became firm friends and frequent correspondents. Wallace's writings did much to promote the progress and understanding of the Darwinian doctrine, but he did not hold with Darwin in all the latter's theories. He held, for example, that other forces besides natural selection have molded a development of the human race, and a *World of Life*, published in 1910, gave clear expressions to these views. In 1881 Wallace was granted the civil pension of £200 a year. In addition to his studies in biology, he wrote much on other subjects. He early became impressed with the evils of the landlord system, and wrote in 1882 *Land Nationalism, Its Necessity and Aims*, and in 1913 *Social Environment and Moral Progress* related to the same subject. He also became interested in physical phenomena, and wrote in 1881 *Miracles and Modern Spiritualism*. In this he expressed a belief in the existence of preterhuman intelligences, able to act on matter and to influence the minds of men.

WARWICK, CHARLES FRANKLIN. An American lawyer, public official, and writer, died April 4, 1913. He was born in Philadelphia in 1852; educated in the grammar schools of that city; and studied law at the University of Pennsylvania, but was obliged to leave his law studies before graduation and became a book-keeper, studying at night and teaching in night schools. In 1873 he was admitted to the bar; became interested in politics; from 1884-95 was city solicitor of Philadelphia; and from 1895-99 was mayor of the city. The election of Mr. Warwick as mayor was one of the first blows dealt to the leadership of Senator Quay. He defeated Quay's candidate, Boies Penrose, who later became a United States senator. At the expiration of his office as mayor, Mr. Warwick became an active criminal lawyer. He found time, however, to study and write about the French Revolution. His first work, *Mirabeau*, was published in 1904. This was followed by *Danton and the French Revolution* (1908); *Robespierre and the French Revolution* (1909); and *Napoleon and the End of the French Revolution* (1910). He was a great admirer of Napoleon, and his Napoleonic collection is one of the most interesting in the United States.

WASHINGTON. POPULATION. The population of the State in 1910 was 1,141,990. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 1,344,686.

AGRICULTURE. The area, production, and value of the principal crops in 1912-1913 are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1913	34,000	952,000	\$ 762,000
	1912	31,000	846,000	651,000
Wheat	1913	2,300,000	53,300,000	38,909,000
	1912	2,285,000	53,728,000	36,535,000
Oats	1913	300,000	14,250,000	5,700,000
	1912	284,000	13,689,000	5,476,000

		Acreage	Prod. Bu.	Value
Rye	1913	8,000	168,000	101,000
	1912	9,000	180,000	117,000
Potatoes	1913	60,000	7,380,000	4,428,000
	1912	68,000	11,356,000	4,088,000
Hay	1913	780,000	21,794,000	19,555,000
	1912	776,000	1,707,000	17,241,000

a Tons.

MINERAL PRODUCTION. The total value of the mineral products of the State in 1912 was \$15,347,313, compared with \$15,865,277 in 1911. The State produces a considerable amount of copper. This in 1912 amounted to 1,069,938 pounds of blister copper, compared with 195,513 pounds in 1911. The total production of coal in the State in 1912 was 3,360,932 short tons, valued at \$8,042,871. This was a decrease from the production of 1911, which was 3,572,315 tons. The coal-mining industries of the State have suffered considerably during the last few years from the competition of fuel oil in California. Nearly all the Puget Sound steamers, which formerly consumed the greater part of the Washington coal, now burn fuel oil. Its use is becoming general, also, among railroads in the State. In 1912 there were 5519 men employed in the coal mines of the State, compared with 6498 in 1911. There were two strikes in the State during the year, and these were not of great importance. The total number of men killed in 1912 was 14, compared with 27 in 1911. The total value of the clay products in the State in 1912 was \$2,388,870, a decrease of \$451,502 from 1911. The principal clay product is vitrified brick.

TRANSPORTATION. The total railway mileage in the State on June 30, 1913, was 8830.90. The railways having the longest mileage are the Northern Pacific, 2738; the Great Northern, 1391; the Oregon-Washington Railroad and Navigation Company, 1199; Chicago, Milwaukee, and St. Paul, 807; Spokane, Portland, and Seattle, 548.

EDUCATION. The number of children of school age in the State on January 1, 1913, was 286,849. The enrollment in the schools was 230,477, and the average daily attendance was 171,488. The total number of teachers employed was 8459, of whom 6795 were women and 1764 men. The average salary paid to male teachers per month is \$106.41, and to female teachers \$80.20.

FINANCE. The total receipts from all sources for the year ending September 30, 1913, were \$9,836,293. The total disbursements for the same period were \$9,877,661. This included \$1,600,000 for the purchase of bonds. There was a balance at the beginning of the fiscal year of \$2,446,247, and at the end of the fiscal year of \$2,404,879. The chief sources of revenue are from direct and indirect taxes, the chief expenditures are for the accident fund, general fund, schools, highways, and the State militia. The bonded debt of the State amounts to \$306,024.

POLITICS AND GOVERNMENT. The State legislature met in 1913, and the most important measures enacted are noted in the paragraph *Legislation* below. In addition to the measures there mentioned, an important act provided for land development. This was popularly known as Murphine's logged-off land bill. Attempts were made by Clallam and King counties to take advantage of the law, but in each case it failed to receive the required number of votes.

There was no general State election during the year, as Governor Lister's term does not expire until January, 1917. The next State election will be held November 3, 1914. From July 5 to 12 the fortieth session of the National Conference of Charities and Correction was held in Seattle. In that city in the same month trouble occurred, as a result of a raid, made on the 18th, by a company of American sailors upon the Socialist and I. W. W. headquarters. As a result of newspaper comments on this affair the mayor of the city on the following day ordered a newspaper suppressed and saloons in the city closed. He was, however, restrained from suppressing the newspaper by court order. Mr. Daniels, Secretary of the Navy, on August 20 ordered the punishment of the sailors who had participated in the raid. On September 27 99 Socialists were arrested in Seattle for defying an injunction against street speaking. They were released from jail by writs of *habeas corpus* on October 3. The League of Washington Municipalities, meeting in Spokane on November 19 to 22, determined upon a policy of broader local self-government. The attempted control by the State of the trading-stamp business was taken to the Federal courts and was declared to be unconstitutional. The Supreme Court in reviewing a test case carried up from Spokane declared the minimum-wage law in the State to be constitutional, as it did also the article in the Cudihoe case.

LEGISLATION. Acts were passed putting into effect the initiative and referendum and recall amendments to the constitution, adopted at the election of November, 1912. Provision was made for the submission of a constitutional amendment removing restrictions against resident aliens holding lands within the municipalities. An industrial welfare commission was established, with power to fix the minimum wages for women. The legislature enacted a mothers' pension act and a juvenile court act. A State humane bureau was created to provide for the protection of incompetents, children, and minors. The legislature passed a family desertion act and an act providing for the abatement of disorderly houses similar to the Iowa law. State hospitals for the care of tuberculous patients were provided. Death penalty for murder was abolished, teachers' pensions and retirement funds were created, and a department of agriculture was established. Provision was made for the creation of agricultural districts for the purpose of utilizing, improving, and selling the idle lands of the State. A State highway law was passed, and a uniform warehouse receipts act. See also *LIQUOR REGULATION*.

STATE GOVERNMENT. Governor, Ernest Lister; Lieutenant-Governor, Louis F. Hart; Secretary of State, I. M. Howell; Treasurer, Edward Meath; Auditor, C. W. Clausen; Superintendent of Education, Josephine P. Preston; Attorney-General, W. V. Tanner—all Republicans except Governor.

JUDICIARY. Supreme Court: Chief Justice, H. D. Crow; Associate Justices, O. G. Ellis, M. A. Fullerton, W. Mount, M. F. Gose, S. J. Chadwick, George E. Morris, Emmett N. Parker, and J. F. Main—all Republicans except Chadwick and Ellis; Clerk, C. S. Reinhart.

STATE LEGISLATURE, 1913. Republicans: Senate, 27; House, 49; joint ballot, 76. Democrats: Senate, 9; House, 18; joint ballot, 27.

Courtesy of the *Review of Reviews*

ALFRED RUSSEL WALLACE

Died November 7, 1913

Progressives: Senate, 6; House, 29; joint ballot, 35. Republican majority: Senate, 12; House, 2; joint ballot, 14.

The names of senators and representatives to Congress will be found in the article UNITED STATES, section *Congress*.

WASHINGTON, UNIVERSITY OF. A State university of higher education, founded at Seattle, Wash., in 1861. The total number of students enrolled in the several departments of the university in the autumn of 1913 was as follows: In the college of liberal arts, 1054; college of science, 354; college of engineering, 432; college of law, 196; college of forestry, 72; college of mines, 59; college of fine arts, 59; school of pharmacy, 68; graduate school, 123; or a total of 2440. The faculty numbered 180. The most important event in the history of the university during the year was the retirement of Thomas F. Kane as president, to go into effect January 1, 1914. Dean Henry Landes was appointed acting president. The productive funds of the university amount to about \$3,000,000, and the income to about \$550,000, most of which is appropriated by the State.

WASHINGTON AND LEE UNIVERSITY. An institution of higher learning, founded at Lexington, Va., in 1749. The students enrolled in all departments in the autumn of 1913 numbered 455. Of these, 274 were in the academic department; 42 in the science department; and 139 in the law department. The faculty numbered 19 professors and 9 instructors. During the year Professor John H. Latané resigned from the professorship of history to become head of the history department at Johns Hopkins University. Dr. C. C. Pearson succeeded him temporarily. Professor A. P. Staples of the law department died in 1913. His successor had not been chosen at the end of the year. The university received from the estate of Robert P. Doremus of New York \$2,000,000, subject to life interests of the testator's father and widow. The productive funds of the university amount to about \$900,000, and the income for the fiscal year ending April 30, 1913, to about \$100,000. The library contains about 50,000 volumes. The president is Henry Louis Smith, Ph.D.

WASHINGTON UNIVERSITY. An institution for higher education, founded, in 1853, at St. Louis, Mo. The students in all the departments of the university in 1913 numbered 1338. There were 245 among the faculty. There were no noteworthy benefactions received during the year and no notable changes in the faculty. The productive funds amounted to \$6,697,590, and the income to about \$460,000. The library contains 138,285 bound volumes and 54,431 pamphlets. The chancellor of the university is David S. Houston.

WATERLOO, STANLEY. An American author and journalist, died October 11, 1913. He was born in St. Clair County, Mich., in 1846; graduated from the University of Michigan in 1869; served as editor on several Chicago and St. Louis papers; and in 1884 established the *St. Paul Day*. He was editorial writer on the *Chicago Tribune*, and for a time editor-in-chief of the *Chicago Mail*, later becoming editor of the *Washington Critic and Capital*. His published writings include: *A Man and a Woman*; *An Odd Situation*; *The Study of Ab*; *The Wolf's Long Howl*; *The Story of a Strange Career*

(1902); *These Are My Jewels*; *The Cassowary* (1908).

WATER POLLUTION. See WATER PURIFICATION.

WATER POWER. The two most important hydro-electric developments of the year were the Mississippi River Company's plant at Keokuk, Iowa, and the Hales Bar plant on the Tennessee River. (See DAMS.) The Keokuk plant supplies 150,000 horse power, with provision for subsequent increase to an aggregate of about 300,000, while the Hales Bar plant, which had been eight years in the course of construction, in spite of its capacity of 44,000 kilowatts, presented many interesting and original features. Other notable plants during the year, either started or extended, were the Appalachian development on the New River, Va., consisting of five plants, with an aggregate of 75,000 horse power, of which two were already completed; five plants for the New England Power Company on the Deerfield River, four of which were completed and the fifth under construction; a 12,000-horse power plant on the Coon Creek rapids in Minnesota, near Minneapolis; the Turner's Falls development on the Connecticut River, and a number of important systems on the Pacific Coast, including those of the Washington River Power Company, the San Joaquin Light and Power Company, and the Pacific Gas and Electric Company. See also ELECTRIC POWER, TRANSMISSION OF.

WATER PURIFICATION. From 1904 to 1913 no less than 17 cities of the United States having populations of 100,000 or more built water-purification plants, and at the close of 1913 the total population in the same country supplied with filtered water was 13,290,000, according to a paper by George W. Fuller, read before the American Public Health Association in September, 1913. The seventeen cities indicated were: Philadelphia, Pittsburgh, Washington, Indianapolis, Providence, Cincinnati, New Orleans, Hackensack (plant serves numerous other New Jersey towns), Louisville, Columbus, Atlanta, Birmingham, Scranton, Minneapolis, Grand Rapids, and (a small part of) New York City. Filter plants were built in Canada recently for Toronto and Saskatoon, and one was under construction for Montreal. Large plants were being built for St. Louis and Baltimore. A very large water-purification plant to treat the portion of the New York water-supply derived from the Croton River was designed through a period of two years and bids for it were received early in 1913. After long delay and some controversy the project was killed by the Board of Estimate and Apportionment, although it had authorized the various steps up to the time for a contract award and the plans had cost perhaps \$100,000. The reason given for abandoning the project was that the purification plant was not needed. This was counter to the opinion of nearly every one of a large number of engineers in private practice and all but one engineer in the employ of the city whose opinions on the subject had been obtained. It was generally agreed, however, that filtration was not imperative, but highly desirable as a safeguard against possible infection and as a means of improving the physical character of the water. The Croton supply is of the class known as surface water,

and it had long been the rule in Germany that all surface waters should be purified before being offered for domestic consumption. It should be added that the Croton supply was being treated with hypochlorite of lime for the reduction of bacteria, as were also hundreds of the water-supplies of the United States—even where the water was filtered.

Although many of the cities of the United States (like nearly all foreign cities which purify their water) were using slow sand filtration, nearly all the newer plants in this country were installing mechanical filters. Sand is the filtering medium in these, also, but with them the rate is very rapid and the washing is done by means of reversed water currents and air. A coagulant is used with the mechanical filters and lately it has also been used as an aid to sedimentation before turbid waters are passed through slow sand filters. Ozone and ultra-violet rays were still being promoted for reducing the bacterial content of water, but as yet neither could be said to be beyond the experimental or exploitation stage in the United States.

Consult Johnson, *The Purification of Public Water Supplies*, Water-Supply Paper 315, U. S. Geological Survey (Washington, 1913) for a readable review of the subject.

WATER-SUPPLY. See **AQUEDUCTS**.

WATER-WORKS. Whatever other improvement they may lack, all cities of any account, and most of the small towns and villages of the United States and Canada, have a public water-supply. It was always easy for the towns in well-watered hill sections to introduce "running water," and with the advent of a variety of low-priced pumping apparatus and elevated water tanks it was almost as easy for a town on the plains to get a water-supply—assuming there was water to be had. Unfortunately, no statistics showing the number and size of the water-works of the country have been compiled for many years past.

By far the largest new water-supply construction going on in 1913 was the Los Angeles aqueduct and its accessories, the completion of which was officially celebrated late in the year, although pipe lines from the end of the aqueduct to the city had not been completed; and the Catskill aqueduct and accessories, for New York City which was well advanced at the close of the year. (See **AQUEDUCTS**.) Projects for notable new water-supplies for Winnipeg, Manitoba, and Ottawa, Ontario, each involving long conduits, were also on foot at the close of the year, but the Ottawa project was clouded with legal difficulties. The San Francisco project for a new water-supply from the Hetch-Hetchy Valley, on the Tuolumne River, was authorized by Congress in December after a long, bitter struggle. The opposition, until near the end, consisted of the Spring Valley Water Company, which was supplying San Francisco with water; the Turlock and Modesto irrigation districts, which had rights in the river; and the so-called "nature lovers," who urged that to flood the Hetch-Hetchy Valley and blot out the beautiful mountain meadow at the proposed reservoir site, which is in the Yosemite National Park, but no part of the Yosemite Valley, would rob the people of the United States of one of their greatest natural beauties. A United States army

board of engineers and various other engineers and Federal officials conversant with the subject held that an equally beautiful mountain lake would be substituted for the meadow and that the water-supply needs of San Francisco and the adjacent cities were paramount. The Spring Valley Water Company and the officials of the irrigation districts withdrew their opposition, the company apparently expecting to sell its works to the city, and concessions having been made to the irrigation districts, the bill became a law. See **AQUEDUCTS**; **DAMS**; **MUNICIPAL OWNERSHIP**; **WATER PURIFICATION**.

WATSON, WILLIAM HENRY. An American physician and scientist, died January 1, 1913. Born at Providence, R. I., in 1829, and graduated from Brown University in 1852, he studied medicine in the University of Pennsylvania, and practiced successfully. But the work for which he became especially known was the development of the higher educational system of New York State, especially those parts of it pertaining to the study of medicine. He succeeded in procuring the passage of an act fixing the educational qualifications essential in beginning the study of medicine, and he was largely influential in extending the term of study for the practice of medicine from three years to four. It was largely due to him that the basis of admission to practice in the three legalized branches of the medical profession was put within the jurisdiction of an independent court appointed by the State. From 1875-81 he was United States pension examining surgeon, and in 1880 was surgeon-general of the State of New York, with the rank of brigadier-general. He contributed many papers to medical journals and delivered many addresses upon medical and literary themes. From 1891-1904 he was a regent of the University of the State of New York.

WEATHER BUREAU. See **UNITED STATES** under **Agriculture**; and **METEOROLOGY**.

WEDEKIND, FRANK. See **GERMAN LITERATURE**.

WEEKS, JOHN WINGATE. An American public official, elected in 1913 United States senator from Massachusetts (see **MASSACHUSETTS**). He was born in Lancaster, N. H., in 1860 and graduated from the United States Naval Academy in 1881. He served in the navy until 1883, when he engaged in business. From 1886-88 he was Assistant Land Commissioner of the Florida Southern Railway and in the latter year became a member of the firm of Hornblower and Weeks, bankers and brokers, in Boston. In 1903-04 he was mayor of the city of Newton, and in 1905 chairman of the Republican State convention. Elected to the 59th Congress (1905), he was reelected successively to the 60th, 61st, and 62nd Congresses. On the announcement, in 1912, by Senator Crane that he did not care to serve another term in the Senate, Mr. Weeks became a successful candidate. Mr. Weeks has always taken a strong interest in naval affairs, and was commander of the second division of the auxiliary United States naval corps on the Atlantic Coast during the Spanish-American War in 1898-99; a member of the militia advisory board of Massachusetts and the militia board of examiners (1894-1900); and in 1898 a member of the board of visitors to the United States Naval Academy.

WEEMS, CAPELL LAIN. A former congressman from Ohio, died January 5, 1913. He was born in Whigville, Ohio, in 1860, and received an academic education. He studied law and was admitted to the bar in 1883. In the following year he was elected prosecuting attorney of Noble County, and from 1894-98 was prosecuting attorney of Belmont County, Ohio. He was elected to the Fifty-eighth Congress in 1903, and was reelected to the Fifty-ninth and Sixtieth Congresses.

WEEVIL. See **COTTON.**

WEIGHTS AND MEASURES. During the year 1913 an increased use of the international metric system was recorded in several countries, the most notable item of progress being that a change from the old standards of Russia was being undertaken and that the metric system had been officially adopted for certain purposes and its general introduction had been officially favored. Such a step, if consummated, will give a common system of weights and measures to all Continental Europe. It was recorded that the same general tendency was being manifested by the republic of China and that preliminary steps towards the general adoption of the metric system have been taken, while in Japan the children in the schools are being taught the use of the metric units, and it seems only a matter of time when the national units, which are officially defined in terms of the metric system, will be supplanted by the international weights and measures. In Siam a central bureau of standards at Bangkok has been established, and the metric system has been introduced into the public works.

By an order in council made on the recommendation of the English board of trade the 200-milogram, or metric carat, for precious stones and the jewelry trade generally, was adopted for England to take effect April 1, 1914. This carat, which had been adopted by the American jewelry trade in 1912 and become standard on July 1, 1913, was also officially adopted by the United States Bureau of Standards and the Treasury Department, as well as the New York State department of weights and measures, and similar bureaus in other States. This makes practically a universal and international standard of weights in the jewelry trade.

A new alloy, available as a substitute for platinum for standard weights, was announced by M. Guillaume of the International Bureau of Weights and Measures. This material, which is an alloy of copper, chromium, and nickel, is non-porous to gases or liquids, homogeneous, non-hygroscopic, non-magnetic, and non-corrosive.

During the year the question of testing track scales on the various railway lines of the United States aroused increased attention, and there was constructed for the National Bureau of Standards a test-weight car to enable the officials of the bureau to make a systematic inspection of the track scales of the various railways. This car was of original design and carried 90,000 pounds of test weights accurately calibrated together with machinery for their handling. It made its initial trip through Vermont in November and enabled the officials in charge to accumulate considerable data for the future study of weight devices of large capacity, in addition to the testing of railway

scales in actual service. (See also **FOOD AND NUTRITION**, section *Food Inspection*.)

WEIHAIWEI. A British leasehold consisting of the island of Liukung, all the islands in the bay of Weihaiwei, and a strip of mainland ten miles wide along the entire coast of the bay. Area, 285 square miles; population (1911), 147,177. Commissioner (1913), Sir J. H. Stewart Lockhart, residing at Port Edward.

WELFARE WORK. During recent years a very considerable number of the largest corporations and other employers of the United States have undertaken various activities which are commonly grouped under the term of welfare work. These include numerous provisions ranging all the way from lunch rooms and locker rooms to the institution of extensive medical and sanitary systems, and provision for old age and compensation for industrial injuries. The United States Bureau of Labor Statistics issued a bulletin (Miscellaneous Series IV; Whole No. 123) entitled, *Employers' Welfare Work*, in which were briefly sketched the plans for industrial betterment in operation in many plants. Included in the study were machine shops, electrical manufacturing companies, woolen mills, factories producing clothing, paints, and various foodstuffs, miscellaneous establishments, printing and publishing houses, mercantile establishments, mail order houses, and telephone, insurance, power, railway, express, and hotel companies.

One of the most expensive schemes is that instituted by the International Harvester Company. Its welfare work was made a regular bureau of the manufacturing department with a superintendent in charge. The superintendents of the twenty plants of the corporation constituted an advisory board for the organization and promotion of welfare work; from them was chosen an executive committee of five. The welfare bureau promotes industrial safety, health and sanitation, educational work, charity, recreation, savings and loans, and civic improvement. Independent of this welfare bureau the company has made provision for old-age pensions, insurance against industrial accidents, and an employees' benefit association. A system of standardized safety devices has been introduced wherever possible in all plants. In addition a pamphlet of rules and instructions printed in ten languages is distributed among employees. Each plant has a safety inspector who regularly inspects each department. Since 1910 the employees in twine mills, lumber mills, steel mills, mines, and on the company railroad have received compensation for injuries resulting from accidents during employment. Compensation in case of death equals three years average wages, but not less than \$1500 nor more than \$4000. Special compensation for loss of hand, foot, or eye, or other serious injury is provided and graded amounts for injuries resulting in temporary disability only. Since 1908 a pension system has been in operation. All male employees twenty years or more in the service of the company may retire at age sixty-five, and must retire at age seventy. All women employees after twenty years or more of service may retire at fifty years of age and must retire at sixty years of age. Pensions amount to one per cent. of the average annual earnings during the ten years preceding retirement multiplied by the number of years of

active service; but no pension is less than eighteen dollars a month or more than one hundred dollars. At the same time a benefit association was organized and its funds guaranteed by the company. This association gives sick benefits to all and accident benefits to all those not included in the industrial accident plan. Its membership in 1910 was 23,246, or about two-thirds of all the employees.

Other extensive plans have been instituted by the United Shoe Machinery Company, the Western Electric and Manufacturing Company, the Shredded Wheat Company, the National Cash Register Company, the Curtis Publishing Company, large department stores in Chicago, New York, Philadelphia, and Boston, and the Chicago Telephone Company. The welfare work of the United States Steel Corporation and the telephone and telegraph companies not included in the Labor Department bulletin is described below.

UNITED STATES STEEL CORPORATION. One of the most extensive industrial betterment schemes is that being carried out by the Steel Trust. It has a voluntary workmen's compensation plan which costs it annually about \$2,000,000. This plan does not deny the worker his legal right to bring suit for damages, but since its inauguration such suits have been begun in only one case out of four or five hundred. The corporation has for six years carried on a consistent campaign for the prevention of accidents both by instructions to employees and by the introduction of safety devices. Since 1907 the number of serious accidents has been reduced 43 per cent.; the cost to the companies has been about \$2,500,000; and a large sum is annually set aside for the continuance of this campaign. At all mills and mines of the constituent companies provision has been made for hospital and medical care for those injured at work. The pension system is financed by annual appropriations, and a fund of \$12,000,000, of which \$4,000,000 was given by Andrew Carnegie. Employees who have worked for the corporation twenty years may be retired on pensions ranging from \$12 to \$100 per month. The corporation has instituted a diversified programme of sanitation and general welfare. This includes sewage disposal, provision of pure water in plants and company houses, drainage, fly prevention, garbage collection, maintenance of neat and attractive yards and properties, the installation of wash-rooms, shower-baths, swimming-pools, and lockers, the establishment of play-grounds, and the cultivation of interest in gardening. Not all of the companies have done all of these things. Most of these reforms require the intelligent coöperation of the workers and their families, and by skillful instruction and management a kindly feeling of employees toward employers was expected to develop. Finally, in 1913, the corporation introduced throughout its activities a six-day week; and effected a reduction in the extent of reliance on the twelve-hour day.

TELEPHONE AND TELEGRAPH COMPANIES. Following the establishment in 1912 of an employees' insurance system for the American Telephone and Telegraph Company, the Western Union Telegraph Company, and the Western Electric Company, there was instituted a system of medical supervision and preventive sani-

tation. This scheme for protecting health was developed by the employees' benefit fund committee, to which had been given the \$10,000,000 set aside in 1912 for retirement pensions, sick benefits, compensation for accidents, and life insurance. Annual appropriations will be made for these purposes and for the new medical department. Dr. Alvah H. Doty, former health officer of the port of New York, was employed as medical director. President Vail announced that this new department was to have a very broad scope, especially in the direction of prevention of all forms of communicable disease. Employees found to be afflicted with tuberculosis were to be promptly removed and cared for by the benefit fund. See also **CHARITIES**.

WELLAND SHIP CANAL. See **CANALS**.

WELLESLEY COLLEGE. An institution for the higher education of women, founded at Wellesley, Mass., in 1875. The students enrolled in the several departments in the autumn of 1913 numbered 1480. The teaching force numbered 133. The most noteworthy change in the administration of the college during the year was the appointment of Alice Vinton Waite, professor of English and composition, as dean of the college, to succeed Ellen F. Pendleton, resigned. The college received during the year \$100,000 as the first contribution to the \$1,000,000 endowment fund which it is attempting to raise. The productive funds in 1912-13 amounted to \$1,314,677, and the income for that year to \$43,744. The library contains 76,770 volumes.

WELSH DISESTABLISHMENT. See **GREAT BRITAIN**.

WERNER, ALFRED. A Swiss scientist, awarded in 1913 the Nobel Prize in chemistry. He was born in 1866. Much of his important work has been in connection with molecules. He conceived the molecule in three dimensions, and showed how two compounds might be identical in composition and connections, and yet be different in structure, and consequently different in properties. He developed a new province of the inorganic world, and built up compounds of cobalt, platinum, ammonia, and water as complex as the hydrocarbons.

WESLEYAN METHODIST CONNECTION OF AMERICA. This denomination was founded in 1843 by members of the Methodist Episcopal Church who strongly opposed the institution of slavery. In 1913 there were about 18,765 members and 705 ministers. In the Sunday schools were 21,050 teachers and officers and 26,711 scholars. Three schools of college grade are maintained—at Central, S. C., at Houghton, N. Y., and at Miltonvale, Kan. One school of preparatory grade with a theological department is conducted at Fairmont, Ind. The denomination carries on missions at Sierra Leone, West Africa, and in India. The last meeting of the body was held in October, 1911. See also **RELIGIOUS DENOMINATIONS AND MOVEMENTS**.

WESLEYAN UNIVERSITY. An institution of higher education at Middletown, Conn., founded in 1831. The enrollment in all departments in the autumn of 1913 was 420. The faculty numbered 41. Professor W. C. Fisher of the department of economics, resigned in the spring of 1913, and Professor Charles A. Tuttle of Wabash College, was appointed in his

place. The productive funds of the college amount approximately to \$2,120,000, and the income to about \$165,000. In the spring of 1913 an endowment fund of \$1,000,000 was raised, and of this about \$625,000 has already been paid in. The library contains 94,500 volumes. The president is William K. Shanklin, D. D.

WESTERN AUSTRALIA. A state of the Commonwealth of Australia. Area, 975,920 square miles. Population (census of April 3, 1911), 282,114, exclusive of full-blooded aborigines. Perth is the capital, with (1911) 31,300 inhabitants; population of the local government area, 35,767; with suburbs, 106,792. A report issued during the year on railways indicated that 2854 miles were completed, or in progress, eight lines aggregating 614 miles. The mileage opened was 48 miles on the Eastern system, 35 miles on the Great Southern Railway, and 33 miles in the north. The state lines have a three-foot six-inch gauge, but from Fremantle to Kalgoorlie there was to be a duplicate line of standard 4-foot 8½-inch gauge, so as to fit in with the Trans-Australian line. This was to be 387 miles long and of this 183 miles had been sanctioned. Governor in 1913, Major-General Sir Harry Barron (appointed 1913). Premier, John Scaddan. See AUSTRALIA.

WESTERN RESERVE UNIVERSITY. An institution for higher education at Cleveland, Ohio, founded in 1826. The students enrolled in the several departments in the autumn of 1913 numbered about 1300. The faculty numbered about 275. There were no noteworthy changes in the faculty during the year. The gifts included the completion of payments of the one-million-dollar endowment for the School of Medicine and the completion of a fund of \$80,000 for the memorial dormitory for the College of Women. The productive funds of the university amount to about \$3,500,000. The library contains 100,000 volumes. The president is Charles F. Thwing, D. D.

WESTLAKE, JOHN. An English jurist and writer on legal subjects, died April 13, 1913. Born in Cornwall in 1828, educated at Trinity College, Cambridge, he became in 1854, a barrister, was appointed professor of international law in the University of Cambridge in 1888, serving in this position until 1908. From 1900-1906, he was one of the members for the United Kingdom of the International Court of Arbitration and of the Hague Convention. Among his writings on legal subjects were: *A Treatise on Private International Law, or the Conflict of Laws* (1858); *Chapters on the Principles of International Law* (1894); *International Law, Part I. Peace* (1904), *Part II. War* (1907).

WESTPHAL'S COMET. See ASTRONOMY.

WEST VIRGINIA. POPULATION. The population of the State in 1910 was 1,221,119. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 1,306,345.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture, and those given for 1913 are estimates only.

		Acres	Prod. Bu.	Value
Corn	1913	732,000	22,692,000	\$18,154,000
	1912	725,000	24,505,000	15,928,000

		Acres	Prod. Bu.	Value
Wheat	1913	235,000	3,055,000	\$ 3,055,000
	1912	233,000	3,378,000	3,412,000
Oats	1913	115,000	2,760,000	1,408,000
	1912	111,000	3,108,000	1,461,000
Rye	1913	17,000	230,000	200,000
	1912	17,000	221,000	186,000
Potatoes	1913	48,000	3,984,000	3,586,000
	1912	47,000	5,264,000	3,264,000
Hay	1913	740,000	8,925,000	13,782,000
	1912	745,000	1,028,000	15,420,000
Tobacco	1913	15,000	10,200,000	1,224,000
	1912	15,800	12,008,000	1,321,000

a Tons. b Pounds.

MINERAL PRODUCTION. The total value of the mineral products of the State in 1912 was \$123,872,358, compared with \$101,932,248 in 1911.

The coal production in 1913 was estimated by the United States Geological Survey at from 5 to 10 per cent. in excess of that of 1912. Labor troubles in the Cabin Creek and Paint Creek districts of the Kanawha field, were settled during the early part of the year, and resulted in the securing of a foothold by the labor organizations in some of the coal mining districts of the southern part of the State. During the spring, in addition to labor difficulties, shipments to the West were cut off to some extent by disastrous floods in the Ohio Valley region. West Virginia is one of the leading producers of coal. It ranks second among States, having taken the lead over Illinois in 1909. When the value of the product is considered, however, West Virginia drops to a rather poor third. The total production in 1912 was 66,786,687 short tons, valued at \$62,792,234. This was the record year in the coal production of the State. In 1911 59,831,580 tons were produced. The average price per ton in 1912 was \$.94, compared with \$.90 in 1911. Over half the coal in the State is mined by machine.

During the greater part of 1912 the portion of the Kanawha district was the scene of a long and bitter struggle between the miners and the operators. The mines affected were located at Paint and Cabin creeks. (For a history of these troubles, see STRIKES and WEST VIRGINIA, *Politics and Government*.) The influence of these troubles upon the production in 1912 is shown in the decrease of 557,469 short tons, or about 10 per cent., in the production of Kanawha County, and of 340,554 tons in output of Fayette County; whereas in most of the other counties of the State, the production of 1912 showed good gains over the preceding year. The total number of men reported idle because of labor troubles in 1912 was 12,165, and the total number of working days lost was 606,588, or an average of 50 days for each of the men employed. The total number of men employed in the coal mining in 1912 was 68,248, to work an average of 266 days. In 1911 there were 66,730 men at work, an average of 221 days. There were 359 fatal accidents in the coal mines of the State in 1912, compared with 360 in 1911. Of the fatalities in 1912, 346 were underground, 3 in the shafts, and 10 on the surface. Falls of roof were the cause of more than one-half the underground fatalities.

The petroleum production in the State in 1912 was 12,128,962 barrels, compared with 9,795,464 in 1911. The production in 1912 was the largest in the history of the State.

The increase was due to the remarkable development in the Blue Creek field in Kanawha County, which was begun in September, 1911. In 1912 the field extended rapidly northeast and southwest, until it attained a length of about ten miles. In May, the production reached about 25,000 barrels a day, but this decreased until at the end of the year there was a total production of 8000 barrels. Other developments in the same locality resulted in other productive wells. The total number of wells in the State in 1912 was 1657. The total value of the clay product of the State in 1912 was \$4,775,874, an increase of \$442,454 over 1911. The principal product is the white ware of which the State is the second largest producer.

TRANSPORTATION. The total mileage of steam railways in 1913 was 3566. The Baltimore and Ohio system had the longest mileage, 1071; the Chesapeake and Ohio had 641; the Norfolk and Western, 437; the Western Maryland Railway Company, 197; and the Virginian Railway Company, 739. The electric railways had a mileage in 1913 of 278.

EDUCATION. The total enrollment in the public schools of the State in 1913 was 287,912. The average daily attendance was 202,172. The total number of teachers was 9590. The average yearly salary of teachers, both male and female, was \$365. In 1912, the latest year detailed statistics are available, there were 365,455 white pupils of school age in the State, and 17,483 colored pupils. The legislature of 1913 passed several important measures relating to education. These included a provision making it possible for two adjoining school districts to provide for a joint district high school, should such a plan prove feasible. Another act established an agricultural extension in the University of West Virginia. The use of cigarettes in school houses and on school grounds was prohibited.

FINANCE. The fiscal year in 1913 contained nine months. The legislature of 1912 changed the fiscal year from October 1 to July 1. For the fiscal year October 1, 1912 to June 30, 1913, the total receipts were \$4,251,999. The total disbursements for the same period were \$5,185,068. There was a balance in the treasury beginning the fiscal year of \$1,615,515, and at the end of the fiscal year of \$683,466. The chief sources of revenue are from license taxes, taxes on the charters of corporations, and direct taxes on personal and real estate. The State has no bonded debt.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions under control of the State, with their populations in 1912-13, are as follows: West Virginia Hospital for Insane, Weston, 1030; Second Hospital for Insane, Spencer, 492; West Virginia Asylum, Huntington, 586; Miners' Hospital No. 1, Welch, 51; Miners' Hospital No. 2, McKendree, 28; Miners' Hospital No. 3, Fairmont, 37; West Virginia Penitentiary, Moundsville, 1139; West Virginia Industrial School for Boys, Grafton, 295; West Virginia Schools for the Deaf and Blind, Romney, 195; State Tuberculosis Sanitarium, Terre Alta, 51; West Virginia Colored Orphans' Home, Huntington, 71; and West Virginia Children's Home, Elkins, 32.

POLITICS AND GOVERNMENT. There were no elections for State officers during the year, as

the terms of Governor Hatfield and the other State officials do not expire until March 4, 1917. The next State election is on November 7, 1916. The most important incidents in the State's history during the year were connected with the strike in the coal-mining regions. For a detailed account of these strikes, see **STRIKES**. The legislature on February 24 elected Nathan Goff United States senator to succeed Clarence W. Watson, whose term expired March 4, 1913. Senator Goff was elected after a deadlock which lasted from January 9 until the date of his election. On February 12 five legislators were arrested for bribery, and on February 15 these members were indicted for this crime. All were convicted after exciting trials, and are now serving penitentiary terms. On October 14 Major Matthew M. Neely, Democrat, was elected to Congress from the first district, to succeed John W. Davis, Democrat, who resigned to accept the office of solicitor-general.

LEGISLATION. The legislature met in 1913 and passed several important measures. These include the following: An inheritance tax act, a public utilities act providing for a public service commission having jurisdiction over persons or corporations engaged in any public service business, a workmen's compensation act, an act providing for State-wide prohibition, a blue-sky law, an anti-trust and monopoly law relating to common carriers, laws regulating insurance rates, and a measure establishing a State road bureau and a State system of roads. See also **LIQUOR REGULATION**.

STATE GOVERNMENT. Governor, Henry D. Hatfield; Secretary of State, Stuart F. Reed; Superintendent of Free Schools, M. P. Shawkey; Auditor, John S. Darst; Commissioner of Agriculture, Howard E. Williams; Attorney-General, A. A. Lilly; Treasurer, E. L. Long; Adjutant-General, Charles D. Elliott—all Republicans.

JUDICIARY. Supreme Court of Appeals: President, George Poffenberger; Associate Judges, William N. Miller, Ira E. Robinson, L. Judson Williams, Charles W. Lynch; Clerk, W. B. Mathews—all Republicans.

STATE LEGISLATURE, 1913. Democrats: Senate, 15; House, 33; joint ballot, 48. Republicans: Senate, 15; House, 53; joint ballot, 68. Republican majority, 20.

The names of senators and representatives to Congress will be found in article **UNITED STATES**, section *Congress*.

WEST VIRGINIA UNIVERSITY. A State university for higher education, founded in 1867, at Morgantown, W. Va. The students enrolled in all departments of the university in the autumn of 1913 were 714. The faculty numbered 96. In the School of Medicine several important changes were made in the faculty. Aaron Arkin, M.D., Ph.D., was appointed professor of pathology and bacteriology. William Henry Schultz, Ph.D., was appointed professor of pharmacology and materia medica. There were no noteworthy benefactions during the year. The productive funds of the university amount to about \$115,000, and the income to about \$240,000. This is derived chiefly from the State legislature. The library contains about 46,500 volumes. The president is Thomas E. Hodges, LL.D.

WHALES. See **FISH AND FISHERIES**.

WHEAT. The world's wheat production in 1913 was about 3,860,000,000 bushels, or approximately 100,000,000 bushels more than were produced in 1912, and about a billion bushels more than the normal yields of twenty years ago. Statistics indicated that the year's yield was the highest ever secured, and the production in several of the principal wheat-growing countries also reached the record mark. According to data published by the International Institute of Agriculture at Rome, Russia ranked first among the countries of the world, with a record yield of approximately 975,000,000 bushels, or nearly 250,000,000 bushels more than the yield of 1912. The yield of European Russia was made up of 295,000,000 bushels of winter wheat and 542,000,000 bushels of spring wheat. The average yield of the winter wheat was 18 bushels and of the spring wheat 12 bushels per acre, while the average acre yield for the total Russian area in Europe and Asia was about 13.5 bushels. The United States ranked next to Russia, with a record yield of 763,380,000 bushels. The crop harvested in British India in the early part of 1913 was about 360,000,000 bushels, which was somewhat less than the crop of the previous year. France produced 322,000,000 bushels, being about $3\frac{1}{2}$ per cent. less than the yield of 1912; and Italy 215,000,000 bushels, or about 30 per cent. more than the year before. The Canadian crop of this year, which amounted to 207,000,000 bushels, was about 4 per cent. greater than the preceding crop, as the result of an increase in acreage, and average acre yield. Germany produced 150,947,000 bushels of winter wheat and 19,928,000 bushels of spring wheat, or a total of 170,875,000 bushels. This was the largest production during the previous ten years, and the rate of yield which was about 35 bushels per acre for each kind of wheat was also the highest for that period. Hungary ranked next to Germany with a yield of about 167,000,000 bushels, being followed by Spain with about 110,000,000 bushels, and Rumania with 104,000,000 bushels.

The United States produced over 33,000,000 bushels of wheat more in 1913 than in 1912. The area devoted to the crop was 50,184,000 acres, which had been exceeded only once. The average yield was 15.2 bushels per acre, compared with 15.9 bushels the year before. On the basis of the farm price of 79.9 cents per bushel on December 1, 1913, the crop was valued at \$610,122,000, as against a valuation of \$555,280,000 and a farm price of 76 cents per bushel on the corresponding date in 1912. The leading States and their yields were as follows: Kansas, 86,983,000 bushels; North Dakota, 78,855,000; Minnesota, 68,040,000; Nebraska, 62,325,000; Washington, 53,300,000; and Illinois, 41,888,000 bushels. The acreage in the different States ranged from 1000 acres in Mississippi and Vermont to 7,510,000 acres in North Dakota, and the average yield per acre from 9 bushels in South Dakota to 32 bushels in Arizona. The unusually low acre-yield of South Dakota was due to the severe summer drouth, which proved very injurious to the later-maturing wheat fields. South Dakota had an acreage of 3,775,000 acres of which all but 100,000 acres was in spring wheat. The production of Arizona is limited to winter wheat and the acreage for the year was only 29,000 acres.

The winter wheat crop of the United States made an exceptionally good growth in the fall of 1912 and most of it was mature when the dry weather set in which characterized the summer of 1913 over a large portion of the country. The total yield of winter wheat reached 523,561,000 bushels, or about 124,000,000 bushels more than produced in 1912. The crop was grown on 31,609,000 acres, as compared with 26,571,000 acres in winter wheat the year before. As in the previous year Kansas and Nebraska again led in production and acreage, the respective yields being 86,515,000 and 58,125,000 bushels. According to the Department of Agriculture, which published the data here given, 39 States reported winter wheat yields and 18 States spring wheat yields. Of the spring wheat States only two, Maine and Vermont, reported no winter wheat production, and of the winter wheat States 23 produced no spring wheat.

The crop of spring wheat was much injured by the drouth and the production of 239,819,000 bushels was about 90,000,000 bushels below the production of 1912. The acreage was somewhat reduced, being 18,485,000 acres, as against 19,243,000 acres the preceding year. The average acre-yield was reduced from 17.2 to 13 bushels. The leading States and their yields were as follows: North Dakota, 78,855,000 bushels; Minnesota, 67,230,000; South Dakota, 33,075,000; and Washington, 20,900,000 bushels. All other States produced less than 10,000,000 bushels.

WHISKY. See LIQUORS.

WHITE, STEPHEN VAN CULEN. An American financier, died January 18, 1913. He was born in Chatham County, N. C., in 1831, and graduated from Knox College in 1854. A few years later he was admitted to the bar, and for nearly ten years practiced in Des Moines, Iowa. He then removed to New York and became a stock broker, forming the partnership of Marvin and White. This firm failed two years later. In 1882 the firm of S. V. White and Company was organized, and took an important part in the affairs of Wall Street, and Mr. White gained a reputation for skill and daring in his stock manipulations. In 1891 he made an attempt to corner the corn supply of the country. This corner was broken and he failed for \$1,000,000. Within a year, however, he had paid off his entire indebtedness. In 1902, at the age of seventy-one, he sold his seat on the Stock Exchange. Mr. White became president of the American Astronomical Society when it was formed in 1883. In 1886 he was elected to Congress as a Republican. He was closely identified with Plymouth Church, and was a warm friend of Henry Ward Beecher. It was said that he paid the expenses of the famous Beecher trial. Mr. White was one of the best-known and most picturesque figures in the financial district of New York.

WHITE, WILLIAM HALE. An English writer, better known under his pen name, "Mark Rutherford," died March 14, 1913. He was born in Bedford, England, in 1820, and in his early years earned a living by hack writing. His full knowledge of certain subjects, including Dissent, past and present, and Calvinism, and his intimate knowledge of the poor, gained through personal experience, made it possible for him to write of these things with authority.

His first successful publication, *The Autobiography of Mark Rutherford*, was widely read throughout English-speaking countries and made a profound impression. It was followed in 1885 by *Mark Rutherford's Deliverance*, *The Revolution in Tanner's Lane*, in 1877, and *Miriam's Schooling*, 1890. Following these came several volumes of philosophical writings, including a work on Spinoza. In 1898 he published *An Examination of the Charge of Apostasy Against Wordsworth*; in 1900 *Pages from a Journal*, and in 1905 a biography of John Bunyan.

WHITE, SIR WILLIAM HENRY. An English naval officer, died February 27, 1913. He was born at Devonport in 1845. After an education in the local schools he entered the Royal Dockyard at Devonport as an apprentice. At the age of fourteen, in 1864, he took a successful examination for entrance to the Royal School of Naval Architecture. He was instructor in this school and at once entered the admiralty, where he rose to be chief constructor in 1885, continuing in this position until 1902, when he was obliged to retire on account of ill health. During this period he designed and constructed 43 battleships, 26 armored cruisers, 21 first-class protected cruisers, 48 second-class, 33 third-class, and 74 unprotected vessels, a total of 245 vessels. At his resignation Parliament voted him a special grant in recognition of his exceptional services to the navy. He had a large part in the investigation which preceded the construction of the *Lusitania* and *Mauretania*, and he was largely responsible for the use of turbine engines in these ships. Aside from his professional duties he took great interest in scientific matters. Among his publications were: *A Manual of Naval Architecture*; *A Treatise on Shipbuilding*; and numerous professional papers published in the transactions of the Institutions of Naval Architects, and in those of other scientific bodies.

WHOOPING COUGH. See VACCINE THERAPY.

WIDOWS' PENSIONS. See PENSIONS FOR MOTHERS.

WILDER, WILLIAM HENRY. An American public official, member of Congress from Massachusetts, died September 11, 1913. He was born in Belfast, Me., in 1855, and in 1866 removed to Massachusetts. He was educated in the public schools until the age of seventeen, when he worked on a farm. He engaged in mercantile and manufacturing business at Gardner, Mass., and built up a large business which was incorporated as the Wilder Industries. He studied law, and in 1900 was admitted to the bar. In 1911 he was elected to the Sixty-second Congress. He made a special study of monetary questions, and studied the monetary systems in Europe in 1909. He wrote many pamphlets and articles on this and other questions.

WILLIAMS COLLEGE. An institution of higher education at Williamstown, Mass., founded in 1793. The total enrollment in all departments of the college in the autumn of 1913 was 496. The faculty numbered 55. There were no noteworthy changes in the faculty during the year, and no notable benefactions. The productive funds amount to \$1,587,286, and the income to \$67,862. The library contains about 70,000 volumes. The president is Henry A. Garfield, LL.D.

WILSON, CHARLES IRVING. An American soldier, died September 22, 1913. He was born at Washington, D. C., in 1837, and was educated in the University of Virginia. In 1861 he was appointed assistant surgeon to the United States army with the rank of first lieutenant, and became finally medical director of the cavalry corps of the military division of the Shenandoah Valley. In 1865 he was brevetted major for bravery in engagements in the Shenandoah Valley. After service in Washington, D. C., as executive officer of the Lincoln General Hospital and as post-surgeon at Fort Washington, Md., he resigned from the medical corps and was appointed captain in the United States infantry in 1867. In this capacity he aided in the reconstruction work in the South. He was promoted through various ranks until he became brigadier-general. In 1901 he retired.

WILSON, HENRY LANE. See MEXICO, History.

WILSON, WILLIAM BEAUCHOP. An American public official. Secretary of Labor in the cabinet of President Wilson. He was born at Blantyre, Scotland, in 1862. In 1870 he removed to the United States and received a common school education in Pennsylvania. From 1871 to 1898 he worked in coal mines in Pennsylvania; took an active interest in labor questions; and in 1888 was elected president of the District Miners' Union, serving until 1890. In 1890 he became a member of the national executive board which organized the United Mine Workers. He was an unsuccessful candidate for Congress in 1892. From 1900-1908 he was secretary and treasurer of the National Union of Miners. In 1907 he was elected to the Sixtieth Congress and was reelected to the Sixty-second Congress for the term expiring in 1913.

WILSON, PRESIDENT WOODROW. See UNITED STATES, *passim*.

WINDWARD ISLANDS. The British West Indian colonies of St. Lucia, St. Vincent, and Grenada; together with the Grenadines, attached partly to Grenada and partly to St. Vincent. See articles on separate colonies. The governor and commander-in-chief (1913, Lieut.-Col. Sir James Hayes Sadler) resides at St. George's (Grenada). Included geographically with the Windward Islands are the Barbados and Trinidad and Tobago.

WINE. See LIQUORS.

WINSLOW, LYTLETON STEWART FORBES. An English physician and psychologist, died July 6, 1913. He was born in London in 1884, and was educated at Downing College, Cambridge. He was a direct descendant of Edward Winslow, the first governor of Plymouth colony. He took his medical degree in 1870, and was associated afterwards with his father. Dr. Winslow became a specialist in lunacy, and appeared as an expert witness in many notable trials in Great Britain and the United States. His published writings on diseases of the mind and other medical subjects include: *Manual of Lunacy*; *Mad Humanity*; *Uncontrollable Drunkenness*; and *Spiritualistic Madness*. He was over eight years editor of the *Psychological Journal*. He wrote also a book of reminiscences, entitled *Recollections of Forty Years*, and contributed many articles to reviews in England and the United States.

WIRELESS TELEGRAPHY AND TELEPHONY. The developments in radio-telegraphic

practice in 1913 showed a distinct trend from the variety of equipment and methods which marks a partially perfected art to the standardization of a mature one. In no respect was this tendency more pronounced than in the general use of sustained waves. For transmission over a few hundred miles it had become almost universal practice to use comparatively high frequency waves occurring in regular groups. The musical tone so produced in the receiver permits communication to go on through practically all atmospheric disturbances, hence is of highest importance in marine work. The excellent penetrating properties of regular spark frequencies of about 1000 per second received ample demonstration. Among plants intended for transmission over very great distances a tendency arose to utilize the interference of two wave frequencies too high to be audible to produce musical "beat" tones in the receiving equipment.

The perfecting of the radio-compass or direction finder of Bellini and Tosi permits the location of a ship sending out distress signals to be determined without the announcement of its position, also provides means whereby warning signals may be received from light-houses, and in event of sustained fog or cloudy weather permits a ship to ascertain its position by reference to signals sent out from other ships.

A number of new high-power stations were built or begun during the year. The great Arlington station of the United States government performed with marked success in tests and practice and developed a night range of transmission of 3500 miles. This station was conducting important experiments in collaboration with the Eiffel Tower station in Paris to determine the relative velocities of earthed electro-magnetic waves and light. Other high-power stations were established, at Belmar, N. J., by the Marconi Company, and at Sayville, L. I., by the Telefunken Company. The latter was employed in conjunction with the station at Nauhen, Germany, for trans-Atlantic communication. It was operated by a 200-kilowatt high-frequency generator. The antenna current was approximately 150 amperes and the wave length 9000 meters. The Goldschmidt Company had built at Hanover, Germany, and Tuckerton, N. J., stations with 800-foot towers and high-frequency generators of 150 kilowatts capacity. This company was bought out by the Marconi Company, which was expected to employ many of its devices in subsequent work.

An interesting experiment was carried on by the Lackawanna Railroad in the application of radio-telegraphy to the dispatching of trains. It was not expected that wireless dispatching would soon displace wire telegraphy and telephony, but the experiment showed its feasibility. It was proposed, however, to equip certain trains with wireless stations for the convenience of passengers.

RADIO-TELEPHONY. The status of radio-telephony was little altered in 1913. The development of this art seemed to point in two directions, one the distortionless transmission of speech over distances greater than can be reached by wire or cable, and the communication between short range stations where it is uneconomical to maintain a telegraph operator. It was still necessary to develop means of modifying vocally the large volumes of radio-power required for long-

distance work. Authentic reports of speech transmission over distances of several hundreds of miles indicated that the problem was capable of solution. See **SAFETY AT SEA**, and **FRENCH WEST AFRICA**.

WIRELESS TELEPHONY. See **WIRELESS TELEGRAPHY AND TELEPHONY**.

WISCONSIN. POPULATION. The population of the State in 1910 was 2,333,860. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 2,419,898.

AGRICULTURE. The area, production, and value of the principal crops in 1912-1913 are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

		Acreage	Prod. Bu.	Value
Corn1913	1,650,000	66,285,000	\$40,095,000
1912	1,632,000	58,282,000	29,714,000
Wheat1913	190,000	3,665,000	3,005,000
1912	188,000	3,564,000	2,958,000
Oats1913	2,275,000	83,038,000	30,724,000
1912	2,272,000	84,746,000	27,119,000
Rye1913	425,000	7,438,000	4,240,000
1912	341,000	6,240,000	3,806,000
Potatoes1913	295,000	32,155,000	17,364,000
1912	29,000	34,920,000	11,873,000
Hay1913	2,375,000	43,848,000	42,713,000
1912	2,250,000	3,600,000	43,560,000
Tobacco1913	43,000	650,740,000	6,089,000
1912	42,200	54,438,000	5,988,000

a Tons. b Pounds.

MINERAL PRODUCTION. The total value of the mineral products of the State in 1912 was \$14,192,287, compared with \$12,032,158 in 1911. There were mined in 1912, 860,600 long tons of iron ore, compared with 698,660 tons in 1911. The State ranks fifth in iron ore production. The total value of the clay products in the State in 1912 was \$1,044,486, a decrease of \$113,653 from 1911. The principal product was common brick.

TRANSPORTATION. The railway mileage of the State on June 30, 1912, was 7517, compared with 7361 in 1911.

EDUCATION. The total school population of the State in 1912 was 775,402. The total enrollment was 435,611. The teachers numbered 12,260, of whom 10,916 were women and 1344 men. The average salary for men teachers monthly was \$70.16, and for women teachers, \$41.88.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions under the control of the State with their populations on December 31, 1913, were as follows: State Hospital for the Insane at Mendota, 614; Northern Hospital for the Insane at Winnebago, 615; School for the Deaf at Delavan, 172; School for the Blind at Janesville, 45; Industrial School for Boys at Waukesha, 381; State Prison at Waupun, 753; State Public School at Sparta, 138; Home for Feeble-Minded at Chippewa Falls, 1070; State Reformatory at Green Bay, 228; State Tuberculosis Sanitarium at Wales, 145. The population of all the State institutions was 4166.

The legislature of 1913 enacted a number of important laws relating to charities and corrections. Among these were measures providing for the compensation of innocent prisoners who had been wrongfully imprisoned; and an enactment relating to pecuniary assistance to prisoners and their families; a law relating to the employment of prisoners sentenced to county jails and lockups; and a provision for mothers'

pensions. The legislature also provided for a tuberculosis camp for convalescent tubercular patients, and for a new home for feeble-minded and epileptics. Another measure provided for a new women's reformatory.

FINANCE. The total receipts from all sources for the fiscal year 1913 amounted to \$15,752,902. The total disbursements for the same period were \$16,989,524. At the beginning of the fiscal year there was a balance in the treasury of \$3,161,512, and at the end of the fiscal year a balance of \$1,924,890. The chief sources of revenue are the corporation taxes, inheritance tax, and income tax. The chief expenditures are educational and administrative. There is no bonded debt except to the State trust funds.

POLITICS AND GOVERNMENT. There were no elections for State officers during the year, as the term of Governor McGovern does not expire until January, 1915. The next State election will be held November 3, 1914. The legislature on February 14 vetoed the resolution for the direct election of senators. A suffrage referendum bill was vetoed by Governor McGovern. The Supreme Court on November 14 held dealings in futures invalid.

LEGISLATION. The most important measures passed in the legislature of 1913 were the following: A blue-sky law applying to all corporations or dealers in stocks and bonds, and requiring filing of schedules of assets, liabilities, etc.; a land labor law providing a schedule of prohibited employments for minors and females, adding to the schedule of prohibited employments for children of 16 years of age; two measures providing for the clearing of undeveloped land; an act reorganizing the educational system under a county board of education which has extensive control over rural, elementary, and high schools, county training and county agricultural schools; a measure providing for land mortgage associations and providing for the organization of a joint stock corporation authorized to loan money to farmers and to pledge the mortgages taken as security for bonds issued in order that additional sums may be thus secured for additional loans, these bonds, however, not to be guaranteed by the State. A minimum wage law was passed. This was to be administered by the State industrial commission. A law was enacted providing for mothers' pensions and for public aid to enable the parent to care for children in the home. All male persons are required to pass a medical examination before marriage. A measure was enacted regulating the employment of persons committed to jails and workhouses at hard labor and the payment of their earnings to those dependent upon them. The State board of control is authorized to employ inmates in the State prison in the construction of highways. One of the most important legislative acts was the defeat by a narrow margin of the market commission bill advocated by the governor. This was intended to foster the organization of rural business through cooperative societies and otherwise, and to provide for trade commission somewhat similar to the federal commission now under consideration. The bill also forbade unfair methods of competition, and delegated to the commission administrative power of investigating and declaring what methods were within the prohibitions of the law. See also LIQUOR REGULATION.

STATE GOVERNMENT. Governor, Francis E.

McGovern; Lieut.-Governor, Thomas Morris; Secretary of State, John S. Donald; Treasurer, Henry Johnson; Attorney-General, W. C. Owen; Superintendent of Education, C. P. Cary; Commissioner of Insurance, H. L. E. Kern; Commissioners of Public Lands, Secretary of State, Attorney-General, and State Treasurer—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, John B. Winslow, Dem.; Associate Justices, Wm. H. Timlin, Dem.; R. G. Siebecker, Dem.; A. J. Vinie, Rep.; Rouje D. Marshall, Rep.; J. C. Kerwin, Rep.; John Barnes, Dem.; Clerk, Clarence Kellogg, Rep.

STATE LEGISLATURE, 1913. Democrats: Senate, 6; House, 24; joint ballot, 30. Republicans: Senate, 23; House, 57; joint ballot, 80. Socialists: Senate, 1; House, 6; joint ballot, 7. Nonpartisans: Senate, 3; House, 13; joint ballot, 16. Republican majority: Senate, 13; House, 14; joint ballot, 27.

The names of senators and representatives to Congress will be found in the article UNITED STATES, section Congress.

WISCONSIN, UNIVERSITY OF. A State institution of higher learning at Madison, Wis., founded in 1848. The total enrollment in all departments in the fall of 1913 was 4438. This does not include the summer sessions, or the winter short course, which begins on December 1. The faculty in 1913-14 numbered 633. There were no noteworthy changes in the faculty during the year. Among the gifts received was one of \$5000 to establish the Hollister pharmacy fellowship fund. The productive funds of the university amount to about \$675,000, and the income from this to about \$37,000. The library contains about 195,000 volumes, and 43,000 pamphlets. The president is Charles R. Van Hise, Ph.D.

WISE, JOHN SERGEANT. An American lawyer and soldier, died May 12, 1913. He was born in 1848 in Rio Janeiro, Brazil, where his father, Henry A. Wise, was then United States minister. He was educated in private schools and when he was sixteen years of age he entered the Virginia Military Institute, which was subsequently known as the West Point of the Confederacy.

In 1864 the cadets at the institute were mustered into service to meet the movements of General Sigel, among them Wise, then little more than a youth. He was soon commissioned a lieutenant and took part in a number of historic battles, including Appomattox, where Lee surrendered. Lieutenant Wise delivered the last message from Lee to Jefferson Davis. After Appomattox he joined the forces of General Johnston and fought until the final surrender of the last of the Confederate forces. The war over, he entered the University of Virginia, graduated in the class of 1869, began the practice of law with his father in Richmond, and from the start took an active interest in politics. In the later 70's he became a Republican and as such was appointed United States district attorney for the eastern district of Virginia. He was elected congressman-at-large in 1883, and two years later was the unsuccessful Republican candidate for governor of the State. In 1888 Mr. Wise removed to New York to become counsel for the Sprague Electric Company, and other large corporations. His career in New York was one of unusual success. He practiced law until

1911, when he retired. He was one of the best-known orators and after-dinner speakers in the country. Although he became a citizen of New York, his interest in the South remained keen and his influence was often exerted to bring about a better feeling between the North and the South. He wrote several books, including: *Diomed* (1898); *The End of an Era* (1899); *The Lion's Skin* (1905); *Recollections of Thirteen Presidents* (1906); *Citizenship* (1906). *The End of an Era* is a narrative of his early life and his experiences during the war, and is one of the most interesting and important contributions to the history of that period.

WOLSELEY, GARNET JOSEPH, first viscount. An English field-marshal, died March 25, 1913. He was born in Dublin in 1833. Entering military service, he was made an ensign in 1852 and joined the 80th Foot, which was then engaged in the second Burmese War. In 1854 he went to the Crimea; was severely wounded, and so prevented from taking part in the final assault and capture of Sebastopol. In March, 1857, he was ordered to join the 90th Regiment in the expedition to China. At Singapore he first heard of the Indian Mutiny. His regiment was diverted from China to India and he was present at the relief of Lucknow by Sir Colin Campbell in November, 1857, and participated in it with great gallantry. He continued to serve in Lucknow until the beginning of 1860, when he accompanied Sir Hope Grant to China as assistant quartermaster-general. He took part in the Anglo-French expedition against that country. At the end of the China War, when only twenty-eight years of age, he had reached the rank of lieutenant-colonel after only nine years' service, and he participated in four wars with great success. In 1870 in connection with the transfer of the Hudson Bay Company's territories to the Dominion of Canada, the settlers on the Red River, who were principally French half-breeds, rebelled against the transfer. After overcoming heavy obstacles, Colonel Wolseley suppressed the uprising, and in so doing showed great professional ability, power of organization, and fertility of resource. For his services he was made a K. C. M. G. On the withdrawal of the regular troops from the Dominion of Canada, Wolseley returned to England, and after six months was appointed assistant adjutant-general in the war office. He at once plunged into the subject of army reorganization, which was for the time being greatly discussed. When it was decided in 1873 to send an expedition to the Cape Coast to punish the Ashantis for the invasion of the Fanti Protectorate, Sir Garnet Wolseley was appointed in command. After five days' fighting he occupied the capital of Ashanti. The signing of the treaty of peace followed and Sir Garnet sailed for England. From 1874-9 he saw service in Natal, Cyprus, and Zululand and in 1880 was made a G. C. B. and appointed quartermaster-general to the forces. For the next ten years, with the exception of two absences in command of expeditions abroad, he was in the war office. He became adjutant-general in 1882, and in the summer of that year commanded the expedition which put down the rebellion of Arabi Pasha, in Egypt. Wolseley was promoted to be general for his distinguished services in the field and was raised to the peerage as Baron Wolseley of Cairo and Wolseley. He led

a second expedition in the autumn of 1884 for the relief of General Gordon at Khartum. Wolseley was mainly instrumental in sending Gordon there. The expedition arrived too late to effect this object, and although the chief blame was placed upon the vacillations of the government, Wolseley was obliged to endure a portion of it. In 1895 he succeeded the Duke of Cambridge as commander-in-chief of the army. He had charge of the organization and transport of men and stores to South Africa at the time of the Boer War, and in this showed his efficiency as an organizer. Although General Wolseley was one of the most notable living soldiers at the time of his death, his reputation was based chiefly upon smaller wars. He was never pitted against a force which equaled his, or against a commanding officer of skill and ability approaching his own.

WOMAN'S CHRISTIAN TEMPERANCE UNION, NATIONAL. An organization formed in Ohio in 1874, for the suppression of the liquor traffic and for other similar purposes. It is regularly organized in every State of the Union. In 1913 there were about 12,000 local unions with a membership, including the children's societies, of about 500,000. The union has 40 distinctive departments of work, presided over by experts. State laws requiring the study of scientific temperance in the public schools were passed largely through the efforts of this organization. The *World's Woman's Christian Temperance Union* was founded by Frances E. Willard, and has auxiliaries in more than 50 countries and provinces. The white ribbon is the badge of all members of the union. The headquarters are in Evanston, Ill. The president in 1913 was Mrs. Lillian M. N. Stevens, Portland, Me.; corresponding secretary, Mrs. Frances P. Parks, Evanston, Ill.; treasurer, Mrs. Elizabeth P. Hutchinson, Evanston, Ill.

WOMAN SUFFRAGE. UNITED STATES. The activity of the women suffragists continued unabated throughout 1913. In the November elections of 1912, constitutional amendments for woman suffrage had been adopted in Arizona, Kansas, and Oregon, but rejected in Michigan and Wisconsin; and a second submission of the amendment in Michigan on April 7, 1913, resulted in defeat by a majority of more than 100,000. The net result was the existing enfranchisement of women in nine States of the American union: Arizona (1912), California (1911), Colorado (1893), Idaho (1896), Kansas (1912), Oregon (1912), Utah (1896), Washington (1910), and Wyoming (1869). During the spring woman suffrage amendments were brought before the legislatures of many States. In Alaska, Arkansas, New Jersey, New York, and Pennsylvania they passed for the first time; in Iowa, Montana, Nevada, North Dakota, and South Dakota they are to be submitted to the people at the next election. The Minnesota Senate twice defeated a resolution of the lower house providing for a popular referendum on the question, and the Maine Senate rejected an Assembly bill of like character. A similar resolution of the Wisconsin legislature was vetoed by the governor. In June the right to vote for presidential electors and city and town officials was extended to the women of Illinois by legislative act. Under a decision of the county court this law permits women to serve as election officers. The constitutionality

of the new Illinois statute was questioned, but was upheld in the State courts by a decision of Judge Schuwerk on November 28. On October 15 the circuit court at Cumberland, Md., upheld the right of a woman to have her name inscribed on the election ballot as a candidate for office. Women were appointed to the police force in Chicago and in Los Angeles, and on December 18 a woman was elected mayor of Warrentown, Ore.

The extension of woman suffrage in the States, especially those of the West, encouraged the leaders of the propaganda to inaugurate a vigorous campaign at Washington in behalf of the adoption of an amendment to the Federal Constitution for the enfranchisement of women throughout the nation. Wide publicity was given by the newspapers to the "hike" of a group of suffragists, headed by "General" Rosalie Jones, from New York to Washington, February 12-28, to participate in a big parade in the national capital on the eve of Mr. Wilson's inauguration. The fact that the parade, one of the most remarkable of its kind, was poorly policed, and therefore badly mauled by the crowd, elicited a feeling of sympathy throughout the country. The demonstrators presented petitions both to Congress and to the new President. The Senate committee on woman suffrage, reorganized on March 15, gave several public hearings and reported favorably on May 14, and fifteen days later a congressional inquiry into the disorders attending the Washington parade acquitted the police of blame. On July 31 women delegates representing all the States presented formal petitions for woman suffrage to the Senate. A permanent National Council of Women Voters was organized at the capital, and a week's convention of suffragists opened there on November 29. The convention asked the House of Representatives to provide a permanent committee on woman suffrage similar to that of the Senate and urged an amendment to the Constitution, inserting the single word "sex" in the declaration of the Fifteenth Amendment that "the right of citizens of the United States to vote shall not be denied or abridged by the United States or by any State on account of race, color, or previous condition of servitude." The convention considered plans for widening the propaganda during 1914. Among the demonstrations of suffragists during 1913, besides the Washington parade, the New York parade of May 3, the Brooklyn parade of November 1, and the "hike" from New York to Albany in December were conspicuous. A woman suffrage organization for the southern States established headquarters at New Orleans on November 12.

GREAT BRITAIN. Militancy continued throughout 1913 to characterize the suffrage movement in the United Kingdom. After the Liberal government in January had withdrawn the franchise bill, and the woman suffrage amendment to the Irish home rule bill had been defeated, the militants, led by Mrs. Emmeline Pankhurst and Miss Sylvia Pankhurst, renewed their violence on a larger scale. Shop windows were smashed, some telegraph and telephone wires were cut, golf links were ruined, mail was destroyed in the pillar boxes, vacant dwellings were fired, the new country house of Mr. Lloyd-George, the chancellor of the exchequer, was blown up, railway coaches were

damaged, and countless other methods of attack upon property were pursued. As a consequence, many women were arrested and put in jail. Forceful feeding, however, failed in several cases (including that of Mrs. Pankhurst herself) to prevent the success of the "hunger strike" as a method of obtaining release from prison, and it was found necessary for Parliament in April to pass the so-called "cat-and-mouse" bill for the reincarceration of prisoners after recovery from their self-imposed starvation tactics. This act, together with the rejection by the House of Commons on May 6 of a bill, whereby it was proposed to enfranchise about six million women with household qualifications, was the signal for particularly grave outbreaks, which not even the closing of the militants' headquarters by the London police on April 30 could avert. The "arson squad" attempted to set fire to the Royal Academy and other public buildings. Religious services in St. Paul's Cathedral were interrupted by litanies for Mrs. Pankhurst and cries of "votes for women." London crowds, led by Miss Sylvia Pankhurst, tried to storm the houses of Mr. Asquith, the prime minister, and of Mr. Lloyd-George. Riotous demonstrations occurred at Newcastle, Nottingham, and Glasgow, as well as in London. On June 4 Miss Emily Davison was terribly injured by throwing the king's horse at the Derby; she died four days later, and her funeral on June 14 was attended by an enormous procession of women who revered her as a "martyr." On August 28 Mr. Asquith, while playing golf in Scotland, had a narrow escape from a personal assault by women suffragists, and again on November 1 he was attacked with a whip. Meanwhile, under the operation of the "cat-and-mouse" act, Mrs. Pankhurst and her daughter, and also other prominent militants, were repeatedly arrested, convicted, imprisoned, released on parole, and reimprisoned, until on October 9 the home secretary ordered the resumption of forcible feeding for incorrigibles. The suffragists replied by attempting to mob the king and queen and actually burning the country home of Mr. McKenna's brother. In November Miss Sylvia Pankhurst enrolled an "army" of some 2000 men, drawn largely from the poorer sections of London, in order more effectively to combat the government. Mrs. Pankhurst in the same month made a lecture tour of the United States, collecting about \$20,000 for the cause. Not all the suffragists of Great Britain approved these tactics, for a meeting of non-militant women in London on July 26 was largely attended from all parts of the country. In general, the Liberal party remained throughout the year divided on the question. The Laborites reaffirmed their support of woman suffrage at their congress on January 30. And the Unionists, while they made provision for woman suffrage in the draft of the proposed constitution for Ulster, refused at the party conference at Norwich on November 14 formally to endorse it for the whole kingdom. (See *GREAT BRITAIN, History*.)

OTHER COUNTRIES. The congress of the International Suffrage Alliance was held in Budapest, June 15-20, and was attended by representatives from twenty-six countries. The congress refused to pronounce on the question of militancy, and Mrs. Carrie Chapman Catt, the prominent American leader, was reflected pres-

FOUR LEADING WORKERS IN THE WOMAN SUFFRAGE MOVEMENT, 1913

ident of the International Alliance. A bill granting woman suffrage was introduced in the Danish Parliament on September 17. A measure completing the enfranchisement of women in Norway was enacted on June 11, and the first woman to serve formally in the diplomatic service was subsequently accredited by that country to Mexico. The Dutch cabinet announced on September 16 its intention to bring in a bill that would enable women in the Netherlands to vote. The lower house of the Hungarian Parliament passed on March 7 a bill for limited woman suffrage. The French Chamber of Deputies rejected a woman suffrage amendment on November 11 by 311 votes to 133. A woman suffrage bill was presented to the German Reichstag on November 25, five days after a similar measure had been approved by the Bavarian lower house. See also various countries, and States of the United States, under *Politics and Government or Legislation*.

WOMEN IN INDUSTRY. Much attention was given to the subject of women's wages and working conditions in 1913. The demand for the enactment of special protection for working mothers was in part met by the passage of mothers' pension acts (see *PENSIONS FOR MOTHERS*), and in part by laws fixing minimum wages (see *MINIMUM WAGE*). A great controversy raged through a large part of the year over the relation of low wages to immorality. (See *PROSTITUTION*.)

NATIONAL WOMEN'S TRADE UNION LEAGUE. This organization was formed in 1901 by leaders of the American Federation of Labor. Mrs. Raymond Robins of Chicago is president. At its biennial convention in St. Louis much attention was given to the manner and means of further organizing women workers. It was decided to start in January, 1914, a school for the training of women organizers. The course of study of the school was to be divided between field and class-room work. The field work was to include the practical administrative and organization activities of various trade unions. The class-room work was to be devoted to the history of trade unionism, trade agreements, trade boards, arbitration and conciliation, constitutions of trade unions, union records, reports, conferences, correspondence, and public speaking. Another problem to which the league was giving great attention was industrial training and the increase in efficiency of girls and young women.

At its annual convention the American Federation of Labor voted an assessment of one cent per member "to be expended by the executive council in whatever manner it may deem best and of the greatest advantage in the organization of the wage-earning women of our country."

LEGISLATION. In addition to the legislation noted in the following paragraph there will be found in the articles on *MINIMUM WAGE* and *PENSIONS FOR MOTHERS* matter containing summaries of laws relating to women workers. See also *CHILD LABOR* and *LABOR LEGISLATION*. The following refers almost entirely to the regulation of hours and conditions of work. Arizona, California, Colorado, and Connecticut passed laws limiting the hours of women in various industries to 8 per day, and 55 or 56 per week. Idaho, Missouri, Montana, and Nebraska passed 9-hour laws or extended that in existence. Del-

aware, Massachusetts, Minnesota, New York, Ohio, Pennsylvania, Rhode Island, Tennessee, and Texas limited the hours in a greater or less variety of industries to 10 per day and to from 54 to 60 per week. New Hampshire limited to 10¼ per day and 55 per week the hours of women workers. Night work was prohibited between 10 P.M. and 6 A.M. in New York and Pennsylvania, the latter in manufacturing establishments only. The legislation regarding hours is far from uniform, much more stringent restrictions being made applicable to manufacturing and mechanical industries than to mercantile. Moreover, frequent exception is made of Saturday afternoons and a short period at Christmas time with reference to work in stores and mercantile establishments. In addition the canning industry is generally excepted. In New York a fairly advanced law permitted females under 18 to work 10 hours per day or 60 per week in canning establishments between June 15 and October 15, or 12 hours per day and 66 per week between June 25 and August 5. Laws regarding seats were enacted in the following States: Arkansas, Idaho, Montana, Nebraska, New York, Pennsylvania, South Dakota, Tennessee, and Texas. Women were prohibited from working two weeks before and four weeks after childbirth in Vermont, and four weeks before and after in Connecticut, following the Massachusetts precedent of 1912.

CONSTITUTIONALITY OF NIGHT-WORK LAW. On December 17 a case was brought in the Court of Special Sessions to test the constitutionality of the New York law providing a period of rest at night for women, effective July 1, 1913. It provided that "in order to protect the health and morals of females employed in factories by providing an adequate period of rest at night, no woman shall be employed or permitted to work in any factory in this State before six o'clock in the morning or after ten o'clock in the evening of any day." An inspector of the State Department of Labor found Louise Kindig working at night for the Charles Schweinler Press. It was understood that the case would go to the highest State court. A similar law of 1907 was declared unconstitutional because it omitted the reference to health. The States of Massachusetts, Indiana, Nebraska, and Pennsylvania also have laws prohibiting the working of women in factories at night.

CONSTITUTIONALITY OF THE FIFTY-FOUR HOUR LAW. In October a case was begun by William Hoelderlin, a candy-maker of Brooklyn, to test the validity of the New York law limiting the hours of all women in manufacturing to fifty-four per week. Similar laws had been upheld by the United States Supreme Court in the case of *Muller v. Oregon*, and by the Supreme Courts of Illinois, Michigan, Ohio, California, and Washington. Nearly all of these laws, moreover, were broader in scope than the New York law.

BIBLIOGRAPHY. The Bureau of Labor Statistics is publishing a series of studies on *Women in Industry*. The first of these, prepared by Marie Obenauer, was *Hours, Earnings, and Duration of Employment of Wage-Earning Women in Selected Industries in the District of Columbia*. The second report in the series was *Working Hours of Women in the Pea Canneries of Wisconsin*; and the third, *Employ-*

ment of Women in Power Laundries in Milwaukee. In the *Miscellaneous Series* by the same bureau is a pamphlet, *Ten-Hour Maximum Working Day for Women and Young Persons*. There were also issued the final volumes of the nineteen-volume *Report on the Condition of Woman and Child Wage-Earners in the United States*, prepared under the direction of Charles P. Neill. The last volume was *Labor and Factory Conditions, 1912* (1125 pp.). Other books of the year were: Mary Van Kleeck, *Women in the Bookbinding Trade*, with an introduction by Henry R. Seagar; L. R. Matthews, *Women in Trade Unions in San Francisco*; L. Montgomery, *American Girl in the Stockyards District*; A. Popp, *Autobiography of a Working Woman*.

WOMEN OFFICE HOLDERS. See MUNICIPAL GOVERNMENT under *Women Holding Office*.

WOMEN'S CLUBS, GENERAL FEDERATION OF. This body is a federation of State federations of women's clubs. The general body provides a programme for the work of the various State clubs. The following departments are included: Department of art, bureau of information, department of civics, department of civil service reform, department of conservation, department of education, peace committee, political science committee, department of household economics, department of industrial and social conditions, department of legislation, department of literature and library extension, department of music, and department of public health. These departments are each under separate leadership, and a programme for the conduct of the work during each year is outlined for the use of the clubs affiliated with the General Federation. The president in 1913 was Mrs. Percy V. Pennypacker, Austin, Tex.; recording secretary, Mrs. Harry L. Keefe, Walthill, Neb.; corresponding secretary, Mrs. Eugene Reilley, Charlotte, N. C. According to the latest statistics, the federation had a direct membership of 120,522; an indirect membership of 659,840; and an affiliated membership of 597,327.

WOOD ALCOHOL. See ALCOHOL.

WOODFORD, STEWART LYNDON. An American diplomat, died February 14, 1913. He was born in New York City in 1835, and graduated from Columbia College in 1854. From the date of his graduation he took an active part in politics and civic affairs. He studied law and was admitted to the bar in 1857. At the convention at which Lincoln was nominated in 1860 Mr. Woodford was a delegate, and was appointed the official messenger to carry to Washington the electoral votes of the State of New York for Lincoln and Hamlin. He was offered the post of associate United States justice for the Territory of Nebraska by President Lincoln, but declined and was subsequently appointed assistant United States district attorney of New York City. After a year in this office he resigned and enlisted as a private in the 127th New York Volunteers. He was elected captain, and when the regiment was ordered to the front he was commissioned lieutenant-colonel. He took part in the defense of Washington and was in Suffolk, Va., when it was besieged by General Longstreet. He was afterwards attached to the Eleventh Corps of the Army of the Potomac. For a time he was in charge of the

batteries used against Fort Sumter and Charleston. In 1864 he was appointed judge advocate-general of the Department of the South, and provost marshal-general and chief of staff of the Department of the South, and was brevetted brigadier-general, and promoted to be colonel. After the evacuation of Charleston by the Confederate troops he organized the provisional government and commanded the city. Following that he was military governor of Savannah. He then resigned from the army and returned to New York City to practice law. After declining the nomination for judge of the court of common pleas, he was in 1866 elected lieutenant-governor under Governor Fenton. A few years later he declined a nomination for Congress. In 1870 he was a candidate for governor, but was beaten by John T. Hoffman, the Democratic candidate. He was a delegate to the Republican national convention which nominated General Grant for the second term, and he seconded Grant's nomination. In 1873 he was elected to the Forty-third Congress, but resigned before the expiration of his term. From 1877-83 he was United States district attorney for the southern district of New York. In 1897 he was appointed United States minister to Spain, and held this office during the momentous days preceding the Spanish War. On the declaration of war he returned to the United States, and became a member of the law firm of Woodford, Bovee, and Butcher. He was president of the commission which organized the Hudson-Fulton celebration, and his efforts contributed much to its success. General Woodford was a member of the Greater New York charter commission. He received degrees of LL.D. from Trinity College and M.A. from Yale and Columbia universities. He was also decorated with the Order of the Rising Sun of Japan, and Crown Order of the first class by the German emperor.

WOODRUFF, CARLE AUGUSTUS. An American soldier, died July 20, 1913. He was born in Buffalo in 1841. In 1861 he was appointed second lieutenant in the second United States artillery, and served throughout the Civil War, receiving successive promotions until he became captain in the second artillery in 1869. He received brevets of major and lieutenant-colonel for gallant services in action. In 1901 he was made colonel in the artillery corps, and in 1903 brigadier-general. In the same year he was retired at his own request after forty years of service. In 1893 he was awarded a congressional medal of honor for gallantry in action at Newby's Cross Roads, Va., in 1863.

WOOL. See STOCK-RAISING AND MEAT PRODUCTION.

WORKINGMEN'S INSURANCE. See WORKMEN'S COMPENSATION; OLD-AGE PENSIONS; PENSIONS FOR MOTHERS; and INSURANCE.

WORKMEN'S COMPENSATION. For a number of years the term employers' liability has tended to be replaced by the term workmen's compensation, owing to an extensive reform in the manner of treating injured workmen. Even with the modified employers' liability, in which the common law defenses were taken away from the employer, injured workmen received very inadequate compensation for the losses which they suffered. Only a small proportion were able to carry on litiga-

tion, and frequently those who were successful received an award quite insufficient to repair their lost earning power. The result has been a remarkably rapid substitution of definitely-prescribed compensation for employers' liability. This furnishes reasonable compensation promptly without litigation, without the great expense of legal procedure, and without adding burdens to charity organizations.

Between 1909 and 1913 inclusive, 24 States and the Federal government created legislative commissions on the subject of compensation. In some other States, commissions were appointed by the governors for the purpose of investigating disadvantages of the old and the advantages of the new methods. In 1913 Indiana, Louisiana, and Vermont created new commissions, and Pennsylvania continued one created in 1911.

General liability laws were enacted or amended in twelve States. These took the form of modifying the employer's defenses as regards railroads in Minnesota, North Carolina, North Dakota, Wisconsin, and Wyoming; and as regards all corporations, except railroads, covered by a law of 1911, in Arkansas. In Florida the principle of comparative negligence was substituted for the complete defense of contributory negligence in certain occupations; in Wisconsin and Wyoming this substitution was made regarding railroad accidents, and in Nebraska regarding all employments.

The more advanced legislation represented by workmen's compensation laws was enacted in Connecticut, Iowa, Minnesota, Nebraska, Oregon, Texas, and West Virginia. Moreover, the laws of California, Illinois, Nevada, Ohio, and Wisconsin were recast. The Oregon law was adopted by referendum in November. The Nebraska law was referred to the State election of November, 1914. Altogether there were 22 States having compensation laws in force at the close of 1913. These laws are compulsory in Colorado, Ohio, and Washington; and election to come under the law is presumed in Connecticut, Illinois, Iowa, Kansas, Minnesota, Nebraska, Nevada, New Jersey, Oregon, and Wisconsin. In Nevada, Oregon, Washington, and West Virginia insurance of the employer must be made through a State fund; in California, Michigan, and Ohio there is a State fund in competition with private and mutual companies which are regulated; in Massachusetts, Texas, and Wisconsin the insurance is made in mutual or private companies encouraged by the State. In Oregon and West Virginia employees are required to contribute to the insurance fund. On account of its advanced character the New York law is the only one fully described below. The experience in Washington and the modified Ohio act are, however, considered, together with data relating to industrial accidents.

NEW YORK. In 1910 a workmen's compensation law was enacted by the New York legislature applying to a specified list of dangerous occupations. This law was made a compulsory one and on that ground was declared unconstitutional in 1911 by the Court of Appeals in the notorious *Ives* decision. A movement was at once begun to secure either an optional law coming within the meaning of that decision or an amendment to the State constitution. The latter was eventually accomplished at the No-

vember election in 1913. At the special session of the State legislature thereafter there was passed a law deemed by many the most advanced of any yet enacted in the United States, if not in the world. Because of its importance its features are given somewhat fully.

The new law created a new State department to be known as the State workmen's compensation commission. This is composed of five members appointed by the governor; the chairman has a salary of \$10,000 and the others \$7000 each. The commissioner of labor is an ex-officio member, but has no vote. The law provides four ways in which an employer may insure himself against losses due to industrial accidents: (1) In a casualty company authorized to do business in the State; (2) in a mutual company composed of not less than forty employers having not fewer than 2500 employees; (3) by the payment of certain designated premiums into a State fund; or (4) by furnishing satisfactory proof to the commission of his financial ability to pay. In the latter case the employer may be required to deposit United States or other government bonds in an amount determined by the commission. This fourth alternative is expected to apply only to railroads or other large corporations.

Those employers accepting the third method are divided into forty-two groups and will pay premiums to a State fund according to rates fixed by the commission. The commission must keep the accounts of each group separate in order to make equitable rates, but the entire fund is available for paying compensation in every industry. Payments must begin to be made on July 1, 1914. Failure to comply with the law makes the employer liable to a penalty of one dollar for every employee for every day after July 1. Moreover, failure to comply renders the employer liable to suit without recourse to the common law defenses of the fellow-servant rule, the doctrine of assumed risk, or the theory of contributory negligence. In this case, however, the employer does have the very frail defenses of willful intention on the part of the injured, and intoxication of the injured as the sole cause. Ten per cent. of the premiums collected from employers insured in the State fund must be set aside until a surplus of \$100,000 is created; thereafter five per cent. of such premiums will be added to the surplus until in the commission's judgment the "catastrophe hazard" is covered. In addition the commission will set aside a reserve adequate to meet all anticipated losses and to carry all claims to maturity.

The schedule of compensations is liberal. For permanent total disability 66½ per cent. of the average weekly wages is the compensation. In case of temporary total disability, a like percentage of average weekly wages will be paid during the continuance of such disability, but not in excess of \$3500. For permanent partial disability two-thirds of the average weekly wages shall be paid for the following number of weeks for the injuries indicated: Loss of thumb, 60; first finger, 46; second finger, 30; third finger, 25; fourth finger, 15; great toe, 38; other toes each, 16; hand, 244; arm, 312; foot, 205; leg, 288; and eye, 128. For any other cases of permanent partial disability 66½ per cent. of the difference between the employee's average weekly wages and his wage-

earning capacity thereafter will be paid during the continuance of such partial disability. In case of temporary partial disability the injured will receive 66⅔ per cent. of the difference of his average weekly wages and his wage-earning capacity during the continuance of such disability but not to exceed \$3500. The weekly payments shall not exceed \$20 per week in case of hand, arm, foot, leg, or eye; in all other cases they shall not exceed \$15 per week nor be less than \$5 per week. Death benefits include funeral expenses up to \$100. A widow or dependent husband without a child under eighteen years of age will receive as a life annuity 30 per cent. of the average wages of the deceased; but if the widow remarry the annuity ceases, but she will receive two years' compensation in one sum. For each child under eighteen years of age an additional 10 per cent. will be paid, provided that the total amount paid does not exceed 66⅔ per cent. of the average annual wages. Children left without any parent will each receive 15 per cent. of the annual wages of the deceased. In all cases excess of wages over \$100 will not be taken into account in computing compensation.

One of the most notable features of this act is the provision that all claims must be passed upon by the State commission, and all payments, regardless of the manner in which the employer has insured himself, must be made through it. These provisions were designed to prevent the duplicating of staffs of adjusters in all parts of the State, and to protect the injured from being misled or coerced into making settlements for less than the law prescribes.

WASHINGTON. The compensation law of the State of Washington has attracted much attention because of its inclusiveness, its compulsory character, and its administration by means of an insurance fund collected from employers and administered by a State commission. The employers in forty-seven extra-hazardous occupations were required to make contributions, each according to a special premium rate per \$100 of his pay-roll. The law fixed the maximum for these rates, the actual rate to be determined by the number of accidents and allowed claims in each group. Thus in logging and lumbering the maximum legal rate is \$2.50, but during the first year the rate assessed was \$1.46; in street railways the maximum permitted is \$3.00, but the actual rate was only 23 cents the first year. The experience for the first eighteen months, to April 1, 1913, showed 6500 firms with 145,000 employees listed by the commission. There were reported 19,226 accidents; claims allowed were 12,753, claims disallowed, suspended, or waived were 4318, and claims being adjusted or investigated, 2155. There had been paid into the fund \$1,703,556. Claims to the amount of \$929,443 had been paid; there had been invested as a reserve to guarantee pensions to the survivors of killed workmen, \$442,681. The gross expense of the commission, which is paid by the State, was \$152,829, or 8.2 per cent. of the total fund.

OHIO. The workmen's compensation act of 1911, which was elective and which provided for a State insurance fund, was replaced in part by a compulsory law. This was made possible by an amendment to the constitution and becomes effective January 1, 1914. The new law requires the State and all its subdivisions,

even including school districts, to insure their employees and pay definite contributions to the State insurance fund. All employers regularly employing five or more workmen must provide compensation for injury or death in one of three ways: (a) By subscription to the State insurance fund; (b) by proving their financial ability to meet probable burdens of compensation, and by giving bond when required by the State board; (c) by mutual associations of employers. Employees who previously contributed ten per cent. of the insurance fund are neither required nor prompted to make any contribution. Employers complying with the law are relieved of liability for suits under either the common law or the liability laws unless willfully negligent. Workmen employed by one not complying with the law may claim compensation from the State insurance fund. The employer in such a case is liable to suit by the State board. Employers having fewer than five employees may insure their workmen under the act if they wish; otherwise they are liable under the employers' liability law of 1910. The State liability board of awards will establish rates for each trade; it will keep a separate account of money paid in every six months by each employer and the amount paid out in compensation to his employees. Each employer will be credited with any balance, thus reducing his payment for the next six months; any excess of disbursements will be collected from him. The object of these last provisions is to stimulate employers to take all precautions to prevent accidents. The rates of compensation remain substantially unchanged, being from \$1500 to \$3400 in case of death and 60 per cent. of the impairment of earning capacity in case of injury.

IRON AND STEEL INDUSTRY. A Federal report on accidents and accident prevention in the iron and steel industry (Sen. Doc. 110, 62d Cong., 1st Sess.) was a study of conditions and experience in 155 plants employing 158,604 men. In 1910 there occurred in these plants 274 fatal accidents, 400 permanent injuries, and 35,364 temporary disabilities of more than one day's duration. The report classified sixteen plants having at least two productive departments into class A when safety devices were very good, class B when they were fair, and class C when poor. The results showed that for every 1000 men employed for at least 300 days the accident rate in class A was 167.1, in class B it was 272.4, and in class C it was 507.9. The accident rate in the best plant was 115.9 per thousand employees in 300 days, and in the worst plant 615.7. These figures at once proved the efficacy of a modern safety system and demonstrated the criminal negligence of some boards of directors. The report studied accidents in some plants for a series of years, showing again the results of efforts at prevention. It compared branches of the industry and gave details for accidents of different kinds and for the duration of disabilities. Finally it gave plans for instituting a safety system.

UNITED STATES. The Department of Commerce and Labor early in the year issued a report on accidents and their compensation in the government service from August 1, 1908, to June 30, 1911. It showed that among 400,000 employees there had occurred 21,033 industrial accidents during these thirty-five months. As

facilities for reporting accidents were crude, it was estimated that there actually occurred not fewer than 10,000 per year. Of the accidents reported 670 were fatal. The report estimated that not more than 30 per cent. of the government employes were included within the provisions of Federal compensation laws. Thus, of the injuries reported, over 6000 were not compensated, among which were 390 fatalities and over 1200 serious injuries. Numerous other details of this report showed the inadequacy of the nation's provisions for its injured employes.

In the closing days of his administration President Taft by executive order extended the workmen's compensation principle to employes of the Canal Zone. The operation of this order was, however, suspended about two months later by President Wilson because funds had not been appropriated therefor.

WORKMEN'S INSURANCE. See OLD-AGE PENSIONS; PENSIONS FOR MOTHERS; and WORKMEN'S COMPENSATION.

WORLD PEACE FOUNDATION. See ARBITRATION, INTERNATIONAL.

WRESTLING. Several professional wrestling bouts were held during 1913, but the plan to have S. Zybasko meet Frank Gotch to decide the world's championship fell through. Gotch took part in only one match, that with George Lurich, whom he defeated in straight falls. Zybasko succeeded in winning more than 20 bouts and appears to be the only wrestler who has a chance to take the championship title from Gotch.

The winners of the national championship held under the auspices of the Amateur Athletic Union were: 105-pound, George Taylor, Newark Turn Verein; 115-pound, J. Hines, Boys' Club; 125-pound, V. Vosen, Bronx Church House; 135-pound, A. E. Anderson, Norwegian Turn Verein; 145-pound, C. Johnson, New York A. C.; 175-pound, J. Varger, Boys' Club; heavyweight, Jack Gunderson, Norwegian-American A. C.

Cornell won the intercollegiate championship, with Princeton second and Lehigh third. The winners of the main bouts were: 115-pound, Suppes, Lehigh; 125-pound, Boak, Cornell; 135-pound, Levy, Cornell; 145-pound, Franz, Princeton; 175-pound, Watson, Lehigh; heavyweight, Gile, Princeton.

The English championships held at London produced the following winners: 133-pound, catch-as-catch-can, P. H. Corkings; 133-pound, Cumberland and Westmoreland, E. Winskell; 161-pound, catch-as-catch-can, S. V. Bacon; 161-pound, Cumberland and Westmoreland, J. Winskell; heavyweight, catch-as-catch-can, W. J. West; heavyweight, Cumberland and Westmoreland, J. Winskell.

WRIGHT, GEORGE. An English jurist, died in May, 1913. He was born at Clonakilty, Cork, Ireland, in 1847, and was educated at Dublin University. In 1871 he was called to the bar and in 1891 was elected a bencher of the King's Inns. In 1900 he was appointed solicitor-general for Ireland and in the following year was raised to the bench.

WRIGHT, ORVILLE D. See AERONAUTICS.

WÜRTTEMBERG. See GERMANY.

WYNDHAM, GEORGE. An English statesman and writer, died July 8, 1913. He was

born in 1863, educated at Eton and Sandhurst, and after leaving the latter institution, he obtained a commission from the Coldstream Guards, and served with his regiment in the Suakin campaign. After a few years he left the army to become a private secretary to A. J. Balfour, then chief secretary for Ireland. In 1889 he was elected member of Parliament from Dover, and long continued to represent that constituency. He was appointed under secretary for war in 1898, and two years later made a speech in defense of the British army in South Africa, which was one of the great triumphs of his parliamentary career. In the same year he was appointed chief secretary for Ireland, and in this position he served for five years; but political complications soon arose by reason of appointments which were resented by the Irish people, and by reason of a lack of diligence in his attention to the duties of his office. When Mr. Wyndham concluded his term as chief secretary he was a very unpopular official. He will be best remembered in connection with Ireland as the author of the Irish land purchase act of 1903. In 1902 he was elected lord rector of Glasgow University, and of Edinburgh University in 1908. He edited an edition of North's *Plutarch*, and Shakespeare's *Poems*, and was a deep student of literature.

WYOMING. POPULATION. The population of the State in 1910 was 145,965. According to the estimates of the Bureau of the Census, made in 1913, the population in that year was 163,325.

AGRICULTURE. The area, production, and value of the principal crops in 1912-13 are shown in the following table. The figures are from the United States Department of Agriculture, and those for 1913 are estimates only.

	Acreage	Prod. Bu.	Value
Corn	1913 17,000	493,000	\$ 394,000
	1912 16,000	368,000	236,000
Wheat	1913 90,000	2,250,000	1,745,000
	1912 76,000	2,181,000	1,745,000
Oats	1913 220,000	3,360,000	3,344,000
	1912 205,000	8,569,000	3,171,000
Rye	1913 4,000	76,000	49,000
	1912 3,000	57,000	37,000
Potatoes	1913 12,000	1,680,000	1,092,000
	1912 11,000	1,540,000	924,000
Hay	1913 480,000	6,912,000	6,110,000
	1912 452,000	859,000	7,387,000

a Tons.

MINERAL PRODUCTION. The total value of the mineral products of the State in 1912 was \$13,374,088, compared with \$11,483,377. The total coal production of the State in 1912 was 7,368,124 short tons, valued at \$11,648,088. It is probable that more than half the entire area of the State is coal-bearing, but in some portions the coal lies under such heavy cover as to be unworkable under present conditions. The production of 1912 was a considerable increase over that of 1911, which was 6,744,664 short tons. The output in 1912 was, with the exception of that of 1910, the largest in the history of the State. The number of men employed in the coal mines of the State in 1912 was 8036, to average 238 days in 1912, against 7924 to average 230 days in 1911. There were 38 deaths by accident in Wyoming coal mines in 1912, compared with 35 in 1911. Of the fatalities in 1912, 32 occurred underground, and 20 of these were falls of roof and coal.

The State produces a small amount of copper.

In 1912 this amounted to 25,080 pounds of blister copper, compared with 130,127 pounds in 1911. The Encampment district, which is the most important producing district in the State, was not active in 1912. The year 1912 marked the entrance of Wyoming as an important element in the oil industry, the Mid-West, the Franco-Wyoming, and the Standard Oil Company all being particularly active. In April a gusher which flowed 1200 barrels a day was drilled in the Salt Creek field, 45 miles north of Casper. This development started a general boom in the oil field, especially in Natrona County. The total oil lands in the State increased from 29,550 acres in 1911 to 64,810 in 1912. The total production in the State in the latter year was 1,572,306 barrels, compared with the production of 186,685 barrels in 1911. (The figure for 1911 includes also the production of Utah.) The number of productive fields in the State at the end of 1912 was 189.

TRANSPORTATION. The railway mileage on January 1, 1912, was 1704. During that year the Union Pacific Railroad constructed about 11 miles of new track; the Oregon Short Line about 23 miles; and the Chicago, Burlington, and Quincy about 225 miles. The last-named road, which will probably be completed in 1914, continued the construction of the Wyoming link of its new north and south line from Seattle to Galveston.

EDUCATION. The total school population in 1912 was 35,786. The total enrollment in public schools was 26,502. The total number of teachers was 1225—174 male and 1051 female. The average salary of male teachers was \$78 monthly, and of female \$57.48.

FINANCE. The report of the State treasurer is for the two years ending September 30, 1912. There was a balance on hand September 30, 1912, of \$769,716. The receipts in 1911 were \$1,069,970, and in 1912, \$1,978,000. The disbursements in 1911 were \$944,453, and in 1912 \$893,307, leaving a balance on September 30, 1912, of \$1,179,672. The chief receipts are from taxation, and the chief expenditures are for State institutions, education, and State officers.

CHARITIES AND CORRECTIONS. The institutions under the control of the State Board of Charities and Reform are the State Hospital for the Insane at Evanston; the Wyoming State Penitentiary at Rawlins; Soldiers' and Sailors' Home at Buffalo; the Big Horn Hot Springs Reserve at Thermopolis; Wyoming General Hospital at Rock Springs; Wyoming General Hospital at Sheridan; Wyoming General Hospital at Casper; and the Wyoming School for Defectives at Lander. The total expenditure for support of these institutions in 1912 was \$450,354.

POLITICS AND GOVERNMENT. There was no election of State officers during the year, as the term of Governor Carey does not expire until January 1, 1915. The next State election will be held on November 3, 1914. The legislature on January 29 reelected Francis E. Warren United States senator. It ratified the income tax amendment and approved the constitutional amendment for the direct election of United States senators.

LEGISLATION. The legislature met in 1913 and passed several important measures. These include the following: An act providing submission to the people of an amendment authorizing a workmen's compensation act; a measure pro-

viding for an eight-hour day for workmen on public works; an act prescribing the liability of railroad companies for injuries to and the death of employees. This follows generally the provisions of the federal statute. Marriage of white persons with negroes, mulattoes, Mongolians, or Malays was declared to be void. An act was passed regulating the sale of cocaine and other drugs. See also **LIQUOR REGULATION**.

STATE GOVERNMENT. Governor, Joseph M. Carey; Secretary of State, F. L. Houx; Treasurer, J. L. Baird; Auditor and Commissioner of Insurance, R. B. Forsyth; Adjutant-General, V. K. Hart; Attorney-General, Douglas A. Preston; Superintendent of Public Instruction, Rose Baird Maley—Houx, Baird, and Preston, Democrats; Carey, Progressive; rest Republicans.

JUDICIARY. Supreme Court: Chief Justice, R. H. Scott; Associate Justices, Cyrus Beard, Chas. N. Potter; Clerk, W. H. Kelly—all Republicans.

STATE LEGISLATURE, 1913. Republicans: Senate, 15; House, 31; joint ballot, 46. Democrats: Senate, 12; House, 26; joint ballot, 38. Republican majority: Senate, 3; House, 5; joint ballot, 8.

The names of senators and representatives to Congress will be found in the article **UNITED STATES, section Congress**.

WYOMING, UNIVERSITY OF. A State institution for higher education founded at Laramie, Wyo., in 1886. The total enrollment in all departments of the university in the autumn of 1913 was 386. The faculty numbered 65. There were no noteworthy changes in the faculty during the year, and there were no notable benefactions. A new agricultural hall costing \$100,000 was in process of erection during the year. The productive funds of the university amount to about \$50,000, and the income in 1912-13 to \$172,250. The greater part of this comes from the State legislature. The library contains about 33,000 volumes. The president is Charles O. Merica, LL.D.

X-RAYS. See **BENZOL, PHYSICS, and RADIO-THERAPY**.

YACHTING AND MOTOR-BOATING. Morton F. Plant's *Elena* and E. Walter Clark's *Irolita* in 1913 duplicated their brilliant performances of the previous year by winning the more important races for schooners. The *Elena* won the Larchmont Yacht Club's 38½-mile run from New Haven to New London on August 5, captured the rear-commodore's cup in the run from New London to Newport of the New York Yacht Club's squadron on August 6, and on the following day carried off the Astor Cup in a 40-mile race. The death of Mrs. Plant, wife of the *Elena*'s owner, resulted in the withdrawal of the schooner from further competition.

This left the field clear for the *Irolita*, which won all but one of the races of the New York Yacht Club's squadron. She captured the vice-commodore's cup, the commodore's cup, and the navy challenge cup. The challenge cup of the Alumni Association of the United States navy passed into the hands of the *Muriel*, Charles Smither's schooner, after a run from Gloucester to Marblehead. The *Muriel* also won the Larchmont Yacht Club's first run from Larchmont to New Haven. Edmund Randolph's sloop *Spartan* (50-foot, one-design class) won the king's cup, and J. P. Morgan's *Grayling* the commodore's cup in a 41-mile run from Provincetown to Marblehead.

In the German-American sonder class race for the President Wilson cup off Marblehead, C. P. Curtis's *Ellen* tied with Guy Lowell's *Cima* and then won in the sail-off. The *Michigan*, representing the Chicago Yacht Club, was the winner of the Manhasset Bay Yacht Club challenge cup. The Brooklyn Yacht Club's 280-mile ocean race was won by the sloop *Ediana*, owned by John A. Crowley. C. Ratsey's *Duchess* was victor in the New York Athletic Club's 100-mile race to Block Island.

Arrangements were made in the summer of 1913 for a renewal of the races for the *America's* cup. Sir Thomas Lipton, through the Royal Ulster Yacht Club, sent a challenge to the New York Yacht Club, holder of the trophy, which was accepted. The races will take place September 10, 12, and 15, 1914. The challenging yacht will be called the *Shamrock IV*, and will be a 75-footer. The defender will be chosen from yachts now being built by the Vanderbilt interests and various individuals.

MOTOR-BOATING. Interest in motor-boating in 1913 was chiefly centred in the international race for the Harmsworth trophy, which took place in Osborne Bay, Isle of Wight, England. The United States and France had boats entered in the regatta. E. Mackay Edgar's *Maple Leaf IV*, an English boat, successfully defended the trophy, and in covering the distance—32.4 nautical miles—established a new world's record of 49.02 knots, or 56.37 statute miles, an hour. *Ankle Deep*, the American contender, owned by Count Casimir Mankowski, finished second in the race, developing a speed of 45.67 knots, or 52.52 statute miles, an hour. *Ankle Deep* also distinguished herself by winning the gold challenge cup over a 20.3-mile course on the St. Lawrence River. She went the distance in 44 minutes, 55 seconds, an average speed of 46.12 miles an hour. H. H. Timken's *Kitty Hawk V*, in winning the Perry Centennial \$1500 prize, made a new American record by averaging 50 miles an hour for 30 miles. James Pugh's *Disturber* and Max Leischmann's *Haida Papoose* deserve mention for making 48.34 miles and 47.04 miles per hour, respectively, during the year. The Philadelphia-Bermuda race (734 miles) was won by *Dream* in 87 hours, 25 minutes, and the Bermuda-Brooklyn race (680 miles) by *Toscam II* in 70 hours, 27 minutes, 39 seconds.

YALE UNIVERSITY. The total enrollment in all departments of the university in the autumn of 1913 was 3272, divided as follows: Graduate school, 274; non-resident, 79; college, 1397; Sheffield Scientific School, 1112; art school, 56; music school, 91; forest school, 32; department of theology, 91; department of medicine, 48; department of law, 133. The faculty numbered 581, of whom 133 were professors, 89 assistant professors, 149 instructors, 90 assistants in instruction, and 124 assistants in administration.

There were several important changes in the faculty of the university in 1912-13. William H. Taft began his work as Kent professor of law in the autumn of 1913. Several assistant professors were promoted to full professorship. Professor John J. Weir retired from his position as Leffingwell professor of painting and director of the Yale Art School. Among the important gifts received in 1912-13 were the following: By the will of Dr. Francis Bacon,

\$220,000 for the library fund and \$100,000 to the scholarship funds; by bequest from Samuel H. Lyman, \$78,000, and from Cyprian S. Brainerd of the class of 1850, \$23,000; and gift of \$125,000 from Miss Emily F. Southmayd to endow a professorship in the law school in honor of her brother, the late Charles F. Southmayd. The total gifts received during the fiscal year amounted to \$1,152,000. (See GIFTS AND BEQUESTS.) The productive funds of the university amount to about \$15,000,000, and the annual income to about \$1,700,000. The library contains about 900,000 volumes. The president is Arthur T. Hadley.

YELLOW FEVER. See VITAL STATISTICS.

YOUNG MEN'S CHRISTIAN ASSOCIATIONS, INTERNATIONAL COMMITTEE OF. The international committee in 1913 consisted of 71 regular members, 20 advisory members, and a board of trustees of 14 members. It is the direct agent of the associations of the United States and Canada, and is elected by delegates from these associations meeting in triennial convention. Work is carried on in foreign countries—in Asia, Africa, the Levant, Latin America, and the eastern part of Europe. In the home field the committee maintains a force of 99 executive, traveling, and office secretaries, and in the promotion of association work in foreign lands it maintains a staff of 176 secretaries. The membership of the North American associations, according to the latest figures, was 597,800, and the net value of their property \$75,000,000. Libraries are maintained by 580 associations, and 770 occupied buildings of their own. There are about 73,000 young men students in educational classes, 360,000 in the physical departments, and 114,000 students in Bible classes. The chairman of the committee in 1913 was Alfred E. Marling; the general secretary, Richard C. Morse; and the executive secretary, Frederic B. Shipp.

YOUNG WOMEN'S CHRISTIAN ASSOCIATIONS, NATIONAL BOARD OF. The object of this board is to unite in one body Young Women's Christian Associations of the United States; to establish, develop, and unify such associations; to advance the physical, social, intellectual, moral, and spiritual interests of young women; and to participate in the work of the World's Y. W. C. A. There were, in 1913, 216 city associations; 684 students and industrial associations, with a club enrollment of 10,283; and 8 rural associations. The total membership was 280,597. There were 11 Territorial and State organizations called field committees. Each year summer conferences are held to train voluntary workers in bible mission study and association work. Activities include efforts to interest recent college graduates in all forms of social service and work among immigrants, negroes, Indians, etc. During 1913 plans were prepared for a woman's building at the Panama Exposition. Three commissions have been formed, the plans for initiating their work to extend over a period of five years. These are commissions of thrift and efficiency; the commission of social morality; and the commission of character standards. The most notable event in the history of the associations during the year was the raising of \$4,000,000 by solicitation. The object of this fund was to erect new buildings, and for other purposes of the associations. The president in 1913 was

Miss Grace H. Dodge; secretary, Mrs. William W. Rossiter; and the treasurer, Mrs. Samuel J. Breadwell. The general secretary is Miss Mabel Gratty.

YUAN SHIH-KAI. See CHINA.

YUKON. A territory of the Dominion of Canada. Area, 207,076 square miles; population (census of June 1, 1911), 8512 (27,219 in 1901). Dawson is the capital, with 3013 inhabitants in 1911. A commissioner administers the territory—George Black in 1913. See CANADA.

ZABERN INCIDENT. See GERMANY.

ZANZIBAR. A British protectorate composed of the islands of Zanzibar (640 square miles), Pemba (380), and several smaller islands. Population, 197,199. The sultan, Seyyid Ali bin Hamud, abdicated December 9, 1911, and was succeeded by Seyyid Khalifa bin Harub. The British agent and consul-general in 1913 was Edward Clarke, residing at Zanzibar, a fine port and the commercial centre.

ZEPPELIN AIRSHIPS. See AERONAUTICS.

ZINC. The production of primary spelter, which is zinc derived from ore, in 1912, was 323,907 short tons, valued at \$44,699,166. This was all from domestic ores. The total production of spelter from both domestic and foreign ores was the greatest in the history of the zinc-smelting industry of the United States, being 338,806 short tons, as against 206,526 tons in 1911. Missouri is the greatest producer of spelter. The production in that State in 1912 was 149,557 short tons. From Colorado comes 60,841 short tons, and from Wisconsin 34,137. These are the only States producing more than 20,000 tons. Other States which produce in considerable quantities are New Jersey, Montana, Idaho, and Kansas. The total production of zinc ore in 1912 was 378,816 short tons. The world's production of spelter in 1912 was the largest in the history of the mining of the metal. It formed a total of 1,070,045 short tons. The United States, the largest producer, was followed by Germany with 298,794 short tons in 1912, and by Belgium with 220,678. These are the only countries which had a production of more than 100,000 tons. The imports of zinc in 1912 were valued at \$1,363,884. The exports were valued at \$1,846,301. The zinc production of the United States in 1913, according to the *Engineering and Mining Journal*, was 356,146 tons, while the production in Europe was about 673,000 metric tons. The world's production of spelter in 1913, as given by the same authority, was 1,001,100 metric tons. See also METALLURGY.

ZOOLOGY. (See also ENTOMOLOGY, ORNITHOLOGY, FISH AND FISHERIES.) The Ninth International Zoological Congress was held at Monaco, beginning March 25 under the presidency of his serene highness, the Prince of Monaco. In contrast to the preceding congresses very few papers in experimental zoology and only two in genetics were read. This was unexpected in view of the great interest taken in these subjects by zoologists in general. Much time was given to the consideration of a report from the committee on nomenclature, especially in connection with the desirability of continuing the application of the law of priority. (See YEAR BOOK for 1907.) It was finally decided that the committee be given power to suspend the rules of nomenclature in

special cases, provided that, after consultation with specialists in the groups concerned, the vote of the committee be unanimously in favor of such suspension. If this vote is only a two-thirds one in favor of such suspension, the matter is to be referred to a special committee for subsequent consideration. The full text of the report on nomenclature was published in the *Zoologischer Anzeiger* for August 29 and September 12. At the congress the Emperor Nicholas prize was awarded to Professors Ernst Bresslau and Th. Mortensen. The O. Kowalevsky prize to Professor Paul Pilsener. The tenth congress was to be held in 1916 at Budapest, with Professor G. Horvath as president.

The Smithsonian Institution reported that their museum had received altogether, from the Roosevelt African Expedition, 23,169 specimens. Of these, 5013 were mammals, 4433 birds, 5153 plants, 2322 reptiles, and 3500 insects.

PROTOZOA. The protozoa, especially in relation to disease, continued to attract attention, the greater part of the work on pathogenic protozoa being on the trypanosomes. Woodruff explained the regular sequence of species of protozoa which appears in hay infusions as due to the fact that each secretes waste products toxic to itself, but not injurious to other species.

TURBELLARIA. Child stated that the small planarian, *Planaria velata*, reproduces by fission. As it crawls along, small particles adhere to the substratum and are left behind. These encyst and in the following spring emerge as new worms. This process Child notes as following a condition of senescence, and is thus a process of rejuvenation.

CESTODES. Scott, experimenting with the tapeworm of the rabbit and dog, *Taenia serrata*, concluded that the final evagination of the cysticercus in the alimentary canal is due to a stimulus first exerted upon it by the gastric, and later by the intestinal, juices. Experiments with artificial fluids showed that if subjected to either gastric or intestinal alone the cysticercus would not evaginate so readily as if it were exposed to both in a sequence like that it would experience in the alimentary canal.

MOLLUSCA. Kishinouye described a Japanese clam, *Meretrix meretrix*, which moves from place to place by secreting long mucous threads which eventually become sufficiently buoyant to support the weight of the animal in the water. It then lets go its hold on the bottom and is carried to considerable distances by the currents. Alverdes made an elaborate study of the composition and mode of formation of pearls. These may be divided into two classes, nucleated and non-nucleated, the former having in the centre some foreign body, the latter without such a centre. The existence of the latter type is denied by some writers, but Alverdes is certain of their existence, for he sectioned many decalcified pearls, and was unable to find them in some specimens. The nucleus may be composed of some one of the normal constituents of the shell, of some bit of tissue from the mussel itself, or of some foreign body. The pearl itself shows the same layers as are present in the shell, sometimes all being represented in a single pearl, but there is no regularity in this respect. The pearls arise in a pearl sack, formed of the mantle. Two may

fuse forming a baroque, or one may fuse with the shell forming a shell pearl. The so-called "blister" is a secretion formed over some foreign matter between mantle and shell.

VERTEBRATES IN GENERAL. Goodrich discussed the question of homologies among vertebrates, and concluded that such metamerically repeated organs as appendages are homologous, irrespective of whether they lie opposite corresponding vertebrae or not. He considered that homology is independent of ordinal correspondence in segmental position, and the only accurate criterion of homology is to say that organs are homologous when all their parts have been derived from corresponding parts in the ancestor. Delsman returned to the discussion of the origin of the vertebrate phylum, and argued for its origin from an annelid-like ancestor, the stimodaeum of the annelid becoming the neural canal of the vertebrate. The ventral ganglia of the annelids secondarily acquire a connection with this neural tube, and form the dorsal ganglia of the spinal nerves, as is shown by the fact that in the ontogeny these are at first separate from the neural tube, and secondarily acquire a connection with it. This is thus an extension of the theory earlier offered by Dohrn. Delsman thought that the Tunicates and Amphioxus are not in the direct line of descent, but are branched in a different direction from that taken by the Craniates.

AMPHIBIA. Hewitt described from South Africa peculiar tadpoles with large oral disks by means of which they could adhere to rocks or boulders in the mountain streams. These were found at Krantskopf in Natal, at an elevation of from 1500 to 1600 feet. Similar forms have been described from the Himalayas. The sucker in some cases is formed by the enormously developed lips and in others in a special structure.

REPTILES. Ruthaven found in the garter snakes evidence that the breeding season begins at no definite date, but takes place as early in the spring as the weather will permit. The period of gestation is 144 days.

MAMMALS. Newmann studied the habits of the Texas armadillo, *Dasypus novemcinctus texanus*. These are very abundant in Texas, large numbers being killed each year for their shells, out of which baskets are made and sold as curios. Newmann thinks that the shell is of slight protection against other animals, but that it does protect against thorns and similar structures, the animals often escaping from their pursuers by headlong plunges into bramble thickets. Sight and hearing are apparently both very poor in this animal, the sense of smell giving it its information concerning its surroundings. It is very sensitive to cold, digging burrows six or seven feet deep, with an enlargement at the end, which it lines with grass or leaves. Newmann found an indication of parthenogenesis in this animal, though the egg never goes beyond the early cleavage stage, and polyembryology is well known. (See YEAR BOOK of 1912.) Newmann regards the latter as due to mechanical conditions surrounding the fertilized ovum in the uterus, which causes it to break up into several parts.

It was reported that the buffalo herd near Lawton, Wyo., in 1913 contained 48 full-blooded bison, of which 27 were male and 21 female. The increase was slow, because so many more males than females were born.

CHROMOSOMES. Much work on chromosomes appeared during the year, the majority of papers tending to confirm a belief in the existence of a special sex chromosome, present in only half of the spermatozoa. An egg fertilized by one of these spermatozoa develops into a female adult, while an egg fertilized by a spermatozoon devoid of this chromosome develops into a male. Most of the known cases of this sort occur in insects, but Wodsedlek has found them in the pig. Chambers, working on a Daphnid, *Simocephalus*, found that no accessory chromosome appears, but that half of the spermatozoa degenerate. This was in agreement with Morgan's earlier work on Aphids, where a similar degeneration of spermatozoa occurs, only the female-producing ones remaining. This Morgan offered as an explanation of the fact that all fertilized eggs develop into females. Especially by Morgan and his students has the connection been emphasized between the accessory chromosome and the transmission of "sex limited" characters. In place of this latter term, Morgan proposed to use the phrase "sex linked," the character in question not being in any sense limited to sex, but merely closely linked to the sex chromosome in transmission from one generation to the next. Morgan stated that he had found twenty-five of such sex linked characters in *Drosophila*, the fruit fly.

Comparison of the results of breeding experiments on *Drosophila* with what is known of the behavior of the chromosomes in maturation and fertilization of this and other insects had led Morgan and his students to a belief in a very exact casual connection between the behavior of the chromosomes at this time and the mode of inheritance of certain characters. In *Drosophila* certain characters on cross-breeding freely assort and give the Mendelian ratio, while others seem to remain connected and give non-Mendelian results. This Morgan explained on the assumption that in the first case, the characters lie in different chromosomes, while in the second they lie in the same chromosome, and may remain connecting in the breeding process. In some cases, when two sets of sex linked characters are crossed, the resulting offspring shows a new combination of these characters, indicating a "crossing over" from one chromosome to another. It has been shown in some insects that when the chromosomes unite they twist around one another instead of lying side by side. Sturtevant suggested that when they subsequently separate in the formation of tetrads, the plane of division is different from the plane of union, and thus "determiners" originally in one chromosome are transferred to the other and a crossing over is the result. Sturtevant asserted that it is even possible on this assumption, to get information as to the architecture of the chromosome. If two determiners lie near together they will not be separated as frequently as if they lie at some distance from one another on the chromosome. Thus a determination of the relative frequency of the crossing of two characters will enable us to estimate the relative distance apart of any two determiners on the chromosome. This seems as yet extremely hypothetical. Bridges reported some non-Mendelian results in *Drosophila* which he explained on the assumption that in the formation of the polar body, some eggs

instead of losing one sex chromosome retained both, while others retained neither. Combination of these eggs with the different forms of spermatozoa would give fertilized eggs with sex chromosomes varying in number from three to none. Aberrant individuals, whose characters might be explained on this assumption of abnormalities in the sex chromosomes, may appear in as high as 5 per cent. of the individuals of a generation.

In connection with the subject of the sex chromosome, Wilson described in the Hemipteron, *Pentatoma*, a small body which he called "chromatoid," which closely resembles the accessory chromosome, but which is quite unlike it in its relations to the cell. Wilson points out the possibility that this has been mistaken for the accessory chromosome by other workers, and that some of the confusion in the literature may have been due to this fact. Foot and Strobell, on the other hand, basing their arguments on the results of a cytological study of some Hemiptera as well as on the results of crossing different species of these insects, came to the conclusion that the chromosomes themselves are too variable and inconstant in character to be as important in heredity as they have been supposed to be, and also that the results of breeding experiments show that certain characteristic sex markings are transmitted in heredity in a fashion that would be impossible if they were linked with a sex chromosome. Zacharias also, in *Ascaris*, found in opposition to Boveri, that in each division of the egg the chromosomes break down completely, and there is no "keimband" in Boveri's sense. There is, he thought, no individuality of the chromosomes, but they are formed anew after each cell division. These conclusions of Zacharias are, however, in opposition to those reached by practically all students of this subject.

Meek proposed a theory of chromosomal evolution based on what he called a metrical analysis of chromosome complexes. He supposed that the chromatin granules of the Protozoa are visible expressions of specialized particles concerned with the transmission of hereditary characters. As organisms evolved into greater complexity the granules were, by linear growth, converted into rods. This process after a while reached a maximum, when the chromatin conjugated into rods having a diameter twice that previously seen. These segment into chromosomes of a new thread width, and such chromosomes are ready to enter a new course of evolutionary growth. In this way chromosomes of forms below Nematelminthes have arisen. When a length limit had been reached, there was another combination giving a second type of chromosome, now characteristic of animals from Nematelminthes to Vertebrates. Within the latter group we get a third type. Thus the animal kingdom may be divided into three groups, each with its own especial type of chromosome. The accessory chromosome does not enter into this scheme, and appears to be undergoing some form of development or disintegration. It may or may not be the determining factor of the sex.

HEREDITY. The work done in heredity during 1913 was mainly a continuation and extension of that done in earlier years. Much of the published reports is very technical and must be regarded rather as accumulated data than as

final conclusions which may be summarized at this time. As in earlier years the Mendelians and the Galtonians follow quite definitely opposed methods, and in consequence often reach opposite conclusions. The *Journal of Genetics*, *Biometrika*, *The Journal of Experimental Zoology*, and various publications of the Carnegie Institution should be consulted by anyone interested in the details of these investigations. Morgan emphasized the distinction which should be made between a unit character and the factor which is responsible for the appearance of that character. The loss of a unit character does not, in his opinion, mean necessarily the loss of a factor, but merely a readjustment. Thus a character may sometimes be dominant and sometimes recessive, depending entirely on its condition. This condition of the factor might be, to use a chemical phrase, reversible, and the above mentioned result would follow. So many of these factors are now known in the heredity of *Drosophila* that Morgan proposed a new scheme of nomenclature for them, the old scheme lacking adaptability to present needs. Modifications of Morgan's proposed code were suggested by Castle, but no agreement was reached as to the most serviceable method. This assumption of a "reversible" factorial condition, according to Morgan, fits better with certain observations on *Drosophila* than does the "presence and absence" theory of Bateson. Sometimes characters apparently absent will later reappear, something they could not do if really absent in the earlier generations. Apparently another active factor may be temporarily substituted for one previously in evidence.

Doncaster reported that in cats the orange color is sex-linked with the male, being transmitted to female only. A female which receives orange color from male parent and black from female parent is tortoiseshell. Newman reported new evidence that night blindness in man is sex-linked. He studied one family where for five generations this has appeared, being transmitted from the affected male through his daughters to some of their sons. Ramaley reported on data concerning the inheritance of left handedness in the families of students in the University of Colorado. In this population he found that this trait occurs in about one-sixth of the whole number, and is inherited as a regular Mendelian recessive.

Davenport reported on the inheritance of skin color in man, basing his conclusion in part on data collected in Bermuda, but mostly from Jamaica, where a considerable amount of inbreeding between blacks and whites has taken place, and where several definite color gradations are commonly recognized. By the use of quantitative methods, Davenport got results which led to the conclusion that in the full-blooded negro from the west coast of Africa there are two double factors, A and B, for black skin pigmentation, and that these are separately inheritable. In inheritance we may get any one of five combinations: (1) No factor, producing white; (2) no B, the A factor simplex, producing quadron; (3) no B, the A factor duplex, or A and B both simplex, producing mulatto; (4) one factor duplex the other simplex, producing a dark color, and (5) both factors duplex, producing black. An octeroon has no factor and when mated with white would,

so far as skin is concerned, produce only white offspring. He found no reason to accept the commonly held notion that two white parents, one of whom had a black ancestor, may have colored offspring.

SEX DETERMINATION: The chromosomal theory of sex determination is that there are two types of spermatozoa, male producing and female producing. If these are present in equal numbers and fertilize the eggs at random, the resulting offspring should be evenly divided as to sexes. Observations have shown that in most animals the sex ratio from generation to generation is fairly constant, and that in a few cases this sex ratio can be more or less altered by modifying external conditions. This has been interpreted as meaning that external conditions directly determine the sex ratio, but there are various difficulties in the way of this explanation. Morgan suggested that the external conditions act, not by a direct effect on the determination of sex, but by influencing the two forms of sex cells differently, thus favoring one at the expense of the other. In this case, we could distinguish between a sex determiner, and a cause which modifies the sex ratio. In a review of the literature of cattle-breeding, Pearl collected evidence to show that if coitus occurs early in the estral period, the offspring would tend to be female, while if late, it would probably be male. This can only be explained on the assumption that the sex chromosomes are modified in their effects by external conditions. Pearl suggested that the accessory chromosome might be an inhibitor of maleness rather than a female determiner.

Nachtsheim, in a study of the chromosomes of the bee, got cytological evidence in favor of Dzierzon's theory of sex determination, for in drone eggs he was able to get no trace of spermatozoa, sperm asters, or conjugating pronuclei. Similar results were reported by Armbruster in the solitary bees, for here the sex appears early, before feeding begins, and cannot therefore be affected by nutrition.

CONJUGATION. Recent work by Jennings on *Paramecium* had indicated that conjugation is not followed by rejuvenation, as some of his lines were weaker after conjugation than before, this being in opposition to earlier work by Calkins, and in substantial agreement with Woodruff, who found that as far as the 3500th generation his cultures of *Paramecium* did not weaken when conjugation was prevented. Calkins and Gregory followed along the lines of Calkins's earlier work, but in this case beginning with an ex-conjugant and isolating its immediate descendants as far as the 32-cell stage, they were able to use each of these as the starting point of a pure line. Marked differences appeared between these pure lines in regard to conjugation, some apparently needing it while others did not. Thus among the cells resulting from the division of an ex-conjugant there are apparently the differences that appear between the soma and the sex cells in the Metazoa. Discrepancies between the results obtained in this field by different workers is, then, probably due to fundamental differences in the protoplasm of the different strains employed.

SECONDARY SEX CHARACTERS. Darwin's theory of the origin of secondary sex characters is now practically abandoned, most writers re-

garding these as due to some influence exerted by the sex organs on the external characters of the body. One theory supposes the presence of a series of internal secretions, or "hormones" sent into the blood from the sex organs, and acting upon body cells in such a way as to produce the characteristics in question. Geoffrey Smith continued his earlier work on the effect of a parasitic crustacean, *Sacculina*, on its host, a crab, where if the host be a male, the animal develops into what is practically a female, with ovary and characteristic secondary sex characters. Smith found that the parasite becomes filled with fat, and at the same time stimulates the liver to an increased secretion of fat. Coincident with this is a diminution in the formation of glycogen. This he thinks can be explained in terms of Ehrlich's side-chain theory. The parasite seizes on the fatty side chains of the liver, which in consequence are regenerated to excess. This, however, is too simple a statement, for the exchange takes place through the medium of the blood, and fat, as such, is not present in the blood, but is in some soluble form in combination with other materials. *Sacculina* seizes on the fatty part of this combination in the blood, setting free the other part to take up more fat from the liver and convey it again to the *Sacculina* roots.

According to Smith, an essentially similar process goes on when the ovary is developing in a normal individual, and there the excess of fat links in the blood are the stimuli leading to the formation of secondary sex characters. Thus the parasitized male forms an ovary, because the effect of the *Sacculina* is essentially similar to that of the developing ovary, the side-chain character liberated into the blood being the same in both cases. This theory, according to Smith, harmonizes better with observed facts than does the assumption of "hormones" thrown into the blood by the sex organs.

INHERITANCE OF ACQUIRED CHARACTERS. As stated in earlier YEAR BOOKS, the question as to the inheritance of acquired characters seems to have narrowed down to a determination of whether any influence can be exerted on the sex cells by forces operating on the surface of the body. Walther, continuing studies on "Die Umwelt des Keimplasmas," experimented on the absorption of magnesium salts into the blood of a crab, *Telephusa*. Here he concluded that there is no reason to believe that chemical substances foreign to the blood can penetrate into and modify the germ plasma. Harms found that when ovaries of one species of salamander are transplanted into the body of another species, the eggs produced by this ovary are like the ones characteristic of the species from which it was taken, and were not modified by the body into which they were put. Weigl reached essentially similar results in the transplantation of skin from one species of salamander to another. The transplanted skin will continue to grow, and become apparently an integral part of the skin of the foreign species, but retain their original character. They are thus self-determining, and not modified by other cells of the body.

On the other hand, Kammerer made elaborate experiments on color changes in *Salamandra maculosa* from which he concluded (1) the color patterns possessed by these animals have:

definite relation to the background against which they habitually rest, so that it is possible from the study of the color pattern of salamander, to determine the character of its usual environment, and (2) acquired color characters are inherited, and this is not a case of parallel induction. Somatic characters are impressed directly on the germ plasm.

FERTILIZATION. A common belief is that the fertilization of the egg is essentially a chemical process. Observations by Lillie on the eggs of Arbacia strengthen this theory. In this animal and in Nereis Lillie found a substance

"fertilizin" secreted by the egg, to which the spermatozoa are positively chemiotactic, and which causes them to agglutinate. Further analysis of this "fertilizin" in Arbacia shows that it is essentially an amboceptor with "oophile" and "spermophile" side chains. When the sperms are bound by the spermophile side-chain, the oophile is released, and by seizing on an egg receptor, fertilizes the egg. Thus the egg is essentially self-fertilizing.
